The causes of death after discharge from the hospital, of which 115 are known to have occurred, are given in Table 2.

Transurethral resections (Table 3) were performed on 8 patients between the ages of 40 and 49; 44 patients between 50 and 59; 179 patients between 60 and 69; 203 patients between 70 and 79; and 49 resections were performed on patients of 80 years and over, the oldest being 91. In this group of patients of advanced age 17 are still living.

A yearly record of the total number of transurethral resections, together with the mortality rates, appears in Table 4.

Of the 483 patients treated (Table 5), a total of 576 prostatic resections were found necessary for one cause or another before relief was obtained.

Multiple operations were planned on 31, but more were required, increasing the number to 39, because of the unusual size of the gland. The remaining number, representing 452 patients, had only one resection for what was believed at the time to afford satisfactory relief of the obstruction. Secondary operation, because of the insufficient removal or the regrowth of tissue, was found necessary on 44 patients who returned to the hospital after their original operation. Of these 44, there was one patient who returned six different times for removal of rapid regrowth of tissue over a period of six years. There were 2 patients who were readmitted four times for re-

current growth over a period of seven or eight years; and 4 patients who were readmitted three times over a period of five to eight years for additional removal of tissue. The remaining patients who returned for the removal of additional tissue are as follows:

1 patient	returned	8 years later
2 patients	returned	7 years later
1 patient	returned	5 years later
6 patients	returned	4 years later
5 patients	returned	3 years later
7 patients	returned	2 years later
8 patients	returned	1 year later
7 patients	returned	6 months to 1 year later

It is interesting to note that 46 of the 483 patients had had previous prostatic surgery elsewhere, in time intervals from twenty years to a few months. Six patients had undergone suprapubic removal, and 6 had undergone perineal prostatectomies. Thirty-one had previously had transurethral resections performed.

The smallest amount of tissue removed to afford relief from obstruction was 1 Gm., and the largest amount removed from any one patient totaled 117 Gm. This rather large amount was removed in three resections from a patient 57 years of age. It is interesting to note that, after five years, cystoscopic examination reveals no tendency whatsoever toward regrowth of prostatic tissue. The average weight of prostatic tissue removed from the first 250 patients was 12.4 Gm., and from the last 233 patients the average was 15.6 Gm. Twenty-seven patients underwent the removal of vesical calculi by litholapaxy or cystotomy, either at the time of the resection or during their initial hospital stay. The average number of years of survival after surgery was 3.34 years. This does not include deaths in the hospital.

The causes of death associated with surgery or following surgery are shown in Table 6.

Complications of a widely diverse nature marked the postoperative course of 172 of the total number operated upon. Of this number 66 might be said to have had major surgical complications, from which all recovered, and 71 had minor complications. The 66 major surgical complications are listed in Table 7.

Those patients showing an elevation of temperature above 102 F., generally associated with chills, were 71 in number. Postoperative urethral strictures were found to be present in 35 patients.

On examination of one or two sections of tissue, malignant prostates were diagnosed in 45 patients (Table 8), and 6 more were diagnosed malignancies upon examination of additional tissue—a total of 51 malignant prostates diagnosed at the time of operation.

TABLE 4.—CHRONOLOGIC SURVEY OF PROSTATIC RESECTIONS

Year	No. of Resections	Rate of Mortality	No. Still Living Age When Operated					Total Living	Total Dead	Not Traced
			40-49	50-59	60-69	70-79	80+			
1932	14	7.1%	..	2	4	3	..	9	3	2
1933	28	7.1%	..	2	..	5	..	7	10	11
1934	35	8.5%	7	5	..	12	9	14
1935	37	8.0%	..	6	6	5	..	17	9	11
1936	42	11.8%	..	1	5	6	1	13	22	7
1937	47	6.0%	1	3	13	9	1	27	12	8
1938	58	15.5%	..	2	8	17	3	30	20	8
1939	66	7.5%	..	2	11	16	3	32	26	8
1940	73	5.4%	3	2	23	19	2	49	20	4
1941	83	6.0%	3	5	20	23	7	58	23	2
Average		8.3%								

Of the number diagnosed as having benign prostates, 31 returned later with unmistakable evidence of malignant changes which were overlooked at the time of the first examination. Of these, 9 had additional tissue removed.

Of the number of patients with known carcinoma of the prostate at the time of operation, 16 are now living and 24 are dead.

Summary and Conclusions

The above information represents only pure factual reporting and is in no sense of the word intended as a comparative study. It is only the representation of experiences gained by as accurate a study as possible of patients undergoing transurethral prostatic resection from the writer's first experience with the operation in 1932, up to and including 1941.

The very low mortality rate associated with this method of prostatic surgery, so many times reported by others, is not here substantiated. The most careful attention to the most advanced operative technic and preparation of the patient has been studiously followed. Not one patient in the entire number was subjected to inhalation anesthesia. There was not one complication or fatality that could be attributed to the anesthetic. All patients in this group were private patients receiving every advantage offered by good hospital and nursing care.

Several years later, cystoscopic examination showed us evidence of regrowth in patients who stated that they were completely relieved of their symptoms and upon whom complete resection had been performed. By complete resection is meant the removal of all obstructing tissue down to the fibers of the prostatic capsule in all directions and in all quadrants of the vesical outlet. The patients who returned with obstructive symptoms years after the original operation were invariably found to have developed hypertrophy in that part of the prostate which was not interfered with at the original operation. The patients who returned a few months or a year later because they were never completely relieved

were usually those from whom not enough prostatic tissue had been removed.

The morbidity associated with prostatic resection has been one of the most disappointing aftereffects. Persistent pyuria, resulting in frequency, burning, and nocturia, has been a discouraging complaint in a large majority of all cases. The pathologic as well as bacteriologic study of the tissue removed has led to the belief that the pyuria is due far more often to the leaving behind of infected bits of prostatic tissue than to the introduction of infection during the operation or immediately following.

It has been found that the pathologist is at a distinct disadvantage in making a correct diagnosis of the tissue removed by resection unless practically every section is examined. Many incipient carcinomata are undoubtedly overlooked as evidenced by the unmistakable signs of malignant processes in later years. Many of these patients would have had a much better chance for cure had they undergone total prostatectomy.

It is our feeling that it is a mistake to consider that the average urethra will easily accommodate the size 28 F resectoscope. Many of these sheaths more nearly approach size 29 F. Practically all of the strictures which follow the operation are the result of too large an instrument being used. An operating instrument having a sheath of no larger size than 26 or 27 F would eliminate most of these strictures. The 24 F resectoscope carries too flexible a loop to permit of a very satisfactory resection, except in very small glands or median bars.

Probably the most important conclusion to be gained from this study is that a great many more patients with severe organic diseases were given the opportunity for relief of their urinary obstruction by the use of resection, wherein other methods of removal may have been considered too hazardous. It is in this narrow field of borderline patients that we feel that prostatic resection offers an advantage over other methods of prostatectomy.

Discussion

Dr. Albert M. Crance, *Geneva, New York*—I wish to acknowledge my sincere appreciation of your invitation to take part in the discussion of this excellent symposium which has been presented to us this morning. All of the speakers are to be congratulated.

The paper on "Rhabdomyosarcoma" by Dr. Robert W. Hunt brings to light the fact that we must always be on the alert for the unusual. I will leave the discussion of the two excellent papers on "Transurethral Prostatectomy" by Dr. Milner and the other by Drs. Orr and Kundert to the other discussers who are possibly more enthusiastic about resections than I am. They should both be congratulated upon their results. Personally, however, I have happened to see quite a number of patients at the office who have been resected by able urologists and who are far from satisfied or they would never have appeared. Those patients who consult another urologist after resection do so for just one reason. Most of them are still bleeding with each voiding or their stream is no better than it was or they are constantly having to get up at night and voiding frequently during the day. Dr. Orr in his very excellent paper on the results of resection unhesitatingly admits that quite an appreciable percentage were definitely dissatisfied with their results.

In passing over this subject briefly, it would not seem entirely out of order to mention that we still have today three methods of attack in so far as prostatic surgery is concerned—namely, suprapubic prostatectomy, perineal prostatectomy, and resection. If one individual happens to favor one method

over the other, that is certainly his privilege. I believe I am not alone in the opinion that there is a tendency on the part of some to attempt resection in the large obstructive adenomas of the prostate, which were probably much better candidates for prostatectomy than they were for resection. In carcinoma of the prostate with obstruction, resection is ideal. This brings us up to the paper by Dr. Huggins, which I should like to discuss more fully.

Since returning from our branch meeting in Hamilton, Canada, last September [1941], at which time I became thoroughly convinced that Dr. Huggins really had something, I have had the opportunity of following 3 cases, the first of which I shall use to close my discussion. In one of the cases there has been sufficient time to see the blood acid phosphatase drop from 21 to 2.7, with a decided decrease in the size and hardness of the prostatic carcinoma and a marked increase in weight and appetite, although this patient's general condition is not as yet anything to boast of. The third case, done only last month, is showing definite improvement in several ways, but, of course, this case is too recent to be of any value.

It occurred to me some time ago that no one, at least to my knowledge, has tried to prove through research in the literature that Dr. Huggins might be wrong. I therefore made an attempt, at least, to find any articles which might possibly show that cancer of the prostate actually does develop in the eunuch. In our *History of Urology*, which was edited by the late Bransford Lewis, we find that there is no authentic description of prostatic carcinoma before the year 1861. Therefore, ecclesiastic

literature on eunuchs is of no value. At my request an apparently thorough search for material on the subject was made by the librarians of the State Medical Library, the A.M.A. Library, the New York Academy of Medicine, and the American College of Surgeons. I asked them this question: "I am asking you to give me a summary of the literature you may have regarding the question as to whether or not carcinoma of the prostate ever existed among eunuchs." I shall endeavor to give you briefly what little I was able to obtain in the review of all the literature I could find which might possibly have a bearing on our subject.

Out of a great many I was able to find the following statements: Woglom,¹ in his article on "Castration and Sarcogenesis," states in his conclusions that under the conditions of the experiment, prepubertal castration neither augments nor diminishes the susceptibility to methylcholanthrene sarcoma in male mice. Here again, however, the experiments carried out by Woglom mention only one case in which the condition developed in the prostate 150 days after castration and after the injection of benzpyrene, which was done on the same day. He outlines this experiment as having been done by Moore and Melchionna and reported by them in the *American Journal of Cancer* 30: 731 (1937). Onuf,² in 1912, describes the subject of eunuchoidism rather thoroughly, but no mention is made of its relation to carcinoma of the prostate. However, in an apparently well-prepared series of papers in which the author made a review of eunuchs, including reports gathered from several foreign countries, the fact that carcinoma of the prostate is not mentioned among them may in itself be of some value. Wagner,³ in a Danish journal in 1932, reported that his experiments found a reduced resistance to subcutaneous carcinoma in castrates, but, unfortunately, his experiments do not mention the prostate. Sauerbruch and Knake⁴ reported in a German journal in 1937 that in experiments with animals they found that out of 60 castrated animals, malignant tumors were found in 8, 5 of which had metastasis. The experiments were done by irritating wounds with injections of lactic acid or cholesterol. Forty control animals which had similar injections, but which were not castrated, showed only one malignant tumor without metastasis. They believe that their experiment clearly shows that damage to the sexual function is one of the general conditions that causes tumors. They further state in their summary that one may connect susceptibility to tumor in old age with the decrease of sexual function.

Again I had hopes, from the title of their paper, that something pertaining to the prostate might be found. Judging from all of the literature that I have been able to obtain and review, Dr. Huggins certainly should consider himself as having clear sailing because I believe it is impossible to find any real scientific evidence to prove that he might be wrong. I might also quote from a personal letter from Dr. James B. Hamilton of the Department of Anatomy at Yale: "I, too, have searched the literature with regard to the incidence of prostatic carcinoma in eunuchs. Discussion of this subject is practically

nil, with legitimate accounts having been made with reference to only two or three castrate men, who had no carcinoma. Our group has been studying a series of approximately two hundred eunuchs, but our work is incomplete as yet and many of the men are of relatively young ages. I am sorry that we are not able to be of any material use to you at present but can sympathize with the importance of the point of view you are pursuing."

In closing, I should like to cite briefly a summary of my first case. E. C., a farmer aged 71, was admitted to the Geneva General Hospital on August 7, 1941, with an acute retention and a history of difficulty in voiding for the past few months. Rectal examination revealed a very large, hard, fixed carcinomatous mass involving all of the palpable adjacent structures. The mass was of stone hardness. An indwelling catheter was inserted with considerable difficulty because of the hard character of the prostatic urethra. In fact, the catheter used was a silk-woven Coude. I chose to do a resection suprapubically on August 12, 1941, which, incidentally, confirmed the diagnosis by the sections made in the many pieces removed. A large indwelling catheter was left postoperatively, as well as a suprapubic tube, which was removed on the seventh day. It was nearly three weeks before he voided. Returning from our Hamilton meeting on September 14, 1941, fully convinced that Dr. Huggins had something on the ball, I convinced the patient of the necessity for the operation, and on September 16, I did a bilateral castration. Three days after this operation he was complaining that he wanted more food on his trays. His weight was then 141 pounds. He was discharged on September 23, with his suprapubic wound entirely healed. His voidings have been made every six to eight weeks since his discharge, and the change in the character of the mass has been nothing short of miraculous. He was in my office on April 3, 1942, and there was no further rectal evidence of his prostatic carcinoma. His weight is now 185½ pounds, a gain of 44½ pounds. He is apparently perfectly well, with an excellent appetite and an appearance of general well-being. In the office he remarked: "Don't keep me long, Doc, because I've got a hell-of-a-lot of plowin' to do!"

Dr. J. Sydney Ritter, *New York City*—I agree with Dr. Milner in that preoperative preparation is essential in the prostatic, regardless of the type of surgery to be employed. Many of us have attempted resection down to the surgical capsule, but unfortunately one complication, that of extravasation, which I did not hear referred to by Dr. Milner, has clouded the picture. Recently I have advocated a return to the McCarthy visualized punch for the floor of the prostatic urethra at the trigone, at which point extravasation, if it does occur, is not brought to light for several days and may lead to serious consequences.

Relative to spinal anesthesia, I feel that muscular relaxation is too great and a false sense of a complete resection is gained, whereas under pentothal sodium this muscular relaxation is not obtained, and a true picture of the ultimate result can be noted on the operating table.

Recently I have omitted postoperative irrigations and have resorted to the forcing of fluids by mouth or intravenously. This, I feel, decreases the muscular activity of the bladder and permits coagulation of the capillary bleeding.

I should at this time emphasize the debt we owe to Dr. Huggins for his contribution in the treatment of carcinoma of the prostate gland. The fact that cancer of the prostate can be relieved when his suggestions are carried out, particularly in those patients with evidences of metastasis, is a most valuable asset.

Since last June [1941] Dr. S. E. Kramer and I have followed 10 cases of this pathologic condition, heretofore apparently hopeless when complicated with metastasis. Our patients have presented symptoms varying from complete retention to those with no retention of urine but with symptoms produced by the metastatic lesions.

In most of our cases the acid phosphatase was elevated. The more marked the metastatic lesions, the higher the blood content of acid phosphatase.

Interestingly enough, within two or three days after orchiectomy these patients were relieved of many of their symptoms. Those with acute retention were able to void before the fourth postoperative day. Within two weeks, pain in those with metastases had subsided.

These results are more encouraging than those of Dr. Huggins; however, I assure you that this is not because of the individual but because of the fact that Dr. Huggins has accepted cases that were in the extreme stages of the disease. I have been informed that patients have been referred to him just short of the moribund stage. This no doubt is a big factor in his results.

At this time I wish to report two cases of prime importance:

Case 1.—The patient reported with the usual symptoms of prostatism, with a diagnosis of benign prostatic hypertrophy being made. No blood

phosphatase was done on this patient, on whom, for instruction purposes, a perineal prostatectomy was performed. On pathologic examination an early carcinomatous lesion in the prostate was found. We later did a bilateral orchiectomy, and this patient is now alive and well.

I mention this case because I believe the time has come when, together with blood chemistry and other laboratory processes employed in the preoperative care of the prostatic, blood phosphatase, both alkaline and acid, should be done.

Case 2.—This is a patient in whom a diagnosis of cancer of the prostate with bony metastases had been made and in whom the alkaline and acid phosphatase were higher than normal, making it somewhat difficult to exclude carcinoma of the prostate as a diagnosis. A total prostatectomy was done and examined histologically. No evidences of carcinoma in the prostate were demonstrable. It is interesting to note that approximately one year after the prostatectomy, the extensive lesions noted in the skull had diminished. The patient is in excellent condition. No castration was performed.

This case has led me to the belief that perineal section should be done for biopsy purposes to confirm pathologically the presence of malignancy before orchiectomy. The diagnosis in this last case was that of Paget's disease.

Will the removal of the prostate have a beneficial effect on this disease? It is my opinion that more study should be carried out in the treatment of Paget's disease from an endocrine point of view. I wonder whether or not Dr. Huggins has done any work along this line. Dr. H. H. Ritter and I have begun a study on the effect of the prostate in Paget's disease.

In the paper by Drs. Orr and Kundert the question of carcinoma once more occupies the center of the stage. The specimens obtained by transurethral resection should not be difficult to study pathologically if the technic suggested by Dr. S. E. Kramer and myself is employed. Postoperative stricture does occur and I believe it advisable that one employ the No. 24 French instrument. If this is unsuitable for introduction, then the Nesbitt technic of external urethrotomy, I believe, would decrease the occurrence of postresection stricture.

BIGGS MEMORIAL LECTURER CHOSEN

Lt. Col. Paul F. Russell, Medical Department of the U.S. Army, will deliver the annual Hermann M. Biggs Memorial Lecture, which will be heard this year at 8:30 P.M., April 1. His subject will be "Malaria and Its Influence on World Health." Open to the general public, the lecture will be given

in Hosack Hall of the New York Academy of Medicine under the sponsorship of the Committee on Public Health Relations.

Lt. Col. Russell is Chief of the Tropical Disease and Malaria Control Section, Division of Preventive Medicine, Office of the Surgeon General.

MEETING OF ORAL DIAGNOSIS SOCIETY

Members of the New York Society for Oral Diagnosis will hold their next meeting at 8:30 P.M., March 17 in Squibb Hall, Squibb Building, 745

Fifth Avenue. The April meeting will be on April 14 at 9:00 p.m. The meetings are open to members of both the medical and dental professions.

Panel Discussion—School Health Services

What's Wrong with Our School Health Service?

HAROLD H. MITCHELL, M.D., Long Island City, New York

IT REQUIRES no inspiration to predict that there will be a shortage of doctors and nurses as the war advances. Already there are increased taxes and demands for cutting the cost of public health services. You know the result of such a situation. Every layman expects the doctor to work harder and in some way arrange to examine a larger number of patients with the same attention he would give if he had more time and fewer patients. It is rare indeed that the layman is willing to accept the idea that the physician should take precautions against attempting too much or that he should limit the number of examinations in order to safeguard their quality.

The physician's job in the schools of New York State is generally one continuous round of examinations, and yet our children need something more than examinations if we are to avoid the medical neglect that occurs all too often. Medical advice and guidance in the use of medical facilities are really essential to civilian morale. If we are to do a better job than the Nazis and the Japs in using all our resources, then the doctor on the home front must have something to say about the health program in the schools.

It is distinctly the job of the medical profession to protect the public from medical service that attempts too much, that promises more than it can deliver, or that does not meet the needs of the children. We have been accused of standing in the way of progress when we have opposed crackpot schemes that assumed that the whole problem of medical care would be solved by the magic words—health insurance. We have often failed to make clear that what we are really opposed to is the mistake of promising more than can be delivered. We have opposed European health insurance schemes that interfere with the quality of service. Too often we have failed to make clear how generally and wholeheartedly we are for sound medical guidance and consultation service in the schools.

The "Platform" of the A.M.A. definitely favors such a service in the schools. This stand, while it does not specify what I call a medical guidance and consultation service in the schools, does

make very clear those principles that call for expansion and extension of this kind of public health service. In fact the kind of school service that I propose to discuss does not conflict with any one of the A.M.A. principles in the slightest degree, and if we make our point of view clear, I believe that you will agree that medical advice and guidance for school staff, and parents is a contribution to public health that is essential to our American educational system. Indeed, we need it to help beat the Axis and to maintain our democratic way of living.

It is my contention that our usual responsibility to promote the principles of the A.M.A. and to speak out against unsound public health service in the schools is now a more serious duty than ever before because the health of the whole population is inextricably tied up with winning the war. We must make clear the fact that the medical profession must decide the important matter of the quality of medical service. The whole future of medical practice is dependent upon whether the medical profession shall determine the character of medical service or whether physicians must work under lay direction without regard for conditions that may interfere with the quality of medical judgment. If we speak out on this school health problem at this time, we have an opportunity to let the public know that organized medicine is earnestly concerned with the public welfare. We have an opportunity to make clear that the A.M.A. principles were established to protect the public health. In fact, we face the need for a campaign to bring about medical leadership where formerly there has been unwise lay control that interferes with quality of medical service.

In order to maintain high standards of medical advice in the schools, the medical profession must decide: how many children a doctor can examine in a given time; how much time is needed to get all the significant facts in a medical history; how much time the doctor needs to explain the child's condition to the parent; how much time he must have to interpret a case to the school authorities; and how much clerical and nonmedical help the physician should have for efficient service. If the medical profession is to decide these important questions effectively, the decision must be made locally according to the staff available, and according to the needs of

Read at the panel discussion on "School Health Services" at the Annual Meeting of the Medical Society of the State of New York, New York City, April 30, 1942.

the children. The dicta of a state or any other distant office cannot answer these questions.

Our State Medical Society has gone on record as favoring Health Department administration for the health service in the schools, but there has been no real campaign to bring this change about by legislation. We know that the State Education Department is not ready to give up this power. Such a change is likely to come and should come only after long and careful consideration, if at all. We should, therefore, speak out very clearly upon the principles that are involved and not assume that this legislative change is the crux of the whole matter. Health Department administration in this State might make it easier to have local determination of needs and medical leadership to decide the character of medical service, but, in any case, there must be strong local medical support of policies. My proposal would be a medical society committee for every school system, recognized as an integral part of the schools, to determine medical policies.

We have reason to be very proud of the medical leadership in this State in most fields of public health. The medical profession, in fact, has been outstanding in giving guidance, support, and real promotion of all fields of public health, except in the schools. Even there, we have had many splendid contributions from individual physicians, but there has been altogether too much neglect from organized medicine. It is unfortunate that our school physicians have been organized as a separate group and not as part of their state and county medical societies. Certainly the state law requiring annual medical examinations and the State Education Department have interfered with the local determination and quality of medical service.

We cannot do much about determining the quality of medical advice rendered in a local school when the State Education Department sends out inspectors to the local community and exerts a powerful influence for more examinations than a doctor can do effectively in the time allotted. As you know, the slightest suggestion may become a strong influence when the state controls the subsidy to local communities. When the medical man in the schools is paid by local school authorities who operate under a system that is continually being directed from Albany, it takes a very determined and independent physician with a great deal of local support and influence with the local school authorities to withstand the demands from Albany. I do not mean to imply that all advice and influence from Albany is bad, but when the Albany office influences the local school to provide routine examinations that crowd out history-taking and

guidance to parents, then it is evident that we need better application of the principles of the American Medical Association and that we should emphasize "local determination of needs and local control of administration."

When local school authorities feel that it is not worth while to try to have children examined by the private physician and the state authorities do not do anything to encourage private physicians' examinations, it is time to have a little more local medical leadership. It is certainly unsound to let the public believe that the examination made in the school is an adequate substitute for the service that can be rendered by the private physician, who sees the child periodically in sickness and in health. I have heard state education officials stress the health educational value of the health examination, but I have never discovered that they appreciate what bad education it is for parents and children to get a false sense of security from inadequate examinations in school. This is a fundamental problem of maintaining the quality of medical service and the utilization of qualified medical and hospital facilities already established.

We may muddle along in peacetime with public health services in the schools that violate our medical principles, but today we have an opportunity to do something about this situation. Because of the war, the medical profession assumes a very different place in the community from the place it holds at other times. Medical advice in governmental matters is sought, and preventive medical services are recognized as essential and as the function of the medical profession. If the medical profession will speak out on these fundamental principles, clearly emphasizing sound health protection and care of school children at this time, I believe the opposition that we have experienced in the past will no longer be able to withstand the prestige of organized medicine today.

We have also an opportunity to use the statements from the educational administrators themselves to support the principles that we stand for. Thanks to Dr. Bauer, of the A.M.A., and some other public health leaders on a committee of the American Association of School Administrators, we have a report, "Health in the Schools," which can be quoted from effectively. For example, the report says:

"... the present trend is to de-emphasize the annual periodic school health examination. . . ." The writers point out that the annual repetition of the examinations consumes so much of the time of the medical, dental, nursing, and teaching staff, that no effort could be made to sort out even those cases needing immediate medical care. They point out the importance

of the medical history and say: "It is better to limit the examination and keep the history up to date." They emphasize the importance of the conference with the parent to explain the importance of medical care, or to convince the parent that it is worth while to seek medical treatment or a medical work-up. And above all, it should be remembered that the American Association of School Administrators makes clear that "the best school examination cannot take the place of the series of examinations done by the family doctor."

I have not discussed how a doctor can do his job in the schools and at the same time maintain the quality of medical advice and guidance.

You will note a reference in the program to new procedures that will meet the needs of children in school without conflicting with the fundamental principles of organized medicine. I shall leave that for Dr. Wheatley to discuss and to show that a sound service is possible even with a limited staff. The procedures are new for New York City and for most other places in the country, but I believe that they are practical and sound.

Finally, both Dr. Wheatley and I believe that the place of the physician in the school and the only practical job he can do is to act as an adviser, as a consultant, and as an educator, not as a mere examiner.

WAYS TO MORE EFFECTIVE SCHOOL HEALTH SERVICE

GEORGE M. WHEATLEY, M.D., New York City

NEW York City has had the opportunity to develop its own school health policies based on "local determination of needs and local control of administration." This freedom of local action has made possible from time to time experimental study of school health practices in New York City. The latest research, the Astoria School Health Study, was completed in 1941, and the report was published by the press of the Commonwealth Fund.* To develop some of the leads which Dr. Mitchell has given me with respect to procedures to meet the health needs of school children which harmonize with the basic principles of organized medicine, I shall draw upon my experience with the Astoria Study and the New York City Health Department from 1937-1941.

Today, when there are more pressing problems of military and industrial health which demand our thinking and our action, you may well ask why discuss school health service? My excuse, paradoxically, is the war. So long as the war lasts there will be an ever increasing encroachment—necessary, for the most part—on peacetime public health activities. Therefore, the efforts of those interested and engaged in school health work must be directed not toward obstructing this trend but toward adjusting to curtailment in public funds and personnel. The basic principle which governed the Astoria Study was to discover, if possible, the most efficient methods of conducting the school medical service and still keep within the bounds of good pediatric

Assistant Medical Director, Metropolitan Life Insurance Company.

* *Solving School Health Problems*, by Dorothy B. Nyswander, Ph.D., Commonwealth Fund, 1942.

practice. We are facing, by necessity, in all phases of civilian life the challenge of effective, yet economical, operation. I should like to discuss three ways in which the school health service may meet this challenge: first, by increased efficiency in record-keeping; second, by conservation of the school physician's time; third, by better utilization of community medical resources. All three have been intensively explored by the Astoria Study. All three are incorporated in the policies of the New York City School Health Program. The first, dealing with school medical records, will have most appeal for school medical directors, but the second and third points have interest for every pediatrician.

Don't lose the child's medical record! This is so obvious that you may think it ridiculous to mention it. Nevertheless, one of the first studies made in Astoria showed that, in spite of the fact that all children were examined at the time they entered school and the information recorded on a card, by the time the child reached the fifth grade it was more than an even bet that he did not have a medical record. The main reason for losing the card was the frequent yearly moving from school to school. About 30 per cent of New York City school children move to another school each year. A year ago these comments would have had little application outside of this city. Today almost every community is experiencing a tremendous shift in population because of workers' families moving to new industrial locations.

The idea worked out to insure the transfer of the record was quite simple although the administration in such a large organization as the New York City school system was sometimes

rather complicated. Whenever a child now transfers from one school to another the parent is given the medical record along with the academic card to take to the new school. Now it is the exception for a record to be lost, for the child cannot be admitted to the new school without these records. Preserving the child's medical record through his school life is the first step in economical administration of school health service.

We found that the school nurse spends about one-fifth of all her time on records. We must make every effort to reduce this time. In the Astoria Study we experimented with the use of nonprofessional workers to do clerical chores, which released the nurse for professional activities in the school. This experience is being used to good advantage today to train volunteer aids.

Another time-saving measure was to print the medical records in two colors to distinguish the sexes. This considerably shortens the time taken to find a record. Metal tabs of assorted colors were introduced to assist the nurse to organize her follow-up work. The appropriate color placed at the top of the individual record designates immediately to the nurse what action she is to perform. And finally, considerable emphasis was placed upon teaching the staff of both doctors and nurses in the school system to put pertinent information on the record. If there is a health problem, answers to three questions must be on the medical record. *What* is the condition? *Where* is it to be taken care of? And *when* will it be taken care of? These are all rather simple administrative suggestions but if fully understood and incorporated into the school medical record system will not only save time but will also improve the quality of service rendered.

Ways to Save the Time of the School Physician

Even more important today than streamlining records is the conservation of the time of the school medical personnel which promises to become scarcer every day. We learned in Astoria that many activities of the school health program can adequately be performed by nonmedical personnel. The classroom teacher made semi-annual vision tests and measured the height and weight of each child. Audiometer tests were made by technicians. Plans were worked out so that the data accumulated both by the teacher and by the audiometer technicians could be routed through the school nurse and physician. This is an essential but sometimes neglected step in the procedure. It must be done to insure proper interpretation of tests to parents. In the school medical examination arrangements were made so that the children could be undressed and

ready for examination when they were presented to the physician. The physician was freed from having to write the record by having the nurse make the notes which he dictated as he performed the examination.

The reason why it is important to conserve the school physician's time by eliminating nonprofessional functions is to avoid speeding up the medical examination. When the load of examinations remains the same but staff is curtailed the tendency is to step up the tempo of the medical examination. To hurry the examination only tears down what has been slowly building up during the last few years—namely, the improvement in the character of the examination given in the schools. Preserve the examination but relieve the physician of doing what can be done just as effectively by others in the school.

The best economy in the use of the school physician, we believe, is to devise screening or case-finding procedures so that children most in need of the physician's judgment can be culled from the hundreds of well children in the school. This seems rather radical to some physicians, especially to school physicians. Nevertheless, it is a well-established method of public health administration and, in a sense, forms the basis for the management of cases in private practice. The physician is never in a position to supervise closely enough the health of every individual in his practice from day to day. He needs to rely, in the case of children, upon the observations of the mother, or, in adult practice, on the symptoms expressed by the patient. What we have tried to do in the Astoria program is to develop the interest and ability of teachers to make day-to-day observations of pupils for signs and symptoms that might suggest the need for medical attention. This information is utilized in the health service by having the nurse visit the classroom periodically for a review of the health condition of each pupil in the class. The classroom discussion between teacher and nurse includes the teacher's observations, the nurse's progress in securing treatment for certain pupils, her information about home conditions, as well as the nurse's evaluation of the teacher's observations. From this classroom conference, children are selected for the physician's attention.

In addition to this rather formal method of case-finding, teachers are encouraged to refer freely from day to day, when the nurse is in the school or at the time when the physician visits the school, any children who have urgent problems. This is the system which is now being used in New York City. In Astoria we found that 8 out of 10 children so selected by this classroom conference method, when examined by the school physician, were found to have a health

problem requiring further medical attention. These do not, as a rule, represent cases of medical neglect, either. They are children whom the teacher may have noted as frequently absent, or doing poorly in school, or exhibiting unusual behavior in the classroom, or she may think a child looks pale, thin, or overweight, or she may know that he has been absent because of sore throat, discharging ear, swollen glands, and so on.

Will Screening Detect Heart Conditions?

Sometimes the question is raised: How do you discover children with heart disease by this system? The best answer I can give is to refer to an analysis of the medical findings of the school physicians in a group of 241 children who had been selected by the Teacher-Nurse Conference method. Seventeen out of the 241, or 7 per cent, were diagnosed by the physician as having heart disease or possible heart disease. Among an unselected group of 426 children, these same physicians found that 1.8 per cent had organic or possible heart disease. This latter figure is comparable to the frequency of heart disease among New York City school children.

A corollary to this question of overlooked cases is the comment that school physicians are alarmists and often needlessly refer cases. We are all familiar with the justifiable complaint of the family or clinic physician who has had to pacify a distraught mother who says the school doctor told her that "Mary has a bad heart" or "Johnnie's tonsils must come out" when you know that Johnnie never had a sore throat, swollen glands, or any other conditions referable to the tonsils, and Mary has a nonorganic murmur which you've observed for years.

The New York City Health Department has done three things during the past four years: (1) it has had a staff education program to teach pediatrics to public health physicians and nurses; (2) mothers have been encouraged to attend the school medical examination so that today Dr. Leona Baumgartner, Director of the Bureau of Child Hygiene of the Health Department, reports that 89 per cent of the examinations done in the period from September, 1941, to January 31, 1942, were made with parents in attendance; (3) a personal history is obtained either from the mother or on a form sent to the child's home. This information, plus the observations of the teacher, aids the physician in his diagnosis.

Table 1 shows the frequency with which the school physician's judgment was confirmed. We think that these data are an indication of more careful selection of children by school nurse and physician. While a more thorough examination takes more time, nevertheless it pays because it usually results in a valid referral for treatment.

TABLE 1.—FREQUENCY OF AGREEMENT BY TREATMENT AGENCY WITH SCHOOL PHYSICIAN

Decision of Treatment Agency	Astoria Children		Health District Brownsville Children

Agreement	209	82%	183	78%
Disagreement	31	12%	34	15%
Undecided	16	6%	16	7%

Greater Participation of the Private Physician

Perhaps the most important contribution of the Astoria Study was the development of private physician participation in the School Health Program. Many school health services have excluded the private physician, some on the grounds that if he is encouraged to participate, the school physician will not have a job; others on the basis that his examination is not so carefully done as the school physician's. We started out on the assumption that most children had some medical attention prior to entering school. Therefore, why not encourage the family to use the physician to whom the child was already accustomed and who, moreover, knew far more about the child's health than we were likely to learn from the brief contact that we had with him in school? Furthermore, if treatment were needed, the child was already in the right hands and it would save us a lot of follow-up time. We believed, too, that if the private physician carried a substantial part of the examination load, the school physician would be released for advisory service to principals and teachers in the schools.

The Health Department has always favored the examination of children by their family physicians wherever possible, but in 1933, based on our experience in Astoria, a vigorous campaign was begun. In 1937 it had been demonstrated that a friendly, simply worded letter signed by the school principal and sent to the parents of each new entrant suggesting an examination by the family physician but *not mentioning that the school physician would do it if the family didn't attend to it in ten days* resulted in a 100 per cent increase in private physician examinations.

In addition to an improved statement on the value of the examination by the personal physician, it is now the policy throughout the city, when parents are registering their children for school, to station physician, nurses, and trained clerks in all the schools to interview parents and encourage the examination. Since the school year 1937-1938 when the percentage of entering children examined by private physicians was 8 per cent, the figure has increased to a magnitude of 42 per cent for the school year 1942. In 1938-1939, 15,600 of the examinations were made by

TABLE 2.—TREATMENT AGENCY ATTENDED BY SCHOOL CHILDREN

Agency	Astoria Children		Brownsville Children	
	Number	Per-centage	Number	Per-centage
Personal Physician	256	100%	232	100%
Clinic	204	80%	145	63%
Undetermined	45	17%	78	33%
	7	3%	9	4%

private physicians, for 1941-1942 the number had increased to 20,800.

Aside from examination of new entrants, to what degree does the private physician participate in the treatment of children referred for medical attention by the school? This varies, of course, with the economic status of sections in so large a place as New York City. We tried to get some information on this question for two districts: one was Astoria, which is considered fairly typical, if any area is, of the New York City school population, and the other was Brownsville, in Brooklyn, judged to be somewhat lower in economic status than Astoria. Table 2 indicates the results of this analysis of the source of treatment. For the city as a whole, in the period from September, 1941, to January 31, 1942, of 41,920 children who had medical attention, 20,147 (48 per cent) went to private physicians.

Thus the private physician is playing an ever increasing role in the school health program in New York City, and under present conditions he is likely to assume greater importance. This raises the question of his responsibility and interest in school health work. If the school earnestly educates children and their parents to seek the best medical attention by visiting their family physician, he in turn must play his part in this preventive medical effort. He must give the lie to those who say, "The family physician will not take the school examination seriously," or, "He gives no information to guide the school in its effort to develop an individualized health program," or, "He doesn't want to be bothered with the school nurse who tries to aid in follow-up of his patients who may have lapsed treatment."

Defects in Private Physician Reporting

Some of the problems are suggested by a study of the reports of private physician examination of 120 new admissions selected at random in the Astoria section. The number is small and they are discussed only for purposes of illustration. Of the 120 examinations, but 41 children, or about one-third, were adequately protected against diphtheria. On the other hand, every child had been vaccinated. This is mandatory because the

educational authorities in New York City cannot admit a child to public school unless he is vaccinated.

Thirty-four conditions requiring medical attention were reported for this group of 120 children. From the description given in the reports, in one-third of the cases it was impossible for the school physician or nurse to understand the nature of these conditions. For 7 of 31 children reported as needing medical attention, the school had no information to indicate that the private physician was assuming responsibility for treatment. A sampling of private physicians' opinion in the city revealed that nearly all physicians would welcome the school nurse's assistance in the follow-up of school children who were their patients. Yet two-thirds of the reports of those children whom the physician said needed medical attention gave the nurse no clue if and when the physician wished to see the child again.

School is obviously a very real influence in the child's growth and development, and physicians are now recognizing its importance in their care of children. If the physician studies this facet of the child's daily life, while he may discover influences which may contribute to or create a health problem, he may find also that the school can contribute to his program of therapy. For example, he may make recommendations concerning play activities or rest periods, additional nourishment for below-par children, seating in class for vision or hearing defects, or providing better understanding by teacher and principal of children with emotional problems. Some idea that the physician is missing such opportunities is gained from these same 120 reports. Of 13 children whose condition suggested recommendations to the school regarding special adjustment of play and physical education activities, such recommendations were made for only 3 children. In the case of 36 additional children, judging by the description of the child's condition in the report, some recommendation might have been made. But in only 9 of this group were any additional recommendations made to the school by the family physician.

These comments are made to indicate that a gap in understanding as well as communication exists between the school and the private physician. If we were to seek the answers to the questions that have been raised we should perhaps discover that the school has been remiss in not explaining to the physician what kind of information it needs in order to provide an individualized health program for the child—on the other hand, we might learn too that the physician has not taken the school health examination very seriously.

The Goal of School Health

The school's function is to educate the child and the family in good health practices. What better education is there than one which advises the full use of community medical resources? An important but incompletely utilized medical facility in the community is the private physician. We have demonstrated that it is possible to increase substantially the private physician's participation in the school health program. We have tried to suggest also that the family physician has a responsibility to perform the health examination in keeping with the best pediatric practice. This includes communicating an adequate report to the school so that the school in turn may understand any special needs of the child and work in cooperation with the family and the physician to secure for the child his best growth and development in mind and body.

This is both an ideal and a challenge—ideal-

istic because we are aiming pretty high to conceive of all physicians cooperating to provide this kind of school health service; challenging because in New York City with a substantial and increasing share of the school health work being done by private physicians the need is before us to develop medical examination standards and a better understanding of school health work among all physicians.

Summary

Three ways to achieve more effective school health service have been discussed. Two of these—modernizing records and saving the school physician's time—can be accomplished by the school medical administrator. The third calls for increased participation of the private physician in the school health program. The ultimate success of this must depend upon the leadership of organized medicine.

EDUCATION AND HEALTH

EVERETT COLGATE JESSUP, M.D., Roslyn, New York

LOOKING back over the years, one is impressed by the recentness of school health work and of the larger field of public health work of which it is a part. Modern public health work dates from the beginning of this century. Since 1904, with the organization of the National Tuberculosis and Public Health Association, have come all the agencies and endeavors that we now take almost as a matter of course—infant mortality campaigns, prenatal care of the expectant mother, venereal disease hygiene, mental hygiene, child hygiene, agencies for cancer and heart disease control, etc. The greatest impetus in this field came less than twenty years ago from the establishment of departments of public health in our medical schools, particularly those of Johns Hopkins and Harvard.

School health activities have followed a similar chronologic pattern, having been inaugurated in England in 1907 with the establishment of medical inspections of schools. In 1913, under the leadership of Dr. Herman Biggs, Commissioner of Health of the State of New York, laws relating to the medical inspection of schools and the maintenance of school health passed the New York State Legislature. Progress was interrupted by the first World War, and thus the ad-

vances that have taken place in this field date from 1919. Although much has been achieved, it would seem that progress would have been more rapid if school health had been placed under the Department of Health, where it naturally belonged, rather than under the Department of Education.

Thus, those of middle age have witnessed in their lifetime the development of a science which is still in its infancy. It is therefore reasonable to conclude that no procedure in public health or school health is so well founded that it may not be the subject of criticism and even be liable to change.

Furthermore, let us not forget that modern education is likewise of recent development and is similarly vulnerable to attack. The article on education in the *Encyclopaedia Britannica* is authority for the statement that "during the nineteenth century up to 1870 and even later, reading writing, and arithmetic and cooking and needle work for girls were considered to be the end-all and be-all of elementary education." Parenthetically, one recalls that some towering intellects developed from the simplicity of this early education. The "frills" of science and history and art and geography have been added since that date. Thus the prevailing curriculum is buttressed by no hoary tradition and is not inviolate; in fact, it has chiefly developed to its

Read at the panel discussion on "School Health Services" at the Annual Meeting of the Medical Society of the State of New York, New York City, April 30, 1942.

TABLE 2.—TREATMENT AGENCY ATTENDED BY SCHOOL CHILDREN

private physicians, for 1941–1942 the number had increased to 20,800.

Aside from examination of new entrants, to what degree does the private physician participate in the treatment of children referred for medical attention by the school? This varies, of course, with the economic status of sections in so large a place as New York City. We tried to get some information on this question for two districts: one was Astoria, which is considered fairly typical, if any area is, of the New York City school population, and the other was Brownsville, in Brooklyn, judged to be somewhat lower in economic status than Astoria. Table 2 indicates the results of this analysis of the source of treatment. For the city as a whole, in the period from September, 1941, to January 31, 1942, of 41,920 children who had medical attention, 20,147 (48 per cent) went to private physicians.

Thus the private physician is playing an ever increasing role in the school health program in New York City, and under present conditions he is likely to assume greater importance. This raises the question of his responsibility and interest in school health work. If the school earnestly educates children and their parents to seek the best medical attention by visiting their family physician, he in turn must play his part in this preventive medical effort. He must give the lie to those who say, "The family physician will not take the school examination seriously," or, "He gives no information to guide the school in its effort to develop an individualized health program," or, "He doesn't want to be bothered with the school nurse who tries to aid in follow-up of his patients who may have lapsed treatment."

Defects in Private Physician Reporting

Some of the problems are suggested by a study of the reports of private physician examination of 120 new admissions selected at random in the Astoria section. The number is small and they are discussed only for purposes of illustration. Of the 120 examinations, but 41 children, or about one-third, were adequately protected against diphtheria. On the other hand, every child had been vaccinated. This is mandatory because the

educational authorities in New York City cannot admit a child to public school unless he is vaccinated.

Thirty-four conditions requiring medical attention were reported for this group of 120 children. From the description given in the reports, in one-third of the cases it was impossible for the school physician or nurse to understand the nature of these conditions. For 7 of 31 children reported as needing medical attention, the school had no information to indicate that the private physician was assuming responsibility for treatment. A sampling of private physicians' opinion in the city revealed that nearly all physicians would welcome the school nurse's assistance in the follow-up of school children who were their patients. Yet two-thirds of the reports of those children whom the physician said needed medical attention gave the nurse no clue if and when the physician wished to see the child again.

School is obviously a very real influence in the child's growth and development, and physicians are now recognizing its importance in their care of children. If the physician studies this facet of the child's daily life, while he may discover influences which may contribute to or create a health problem, he may find also that the school can contribute to his program of therapy. For example, he may make recommendations concerning play activities or rest periods, additional nourishment for below-par children, seating in class for vision or hearing defects, or providing better understanding by teacher and principal of children with emotional problems. Some idea that the physician is missing such opportunities is gained from these same 120 reports. Of 13 children whose condition suggested recommendations to the school regarding special adjustment of play and physical education activities, such recommendations were made for only 3 children. In the case of 36 additional children, judging by the description of the child's condition in the report, some recommendation might have been made. But in only 9 of this group were any additional recommendations made to the school by the family physician.

These comments are made to indicate that a gap in understanding as well as communication exists between the school and the private physician. If we were to seek the answers to the questions that have been raised we should perhaps discover that the school has been remiss in not explaining to the physician what kind of information it needs in order to provide an individualized health program for the child—on the other hand, we might learn too that the physician has not taken the school health examination very seriously.

of new playgrounds, a tardy recognition of the greatest need of city children.

What can be done about it? What means and methods can be used to adjust these incompatible elements in the education of children? Suffice it to say that the method of achieving a more rational balance in the training of the mind and body will undoubtedly be by minor adjustments here and there, fought for by health, grudgingly yielded by formal education.

The first battleground in the fight must be that no man's land called detention. Formal education must cease intruding upon the time of physical activity. A detention period must be set aside as a part of the curriculum. Children not serving detention should have this extra period for physical activity. The teacher of arithmetic should no more think of poaching upon the period of physical activity than she would think of poaching upon the English hour. In fact, if any poaching has to be done, it would be far better to poach upon the time allotted to the course in which the child excels and thus give added time to the subject in which he is deficient. The teacher must be made to realize the vital necessity of physical activity in youth and must be sympathetic toward it. Noteworthy changes for the better in rowdiness and the gang spirit in our schools and colleges have been due to the directing of physical activity into the contests of the playing field, to the associated influence of the spirit of sportsmanship, and to the mental and moral qualities developed by proper training in competitive sport.

The second battleground, where the fight is easiest, is the primary grades. Formal schooling lasts a half-day here and allows plenty of time for adequate exercise after the last recitation, but the school avoids the obligation by sending the child home. This suggests the appalling waste in the use of our equipment, our beautiful grounds lying idle for a large part of the day. This situation has been met in some schools by the platoon or work-study-play plan—half of the children in the classroom, the other half on the playground. Besides making fuller use of the playing facilities, this scheme increases the amount of classroom space available.

School hygiene intrudes on the reading problem of the primary grades. Many authorities hold that letters and the finely coordinated movements of reading are prominent causes of nervous fatigue in the child. Dr. James Kerr, of London, who has written a book on school vision, states: "The importance of letters before the age of seven is exaggerated by teachers. It would be better if they were not permitted to be formally taught before this age."

The real fight starts in the junior grades, where formal education begins to bear down heavily and the need for physical activity is at its greatest. Physical activity must be provided, and in sufficient amount. How? Based solely on the time element, the figures of Hetherington mean little. An hour of football produces more physical fatigue than an hour of ordinary play. The most vigorous exercise known, which comes next to fighting for one's life in actual energy expense, is modern basketball. The character of physical activity is of great moment, and the time element must vary inversely with the degree of energy expended. It would seem, however, that the ideal system in maintaining body health is intermittent exercise, not cramming all in one short period or in a week end. This might mean at least two half-hour periods of moderately stimulating exercise during the so-called school hours and at least one and a half hours of strenuous exercise afterward. The aim is to produce healthy muscular fatigue. That is the nectar that youth thrives on—so muscularly tired at 8:30 P.M. that no one even thinks of the movies!

In reference to the now obsolete walk to school, would it not be wise to start school earlier and devote the first half hour to stimulating exercise? Does every girl know a folk dance for each year of her age? Does every primary child know four singing games? Do all the children know one game or sport for each year of their age? There is much that could be done in that first half-hour to change the whole spirit of the day. The edge would be cut from the prevailing early morning restlessness, for biologically the child is ready at dawn for muscular activity, not for rest in a chair deciphering print. The second half-hour period would be the present recess prolonged. There would be a fifteen- to thirty-minute rest period after lunch. A full hour and a half of strenuous exercise would close the day, with the dismissal time advanced to 4:45. Such a scheme would interfere very little with the curriculum; maybe it would improve scholastic standing.

It would seem that the ideal educational system of the future would in some way combine many of the elements of the modern summer camp. The latter began as an organization devoted solely to physical activity and moral training, with emphasis on the physical activity. The author attended one thirty years ago where the boys played games all day long. Now the best summer camps are offering training in painting, modeling, voice, music, dancing, carpentry, pottery, jewelry, rug-making, woodcraft, first aid, and natural science, even to the extent of using the microscope, training in unusual hobbies,

present form during the past thirty years. The impact of school health work on the great field of primary and secondary education is only beginning to be felt. Profound changes in the educational sphere are likely to follow. It is a trite saying, *mens sana in corpore sano*, but it is the end that school health work is aiming to achieve, and formal education must adjust itself to a new point of view.

The fact of the matter is that the modern, formal, educational process in youth creates an environment that is biologically abnormal in two respects. First, the method of acquiring knowledge from the printed page is biologically a strange procedure. For millions of years men learned through other means. The production of printed books began five hundred years ago, and it is only within the last hundred years, with the coming of mass production, that they have been available to more than a few. Education has seized upon this means to such an extent that the whole educational process revolves about a book. In fact, the production of a book is for a teacher one of the chief means of recognition in his profession, as well as being a source of income. An excellent textbook makes the labor of teaching less arduous, and thus a vicious circle is created. As a result, learning has become a sedentary and indoor occupation, the second biologically abnormal situation. In the long history of the race, the child played through the entire day or learned the elements of life and race preservation by actual experience with father or mother, ending the day physically tired. Now he spends long hours indoors, seated at a fairly uncomfortable desk, endeavoring to transpose printed words into mental images that mean something (for many, a very difficult process), and as a result ends the day with less than two hours of exercise outdoors, tired mentally and nervously, but not physically.

That this is a particularly severe trial in early life was the opinion of Plato at a time when the education of the select few was the only problem. He stated in his *Republic*, written in 364 B.C., "For the first ten years of life, education shall be predominantly physical. Each school is to have a gymnasium and playground. Play and sport are to be the entire curriculum, and in this first decade such health will be stored up as will make all medicine unnecessary."

Herbert Spencer, surveying the whole field of education, appraising the value of languages and mathematics, philosophy and art, and all the other subjects, endeavored to answer the question, "What kind of education is worth most?" He concluded that the most important subject of education is *health*.

We have forgotten some of these precepts.

The accumulation of facts from the printed page has become an obsession and education has become a forcing process. Let us remember that the greatest nation of the past, intellectually and artistically, devoted far more attention to athletics and the training of the body than modern education has devoted even in its most liberal moments. Complaints are made that colds run rampant, that children are pale, peaked, and irritable, eat badly, bite their fingernails, have frequent gastrointestinal attacks, round shoulders, crooked spines, flat feet, chronic sinusitis, etc. Under our present system it is indeed remarkable that so many are able to retain as much health as they have.

Modern living conditions are greatly increasing the problem. In the cities with inadequate playgrounds or even none at all, education has been conditioned by its environment. Children are sent to school, and the hours are long to keep them off the streets and out of mischief. Automobile transportation is making terrific inroads on physical exercise. The modern child, after a hasty breakfast, is bundled into a closed car, conveyed to school, and deposited behind a desk. Compare this with life a few years ago. Picture that mile or two-mile walk to school when all sorts of things had to be done—birds and animals observed, fences climbed, brief contests staged, stunts performed, six-foot mud puddles jumped, snow drifts conquered, winds buffeted, so that students arrived at school rosy-cheeked, bright-eyed, body stimulated, ready for the day's work. Now even mud puddles are gone.

You ask what can be done about it? If a school is fortunate enough to have playgrounds, how much should they be used? In fact, how much physical exercise is really necessary for a child? Hetherington has estimated that the minimum of physical exercise for the maintenance and development of physical health is as follows: at the age of 5 and 6, four hours daily of muscular activity; from 7 to 9, five hours; from 9 to 11, six hours; from 11 to 13, five hours; from 13 to 16, four hours; from 16 to 18, three hours; from 18 to 20, two hours. This presents a pretty problem for modern education. Fit this in with the modern curriculum if you can. Maybe there is a reason why one-third of the applicants for army service are turned away as physically unfit. Maybe there is a reason why so many children who have plenty of rest, balanced diets, and the best of pediatricians, continue to run low hemoglobin percentages! Maybe there is a reason why we flee to hormones and vitamins and vaccines and tonics. The trouble is really the way of living. Millions and millions of dollars have just been spent by the United States and the City of New York, creating many hundreds

in Syracuse. We invite the parents to be present at the time of the examination, and if they do not come, those whose children were found to have defects are invited to a parent conference with the school physician, who demonstrates the defect found and discusses with the parents ways and means of correcting both the defects and general health habits. Ten per cent of the parents do come to the school either for the examination or for a conference. The response of parents of kindergarten and lower grade children is much better than those of children in the higher grades where, as a matter of fact, the pupils themselves do not seem to want them present.

The work of the school physicians is considerably lightened by the audiometer testing by a technician, vision testing by the teachers and nurses, and the examinations made by the dental hygienists in the six lower grades. This again is in line with the recommendation of Dr. Wheatley that the doctors' time be saved as much as possible by having less skilled personnel make such examinations.

The pupils found to have defects are referred back to the family physician, or dentist, for treatment. There is an exception to this, however, in the case of indigent children who need dental care, inasmuch as some of these are taken care of in the school by our two staff dentists.

Apparently Dr. Jessup favors an increase in the physical activity program, but I doubt very much that such a program would bring about the desired results. It would seem from his remarks that he has in mind the pupils of the centralized rural schools who are picked up by busses at their homes and taken to the school buildings. Our children have to walk to school—some of them at least a mile—so they still get considerable exercise going to and from school. The findings of the Selective Service indicate that young men are being rejected for defects such as decayed teeth, poor vision, heart disease, nutrition, mental and nervous diseases, ear conditions, etc., and I feel that finding and correcting these defects is more important than adding to the physical activity program. Very few, if any, are rejected because of lack of muscular development.

As a matter of fact there is real danger in too much physical education. Studies by Greenleaf, of Olean, of the blood pressure of basketball players, and by Preston, of Oneida, of the urinalyses of football players, have shown abnormal findings. Dr. Preston found that many of the football players showed albumin, casts, and red blood cells in their samples, and Dr. Greenleaf found abnormally high blood pressures in the basketball group. Whether or not these findings indicate permanent injury is hard to say at the present time.

Exercise has its part in physical well-being, but I believe it should be done in the open air, outside of school hours, rather than by prolonging the pupil's stay inside the school room.

I appreciate the privilege of being able to take part in this discussion and feel that I have benefited considerably from it.

Milton I. Levine, *New York City*—The problem of the relative position of the school physician and the

private practitioner in the school health service is not a new one to the pediatrician of the private school.

The very nature of the private school makes this problem ever present, for the pupils are usually of a higher economic status and have their own private physicians.

This would seem to place the greater part of the burden on the child's own doctor, but conflicts can and do arise, since the school demands almost daily contact of the school physician with the children, as well as rather frequent contact with the parents.

Under such a routine it is not difficult to understand how a parent might decide to shift from his child's previous physician to the pediatrician who sees the child daily and whose relationship with the child will naturally be more casual and friendly.

Several years ago a questionnaire was sent to the members of the American Academy of Pediatrics asking whether they felt that medical supervision in the public schools was detrimental to their practice. A number of responses absolved the public schools of making any such inroads, but, on the other hand, stressed that the private schools were definitely an interference.

At the present time, the ratio of public school children to each public school physician in New York City (1 to 10,000) is such that little or no problem is present in the city as a whole.

However, the experience of the private schools presents something of a preview of difficulties that might arise if at some future date there were not only more public school physicians but more frequent contact between the student and the physician, and the parent and the physician.

There is no doubt that many steps detrimental to the welfare of the private physician have been made by the private schools, and, unfortunately, in many schools these conditions still exist.

The private schools, in an attempt to present a well-developed health program to the parents, often use the school physicians in practices which will inevitably hurt the private practitioner.

Certain of these schools charge a health fee of five or ten dollars a year, which adds to the funds supporting the health service of the schools, but the parents are informed that this fee covers a careful physical examination of their child by the school physician. Naturally the assumption is that this takes the place of the yearly examination by the child's own doctor.

In certain private schools the physical examination takes place in the presence of the parents and a discussion of the child's physical problems follows immediately afterward between the school physician and the parent.

Not that the examination in the presence of parents or the discussion is to be condemned, but it should be distinctly emphasized that this does not supersede or take the place of the examination by the child's physician.

A further practice to be censured—and one that is most detrimental to the private practitioner—is the habit of certain private schools and many public schools of sending letters to the parents, stating that

etc. Can you imagine a summer camp not starting the day with some exercise?

Similarly, formal education, starting from the opposite pole of solely mental training (the author forty years ago attended two large schools in the city of Brooklyn that had neither gymnasiums nor playgrounds), is planning more and more for the physical activity of its pupils. The two systems are approaching each other along the previously mentioned work-play-study pattern, the pattern of a balanced training of the mind and the body. What folly that for three brief months of summer one trained the body and for the rest of the year trained only the mind! What folly that an educational system should be so constituted that both teacher and pupil need a vacation of several months in summer, several weeks at Christmas, and several weeks at Easter in order to recuperate from an unconsciously recognized but never openly acknowledged abnormal scheme of living! What other activity of man needs or demands such respite?

At such a time as this the international implications of the subject must not be forgotten. While a Nazi Germany is glorying in its youth movement, rating physical fitness as the *sine qua non* of a virile state, our medical draft boards are rejecting American youth by the tens of thousands for underdeveloped or maldeveloped bodies, for "emotional instability" and "constitutional inferiority." It is estimated that of the 16,500,000 registrants in the first draft less than 60 per cent will be classed for general military service. Think of this next time a frill is to be added to education.

I have outlined a fundamental problem of school health. Who is going to fight for it? Whose responsibility is it? There is only one answer—the school physician. He must raise himself, by his boot-straps if necessary, out of the

mire of routine physical examinations, and, as Dr. Mitchell has said, become an adviser, a consultant, an educator in the field of health and education. The attitude of mind that figures a school salary as representing merely a sum for so many physical examinations at so much per examination has got to go. It will be helped on its way by handing over the physical examination to the family doctor where it rightfully belongs and where it can be better handled. Then the school physician will have time to devote to the really important details of his job—time, for instance, to strengthen the weakest link in our present system, the follow-up for the correction of defects; time for frequent consultation on fundamental matters of policy and on individual cases with the school principal, the teacher, the parent, and the family doctor; time for creative thinking in the field of school health; and time for fighting to put such thoughts into effect.

Under the present system only the exceptional man raises above the inertia of his job. With real delight I heard one of our school physicians in Nassau County describe his method of solving the problem of correction of physical defects. He passed regulations that if a remedial defect is not remedied or is not in the process of being remedied, the student cannot play on an athletic team or hold a position in a student organization, such as the glee club, the band, the dramatic society, the school paper, etc. He is planning further to threaten holding up the student's working papers and his diploma.

Yes, creative thinking and activity in the field of school health is the crying need—now more than ever. As pointed out in the beginning of this paper, school health work is a new field whose soil has just been turned. There is plenty of work yet to be done, and the man to do it is the school physician.

Discussion

Dr. William E. Ayling, *Syracuse, New York*—This discussion of school health services has been most interesting. Dr. Mitchell's suggestion that every school system should have a committee on school health in its county medical society, to which it could turn for consultation and advice, is a good one. Perhaps in further discussion of this subject I will be excused if I draw on my experiences in Syracuse, following the example of Dr. Wheatley, who has discussed the Astoria survey.

School medical inspection was started in Syracuse in 1906, before it became a state requirement in 1913. We urge examination of school children by private physicians and endeavor to bring this about by first notifying the parents at the beginning of the term that an examination will be necessary, and then, just before the scheduled examinations by the

school doctor, by sending another notice again urging examination by the private physician but stating that if this is not done within two weeks the school physician will proceed with the examination. We have been unable to have as high a percentage examined by the private doctors as Dr. Wheatley reports, and I should be interested to know just how he gets such good results.

Up to the present year periodic health examinations in specified grades were being done in Syracuse but, under stress from the State Education Department, we are now attempting to reach every child. The addition of two nurses to our staff and extra pay for the school physicians, who spend two hours each day in school work, have facilitated this attempt.

Dr. Wheatley has stressed the importance of personal contact with the parents, and we also do that

THE ABSORPTION OF CARBON DIOXIDE FROM ANESTHESIA APPARATUS

DOUGLASS H. BATTEN, M.D., Brooklyn

THE absorption of carbon dioxide from anesthesia apparatus is a feature of modern anesthesia which most anesthetists take for granted. Yet its development is of comparatively modern origin, and its widespread acceptance has but recently come about.

The Development of Absorption Machines

The anesthetist who utilizes the closed carbon dioxide absorption method is indebted to the early workers^{1,2} in the field of metabolism for the development of this procedure. It is upon the experiments of these workers that Jackson³ in 1915 based his report of anesthetizing small animals by placing them in an airtight chamber. He used a pump to circulate the atmosphere breathed by the animals. The necessary oxygen was supplied from a cylinder, and the carbon dioxide was absorbed by means of a strong aqueous solution of sodium and calcium hydrates. He used several of the common anesthetic agents in his experiments, and he was able to keep his animals anesthetized for as long as five and a half hours without ill effects. He made particular mention of the small quantity of anesthetic agent used in this closed system.

The economic and physiologic aspects of these animal experiments attracted Waters, who investigated this work of Jackson with the idea of utilizing it on man. After years of experimentation and investigation, Waters concluded in 1924 that "total rebreathing of nitrous oxide and other anesthetic drugs is practical by means of a carbon dioxide filter interposed between the face mask and the breathing bag."⁴

This same author pointed out that there are available for rebreathing two types of apparatus—viz., the circle filter and the to-and-fro system. In his investigations Waters was reluctant to use a motor, as Jackson did, to circulate the respired gases. He felt that this was unwise because of their highly inflammable nature. He early discarded the circle type of filter because of the resistance encountered by the valves necessary to provide the unidirectional flow of the gases. He has since championed the to-and-fro method of rebreathing in which the absorbing unit is placed between the face mask and the breathing bag and through which the respired gases must pass twice before again being inhaled. In many clinics

today this to-and-fro system is held to be the more physiologically desirable type of apparatus.

More recent investigations^{6,7} have emphasized the importance of the shape and size of the canister that contains the absorbent. The most desirable shape is the one that offers the least resistance and at the same time allows maximum contact with the absorbing material. It has been shown⁸ that the most efficient container is the one whose size is such that it will just accommodate the patient's tidal volume. Because of the marked variance in tidal volume between patients, it should be emphasized that it is wise, when using the to-and-fro system, to have various-sized canisters available.⁸

The History of Absorbing Agents

It was Black⁹ who first demonstrated that carbon dioxide is readily absorbed by alkaline hydroxides. Benedict and Tower¹⁰ were the first workers to make use of a mixture of sodium and calcium hydroxides to absorb carbon dioxide. Since these fundamental studies were made, several investigators^{11,12,13} have confirmed the value of the alkalies in this respect.

For some years a mixture of these alkaline compounds, known as soda lime, has been widely used in anesthesia. This material, granular in nature, is composed of 5 per cent sodium hydroxide, 65 per cent calcium hydroxide, and 30 per cent inert binder. The process of carbon dioxide absorption is one of neutralization of carbonic acid by the hydroxides of sodium and calcium. There are evolved, for each gram molecule of water formed, approximately 13,000 calories. This process of neutralization probably occurs on the surface of the granules. Frequent rest periods have been found necessary in the use of soda lime to permit its reactivation. Experience has shown that soda lime is not without its disadvantages. In the main, these disadvantages include the essential rest periods for reactivation, fragmentation of the granules with dust formation, and the inherent causticity of the material.

Theoretically, the hydroxide of any of the alkaline metals—potassium, sodium, or lithium—or of any of the alkaline earth metals—barium, strontium, calcium, or magnesium—might be used for carbon dioxide absorption. Recently a new compound has appeared. It consists of 20 per cent barium hydroxide and 80 per cent calcium hydroxide. Unlike soda lime, it requires no inert binder for hardness, for in its hydrate form

Read at the Annual Meeting of the Medical Society of the State of New York, New York City, April 23, 1942.

Director of Anesthesia, Methodist Hospital, Brooklyn.

unless the examination or injections are given within a certain period of time, these services will be performed without charge by the school physician.

Undoubtedly a large part of the fault for permitting such a system to exist lies with the family physician for not insisting that such services given at the school should be limited only to those children whose economic status is so low that private medical care is practically impossible.

An ideal setup satisfactory to both the school and the family physician would include the following:

1. An annual physical examination of the child by the private physician. This should be demanded of every child, and those whose families are unable to afford a private physician should receive an examination at school.

2. The school physician should realize that he is working with the child's physician and should at no time supersede him. If at times a special examination of a student is requested by school authorities and is performed in the presence of the child's parents, the latter should be informed that this examination does not take the place of the examination by the child's own doctor. In discussing the condition of a child with his parents, the school physician

should under no circumstance disagree with the opinion of the child's own physician. Much more will be gained by contact with the private physician and discussion of the child with him. Experience has shown that parents often distort or misinterpret the directions given them by their physicians.

Suggestions as to the necessity for treatment of anemia, impetigo, acne, ringworm, pediculosis, etc., may be made to parents, but the actual treatment should be instituted and followed by the private practitioner.

3. Under no circumstance should a school physician be permitted to take as his own patient a child already under the supervision of a private physician.

4. The school physician's primary purposes are to supervise the general health program of the school, to aid in preventing contagion, to examine specific cases when the request comes from the school, and to serve as the connecting link between the school and the child's private physician.

In summarizing, it might be said that the school physician should work hand in hand with the private practitioner but should always act in a secondary role, never treating the children except with the definite consent of the private physician.

OBSTETRICS AND GYNECOLOGY EXAMINATIONS

The general oral and pathologic examinations (Part II) for all candidates will be conducted at Pittsburgh, Pennsylvania, by the entire Board of Obstetrics and Gynecology from Wednesday, May 19, through Tuesday, May 25, 1943. The Hotel Schenley in Pittsburgh will be the headquarters for the Board, and formal notice of the exact time of each candidate's examination will be sent him several weeks in advance of the examination dates. Hotel reservations may be made by writing direct to the hotel.

Candidates for re-examination in Part II must make written application to the Secretary's Office not later than April 15, 1943.

The Pittsburgh Obstetrical and Gynecological Society will hold a subscription dinner meeting at the Hotel Schenley on Saturday evening, May 22, 1943, at 7:00 p.m. Visitors, here for the examinations, are cordially invited to make arrangements to attend. Reservations may be made by writing to Dr. Joseph A. Hepp, Secretary of the Society, at

121 University Place, Pittsburgh. An interesting program is being provided.

The Office of the Surgeon General (U.S. Army) has issued instructions that men in Service, eligible for Board examinations, be encouraged to apply and that they may request orders to Detached Duty for the purpose of taking these examinations whenever possible.

Candidates in Military or Naval Service are requested to keep the Secretary's Office informed of any change in address.

Deferment without time penalty under a waiver of our published regulations applying to civilian candidates will be granted if a candidate in Service finds it impossible to proceed with the examinations of the Board. Applications are now being received for the 1944 examinations. For further information and application blanks, address Dr. Paul Titus, Secretary, 1015 Highland Building, Pittsburgh (6), Pennsylvania.

PAUL TITUS, Secretary

UROLOGICAL AWARD AND MEETING CALLED OFF

The \$500 Research Prize annually offered by the American Urological Association will not be awarded this year.

The government has again discouraged the holding of medical conventions, except those primarily of military interest—and at these there is to be a

ban on social events. Under the circumstances, plans for the June meeting of the American Urological Association in St. Louis have been canceled.

CARBON DIOXIDE CONCENTRATIONS — ABSORBENT BARALYME

Fig. 1. Illustrating the efficiency of Baralyme throughout thirteen consecutive anesthetics. Each case separated from the next by varying periods of time. Clinical efficiency more than nine hours.

it is of such a nature as to permit easy molding. It is known as Baralyme* and is marketed in the form of round pellets, $\frac{3}{16}$ inch in diameter and $\frac{1}{8}$ inch in maximum thickness.

The theoretic possibilities of this compound have been examined through laboratory experiments,⁸ which show that this barium lime mixture has certain features that make it more desirable than the time-honored soda lime. The superiority of Baralyme* has likewise been borne out by clinical investigations.^{8,13} It should be pointed out that in an investigation of this sort it is manifestly impossible to duplicate in clinical practice the results obtained in the laboratory. Carbon dioxide output, tidal volume, respiratory rate, and minute respiratory exchange vary from moment to moment and do not lend themselves to ready control. Because of these variables, clinical studies can at best only approximate the finite data of the laboratory.

The Clinical Use of Baralyme

Clinical studies on this new barium lime mixture involved the use of adult patients with essentially normal cardiovascular and respiratory systems. Nitrous oxide and oxygen were used for induction and ethyl ether for maintenance of the anesthesia. The to-and-fro system was used throughout these investigations. The

canister size was 8 by 13 cm. and contained approximately 500 Gm. of the absorbent. The absorbing unit was not put in place until the hyperpnea necessary to the induction of anesthesia was no longer essential. These clinical studies have shown that this new Baralyme has a longer efficiency than the popular soda lime. This is probably explained by the fact that it contains 20 per cent of the highly active barium hydroxide. Soda lime, on the other hand, has a low content of activating material—only 5 per cent sodium hydroxide.

Analyses† of samples of gas taken from the breathing bag at various intervals during a series of consecutive anesthetics are shown in Fig. 1.

Fig. 1 is a composite chart showing the percentage of carbon dioxide in the breathing bag beginning in each case some ten minutes after the canister containing Baralyme had been placed in the system. The essential feature is that the efficiency of the carbon dioxide absorbent remains constant throughout the life of the charge. No matter how long the case, no rest period is required for reactivation. Exhaustion, when it occurs, is rapid and irreversible.

Fig. 2, similar in construction to Fig. 1, shows the accumulation of carbon dioxide at various intervals throughout the life of a charge of 4 to

†Carried out on single modified Hemple-type absorption pipette connected to a modified 100 cc. burette, calibrated to 30 cc. in 0.1-cc. divisions. Error is ± 0.1 per cent.

CARBON DIOXIDE CONCENTRATIONS — ABSORBENT SODA LIME

FIG. 2. The absorption of carbon dioxide by soda lime. Note rise in carbon dioxide concentrations after canister has been in use for some time. Efficiency slight after six hours of intermittent use.

TEMPERATURES IN CANISTER NEAREST MASK

FIG. 3. Temperatures in Centigrade in thermometer nearest mask end of canister.

TEMPERATURES IN CENTER OF CANISTERS

FIG. 4. Temperatures in center of canister are for same series of cases as that in Fig. 3.

8 mesh soda lime. It is to be noted that where the canister is in use for some period of time the absorptive efficiency is lessened, and carbon dioxide accumulates rapidly. After a period of rest, the canister may again be used. Its period of effectiveness, however, is this time briefer than if it were fresh.

The heat generated by the absorption of carbon dioxide has been a subject of interest. Studies with three thermometers inserted into the canister have been carried out. The tips of the thermometers were so placed that each was equidistant from the side of the canister. One was near the mask end, one in the center, and the third near the bag end.

Fig. 3 shows the recordings of the thermometer near the mask end of the canister. The two absorbents—soda lime and Baralyme—are used. It is to be noted that the length of the cases done with one agent does not correspond exactly with that done with the other, one of the insurmountable problems of clinical experimentation.

Because this thermometer was nearest the exhaled atmosphere, the absorbing activity in this area of the fresh charge was great. The temperatures are therefore highest at the beginning of

the use of the charge and diminish as the activity lessens. The temperature recordings with Baralyme are in general slightly lower than those with soda lime.

Fig. 4 shows the recordings of the middle thermometer in the same series of cases. It is of interest here to point out that the temperature of the soda lime mixture varies greatly from time to time, while that of the Baralyme follows a more definite pattern.

Fig. 5 demonstrates the temperatures developed in the thermometer nearest the breathing bag. As would be expected, the activity in this portion of the canister is least when the canister is first placed in use and greatest as the life of the charge nears its end. Hence, the temperature of the reacting substance is highest during the latter hours of its usefulness.

There is less dust formation with Baralyme than with soda lime. Since these pellets of Baralyme have smooth surfaces, there is little tendency to fragmentation. Even with the jarring that is incident to the use of the to-and-fro canister there is minimal dust formation.

Because of the low solubility of barium compounds, their causticity and toxic effects are

TEMPERATURES IN CANISTER NEAREST BAG END

FIG. 5. Temperatures in Centigrade in thermometer nearest bag end in same cases as those shown in Fig. 3.

negligible. This is in contrast to the extreme solubility of sodium hydroxide and its necrotizing action on human tissues.

Summary

A survey of the literature indicates that the absorption of carbon dioxide in anesthesia apparatus is a refinement of comparatively recent origin.

Two types of apparatus are available—the circle and the to-and-fro.

Using the to-and-fro system, a comparison of mixtures of sodium and calcium hydroxides with barium and calcium hydroxides has been carried out.

From the standpoint of efficiency, temperature reaction, causticity, and fragmentation, the barium mixture has certain advantages over the soda lime compound, and its further clinical use is advocated.

Discussion

Dr. Melville G. Kilborn, *West Orange, New Jersey*—I wish to thank Dr. Batten for the privilege of discussing his paper. A great amount of time and effort must have been expended in this clinical investigation and Dr. Batten is to be congratulated.

I am very pleased to see that he found the same advantages of Baralyme while working with the to-and-fro method as we did in working with the circle filter at our hospital.

It seems strange to me that so much work has been done in the past in an attempt to improve the mechanical features of absorption apparatus without a corresponding amount of investigation being done on the absorbent material. Anesthetists in general have realized the disadvantage of highly caustic material, of high temperatures generated by sodium

hydroxide and its necessary rest periods, but these disadvantages were accepted as a necessary evil. No advance in absorbent material was made until Mr. Gardener, chief chemist of the Medical Gas Division of Thomas Edison Industries, started to work on acid gas absorbents, believing that there was a better and safer material than caustic soda. Consequently, his development of compressed pellets of calcium and barium hydrates without the use of an inert binder is unique, and I feel that he is to be congratulated not only for giving us a new absorbent with many advantages but also for starting

the ball rolling for further research in acid gas absorbents. Acid gas absorbents are not limited in their use to anesthesia apparatus but have a very important place in basal metabolism machines, in high altitude oxygen supply apparatus, in submarine air purification, in oxygen therapy apparatus, and in chemical warfare. For this reason we should be continually on the lookout for better materials and improvements in methods. There is an old saying that you should not let the good damn the best.

Again I would like to thank Dr. Batten for this opportunity and say how much I enjoyed his paper.

Invite Enrollment for Emergency Medical Service

Dr. Edward M. Bernecker, commissioner of hospitals and Chief of the Emergency Medical Service of the City of New York, has issued the following memorandum concerning Greater New York's organization for emergency medical service:

"The response of the medical profession in New York City in volunteering to work with the Emergency Medical Service has been most gratifying. A canvass of physicians in each borough who had previously registered for this service is now being conducted. Those physicians who are still available, and have indicated their continued desire to be associated with this work, will shortly receive new cards and arm bands, identifying them as members of the Emergency Medical Service. Physicians so identified will function in the following manner:

"1. Those with definite hospital commitments, staff appointments, will of course report to their respective hospitals.

"2. Those without staff appointments shall care for persons injured in the immediate vicinity of their homes or offices should an incident occur in that area.

"3. They shall report as reserve groups to nearby hospitals who have set up Emergency Medical Field Units. These groups will be called by the Control Station for field service, either with the Hospital

Units, or at first aid posts and Casualty Stations.

"4. If a physician registered in the Emergency Medical Service is not in the immediate vicinity of his home, office, or the hospital to whose reserve group he is assigned, he should remain wherever he happens to be, to give local aid if needed, or until traffic is once more permitted to move; at which time he should report to his emergency assignment.

"We wish to invite all members of the medical profession, who are not at present assigned to hospitals or registered with us through their county societies, and who wish to enroll for service in the event of enemy action, to register either with their local county society, or directly with the office of the Chief of the Emergency Medical Service, Dr. E. M. Bernecker, commissioner of hospitals, 125 Worth Street, New York City.

"All that is required of the physician, is that he forward his name, home address and telephone number, office address, office hours and telephone number to either of the offices previously stated. He will then be required to sign the official oath of the Citizens Defense Corps, following which he will receive his identification card, arm band, and assignment."

Clinicopathologic Conferences

DEPARTMENTS OF MEDICINE AND PATHOLOGY, NEW YORK POST-GRADUATE MEDICAL
SCHOOL AND HOSPITAL, COLUMBIA UNIVERSITY

Conducted by HERMAN O. MOSENTHAL, M.D., and MAURICE N. RICHTER, M.D.

Date: October 20, 1942

History

Case J-65954

DR. JOHN A. GRIMSHAW: This is the first admission of a 45-year-old man of Prussian descent, whose occupation has been that of masseur. His case history goes back to a short time before November, 1941. At that time, although he felt perfectly well, he began to have bloody urine not associated with pain, frequency, burning, fever, or any other symptom. In November, 1941, he was hospitalized with the complaint. There had been no weight loss, cough, or anorexia. Urine at this time was said to have been negative, and cystoscopy revealed nothing unusual. A urogram suggested papillomatosis of left kidney and pelvis, with a later one showing a filling defect that suggested the same thing. On November 15, 1941, a left nephrectomy was done. The report we have states that "papilloma of pelvis and ureter" was found, but it does not mention whether this was a gross or a microscopic diagnosis. Chest x-ray was reported as follows: "Throughout both lung fields, alongside the vascular tree, particularly in both perihilar regions, a number of soft miliary nodulations are noted, suggestive of a hematogenous type of tuberculosis."

After his discharge from the hospital, his wound healed well, but he began to lose weight rapidly and in four months lost 24 pounds. His appetite was poor; he felt weak and tired. About one month after discharge—i.e., about January, 1942—he began to have a bothersome hacking cough, nonproductive at first, but later accompanied by moderate amounts of yellowish sputum, although there were no known fever, night sweats, or hemoptysis. At the same time, he began to notice dyspnea even on mild exertion, and frequent epigastric discomfort and fullness, particularly after meals, with occasional vomiting. There were no hematemesis and no tarry or bloody stools. Since the operation he complained also of weakness and numbness of the right hand and arm.

Past history revealed absolutely no previous illness of any kind. Family history was also negative—no known tuberculosis, hypertension, diabetes, or other familial disease.

He was admitted to this hospital on March 28, 1942, with the above complaints.

Physical examination on admission revealed a husky, rather pale man. There was evidence of recent weight loss, and he appeared chronically ill.

Teeth in the upper jaw were all absent and the remainder in poor condition. The pharynx was moderately inflamed. There was no lymphadenopathy. The lower half of both lung fields was filled with many fine and coarse moist rales, but there was no change to percussion. Diaphragms were high on both sides. The heart was not remarkable, with no apparent enlargement and no murmurs. The blood pressure was 128/80 mm. of mercury. The liver was firm, slightly tender and nodular, and down to about 2 inches above the umbilicus. There was a well-healed scar on the left flank. Ascites was not demonstrable. No other masses or organs were felt. There was noticeable wasting of the flexors of the right forearm and thenar eminence and adductors of thumb, with diminished sensation to pinprick on the radial side of the forearm and of the index, the middle fingers, and the thumb. There were no other neurologic findings. Genitalia and rectal examinations were negative.

Laboratory Data.—Blood count: hemoglobin, 12.8 Gm.; red blood count, 4,900,000 per cubic mm.; white blood count, 10,350, differential—73 per cent polymorphonuclears, 16 per cent lymphocytes, 8 per cent monocytes, 2 per cent eosinophils, 1 per cent basophils. Urinalysis: several casual specimens of urine revealed no albumin, no casts or pus, but occasional red blood cells. Blood chemistry: urea nitrogen, 11.0 mg. per cent, nonprotein nitrogen, 27 mg. per cent, sugar, 85 mg. per cent, cholesterol, 180 mg. per cent, esters, 115 mg. per cent. Sedimentation rate: 96 mm. per hour. Blood Wassermann: negative. Spinal tap: normal manometrics, clear colorless fluid with negative Wassermann, protein 31.7 mg. per cent, no cells, negative culture, and normal colloidal gold.

On March 30, 1942, two days after admission, an x-ray examination showed "an extensive reticular and spotty, and in part miliary-like, infiltration throughout both lungs. These . . . are in the main central and most advanced in the lower lobe areas. . . . Conclusion: diffuse peribronchial and coarse miliary infiltration throughout both lungs."

On April 20, 1942, another chest x-ray showed "condition practically as previously reported. Conclusion: chronic, organized tuberculous type bronchopneumonic infiltration throughout both lungs."

An electrocardiogram taken on March 30 showed normal rhythm, "diphasic T₁ and T₂ with a U-shaped appearance very suggestive of recent digitalis," although the patient certainly had no digitalis in the previous two days and gave no history of having taken it before admission.

Clinical Course.—The course in the hospital was continually downhill, slowly at first, then more rapidly. The temperature was constantly about 100 F., with slight diurnal variation; it went above 100 F. on only two occasions. The pulse was within the range of 85 to 100. Appetite was poor, and the patient had a feeling of pressure after eating. One week after admission there was definite shifting dullness and fluid wave in the abdomen. A course of mercupurin was given, with poor results, and a week later a paracentesis yielded 5,000 cc. of cloudy grayish fluid. This had a specific gravity of 1.010, the protein was 0.97 per cent, a culture was negative, and no acid-fast bacilli were seen on smear. Guinea pig was inoculated.

Ten days later another paracentesis yielded 5,000 cc. of fluid with essentially the same characteristics. Sediment of the centrifuged specimen was fixed and blocked and sections showed only lymphocytes and macrophages; no tumor cells were seen. Numerous sputum examinations failed to demonstrate any acid-fast organisms. Progressive weakness developed rapidly, and one month after admission the patient expired.

Discussion

DR. CARL H. GREENE: This patient came to the Medical Service with the complaint of progressive weakness and ill health following a nephrectomy. When a patient does badly after a nephrectomy, one's first thought is of a hypernephroma with metastases. Because a hypernephroma invades the blood stream directly, metastases to the lung are most frequent. This patient, however, does not fit into that clinical picture. In the report from the other hospital, the lesion was first described as a papilloma of the renal pelvis. In a second paragraph of that report the term "papillary carcinoma" was used. A papilloma is a benign lesion. Metastasis from a papillary carcinoma of the kidney is possible but it does not occur with the marked frequency and degree seen in cases of hypernephroma.

Examination of the patient did not serve to establish the diagnosis. A few rales were noted in the lungs. The liver was enlarged, slightly

tender and the surface was somewhat irregular. A generalized carcinomatosis could not be established on the clinical findings on admission. The patient was markedly dyspneic, and cardiac decompensation was considered. However, he did not present the clinical picture of chronic passive congestion and heart failure. The pulse was regular and the blood pressure was not remarkable. The dyspnea was disproportionate to the number of rales heard in the chest. The liver was not pulsating.

An x-ray was taken and reported as showing a diffuse miliary tubercular infiltration. This diagnosis is a descriptive one and is not synonymous with a diffuse miliary tuberculosis. Nevertheless, an intensive search for acid-fast organisms was made without success. No other signs of tuberculosis were demonstrable.

My first impression, based largely on the history, was the same as that of Dr. Grimshaw.

While in the hospital, the patient developed ascites and had to be tapped. No characteristic tumor cells were found in the ascitic fluid. The specific gravity was fairly high with over 1 per cent protein. Only a slight diuretic response was obtained by the injection of mercupurin. This, too, speaks against chronic passive congestion and cardiac decompensation, for such patients give the best response to the mercurial diuretics.

My final diagnosis, therefore, was malignancy (papillary carcinoma) of the kidney with secondary involvement of the lungs, liver, and spleen, and possibly of the peritoneal cavity.

I did not consider that the x-ray picture of the lungs would exclude pulmonary metastasis. Three years ago I saw another patient who had had a chronic lymphatic leukemia for seventeen years. He developed an acute respiratory embarrassment (x-rays showed a diffuse infiltrative lesion throughout the lungs), and died primarily from oxygen want. Autopsy showed the lesion to be a carcinoma of the pancreas with a lymphatic spread throughout the pulmonary tree. There was enough similarity between the x-ray picture in this case and the one under discussion today to suggest that the latter, too, had a diffuse carcinomatous infiltration of the lungs.

Dr. Greene's Diagnosis

Papillary carcinoma of the kidney with metastases to the lungs, liver, spleen, and possibly the peritoneal cavity.

DR. MOSENTHAL: The x-ray reports at various intervals, considered in succession, as they have been in the history, are somewhat confusing. I believe we would have a clearer picture if we had a summary of this situation from Dr. Meyer.

DR. WILLIAM H. MEYER: Examination of the thorax shows an extensive, reticular, and spotty, and in part miliary-like, infiltration throughout both lungs. These structural changes are in the main central and most advanced in the lower lobe areas, though as above stated, the lesion is more or less throughout both lungs. Conclusion: diffuse, peribronchial and coarse miliary infiltration throughout both lungs.

In making a radiologic recheck, it might be said that the picture is such as could be characterized as organizing, reticular and coarse miliary-type metastatic malignancy. The word "miliary" or even "tubercular-type" should not be interpreted as indicating tuberculous character; this description is used purely as a term of gross pathologic interpretation.

DR. MOSENTHAL: The condition of the right forearm—namely, the weakness occurring after the operation on November 15, 1941, the atrophy in the muscle, and the diminished sensation to pin-pricks—presents a very interesting problem as to the causative diagnosis. Dr. Sherwood made an examination to cover this problem.

DR. WILLIAM D. SHERWOOD: In the presence of primary malignancy anywhere in the body, and later the development of symptoms in the nervous system, there is a great temptation to make a diagnosis of metastasis. The argument, *post hoc ergo propter hoc*, is probably the worst form of reasoning. It is very intriguing and presents an invitation which it is somewhat difficult to side-step. It can, however, lead us into devious paths and to completely erroneous conclusions. To be sure, the possibility of metastasis must be kept in mind, but it must be borne out by physical findings before we hang our hat on that hook.

In this case, the man's symptoms were confined to the hand and consisted of some sensory loss in the distribution of the radial nerve, together with some atrophy of the thenar eminence and great difficulty in approaching the thumb to the little finger. A secondary malignant infiltration of the nerve sheaths or blood vessels sometimes gives us a picture of peripheral neuritis with pain and motor disability, but in this case the biceps and triceps reflexes would then be involved. This was not so. Both of these reflexes were equally active in both upper extremities. Therefore, it would seem to me that we are compelled to place our pathology below the elbow. A peripheral neuritis would explain the findings. There is, too, the fact that this man was a masseur. His work would necessitate the constant daily use of the very muscles involved, and so the thought of pathology of occupational disease comes to mind.

Your chairman, Dr. Mosenthal, in order presumably to test our diagnostic acumen, has withheld, until after the discussion, the findings of the pathologist's postmortem, but I feel quite sure that they are negative so far as the brain or cord are concerned.

DR. GRIMSHAW: As a further causative factor, traumatic neuritis incurred at the time of transfusion or at the time of the operation might also be considered.

DR. MOSENTHAL: Dr. Greene said that the abdominal fluid had the characteristics of an exudate and was not a transudate. I should think from the findings that this was a transudate. The specific gravity of 1.010 and a protein content of 1 per cent would indicate this.

DR. GREENE: In my opinion there is no sharp distinction between transudates and exudates. Exudates have a higher specific gravity and a higher protein content than transudates, but that is all.

DR. MAURICE BRUGER: I agree with Dr. Mosenthal.

DR. MOSENTHAL: The character of the ascitic fluid, whether this is a transudate or an exudate, would seem to be of considerable significance here because if this is a transudate, then in all probability there is one of two conditions existing in this liver: either there are metastases or enlarged lymph nodes obstructing the portal vein, or there is a cirrhosis of the liver independent of or secondary to the malignancy. Another interesting point in this connection is that the vomiting preceded the ascites. Cirrhosis of the liver might have been responsible for this. These symptoms, coupled with the characteristics of the ascitic fluid, point to the presence of cirrhosis of the liver. This does not gainsay that there is not a malignancy as well.

Pathology

DR. MAURICE N. RICHTER: About 2,000 cc. of ascitic fluid were present. In the left lumbar region was a mass of fat, in place of the kidney which had been previously removed. This fat was surrounded and partially infiltrated by tumor tissue. Similar tumor tissue was seen around the right kidney, but did not infiltrate the organ itself.

Each lung was studded with small, white nodules, the smallest barely visible and the largest about 1 cm. in diameter. These were seen on the pleural surfaces and also throughout the lung tissues. On the cut surface the smaller nodules were often noted around the bronchi. The bronchial lymph nodes were enlarged and partly replaced by soft, grayish-white tissue, occasionally necrotic.

Nodules of soft, grayish-white tissue similar to that described in the lungs, were seen in many other situations. The lymph nodes in the pelvis, along the aorta, in the mediastinum and cervical regions, were all enlarged, and often had necrotic centers. Three small nodules of similar tissue were noted in the muscle of the right auricular appendage. On the peritoneal surfaces of the stomach and small intestine distended lymphatics were noted, containing soft, friable, grayish material. Similar distended lymphatics and nodules were found in the diaphragm, the serosa of the gallbladder, and in the mesentery.

The liver was enlarged (2,040 Gm.) and had a distinctly granular surface. Nodules of liver tissue surrounded by grayish, periportal fibrous tissue were seen throughout the cut surface. The spleen was slightly enlarged.

These gross findings indicate that we were dealing with a neoplasm, although the appearance of some of the smaller nodules in the lung strongly suggested miliary tubercles. A microscopic slide of the kidney tumor removed at another hospital was obtained for examination, and found to be a papillary carcinoma. The sections of various organs from the autopsy showed that the nodules and infiltrations described were secondary deposits of the same tumor. It was particularly interesting to observe the invasion and distention of lymphatic channels throughout the body. This was particularly noticeable in the lungs, the diaphragm, and the peritoneal surfaces. The wall of the thoracic duct itself was invaded by the tumor, although occlusion did not occur. In several of the distended lymphatics the papillary structure shown in the original tumor was reproduced. Involvement of small veins was also noted in

several organs. Invasion of the stomach and small intestines occurred in several places, apparently by way of the lymphatics from the peritoneum. Tumor cells reached the stroma of the mucosa, without causing ulceration.

In a few areas cells with very clear cytoplasm were noted among the tumor cells, but this feature was only occasionally seen and did not suggest a hypernephroid tumor.

The liver was of great interest, in that extensive cirrhotic change was associated with infiltration of the carcinoma in the periportal connective tissue, producing the picture that is often called "carcinomatous cirrhosis." Associated with this were the ascites and moderate splenic enlargement.

From the pathologic standpoint the case is fairly clear, as far as diagnosis is concerned.

The mode of spread in this case was mainly by way of the lymphatics, for the distension of lymphatic channels was one of the most conspicuous features. However, some of the secondary deposits may have arisen through metastases from the lung, the heart, or the liver. The spinal cord and brain were not examined; consequently, I have no answer as to the cause of the nerve lesions involving the right forearm.

Anatomic Diagnoses

Papillary carcinoma of kidney, left.

Obsolete operation: nephrectomy, left.

Secondary carcinoma of lungs, pleurae, heart, stomach, intestines, peritoneum, pancreas, liver, urinary bladder, lymph nodes (pelvic, lumbar, mesenteric, coeliac, mediastinal, cervical).

Cirrrosis of liver, due to secondary carcinoma.

Ascites.

Splenomegaly, due to portal hypertension.

SOIL DEPLETION AND FOOD VALUES

Dr. Ouida Davis Abbott, of the University of Florida, reported an interesting study based on the concept that the nutritional status of rural people gives more conclusive evidence of soil deficiencies than chemical analysis of either the plants or the soil. In the course of the study, the nutritional condition of 3,503 rural children was determined, the endemic nature of anemia noted and associated with soil and plant deficiencies. In sections where local cattle ranges were classed as deficient in "salt lick" of cattle, the children had lower hemoglobin values than in sections where the ranges were classed as healthful. Also in areas deficient in this respect, functional heart defects were much higher than in the nondeficient areas.

Roentgenograms of the wrists of selected children

of the same sex and age showed considerable variations in bone age and development. Children with skeletal imperfections came from sections where cattle also had poor bone formation and suffered from other nutritional defects. Young rats whose only food was milk from these poorly nourished cows soon showed symptoms of malnutrition and died unless a mineral supplement was added to the diet.

Another interesting fact reported by Doctor Abbott was that the iron content of pot herbs grown on different types of soil varied widely. When produced on soils classed as protected, greens contained from two to three times as much iron as when grown on deficient soils.—*Excerpt from "Nutrition Discussions at the A.Ph.A. Meeting," Health News, December 21, 1942*

Therapeutics

CONFERENCES ON THERAPY

THESE are stenographic reports, slightly edited, of conferences by the members of the Departments of Pharmacology and of Medicine of Cornell University Medical College and the New York Hospital, with collaboration of other departments and institutions. The questions and discussions involve participation by members of the staff of the college and hospital, students, and visitors. The next report will appear in the May 1, issue and will concern "The Status of Therapy with Anticoagulants."

Treatment of Some Common Diseases of the Eye

DR. HARRY GOLD: Our conference this morning is on the treatment of disorders of the eye, more particularly those disorders which are commonly encountered in the general practice of medicine. The discussion will be opened by Dr. McLean.

DR. JOHN M. McLEAN: Some of the most annoying things we have to treat about the eye are some of the simplest and less serious diseases.

One of the very simple ones we might begin with is hordeolum or the common sty. An individual hordeolum or two is not at all a complex problem. It is nothing more or less than a small abscess of a marginal lid gland and should be treated as such in the early stage with hot moist applications. I believe that it does not make much difference whether you use hot compresses with salt solution, boric acid, magnesium sulfate, or hot tap water, so long as the moist heat is adequately applied at the right place. When the sty reaches the proper stage and begins to point, of course the obvious thing to do is to open it with the point of a small sharp knife and drain it. But there are patients who keep coming back with chronic recurrent sties, and it is often very difficult to clear these up for any but a short period of time.

The difficulty that we have in handling them is reflected in the almost endless list of therapeutic agents which have been proposed. I do not intend now to go into this long list in detail. The commonest application is an ointment of 1 or 2 per cent yellow oxide of mercury. When that is ineffective, it is customary to shift to some other mercurial ointment, usually about 2 per cent ammoniated mercury.

Some recent unpublished work indicates that there is little effect from the supposed active principle in these ointments and that bland ointment bases are almost as effective—that it is perhaps the massage in rubbing the ointment in and the cleaning rather than the actual mercurial salt which produces an effect. I am not sure which way we ought to lean in that respect.

Most of these chronic sties are caused by staphylococcal infections and for the correction of them various vaccines, many of them autogenous, have been prepared. Staphylococcus toxoid has been used, and desensitization with staphylococcus toxin seems to be about the most effective of all these procedures.

Recently a 5 per cent sulfathiazole ointment for use locally has been added to the list of therapeutic agents, and apparently it has been somewhat successful.

There is also one other factor. Many of these patients have definite refractive errors and seem to improve when they wear the proper glasses. A logical explanation of this coincidence is a little difficult.

In the same connection we have chronic blepharitis often accompanied by such sties. One of the most important factors in treating chronic blepharitis is mechanical cleansing of the lid margin, removing the crusts, and drying up the secretions which are present. This can be done adequately with cotton and warm water. Sometimes it is worth while to add a mild soap. Always remember that some soaps can produce considerable damage to the corneal epithelium if they are used carelessly.

It is important to remember that every once in a while, particularly in patients who come from surroundings with poor hygienic conditions, pediculi can be found in the eyelashes. They must be looked for carefully. We may overlook them and suspect something else unless they are kept in mind. When nits are present they should, of course, be removed with careful cleansing.

A 2 or a 3 per cent ammoniated mercury ointment seems to be of definite value for this purpose. Yellow oxide of mercury is used, and also zinc oxide ointment, 1 per cent or 2 per cent, as well as an ointment of bichloride of mercury in strengths varying from 1:5,000 to 1:12,000 or 1:15,000. How much value such an ointment may have is problematic.

If the marginal blepharitis is stubborn, it often can be helped a great deal after mechanical cleansing by painting the margin of the lids and the roots of the lashes with half-strength tincture of iodine. In those cases in which there are crusts and weeping secretions from the marginal glands, often 2 per cent tincture of brilliant green in 70 per cent alcohol helps to dry up the lid margins and shorten the course of the disease.

Sometimes following blepharitis or hordeolum, and sometimes independently, we find chalazia, which are retention cysts of the meibomian glands or the tarsal glands. If a mild astringent collyrium is used, with gentle massage and heat, many of these chalazia open up and discharge their contents slowly through the normal gland opening and disappear. Those that do not regress in that fashion must be treated by surgical incision through the conjunctiva and complete removal of the cyst wall, either by careful curettage or by destruction with caustic agents.

After diseases of the lids, we come to the large group of conjunctivitis. Acute catarrhal conjunctivitis is one of the most common problems, often spoken of as "pink eye."

The old standard treatment for acute conjunctivitis, of course, is argyrol, and I think the pharmacologists will speak later about the very weak antiseptic effect of argyrol and the other silver proteins in that group.

Argyrol is of mechanical benefit, however, because it does tend to coagulate and agglutinate the protein and mucoid shreds and the discharge. It will make it much easier to wash them out mechanically by irrigations with 2 per cent boric acid, normal saline, or some similar cleansing agent.

In the very acute phases there is usually more or less photophobia, which is helped by dark glasses, by ice compresses, and medications which contain epinephrine.

The whole story of photophobia is still somewhat obscure, but certainly we know that superficial vasodilatation is often associated with photophobia, many cases being conjunctivitis, and in those cases the photophobia is relieved by local vasoconstriction by epinephrine.

This simple preparation is useful:

R̄	Zinc sulfate	gr. i
	Boric acid	gr. x
	Epinephrine (1:1,000)	3 ss
	Distilled water	3 i

It relieves the symptoms and often ameliorates the condition. As you see, it is only a mildly antiseptic astringent preparation.

It is worth while in cases of conjunctivitis that do not yield promptly to simple treatment

to make bacterial studies and find out what organisms are involved. If pneumococcus is found, it is customary to use optochin (ethylhydrocupreine), but most cases of pneumococcus conjunctivitis get well just about as rapidly without it.

If the Koch-Weeks bacillus or the Morax-Axenfeld bacillus are found—I would like to remark here that there is no difference between the Koch-Weeks bacillus and the influenza bacillus—preparations containing zinc, either like the one just mentioned or the simpler one containing zinc sulfate, $\frac{1}{4}$ per cent in water, are of considerable use.

In stubborn cases we often paint the conjunctival surface of the lids with a weak silver nitrate, 1 or 2 per cent. This stimulates the circulation—a great deal and tends to remove the superficial epithelial cells, which, in many instances, contain most of the bacteria.

In chronic conjunctivitis it is important to remember that the source of the infection may reside in the lacrimal sac with a constant drainage into the conjunctival sac, in which case the lacrimal apparatus should be cleaned out with irrigations or dilated with probing if there is constriction.

Gonococcus conjunctivitis is a problem in itself. It is sometimes found in newborn babies and sometimes in adults. The treatment used to be very vigorous and still was somewhat unsatisfactory when the sulfonamides came into use. Before that time, very frequent irrigations day and night were necessary for weeks at a time, and even then many cases progressed to corneal ulceration and perforation with the loss of the eye. Now with adequate sulfonamide therapy the prognosis is excellent if the case is treated early. The only additional local treatment required is an occasional cleansing irrigation with normal saline or half-saturated boric acid solution.

The sulfonamides are given by mouth if possible, and by other means if necessary, and sometimes in newborn babies and in prematures the administration is a problem. I think Dr. Wheeler will take that up presently.

Inclusion blennorrhea, sometimes known in adults as swimming-pool conjunctivitis, is a virus disease of the conjunctiva which is self-limited but which takes a very long chronic course, lasting for months. In newborn babies it is a virus infection which produces so much purulent discharge that it is often clinically mistaken for gonorrheal ophthalmia. Until the advent of the sulfonamides, this condition also was treated with frequent irrigations. The course was very long, although no permanent

damage resulted. Now a very short course with sulfonamide therapy—sulfanilamide, sulfathiazole, or sulfadiazine—will clear it up completely.

It is interesting that along with trachoma, another virus disease, we have two virus infections of the eye which are treated best by sulfonamide therapy, although I believe that in general the sulfonamides are not particularly effective against viruses.

Vernal catarrh is essentially an allergic conjunctivitis. It is not serious, but it can be very annoying. The local symptoms are usually temporarily relieved by instillation of 1:1,000 epinephrine in the conjunctival sac. Sometimes a more permanent result is obtained with 3 per cent sodium bicarbonate. It must be remembered that this solution should not be given at the same time as epinephrine.

Mild 1 per cent solutions of acetic acid have also been used. In the very intractable forms with extensive swelling, the so-called pavement block involvement of the conjunctiva, simple mild radiation with the soft beta rays from radon is very effective, but this can be a dangerous therapy around the eye and must be handled by persons who are well acquainted with its use and its dangers.

Removal of foreign bodies from the eye is a problem that faces every physician and many others. If a foreign body is on the conjunctiva of the globe or of the eyelid, I think it is always advisable to remove it with soft cotton applicators without local anesthesia, if possible. However, when a foreign body is on the cornea, it is usually difficult to remove it unless a local anesthetic is used.

There is a large list of local anesthetics that can be used with safety: $\frac{1}{2}$ per cent pontocaine, 2 per cent metycaine, 1 per cent butyn sulfate, 1 per cent holocaine, and, of course, cocaine, although it is preferable to avoid cocaine because it has a slight macerating effect on the corneal epithelium. After the removal of the foreign body it is wise to irrigate the eye with some mild antiseptic solution in order to help prevent secondary infection and corneal ulceration at the site.

Always remember after using a local anesthetic in the eye that the corneal sensitivity will be absent for several hours afterwards, and it is not safe to let the patient go outdoors and walk around in the wind, exposing his eye to countless other foreign bodies which may scratch and irritate the globe without discomfort until the anesthesia wears off. Therefore, if he has to go out, put some simple ointment in his eye and protect it with an eye pad for several hours until the sensitivity has returned.

From time to time the general physician, the general surgeon, and the neurosurgeon are faced with exposure keratitis and neuroparalytic keratitis, either from damage to the fifth nerve, from mechanical proptosis of the eye, or from facial nerve palsy which prevents adequate closure of the lids. The immediate treatment of this condition is simple and consists primarily of protection. The old-fashioned Buller shield arrangement made with cellophane is comfortable to the patient, easy to apply, and is not liable to leak around the edges. In advanced cases it may be necessary to use surgical procedures on the lid margins in order to secure adequate protection.

Chemical burns of the cornea are acute emergencies which require immediate treatment by whatever physician is first at hand, particularly burns with strong acids and strong alkalis. Of these two types of burns, those from strong alkalis are much more serious because strong acids do not penetrate the cornea readily. Strong alkalis do penetrate easily into the eye, producing much worse permanent corneal scarring and sometimes loss of the eye itself.

It is not worth while to take time to find out whether it was an acid or a base, or to look for a piece of litmus paper. The thing to do is to wash the chemical solution out of the eye adequately and promptly, and if the nearest thing is a hose or water faucet, put the patient under it and turn the water on him. Force his lids open and wash out the conjunctiva and cornea completely. After that you can stop and worry about whether it was sodium hydroxide or sulfuric acid, and then is the time, if at all, to use mild neutralization with weak acetic acid or weak sodium bicarbonate.

As soon as possible after this treatment, stain the cornea with slightly alkaline fluorescein or some other adequate stain which will demonstrate any loss of corneal epithelium, and if there is any damage to the epithelium, the eye must be lubricated with mineral oil or any bland ointment, and must be protected with an eye pad or other similar device. This is the time to get the patient into the hands of the ophthalmologist because the final results of some of these alkaline burns are very serious, for although they often look much milder for the first day than acid burns, the end result may be much worse.

It is also worth mentioning that in burns with lime, the calcium salts penetrate the cornea and precipitate in an insoluble form, causing permanent corneal damage. Immediate instillation, after irrigation, of a solution of from 5 to 10 per cent neutral ammonium tartrate will help to keep the lime soluble, so that it can be mechanically washed out.

There are a few other emergencies that the general physician runs into. Sometimes you see a sudden complete occlusion of the central retinal artery. If that occlusion is complete, any treatment which is used must be immediate because speed is very important. Without nutrition the ganglion cells in the retina die very rapidly.

The obvious treatments and the standard ones are vasodilators, the inhalation of amyl nitrite or doses of erythrol tetranitrate, or nitroglycerine. The choline drugs have been used recently by local injection behind the eye. It was at first supposed that that would produce considerable vasodilatation, and now there is some fairly clear evidence that the choline drugs so used are not particularly effective on the retinal circulation.

If the equipment and someone who can handle it are available, one of the best mechanical treatments is immediate decompression of the eye by paracentesis of the anterior chamber, a very simple surgical procedure which lowers the intraocular tension abruptly and markedly, and which, followed by massage of the globe, often relaxes the spasm or dilates the central vessel enough for an embolus to pass on into a minor branch where it is much less harmful.

Occlusion of the central retinal vein is a less urgent condition and one which until quite recently had been considered practically hopeless. It is followed in many cases by severe hemorrhagic glaucoma, which results in enucleation. In recent months some astounding reports have come out in the literature of the cure of central retinal venous occlusion with the prolonged intravenous heparin treatment. There are some dangers in this form of treatment, but in such a serious condition we are justified in taking fairly radical measures to avoid eventual blindness.

Just a word about the involvement of the optic nerve: Optic neuritis or retrobulbar neuritis is a fairly common cause of sudden blindness. It may be due to syphilis, and when it is, it must be treated very rigorously with antisyphilitic therapy. I do not believe there is any satisfactory evidence to frighten us away from the rigorous use of the arsenicals. I think the mild treatment with the heavier metals and with mercury unctions is probably so much time wasted.

It is a time-honored procedure to have the posterior accessory nasal sinuses opened for retrobulbar neuritis, whether there is any evidence of sinus disease or not, and frequently these patients do show improvement shortly thereafter, which is always attributed to the sinus surgery. When they are followed over a long period of time, it turns out in about 90 per cent of the cases that the real disease is a demyeliniz-

ing process, usually multiple sclerosis, and sometimes other forms, such as neuromyelitis optica which have spontaneous remissions and which may clear up a little more rapidly because of the local vasodilatation produced near the optic nerves by the sinus surgery. However, I do not believe that radical surgery is often indicated in these patients.

Toxic amblyopia, which produces a very similar picture, is usually caused by the overuse of tobacco and alcohol. The obvious treatment is complete withdrawal of these poisons, but we also now know that the adequate use of vitamin B complex is distinctly worth while, and it has been shown by Carroll that it is possible with large doses of yeast to keep these patients on their alcohol and on their tobacco and still cause improvement. However, I think the proper treatment is complete withdrawal of the toxic agents, plus vitamin B in fairly large doses. Probably the effective part is the thiamine element, but it is just as easy to give the yeast tablets as such.

A final word about optic atrophy: One of the big problems of optic atrophy is in late syphilis, usually tabes, and there the routine antisyphilitic treatment should be continued, but tryparsamide should be avoided. We know now from the recent work of Earl Moore and his associates that the best prognosis goes with a combination of routine antisyphilitic treatment and malarial therapy. We cannot hope to recover much of the vision which is lost in an optic atrophy, but we can hope to arrest the process with this combination.

I will wind up with a few words on general advice that the family physician is often called upon to give about eye conditions that are beyond the scope of his treatment.

One is glaucoma. I think the best way to make a simple analogy of the glaucoma problem is to compare it with diabetes. Glaucoma is a disease which is never cured but which can be controlled. The medical treatment is comparable to dietary control in diabetes and the surgical treatment which may become necessary at any stage of the disease is more or less analogous to insulin therapy in diabetes. The patients have to be carried along a similar regimen, with constant observation and control.

Another such problem is cataract. Many physicians today, who have heard little about cataract since their days in medical school, are telling their patients things which are no longer true. They are advising them, for instance, that it is necessary to wait until a cataract is completely mature before operation is performed. By modern surgical procedures that advice is not only obsolete but not good because

the ideal cataract to remove by modern operative technic is one that is not quite mature. An operation can be performed at almost any stage of development of the cataract. Therefore, the time to operate is whenever the patient's vision has reached the stage which incapacitates him in his own visual requirements. That trend in modern surgery I think almost eliminates the use of dionin, which was given to patients with immature cataracts for years on end as a local irritant and a local vasodilator on the theory that it therefore would improve the ocular circulation and so slow up the development of the cataract.

DR. GOLD: The meeting is now open for questions. Dr. McLean has touched upon a large number of drugs, antiseptics, astringents, and local anesthetics, autonomic drugs used in the eye, and a variety of others for specific effects.

Dr. Wheeler, will you say something about the sulfonamides?

DR. C. H. WHEELER: I want to say something on the question of dosage in infants and small children. The dose that pediatricians commonly use is a total daily dose of 0.2 Gm. per kilo, divided either in four or six doses, given at regular intervals throughout the day.

This dose can be given in any of several ways. If it is difficult to introduce the drug into the child with the feedings or with water, it can be given by lavage or it can be given in a clysis subcutaneously. In small infants and children, I think probably the subcutaneous administration is more practicable than the intravenous although it sometimes can be given intravenously.

The total daily dose of 0.2 Gm. per kilo, you will note, would be a very large dose for an adult—about twice the ordinary adult dose.

DR. GOLD: I think Dr. McLean said we did not get very far with the treatment of the gonorrheal infections until the sulfonamide compounds made their appearance. Is that not so?

DR. McLEAN: We lost many more eyes from gonorrheal ophthalmia before the sulfonamides came in.

DR. GOLD: That, I assume, has to do particularly with the treatment of gonorrheal ophthalmia but not so much with prevention. We did get along pretty well with the prevention of gonorrheal ophthalmia, did we not?

DR. McLEAN: We did, and we still do. I did not mention anything about the use of silver nitrate for prophylaxis. I think it is important to use the silver nitrate for prophylaxis as required by law in many, but not in all, states, rather than the mild silver protein which some

people are inclined to use and which is much less effective prophylactically.

DR. GOLD: What per cent silver nitrate?

DR. McLEAN: One or two per cent.

DR. GOLD: Dr. Cattell, would you say something about the stronger and milder forms of the colloidal silvers?

DR. McKEEN CATTELL: There is a point of interest in relation to the preparations which are used.

In the first place the so-called mild silver protein actually contains more silver than does the strong. The effectiveness of the organic silver salts depends upon the degree of ionization and that is why the strength fails to parallel the silver content.

Then it is important that the solutions be fresh. They all deteriorate fairly rapidly. The mild solutions become stronger because of a greater ionization of the silver salt, whereas the strong preparations become weaker on standing because in them the ionization is decreased.

DR. OSCAR BODANSKY: Would the use of irrigations containing sulfonamide drugs in association with oral therapy have an advantage over oral therapy alone?

DR. McLEAN: That treatment is used, but so far as I know there is no conclusive evidence that irrigations with the sulfonamide solutions help the picture very much.

DR. GOLD: How about 5 or 10 per cent ointments of sulfonamides?

DR. McLEAN: They are very difficult to use where there is so much purulent secretion.

INTERN: Dr. Gold, do you think the use of silver acetate in prophylaxis would be preferable to the use of silver nitrate?

DR. GOLD: We might pass that on to Dr. McLean, who may have had some direct experience.

DR. McLEAN: Yes, I have seen silver acetate used in a series of newborn babies for prophylaxis, and I have seen gonorrheal ophthalmia develop in spite of it, although most people who have tried it have the impression that it is practically as good and somewhat less irritant.

DR. WHEELER: How long is it safe to use silver preparations in the eye?

DR. McLEAN: That depends a great deal on the solution which is used and the local conditions, such as, how much lacrimation there is that will wash the silver out. I do not think you can set any arbitrary time limit, but as a general principle it is always unwise to use silver protein, or silver nitrate, or other forms of silver over any protracted period of time.

DR. GOLD: I was wondering why cocaine has become less popular as a local anesthetic in eye

There are a few other emergencies that the general physician runs into. Sometimes you see a sudden complete occlusion of the central retinal artery. If that occlusion is complete, any treatment which is used must be immediate because speed is very important. Without nutrition the ganglion cells in the retina die very rapidly.

The obvious treatments and the standard ones are vasodilators, the inhalation of amyl nitrite or doses of erythrol tetranitrate, or nitroglycerine. The choline drugs have been used recently by local injection behind the eye. It was at first supposed that that would produce considerable vasodilatation, and now there is some fairly clear evidence that the choline drugs so used are not particularly effective on the retinal circulation.

If the equipment and someone who can handle it are available, one of the best mechanical treatments is immediate decompression of the eye by paracentesis of the anterior chamber, a very simple surgical procedure which lowers the intraocular tension abruptly and markedly, and which, followed by massage of the globe, often relaxes the spasm or dilates the central vessel enough for an embolus to pass on into a minor branch where it is much less harmful.

Occlusion of the central retinal vein is a less urgent condition and one which until quite recently had been considered practically hopeless. It is followed in many cases by severe hemorrhagic glaucoma, which results in enucleation. In recent months some astounding reports have come out in the literature of the cure of central retinal venous occlusion with the prolonged intravenous heparin treatment. There are some dangers in this form of treatment, but in such a serious condition we are justified in taking fairly radical measures to avoid eventual blindness.

Just a word about the involvement of the optic nerve: Optic neuritis or retrobulbar neuritis is a fairly common cause of sudden blindness. It may be due to syphilis, and when it is, it must be treated very rigorously with antisyphilitic therapy. I do not believe there is any satisfactory evidence to frighten us away from the rigorous use of the arsenicals. I think the mild treatment with the heavier metals and with mercury unctions is probably so much time wasted.

It is a time-honored procedure to have the posterior accessory nasal sinuses opened for retrobulbar neuritis, whether there is any evidence of sinus disease or not, and frequently these patients do show improvement shortly thereafter, which is always attributed to the sinus surgery. When they are followed over a long period of time, it turns out in about 90 per cent of the cases that the real disease is a demyeliniza-

ing process, usually multiple sclerosis, and sometimes other forms, such as neuromyelitis optica which have spontaneous remissions and which may clear up a little more rapidly because of the local vasodilatation produced near the optic nerves by the sinus surgery. However, I do not believe that radical surgery is often indicated in these patients.

Toxic amblyopia, which produces a very similar picture, is usually caused by the overuse of tobacco and alcohol. The obvious treatment is complete withdrawal of these poisons, but we also now know that the adequate use of vitamin B complex is distinctly worth while, and it has been shown by Carroll that it is possible with large doses of yeast to keep these patients on their alcohol and on their tobacco and still cause improvement. However, I think the proper treatment is complete withdrawal of the toxic agents, plus vitamin B in fairly large doses. Probably the effective part is the thiamine element, but it is just as easy to give the yeast tablets as such.

A final word about optic atrophy: One of the big problems of optic atrophy is in late syphilis, usually tabes, and there the routine antisyphilitic treatment could be continued, but tryparsamide should be avoided. We know now from the recent work of Earl Moore and his associates that the best prognosis goes with a combination of routine antisyphilitic treatment and malarial therapy. We cannot hope to recover much of the vision which is lost in an optic atrophy, but we can hope to arrest the process with this combination.

I will wind up with a few words on general advice that the family physician is often called upon to give about eye conditions that are beyond the scope of his treatment.

One is glaucoma. I think the best way to make a simple analogy of the glaucoma problem is to compare it with diabetes. Glaucoma is a disease which is never cured but which can be controlled. The patients have to be carried along a similar regimen, with constant observation and control.

Another such problem is cataract. Many physicians today, who have heard little about cataract since their days in medical school, are telling their patients things which are no longer true. They are advising them, for instance, that it is necessary to wait until a cataract is completely mature before operation is performed. By modern surgical procedures that advice is not only obsolete but not good because

cycloplegia without mydriasis? Would that solve the problem?

DR. McLEAN: That would solve the problem, but we have no such drug.

DR. GOLD: I have here a paper which appeared in the *Journal of the American Medical Association* in which cycloplegics are discussed. It contains the phrase, "Since most of the members of this group are also mydriatics." Are there any cycloplegics which are not mydriatics? If there were, that would solve your problem.

DR. McLEAN: I do not know of any adequate cycloplegics which are not mydriatic.

DR. GOLD: I do not know of any either.

DR. WHEELER: There is a problem in the wards of this hospital: If you have an elderly patient whose pupils are too small to allow adequate visualization of the fundus, and if the patient has no history of anything to suggest glaucoma, and if the intraocular pressure on crude palpation of the eyeball is not increased, is it safe routinely to dilate the pupils of that patient in order to see the fundi?

DR. McLEAN: It is perfectly safe in almost all those patients to dilate the pupils with a drug of the epinephrine group, such as 1 per cent suprenen or epinephrine bitartrate. It must be remembered that ordinary 1:1,000 epinephrine will not dilate the pupil. You can also use 3 to 5 per cent ephedrine sulfate, or in elderly white patients in whom there is no suspicion of glaucoma a 5 per cent euphthalmine. All these drugs should be followed by a miotic as soon as the examination is finished. You will find that in darkly pigmented Negro patients the stronger adrenalin preparations and 1 per cent homatropine will dilate the pupil adequately.

DR. WHEELER: In other words, we are taking a risk in using homatropine routinely to dilate the pupils in elderly individuals. It would be preferable to use one of the adrenalin preparations.

DR. GOLD: Or euphthalmine?

DR. McLEAN: I think euphthalmine is probably the best all-around drug for that purpose. In elderly people it should be followed by a drop of pilocarpine.

DR. GOLD: Did you say that euphthalmine does not produce cycloplegia?

DR. McLEAN: It does produce a very slight cycloplegia. It is not commonly noticed in individuals who have a great deal of residual accommodation. In elderly people it may be completely knocked out by euphthalmine.

DR. CATTELL: The accepted term for that drug is now eucatropine.

DR. GOLD: Euphthalmine is a trade brand of eucatropine.

DR. DuBois: What should the average physician carry in his bag?

DR. McLEAN: I think for the average physician in this community 5 per cent euphthalmine and either 1 or 2 per cent pilocarpine or a $\frac{1}{4}$ per cent of physostigmine will be satisfactory.

DR. GOLD: Would you use pilocarpine as the nitrate?

DR. McLEAN: As either the nitrate or the hydrochloride. Eucatropine will not suffice, however, if a doctor has to see many Negro patients, because the iris is much stiffer and more pigmented in the Negro than in the white. Here it is necessary to use a 1 per cent homatropine or a stronger drug of the epinephrine series.

DR. CATTELL: Do you use those drugs in combination?

DR. McLEAN: It is not necessary for preparing a patient for fundus examination. We use them in combination frequently in breaking synechia in iritis, and such things.

DR. GOLD: Do you use optochin in the treatment of pneumococcus ophthalmia? Optochin, or ethyl hydrocupreine, has been deleted from the *Pharmacopeia*.

DR. McLEAN: Good!

DR. GOLD: You think it should have been deleted?

DR. McLEAN: Yes.

Summary

DR. GOLD: It is clear from the discussion today that the general practitioner has a good deal of responsibility in treating disorders of the eye.

A fairly formidable list of conditions comes within his purview: the common sty; chronic blepharitis; pediculosis of the lids; retention cysts (chalazia); conjunctivitis (influenza, pneumococcus, gonococcus); inclusion blenorrhea (a virus disease); trachoma; vernal catarrh (an allergic conjunctivitis); foreign bodies on the conjunctiva or cornea; neuroparalytic keratitis; chemical burns with alkalis, acids, and lime; acute occlusion of the central retinal artery and vein; optic neuritis or retrobulbar neuritis; toxic amblyopia; optic atrophy; glaucoma; and cataract. Many of these obviously require the attention of the specialist. It is pointed out, however, that the general practitioner may treat several of them from beginning to end; in others he applies only the initial emergency treatment; and in still others he carries out protracted treatment under the guidance of the ophthalmologist.

Among the agents that should be at the command of the general practitioner are appropriate acids and alkalis for the neutralization of chemical

work. You say that it tends to produce maceration of the corneal structure. Is cocaine supposed to be unduly irritant by itself, or is it because it produces local anesthesia of longer duration, or are there other reasons?

DR. McLEAN: I think you will find if you use cocaine and, in a parallel series of eyes, pontocaine, for example, that there will be definitely demonstrable slight damage to the corneal epithelium in the eyes in which cocaine has been used and not in the eyes in which comparable anesthesia has been obtained with another drug.

I did not mean to suggest that cocaine is unpopular. It is still probably the most popular topical anesthetic in use for the eye. Another objection to its routine use is that it also dilates the pupil, which under many circumstances is undesirable, and many other anesthetics do not.

DR. GOLD: I wonder whether it may not have something to do with the way stock solutions are prepared. Cocaine hydrochloride makes an almost neutral very faintly acid solution, but in the endeavor to produce various stock solutions these have been prepared by various manufacturers with a pH of 3.5. I wonder if the low pH of these solutions is not responsible for the local irritant action, in part at least.

DR. EUGENE F. DuBOIS: May we have the names of several preferred local anesthetics and their synonyms?

DR. McLEAN: Pontocaine $\frac{1}{2}$ to 1 per cent; butyn 1 to 4 per cent; metycaine 2 to 4 per cent; holocaine (phenacaine) 1 per cent; cocaine 1 to 5 per cent. I would choose them in the above order.

DR. WHEELER: I would like to ask Dr. McLean whether there are any general principles about refraction, which is one of the commonest forms of therapeutics, that the general practitioner should know. Also, in that connection, I should like to ask whether the average optometrist, who does refraction, is competent to do so?

DR. McLEAN: In the first place, as for the general principles of refraction, it is a mistake to believe that because a patient has 20/20, or 20/15 vision he necessarily does not have a refractive error, for many cases of hyperopia and some patients with astigmatism have normal or nearly normal vision without correction, but are under a constant strain which will produce local ocular redness, puffiness of the lids, generalized tiredness, and headaches. This is also true of certain muscle imbalances, even where the refractive error may be negligible.

For the proper evaluation of refractive error in people under the presbyopic age, which begins

in the forties, it is important to use an adequate cycloplegic for refraction, which means usually atropine in children and homatropine in older people. Without this it is impossible to uncover much of the latent hyperopia which is one of the causes of symptoms.

On this score the optometrist is never entirely competent to refract because he is not allowed by law to use these drugs, nor is it safe to allow him to use these drugs because they have their dangers, particularly in the possible production of an acute glaucoma, and less often in the occasional production of atropine poisoning when they are used improperly.

The term "ophthalmologist" and the term "oculist" are practically synonymous.

An optometrist is a man who usually has had a high school education and has sometimes been to college and has acquired the title of optometrist in studying anywhere from a four-year course in optometry to a course of a few months. In some states these men are examined by optometric boards and licensed. In some states they practice almost at will.

I think even more important than their inability to refract other than elderly people adequately is the harm which they do by passing themselves off as eye physicians, selling patients glasses, and then telling them that their eyes are all right with the glasses. They overlook many cases of chronic glaucoma. They overlook many cases in which the fundus gives the first clue to serious systemic disease, and they send the patients away with a false sense of security.

Many of these patients, because of their visit to the optometrist, do not reach medical attention until it is almost too late.

While we are on the subject of terms, I might add that an optician is the ophthalmologist's counterpart of the pharmacist. He does not refract. He does not prescribe. He fills prescriptions for glasses.

DR. CATTELL: What precautions do you use in avoiding the dangers of increased ocular pressure?

DR. McLEAN: You should know by your preliminary examination of the eye when that is liable to happen and so use other methods in refraction.

DR. CATTELL: Will you tell us what those are?

DR. McLEAN: The best we can do is that sometimes we can produce with mild solutions of homatropine a very temporary cycloplegia, and immediately control the mydriasis with physostigmine, pilocarpine, mechoyl, etc., before any harm is done.

DR. GOLD: Is it your problem to produce

Postgraduate Medical Education

Programs arranged by the Council Committee on Public Health and Education of the Medical Society of the State of New York are published in this section of the JOURNAL. The members of the committee are Oliver W. H. Mitchell, M.D., Chairman (428 Greenwood Place, Syracuse); George Baehr, M.D.; and Charles D. Post, M.D.

Program on Plasma and Whole Blood Transfusion

(Group of Special Lecturers Now Available)

PLANS have been completed to present to the medical profession the very latest information concerning blood plasma therapy and whole blood transfusion. This program is sponsored by the Medical Society of the State of New York, the Office of Civilian Defense, the Health Preparedness Commission of the State War Council, and the State Department of Health. The instruction will be presented by a group of especially interested and prepared physicians. The physicians available for lectures and demonstrations at meetings of county medical societies and hospitals staffs attended a conference on Friday, February 26, in the State Office Building, Albany, New York. Leading authorities on plasma therapy and whole blood transfusion addressed the group and there were round-table discussions.

These lectures may be arranged as special single sessions or in connection with formal courses or for a special or regular meeting of county medical societies. It is anticipated that this program will be much in demand. County medical societies have been supplied with the names of the speakers. Some requests have already been received.

Expenses of the speakers are paid by the Medical Society of the State of New York and the New York State Department of Health.

For information regarding a blood plasma and blood transfusion program address communications to:

O. W. H. MITCHELL, M.D., *Chairman*
Council Committee on Public Health and
Education
428 Greenwood Place, Syracuse, New York

Lecture on Plasma Therapy

THROUGH the combined efforts of the New York State Department of Health and the Medical Society of the State of New York, a single lecture on "Plasma Therapy" has been arranged for the Cortland County Society. The lecture,

which will be delivered at 8:30 P.M. March 19 at the Cortland County Hospital in Cortland, will be given by Frederick N. Marty, M.D., instructor in clinical medicine, Syracuse University College of Medicine, Syracuse, New York.

Dr. Reznikoff Speaks in Syracuse

AT a joint meeting of the Onondaga County Medical Society and the Syracuse Academy of Medicine a postgraduate lecture was heard on the subject of "The Diagnosis and Treatment of Anemia."

The meeting was held on March 2 at the University Club in Syracuse. Dr. Paul Reznikoff, associate professor of clinical medicine at Cornell University Medical College in New York City, was the speaker.

COLLEGE OF PHYSICIANS CANCELS SESSION

The Board of Regents of the American College of Physicians has announced the cancellation of their 1943 Annual Session, which was scheduled to be held in Philadelphia, April 13-16, 1943. This action was taken after thoughtful consideration of all factors involved, including an intimation from the Secretary of War and the Office of Transportation that larger national medical groups should not plan meetings at the time set; a growing difficulty in getting speakers and clinicians of top rank to maintain the usual standards of the program;

prospect of greatly reduced attendance because civilian doctors are faced with too great a burden of teaching and practice already; a decreasing active membership, due to approximately 25 per cent of all doctors being called to active military service. President James E. Paullin announced, however, that all other activities of the College would be pursued with even greater zeal and that the College would especially promote regional meetings over the country and organized postgraduate seminars in the military hospitals for doctors in the armed forces.

burns, astringents to reduce congestion, antiseptics, pupillary constrictors and dilators, vasoconstrictors and vasodilators, and local anesthetics. The following drugs were considered in relation to the eye conditions for which they are used: an ointment of 1 or 2 per cent yellow oxide of mercury; an ointment of 2 per cent of ammoniated mercury; a 5 per cent ointment of sulfathiazole; a 1 or 2 per cent ointment of zinc oxide; an ointment of 1:5,000 and 1:15,000 of bichloride of mercury; half-strength tincture of iodine; a 2 per cent tincture of brilliant green in 70 per cent alcohol; a solution of mild silver proteinate; 1 or 2 per cent solution of silver nitrate; a 2 per cent solution of boric acid; physiologic salt solution; a solution containing 1 grain zinc sulfate, 10 grains of boric acid, $\frac{1}{2}$ dram of 1:1,000 epinephrine solution to the ounce of distilled water; one of the sulfonamides for oral administration; a 1:1,000 solution of epinephrine; a 5 per cent solution of ephedrine sulfate; a 5 per cent solution of eucatropine; a 1 per cent solution of homatropine; a 2 per cent solution of pilocarpine; a $\frac{1}{2}$ to 1 per cent solution of pontocaine; a 3 per cent solution of sodium bicarbonate; a 1 per cent solution of acetic acid; a 5 to 10 per cent solution of neutral ammonium tartrate; mineral oil; amyl nitrite pearls or nitroglycerine tablets; ampules of arsenicals for the treatment of luetic optic neuritis; thiamine chloride tablets or brewers' yeast.

The conditions in which the foregoing agents

are put to use and the manner of their application are outlined in the discussion. It is to be noted that the dilatation of the pupil for fundal examinations, which is a very common practice, carries with it the danger of glaucoma in elderly patients, and that it is wiser in these cases to use the eucatropine solution instead of atropine. It ordinarily dilates the pupils but exerts relatively little effect on the ciliary body. In suspicious cases it is pointed out that the mydriatic should be allowed to act no longer than is necessary, and that its effects should be counteracted by a few drops of pilocarpine solution. Optochin enjoyed a period of popularity in the treatment of pneumococcus ophthalmia, but further experience indicates that it is probably of little use. Silver nitrate solution appears to be preferable to the silver proteinate solutions for the prevention of gonorrheal ophthalmia. The most important treatment for this condition after it is developed is the systemic administration of the sulfonamides. The treatment of luetic optic neuritis by means of bismuth and mercury is discouraged, and the more vigorous treatment with the arsenicals is advised. Attention is called to the fact that if a local anesthetic is placed in the eye for the removal of a foreign body or for any other condition, pontocaine is preferable to cocaine because it is less injurious to the cornea, and the eye should be protected, with a shield if necessary, until the sensitivity of the conjunctiva and cornea is re-established.

THE NATIONAL QUININE POOL

This week [February 6] to every druggist in the United States went from the War Production Board an appeal for quinine, supplemented with statements by Ross T. McIntire, Surgeon General of the Navy, Donald M. Nelson of the War Production Board, and Jesse H. Jones, Secretary of Commerce. The Army and Navy need every grain of quinine that can be secured. "Even though atabrine and other synthetic antimalarials are being used in tremendous quantities," says the statement, "quinine is vitally needed for our soldiers abroad because this drug has a faster action, brings the malaria under control more quickly, and thus shortens the length of time the soldier is incapacitated. Quinine is also necessary for use in cases which cannot tolerate atabrine and other synthetic drugs." The needs of our civilian population for antimalarial drugs will be cared for by the development of totaquine, which is a mixture of cinchona alkaloid prepared from the low-grade barks in South America. Totaquine, while excellent for domestic use, is not as stable as is quinine and therefore not as suitable for shipment into areas of varying climatic conditions. To the pharmacists of the country the appeal has been made

that they send all supplies of quinine, alkaloids, salts, and other cinchona derivatives, whether in open or in closed packages, to the National Quinine Board, which is in the headquarters of the American Pharmaceutical Association, 2215 Constitution Avenue Northwest, Washington, D.C. These materials, when collected, will be processed and thus made available to our armed forces. Each druggist who makes a contribution will be privileged to display in the window of his store a card indicating that he has contributed to the National Quinine Board and thus has rendered an important service to the armed forces. At the same time as this arrangement was being put into effect in this country, an announcement came from Great Britain that drastic restrictions have been placed on quinine, making it illegal to prescribe, dispense, or supply quinine except in the treatment of malaria or in the case of guanidine in the treatment of cardiac arrhythmia.

So important is the control of malaria to the health of our troops in many of the combat zones that the supply or lack of quinine might well be the determining factor in the winning of the war.—J.A.M.A.

his authorized representative. A circular giving full instructions for the use of the product shall accompany each final container, and copies of all circulars of information and directions including methods of dilution and of administration shall be filed with the State Commissioner of Health. Each package shall be clearly labeled with the dosage, unit value in standard units, and the expiration date.

Regulation 4: Institutions to keep records of transfusions. Complete and accurate records of transfusions of human blood, human plasma, human serum, or their derivatives shall be kept by the institution in which the transfusion is performed. The director or person in charge shall be responsible for the proper maintenance of these records. Such records shall be open to inspection by the State Commissioner of Health or his authorized representative and shall include the information specified in Regulations 5, 6, or 7 of this chapter, whichever shall apply.

Regulation 5: Records to be kept when unstored human whole blood is used for transfusion. When human whole blood is not stored and is used for transfusion, the records kept by the institution in which the transfusion is performed shall include:

- The date of the transfusion and quantity of material given.
- The name of the physician or surgeon making the transfusion.
- The name and address of the recipient.
- The condition of the recipient during and after transfusion.
- The name and address of the donor or donors.
- Certification from a physician registered under the laws of New York State showing that a physical examination of the donor or donors has been made within thirty days immediately preceding the blood donation and that such donor or donors is or are in his judgment free from communicable disease, including malaria and acute upper respiratory infection, and that the blood of the donor or donors has a hemoglobin content of at least 11 Gm. per 100 ml. of blood.
- The results of serologic tests of the donor's blood for evidence of syphilis.
- The results of tests to determine the blood group to which both the recipient and the donor belong according to the Landsteiner classification and of cross-matching tests to indicate that the blood of the donor and of the recipient are compatible.

Regulation 6: Records to be kept when human blood or nonpooled human plasma is stored. When human whole blood or human nonpooled plasma is stored for future use, the records of the institution in which the

blood is drawn and prepared for storage shall include:

- All items included in subdivisions (e) to (g) inclusive of Regulation 5 of this chapter.
- The date on which the blood was drawn.
- The specimen or lot number or other identification of the product.
- The blood group to which the donor belongs according to the Landsteiner classification.

The container shall bear a label on which shall be entered the name and address of the producing laboratory or hospital, the date on which the blood was drawn, the results of serological tests for evidence of syphilis, the specimen or lot number or other identification of the product and the blood group, according to the Landsteiner classification, to which the blood belongs.

Regulation 7: Records to be kept when stored human whole blood is used for transfusion. When human whole blood is stored and is used for transfusion, the records kept by the institution in which the transfusion is performed shall include:

- All items included in subdivisions (a) to (e) inclusive of Regulation 5 of this chapter.
- The name and address of the producing laboratory or hospital.
- The specimen or lot number or other identification of the product.
- The length of time that the blood was stored before it was used for transfusion.
- The results of tests to determine the blood group of the recipient, according to the Landsteiner classification, and of cross-matching tests to indicate that the blood of the donor and of the recipient are compatible.

Regulation 8: Records to be kept when human blood plasma, human serum, or their derivatives are used for transfusion. When human blood plasma, human serum, or their derivatives are used for transfusion, the records kept by the institution in which the transfusion is performed shall include:

- All items included in subdivisions (a) to (e) inclusive of Regulation 5 of this chapter.
- The kind of product used.
- The name and address of the producing laboratory or hospital.
- The specimen or lot number or other identification of the product.
- The expiration date of the product.

Regulation 9: When to take effect. Every regulation in this chapter, unless otherwise specifically stated, shall take effect on the first day of March 1943.

County News

Albany County

Dr. Milton Helpert, assistant medical examiner for New York City, addressed a meeting of the county society on February 24 on the topic "Medico-legal Investigation in New York City—the Responsibilities of the Medical Examiner's Office to the Medical and Legal Professions and Law Enforcement Agencies."

. . .

David Craig Adie

By the death of David Craig Adie on February 23, 1943—for the last ten years head of the Department of Social Welfare, State of New York—the people of the state have lost a practical, energetic and cooperative idealist and the profession of medicine a sympathetic, forward-looking coworker whom they owe much in the building up of a worthy public medical service.

Born in Hamilton, Scotland, the son of Lauren and Madeline Cooper Adie, Dr. Adie attended t

Requirements for Processing Human Blood for Transfusions

The regulations contained herein were published in the March 1 issue of Health News, official publication of the New York State Department of Health.—Editor

REGULATIONS governing human blood donors, human whole blood, human plasma, human serum, or other human blood derivatives used for transfusion purposes were established by the Public Health Council at its meeting in Albany on February 19. These regulations, effective March 1, are embodied in a new chapter of the State Sanitary Code, Chapter IV-A, which appears in the supplement to the March 1 issue of *Health News*. It is believed that this is the first regulatory action taken by a state body in this field.

The requirements prescribed in the new chapter are designed to meet the need for basic standards to insure the safety of human blood products which has been experienced by hospitals and laboratories engaged in processing human blood and in providing transfusion services. They were adopted only after long and careful deliberation by the Council and a critical review by representatives of several hospitals, the National Institute of Health, the Office of Civilian Defense, the Medical Society of the State of New York, and other interested agencies.

The possible dangers from the use of improperly prepared or stored human blood products for transfusion purposes were first discussed by the Council in 1941, thought being given to the need for regulatory action to protect the public. At that time, acceptable methods of preparing, storing, and testing frozen and dried blood plasma still lacked stability. As processing practices became more stable and it appeared that the establishment of blood plasma banks would become widespread and might include many small institutions lacking adequate equipment and qualified personnel, regulatory action was deemed desirable. Accordingly, in June of 1942, a committee of the Council was designated to study the subject and to prepare a suitable amendment to the Sanitary Code. Exhaustive discussions following consultation of authoritative sources and further detailed study of the subject constituted a major part of the proceedings of subsequent Council meetings. Numerous revisions of the amendment were prepared to care for not only changes affecting the technical aspects but also decisions on such overall factors as a determination to distinguish between the requirements for commercial laboratories and other laboratories and hospitals and to regulate by requiring careful recording of basic information instead of listing certain specific requirements as to how the blood should be collected, processed, stored, and used, the purpose being to promote progress in the development of blood processing while fixing responsibility for the procedure on the part of the laboratory or institution. It was not until February, 1943, that the Council finally accepted Chapter IV-A as reflecting the views of the members in practical form.

The addition of the new chapter entailed certain changes in the present Chapter IV, which also appear in the accompanying supplement.

CHAPTER IV-A

Human Blood Donors, Human Blood, Human Plasma, Human Serum, or Other Human Blood Derivatives

Regulation 1: The methods of preparation, distribution, and use of human blood, human plasma, human serum, or their derivatives for transfusion regulated. The methods of preparation and distribution of human plasma, human serum, or their derivatives to be sold or offered for sale by commercial biological laboratories for transfusion including the collection of blood, sterility and safety tests, packaging, labeling, dating, storage, and records of distribution shall conform to the requirements of the National Institute of Health of the United States Public Health Service. The methods of preparation, distribution, and use of human blood, human plasma, human serum, or their derivatives by other laboratories or by hospitals for transfusion shall conform to Regulations 2 to 8, inclusive, of this chapter.

Regulation 2: Laboratory tests to be made in an approved laboratory. Laboratory tests required as an aid in determining that blood donors are free from communicable disease,* including malaria and syphilis, and tests of sterility required to determine that the blood, plasma, serum, or any derivative of them is suitable for purposes of transfusion shall be made in a laboratory approved for such examinations by the State Commissioner of Health, in a laboratory licensed by the Federal Security Agency for the preparation of human blood plasma, serum, or other human blood derivatives, or in a laboratory maintained by the United States Army, Navy, Veterans Bureau, or Public Health Service.

If, owing to an emergency, a specimen of the donor's blood cannot be sent to an approved laboratory prior to the transfusion of blood, a preliminary test for evidence of syphilis shall be made. In every case, a specimen of blood shall be collected from the donor at the time of transfusion and sent to a laboratory approved for the serologic test for evidence of syphilis.

Regulation 3: Blood processing laboratories or hospitals to submit a statement and to keep records. Laboratories or hospitals engaged in or undertaking the processing of human blood, human plasma, human serum, or their derivatives for transfusion shall submit to the State Commissioner of Health a statement of the procedures used in the preparation, testing, and storage of the product or products sold, distributed, or offered for use. Complete and accurate records shall be kept by such laboratories or hospitals. The premises, equipment, procedures, records, and circulars of instruction shall be open to inspection by the State Commissioner of Health or

* See Article III, Section 24-A, Public Health Law.

Niagara County

The history of the medical profession in Niagara Falls for a half century was retold on February 22 as old friends and professional associates of Dr. Frederick N. C. Jerauld honored him at a dinner in the Niagara Falls Country Club, Lewiston Heights, in observance of his "golden jubilee" as a physician and surgeon.

Approximately 70 physicians from the western New York and Ontario areas attended the dinner, in addition to many laymen who had been associated with Dr. Jerauld during his long residence and practice in this city. Toastmaster was Dr. Thomas J. McBlain, whose fiftieth anniversary as a physician and surgeon was observed two years ago.*

Oneida County

The use of drugs in the treatment of burns and shock from burns was described on February 18 by Dr. Emmett A. Dooley at a dinner meeting of the Utica Academy of Medicine in Utica.

Dr. Dooley is a member of the staff of the Morristania Hospital, New York City.*

* * *

Dr. Frank J. Slater discontinued his medical practice in Clinton on March 1 to join the staff of the Slocum-Dickson Clinic in Utica. He will specialize in internal medicine and anesthesia.

Queens County

The March 19 "Friday Afternoon Talk" will be entitled "Differential Diagnosis of Low Back Pain" Dr. Samuel Kleinberg, orthopaedic surgeon, Hospital for Joint Diseases, and consultant orthopaedic surgeon, Rockaway Beach and Israel Zion Hospitals, will be the speaker.

The speaker on March 5 was Dr. Harold Pardee, whose subject was "Cardiac Emergencies." Dr. Pardee is associate physician at New York Hospital, and cardiologist at Polyclinic Hospital.

* * *

There is an urgent need for more physicians for the Pre-Induction Examining Teams in Queens Doctors who have already volunteered for the work are urged to report for duty, and additional ones are asked to offer their services.

Richmond County

Doctors and dentists of Staten Island gathered on March 10 at 9 p.m. for a joint meeting of the Richmond County Medical and Dental Societies in the Richmond Health Center, St. George.

The program, arranged by the Dental Society, included a talk by Dr. Leo M. Taran, medical director of St. Francis Sanitarium for Cardiac Children, Roslyn, Long Island, and chief of the children's cardiac clinic at Kings County Hospital.

Dr. Taran's topic was "Dental Care of Children with Rheumatic Heart Disease."

Officers of the medical society attended a dinner in honor of Dr. Taran in Lazzari's Restaurant, Rosebank, before the meeting.

Schenectady County

Dr. Richard B. Cattell of the surgical staff of the Lahey Clinic in Boston was the speaker at the February meeting of the county society.*

Tioga County

On February 13, Dr. Peter Irving received the following letter, with a clipping enclosed, from Dr. Paul B. Brooks, deputy commissioner of the State Health Department:

"Assuming that you are interested in expressions of intelligent laymen concerning their physicians, I am enclosing a clipping from the editorial page of the *American Agriculturist* of January 16.

"The doctor to whom Mr. Eastman referred was Dr. Hiram L. Knapp, of Newark Valley, New York, whom I take to be the older of the two men by this name listed in the latest edition of the State Medical Directory."

The item, an editorial by E. R. Eastman, follows:

But the Old Man with the Scythe with whom he had contended for years finally came for the doctor himself. Then the folks, mostly farmers, came pouring out of the hills in an unending procession of callers to pay their last respects to "Old Doc," to the friend on whom they and their fathers before them had called when in trouble, and never called in vain.

For fifty years, Dr. Knapp rode the hills and valleys of my home town, one of the finest of that great breed of men now rapidly disappearing—the country doctor. Dr. Knapp's father, grandfather, and great-grandfather were doctors, and all of his four sons are either doctors or dentists.

My memories of Dr. Knapp go back to the time on the old farm when my youngest brother Albert, then a small boy, was deathly sick with pneumonia. Worried and depressed, every member of the family watched the old hill road every morning, anxiously looking for the doctor to come crawling down through the drifts with his horse and cutter. When he came, his keen sense of humor, his jolly laugh, and his unfailing optimism changed the whole atmosphere in the home and in the sick room, and had as much to do with the recovery of his patient as his pills. His sense of humor was shown by a sign in his office over which he and I often laughed together "Take my pills and grow fat."

Through all of Mother's later years, Dr. Knapp took care of her and kept her alive and happy well into her eighties, in spite of the fact that she always had a weak heart. When she died, I came on him suddenly, staring unseeing out of the kitchen window, with tears in his eyes.

Tompkins County

A regular meeting of the county society was held in the Cafeteria of Tompkins County Memorial Hospital on Tuesday evening, February 16, at 8:15 p.m.

Neal E. Artz, Ph.D., associate professor of physiological chemistry, Syracuse University, and Dr. John J. Bourke, state medical officer, New York State Health Preparedness Committee, gave a program on "Medical Aspects of Chemical Warfare."

This program was arranged by the Council Committee on Public Health and Education of the Medical Society of the State of New York, in cooperation with the Health Preparedness Commission of the State War Council.

Discussion on compensation fees was held after the scientific program.—Dr. J. N. Frost, President

* * *

At the county society meeting on February 16, Dr. Richmond Douglass was elected alternate delegate to the State Society.—Dr. W. Wilson, Secretary

Westchester County

Members of the Westchester County Woman's Medical Society heard Dr. Vera Collins discuss "Infection of the Gastrointestinal Tract" at a meeting on February 24 at the home of Dr. Mary B. Sanford in Mt. Vernon.

public schools of Scotland. He came to this country in 1913 and became a citizen in 1919.

He was assistant secretary of the Minneapolis Civic and Commerce Association, 1914 to 1918, associate secretary of the War Labor Policies Board in 1918, impartial chairman of the men's and boy's clothing industry, New York City, 1919 to 1920, and campaign manager of the American City Bureau, New York, 1921 to 1922.

Dr. Adie served as secretary of the Charity Organization Society of Buffalo and secretary of the Council of Social Agencies, Buffalo, before becoming New York State Commissioner of Social Welfare.

He was a professorial lecturer in sociology and social work, a member of the curriculum committee of the University of Buffalo, and a member of the faculty of the New York School of Social Work and of Fordham University.

He was named State Social Welfare Head in July, 1932, to succeed Charles H. Johnson.

During Commissioner Adie's tenure the social welfare department became responsible not only for supervision of the public assistance programs, which the state brought into consonance with provisions of the Federal Social Security Act, but also for supervision of the unemployment relief program, previously the responsibility of the temporary Emergency Relief Administration. The latter was abolished in June, 1937.

The Department was reorganized for broader duties and established a decentralized administration through which it might maintain a more intimate relationship with the various localities.

"Poor naked wretches, wheresoe'er you are,
That bide the pelting of this piteous storm,
How shall your houseless heads and unfed
sides,
Your loop'd and windowed raggedness, defend you
From seasons such as these? . . ."

Broome County

Binghamton's physicians are losing valuable time hunting for houses with concealed street numbers, and want the City Council to do something about it.

In behalf of the county medical society, Dr. Victor W. Bergstrom, society secretary, wrote to the council asking that proper numbering of residences be required.

"Many homes," he wrote, "are conspicuous by the absence of a number visible from the street. At night, particularly, this makes it most inconvenient and requires considerable time on the part of a physician making calls to find the residence for which he is looking.

"In these days, when physicians are so scarce, any small item in the economy of time is important. The society, therefore, asks that you consider this problem and that some action be taken to induce the citizens to number their houses properly."*

. . .

When old age assistance or home relief clients in the City of Binghamton get an order for medicine now, the chances are they will be able to have it filled immediately at the clinic of the City Welfare Department.

With the cooperation and advice of the county society and its members in the city, the drug supply of the clinic has been increased approximately 100 per cent since the first of this year.

Three nurses are employed at the clinic, and one is on duty in the office all during the week. Week

ends and after hours one of the nurses always can be reached through police headquarters in case of emergency.

On clinic days, which are Wednesday afternoon and Saturday morning, approximately 15 persons are examined at the clinic, according to Mrs. Helen M. Hickey, supervising nurse. In addition, between 10 and 15 others come in each day to obtain medicine. Mrs. Hickey is assisted by Miss Helen L. Borland and Mrs. Bernice Reynolds.*

Dutchess County

Dr. Max M. Simon, senior attending surgeon and orthopaedist at St. Francis' Hospital, has been appointed surgeon to the Poughkeepsie Board of Education's new orthopaedic clinic. The first clinic session was held at the high school on March 2.

Dr. Helen L. Palliser, school physician, with the assistance of Dr. Theodore M. Rimai and Dr. Ernest K. Kaluza, has been carrying on physical examinations of all school pupils. "Screening" by these examinations will make it possible to refer to Dr. Simon's attention those children who require the services of an orthopaedist, according to Superintendent of Schools Holden. Dr. Simon will prescribe corrective exercises, which will be given under the direction of Samuel J. Kalloch, who has charge of the physical education program.*

Erie County

We quote, in part, an interview published in the Buffalo *Courier-Express* of February 21:

"In nearly fifty-two years of practice in Buffalo, Irving White Potter, M.D., internationally known specialist in obstetrics, has delivered more than 25,000 babies. With most of our young doctors off to war and an exceptional increase in births, Dr. Potter works harder and longer than many a man of 50. And few men enjoy their work as he does.

"Retire? Not while I can stand on my feet; not while my hand is steady; not so long as I'm capable of doing my own thinking," he declares, adding: "On my seventy-fourth birthday, last November 12, I officiated at four cesarians and assisted my son, Dr. Milton G. Potter, with another delivery.

"I believe a doctor has no business to retire as long as he can be of service. Several physicians I know have done their best work when past 60 years old. After long and varied experience, a doctor may develop a new technic that is an important contribution to the medical profession. Experience is of great value to a doctor, and I think he ought to practice as long as possible in order to make the most of it."

New York County

To protect public health against a possible deficiency of fats and fat-soluble vitamins in the national diet, the Public Health Relations Committee of the New York Academy of Medicine on February 15 recommended that the manufacture, distribution, and consumption of oleomargarine be encouraged. It proposed mandatory fortification of all oleomargarines with vitamin A at a uniform level of 9,000 United States Pharmacopoeia Units per pound of finished product; W.P.B. permission for the use of fats and oils for the manufacture of oleomargarine in such quantities as would offset the necessary withdrawal of butter from civilian use; suspension of federal and state laws restricting the manufacture and distribution of oleomargarine for the duration of the butter crisis; and public education in the nutritional value of fortified oleomargarine.

Medical Legislation

The following bulletin (No. 4) was issued on February 20 by the Legislative Bureau of the Medical Society of the State of New York.

State Legislation

THE conference of county chairmen was held in Albany on Friday as previously announced. It was most gratifying to the Committee to have 33 of the 61 County Societies represented. It must be considered indicative of a live interest that physicians are taking in legislative matters when such a large number of men can arrange to spare the time—and in some instances more than two days—necessary to come to Albany for the purpose of discussing the bills that are being considered by the Legislature. All, except a few in the immediate vicinity of Albany, had to come by railroad this year instead of automobile, and had stories to tell of the difficulty they had in obtaining seats or the trains had in maintaining their schedules. A list of the counties represented follows:

Albany	Jefferson	Oswego
Allegany	Kings	Putnam
Cayuga	Madison	Queens
Chemung	Monroe	Richmond
Chenango	Nassau	Rockland
Clinton	New York	Schenectady
Cortland	Niagara	Schoharie
Erie	Oneida	Tompkins
Essex	Onondaga	Warren
Genesee	Orange	Washington
Greene	Orleans	Westchester

As usual, the merits of the bills which we have been following were discussed in open forum and a decision reached as to whether they should be supported or opposed. In a number of instances bills were approved in principle but objection was expressed to the manner in which they are drafted. At the close of the conference the Committee impressed upon the chairmen the importance of taking up with their legislators at home the decisions reached at the conference. Especially was it asked that this be done in the interests of the x-ray bill. A report of the action of the conference follows:

Approved

S.Int.9—Wicks (Optician bill)

Approved except for the provision on page 8, lines 16 and 17 (Pr. 9) which states: "The Department (of Education) shall issue a license to practice optical dispensing to any duly licensed physician or optometrist who pays a fee of \$25." The objection was that physicians should be permitted to dispense glasses without paying the extra fee of \$25. This objection has been taken up with the sponsor of the bill since the conference and our attention is called to provisions in Section 1519, page 17, line 26, to line 9, page 18, inclusive, in which it is specifically stated that nothing in this article shall be construed to limit or restrict in any way the practice of medicine by duly licensed physicians or to limit or restrict a duly licensed physician from the practices enumerated and defined in the article and, further, that a licensed physician shall have all the rights and privileges which may accrue under this article to dispensing opticians. This apparently meets the objection raised at the conference.

Bills Introduced Since Last Bulletin Was Issued

Senate Int. 605—Burney, relative to licenses to practice certain professions following military service. Referred to National Defense Committee.

Comment: Same as Assembly Int. 672—Pillion, reported in Bulletin No. 3. No action taken on this bill by conference.

Senate Int. 613—Marasco, provides in action to recover damages for personal injuries, plaintiff shall be entitled to copy of report of each physical examination to which he submitted pursuant to order. Referred to the Codes Committee.

Comment: To give the plaintiff a copy of the report of physical examination made at the request

meet exigencies of war and postwar conditions
In relation to emergency health and sanitation areas

In relation to the office of assistant town physician
Habit-forming drugs or medicine, sale at wholesale

Medical Grievance Committee

Sanitary rules and regulations, power of a county health board to adopt

Creating commission to study feasibility of establishing facilities for rehabilitating persons recovering from tuberculosis
X-ray bill

In relation to persons infected with venereal disease
Jurisdiction of magistrates, New York City

Noxious weeds, removal in cities

Health insurance

Working mothers, care of children

Physiotherapy bill

Re: opticians and practice of optometry
Civil Practice Act, reports of physical examination to be given plaintiff

Injured employees, care and treatment by podiatrists

Removal of noxious weeds, general

Nurses, license

Nurses, license

Workmen's compensation, mentally disabled

Registration by health officer and investigation by coroner of deaths occurring without medical attendance

Creating consumers' bureau in State Department of Health
Operator of motor vehicle, physical exam.

Relating to advertising of eye-glasses and materials used for ophthalmic purposes

Prohibiting employment of domestic workers suffering from communicable disease

Licenses, certain professions, military service

Workmen's compensation, physical examination of injured employee

On February 16 there was a joint meeting of the county society with the Westchester Society of Gastroenterology, whose president, Dr. Ferdinand M. Jordan, of White Plains, introduced the guest speaker of the evening, Dr. S. Allen Wilkinson, of the Lahey Clinic in Boston. Dr. Wilkinson presented an illustrated paper on the topic "Gastric Ulcer and Carcinoma." A lively discussion followed Dr. Wilkinson's paper.

In its business session, the society adopted memorial resolutions on the late Dr. Norman B. Sowell, of Briarcliff Manor, who died on October 3, 1942, and the late Dr. Louis B. Chapman, of New Rochelle, a former president of the society, who died on January 9.

The public health committee, under the chairmanship of Dr. John B. Ahouse, of Yonkers, announced the development of a county-wide campaign for smallpox vaccinations to be carried on in the late spring and stated that the committee would seek the cooperation of local civilian protection agencies and war councils.

The public health committee also announced that a letter is being sent to the staffs of hospitals in the county, describing the need of nurses for the Army and Navy. The committee is urging that physicians discourage unnecessary use of nurses by their private patients and promote the use of group nursing by private-duty nurses in order to conserve nurse power in local institutions. The committee is also recommending other steps to bring back into service local nurses who have not recently been engaged in nursing but through whose service younger nurses eligible for military duty could be released from the hospitals.

It was announced that the society had been awarded a certificate of appreciation by the National Red Cross in recognition of its services rendered in connection with the blood donor program, for which the Red Cross has received the Army and Navy "E."*

The possibility that rats and mice play an important part in the spread of infantile paralysis has resulted from extensive studies made of last summer's cases in White Plains by Dr. Gilbert Dalldorf, of Bedford Road, director of laboratories at Grasslands Hospital.

In an article published in the February issue of the *American Journal of Public Health*, Dr. Dalldorf records the recovery of a rodent-paralyzing virus from house mice collected in an epidemic area of human poliomyelitis, and the apparent transfer of poliomyelitis to rodents from one of the human cases involved in this epidemic.

Any further conclusions drawn from these studies are highly speculative, Dr. Dalldorf emphasized. If the same facts are noted in independently studied cases next summer, the discovery will mean more, he said.

Under no circumstances, said Dr. Dalldorf, would he permit tests on human beings before much more experimental work has been done in the laboratory. The very uncertain and complicated characteristics of the disease mean that any discovery must be treated with the utmost conservatism, he said.

Suspicion was pinned on mice and other rodents by Dr. Dalldorf and independently by Dr. C. W. Jungeblut, of Columbia University, after Westchester Health Commissioner William A. Holla had a "hunch" about rodents during an investigation of the death of a White Plains fireman last September. A dead mouse was found on the fireman's coal pile and other infected mice were discovered in the same neighborhood, where four more cases of poliomyelitis developed in the next ten days.

Two special courtesies for members who have gone into the services have been arranged by the Westchester County Medical Society, both of them interesting enough for public attention and discussion.

For instance, the society is distributing to its members an office poster, which requests patients to remember their former physicians—if now in service—and to return to them after the war is over.

The society has also engaged in negotiation with the New York Telephone Company, with the result that a plan has been worked out whereby doctors who go into service are permitted to retain their telephone numbers, so that their telephone service can be reinstated with the same number on their return to civil practice.

"This is now understood to be the policy of the company," says a society bulletin, "and these telephone numbers will be reserved as far as possible."

COLLOIDAL IRON

V/S

IONIZABLE IRON

Non-Ionizing:
Non-Irritating

Iron Salts May
Irritate Stomach

In RUN-DOWN states

THERE ARE many sound reasons why OVOFERRIN is the preferred hematinic and tonic in run-down conditions. But basically, these stem from the fact that it is a unique colloidal iron-protein, and it has many noteworthy therapeutic advantages over the iron salts (sulphates, citrates, etc.). The ionizable salts are split up in the alimentary tract with the release of ions likely to be astringent and irritating. In the intestines the iron ion precipitates may dehydrate and constipate, are less efficiently assimilable.

OVOFERRIN's colloidal iron-protein on the other hand does not release irritating ions in the stomach. It arrives in the intestine as a fully

hydrated colloidal oxide, a logical, nutritional form which is readily assimilable and can not constipate.

In the run-down business man, school child or housewife, OVOFERRIN produces prompt nutritional improvement, appetite stimulation and a better blood picture. Its palatability, its freedom from odor and from staining properties assure patient cooperation. But these qualities are not the result of sweetening, masking, or coating. They are inherent in OVOFERRIN's colloidal form. Dosage—1 tablespoonful in a little milk or water at meals and bedtime.

of the court might complicate the trial very much because the plaintiff's lawyer would certainly take whatever advantage he could of the report of the examination. Considered by conference and disapproved.

Senate Int. 699—Condon; Assembly Int. 880—M. Wilson, provides that in workmen's compensation cases injured employee may be treated by licensed podiatrist authorized by industrial commissioner to render such care; provides for schedules limited to defined localities, of minimum charges and fees therefor. Referred to the Labor Committees.

Comment: Authorizes podiatrists to treat cases under the Workmen's Compensation Law. Disapproved by conference on the grounds that at present, where the services of a podiatrist are needed, cases are referred to them for treatment.

Senate Int. 705—Williamson; Assembly Int. 877—Owens, provides that rules and orders of county health board shall state date on which they take effect, copy signed by county health commissioner or deputy to be filed in State Health Department, county health department and county clerk's office; they must be published from time to time as sanitary code, certified copy to be furnished for fee of \$1.00; such code shall have effect of law. Referred to Internal Affairs Committee in Senate and Health Committee in Assembly.

Comment: Considered by conference and approved.

Senate Int. 785—Hampton; Assembly Int. 958—Archinal, provides that restriction on public hospitals treating workmen's compensation cases only during emergency shall not apply where carrier or employer refuses or neglects to authorize hospital service after employee requested that they furnish same or when nature of injury required such services and employer or agent neglected to provide same; injured employee may then select any hospital. Referred to the Labor Committees.

Assembly Int. 789—McCarron, strikes out provision giving employee or carrier in workmen's compensation cases right to select and pay physician to participate in physical examination required by

industrial commissioner or board. Referred to the Labor Committee.

Comment: This bill has been before the Legislature for a number of years. It would require that when an injured workman is to be examined by a physician from the Department of Labor, no other physician shall be present. Last year the conference saw the reason for the amendment but suggested that it should be so drafted that either no physician shall be present or both the physician for the carrier and for the injured employee. This year the conference was of the same mind but took no action on the bill.

Assembly Int. 907—Molinari, provides that when ragweed or other noxious weed or plant is growing in any city, local health board may declare it to be a nuisance and order it destroyed or abated; if order is not complied with, local board may enter property and remove same. Referred to the Health Committee.

Comment: The bill was approved by the conference with the suggestion that it should be extended to cover incorporated villages.

Among the bills to be mentioned casually this time is one which would make it a misdemeanor to grow marihuana without a license.

Publicity

The State Nursing Council now has a functioning Publicity Committee which aims to assist local councils in publicizing their programs. It has been suggested that all local councils appoint publicity chairmen to be responsible for local publicity in cooperation with their Council chairman, local student recruitment chairman, and supply and distribution chairman. Although suggested publicity will be sent from the State Committee (often in form to be presented to the local newspapers) all local committees are asked to initiate publicity which may be timely in their areas, and to report to the State Nursing Council on such publicity so that the planning may be shared with other committees.

Newly appointed publicity chairmen may receive back numbers of publicity letters upon request to State Nursing Council headquarters, 152 Washington Avenue, Albany.

Stationery

It is again called to the attention of local councils that State Nursing Council stationery may be purchased at a cost of \$0.85 per 100 sheets of $\frac{3}{4}$ size; and \$1.00 per 100 full size sheets.

EMILY L. CREEVEY, R.N.
Executive Secretary

N.Y.U. ADDS COURSE IN POLIOMYELITIS

Through the grant provided by the National Foundation for Infantile Paralysis, courses have been established at New York University on "The Modern Concepts of Poliomyelitis."

A practical course for training physical therapy technicians has already been in progress under the auspices of the School of Education, and beginning March 29 a second course under the auspices of the College of Medicine will be given for physicians. The latter course is designed to cover epidemiologic, pathologic, and physiologic aspects of poliomyelitis, together with the diagnosis of the disease and its treatment by chemical, serologic, orthopaedic, and physical therapeutic means, including the Kenny Method.

A series of eight lectures at weekly intervals will be given by visiting lecturers from various medical schools throughout the country, and demonstrations of the various techniques will be given in the hospital.

Additional information can be obtained from the Secretary, New York University College of Medicine, 477 First Avenue, New York City.

USED NEEDLES RETURNED TO SERVICE

Physicians who serve as local draft board medical examiners have been urged by the New York City Department of Health to return all used blood-letting needles. These needles are made of vital materials, and their salvage and return, for re-sharpening and redistributing, is a matter of great importance to the war effort because of the large quantities needed in the serologic examination of selective service registrants. Needles should be rinsed in cold water after use and returned to the Health Department with the blood specimens.

Say you saw it in the NEW YORK STATE JOURNAL OF MEDICINE

For the OILY SKIN

CREAM OF SOAP a neutral fine soap in colloidal cream form, is highly efficient for keeping the skin free from accumulations of grease. With massage it penetrates into the follicles and produces an extraordinary de-greasing action. It is rubbed on the dry skin, then rinsed with water. It leaves the skin comfortable, soft and supple and no case of irritation has been observed or reported when used as a cleansing adjunct in dermatological cases. CREAM OF SOAP is accepted for advertising in publications of the A.M.A. Retails \$1 per jar. Samples will be gladly sent to any physician on request.

CREAM OF SOAP, 55 W. 16th St., New York, N.Y.

PLAIN, UNFLAVORED KNOX GELATINE

Recommended by Physicians
for special dietaries in treatment of:

- ...Peptic Ulcer ...Reducing
- ...Diabetes ...Convalescence
- ...Colitis ...Infant Feeding
- ...Debility

caused by lack of adequate protein

NOTE: Knox Gelatine should not be confused with ready-flavored gelatine dessert powders. They are only about $\frac{1}{3}$ protein, mostly acid-flavored. Knox is all gelatine, no sugar...a pure wholesome protein. Contains 7 of the 10 essential protein parts.

If you would like information, reprints or suggested recipes for any of the above, simply check the subjects, clip this ad to a prescription blank and mail to Knox Gelatine, Dept. 474, Johnstown, N. Y.

New York State Nursing Council for War Service

Bulletin No. 4 (February 18, 1943)

Progress in Organization of Local Councils for War Service

Within the past two months the organization of local Councils for War Service has made rapid progress. At the present time there are 61 local councils set up and functioning, with committees on student recruitment and on supply and distribution of nursing service. In addition, many have also appointed publicity committees.

Recruitment of Student Nurses

The increased number of strong county and city nursing councils is making it possible for the student recruitment program to be carried out on an intensified scale. There was an increase of 1,226 admissions to schools of nursing in New York State during the two-year period from July 1, 1940, to July 1, 1942, and since that time summer and fall, 1942, admissions have been stepped up.

When the total number in spring, 1943, classes is known, it is fully expected that it will go well beyond last year's figures for the same period and may very probably meet the quotas set by the National Nursing Council for War Service of 5,610 for the school year 1942-1943. Enrollments have exceeded any previous peak of enrollment, including that of the World War I period. The addition of classes starting in the summer has contributed to this increase, and the opening of central schools of nursing will make possible continued increases in enrollment.

At the opening exercises of the Central School Nursing program at Adelphi College, Garden City, Long Island, the degree of Master of Humane Letters was bestowed upon H. Lenore Bradley, Chairman of the Committee on Central Schools of Nursing. The establishment of this program at Adelphi and Keuka Colleges has set a pattern for a new type of nursing preparation and is arousing keen interest in other states as well as in New York.

The importance of careful selection of applicants to schools of nursing is borne out by studies of the Psychological Corporation (which tests applicants to schools of nursing), showing a decrease in the number of students who drop out of nursing courses. In the group of students entering New York State schools in 1935, 40 per cent dropped out before completing the course; in the group entering 1938, 24 per cent dropped out. Although this indicates the value of careful selection of students, the large number of students who withdraw from schools of nursing is a source of concern and great expense. During the first six months of nursing preparation the student is not of great practical value to the hospital and is a definite expense and loss if she drops out. This fact has to be kept in mind in a program which stresses the need for recruiting large numbers of students.

The U.S. Office of Education is cooperating in the Student Recruitment program. In their booklet "Professional Nurses Are Needed" they have outlined the role high schools can play in recruitment of students, in cooperation with schools of nursing, and local nursing councils. This program has been outlined for recruitment chairmen in recruitment newsletter No. 2.

Plans for "Open House" are in progress in many

parts of the state and have been described in recruitment newsletter No. 4.

The State Federation of Women's Clubs has begun the planning for its scholarship-raising program. Applications for scholarships are to be made by directors of schools of nursing on behalf of financially needy applicants to Mrs. Marie F. Kirwan, 20 South Broadway, Yonkers, New York.

Plans are under way for the cooperation of the State War Council in furthering student recruitment through their Block Plan program.

Newly appointed recruitment chairmen who have not received copies of the State Nursing Council Bulletins or the Recruitment Newsletters may have them by writing to the Council headquarters, 152 Washington Avenue, Albany. Their attention is also called to the use of recruitment material such as the poster "Become a Nurse," pamphlets "War Work with a Future," "Nursing and How to Prepare for It," the Directory of Schools of Nursing, and the article on admission requirements. All may be obtained from Council Headquarters.

Supply and Distribution of Nursing Service

Material is being prepared to serve as an interviewing guide to supply and distribution committees in conducting local surveys of nursing needs and resources. The first guide will cover hospitals; later suggestions will be offered to cover other agencies employing nurses.

The principle of a nursing supply board has been approved by the War Manpower Commission, and although details of its setup are not known, all local supply and distribution committees are strongly urged to conduct surveys and to bring local inventories of nursing power up to date.

Cooperation of the War Council Block Plan has been sought in locating inactive nurses, and details of this program will be reported in the near future.

Subcommittee on Nursing

The need for a closer tie-up with the State War Council has been recognized by the State Nursing Council. On the national level, a subcommittee on Nursing was set up under the Health and Medical Committee of the Defense Health and Welfare Services and serves as a means of channeling plans and information between government and the professional nursing organizations (represented by the National Nursing Council for War Service).

The State Nursing Council for War Service has requested the setting up of a Subcommittee on Nursing on a state level under the State Health Preparedness Commission to function in the same capacity as the National Subcommittee. Mr. Lee Mailer, Chairman of the State Health Preparedness Commission, has approved the creation of such a State Subcommittee and the membership of that subcommittee is now being considered.

It is suggested that local Nursing Councils acquaint themselves with local War Council activities and seek their cooperation in the Nursing Council program.

Compulsory Registration of Nurses

The State Nursing Council for War Service has gone on record as favoring compulsory registration of all nurses.

HUMANISM

The Canadian Humanist Group, an organization studying reconstruction and rehabilitation plans in Canada and other countries, report some thoughts they have assembled in their publication, *Man*.

In discussing "*Humanism and the Making of the Future*," they emphasize that "not one of us is free from responsibility for the making of the future . . . Not one of us is without the power to contribute something to the making of the future."

Humanism is presented by them as being composed of two ideas:

- (1) The value of the individual.
- (2) The responsibility of the individual.

Accordingly, everyone must realize his own value and his own responsibility. Everyone must also appreciate and admit the value of the other person and his individual responsibility.

Stressing this theory, the article states, "One of the great discoveries of today is the persistent teachability of the human being. There is not a moment between birth and death in which the human being cannot acquire new skills. But none of us has developed to the full our imagination, our reason, our spiritual will, our life purpose, our powers of observation, of evaluation, our power to love, our power to heal, or our power to create. None of us has gone 'all out' in the living of this lifetime; none of us knows 'total living' as we might know it. Very few have developed fifty per cent of their natural capacity for experience or assimilation. It is the unlivid portion of each individual's life that is his real tragedy."

Deploing the obvious wastes the world has recently experienced in human life and the materials for sustaining human life properly, the article suggests that "we must determine to cooperate with each other in that larger area which is the common life, and tolerate each other in the little area of uniqueness."

Some of these things all have in common are:

"(1) The social structure of the nation. None of us can escape that whether it be conservative, socialistic, or dictatorial. (2) The laws of the nation. None of us can escape them. (3) The economic system of the nation. (4) The educational system of the nation, its schools, libraries and press. (5) The basic nature of the country, its fertility or its nonfertility, its psychic atmosphere and its history. None of us can escape these things."

Thus a large part of our lives is collective—a smaller part is unique (or individualistic).

"It is merely that the small part which is unique is supremely important to us. That is why, in the new society, while our collective needs must be protected, our need for the integrating factor of our personal uniqueness must also be protected. Here Humanism will play its part because of its basic belief in the individual man.

"Humanism conceives a dynamic democracy concerned with the detailed working out of a way of life in which education, training for labour, the right to expression of normal human emotions, are provided for; where marriage and the right to home and family will be based on the 'human demand' not on the 'effective demand' of the ability to pay in cash; where health will be provided for by a sound agriculture and normal living, with recreation, cultural activities and social security."

Books

Books for review should be sent to the Book Review Department at 1313 Bedford Avenue, Brooklyn, N. Y. Acknowledgement of receipt will be made in these columns and deemed sufficient notification. Selection for review will be based on merit and interest to our readers.

Ultra-Violet Light and Its Applications. Including a Description of the Numerous Practical Applications Found for Ultraviolet Light and Fluorescence in the Industries, Sciences, and Arts. By H. C. Dake and Jack DeMent. Octavo of 209 pages, illustrated. Brooklyn, Chemical Publishing Company, 1942. Cloth, \$3.25.

The phenomenon of fluorescence is finding many valuable applications in medicine. This timely volume gives a complete account of these uses in a concise and interesting manner. It is not a textbook of ultraviolet therapy, and in this the title may be a little misleading. The value of fluorescence in diagnosis is rarely utilized to its full extent, usually because of a lack of understanding of the methods and apparatus used and their comparative simplicity. A study of this little volume will do much to correct this error. A chapter devoted to the use of fluorescence in the medical sciences and another to its uses in microscopy, research, and education are of particular interest. The book is well written, clearly printed and illustrated, and is to be highly recommended to all medical students and practitioners.

JEROME WEISS

Neuro-Anatomy. By Walter R. Spofford, B.S. (Oxford Medical Outline Series.) Octavo of 110 pages. New York, Oxford University Press, 1942. Cloth, \$2.00.

This outline prepared by Dr. Spofford consists of 102 printed pages interleaved with blank pages. The nervous system has been adequately subdivided, enabling one to study it as a whole or in subdivided groups.

The book is, as its name implies, purely an outline which enables the student to check his progress or to be better oriented as he studies from standard textbooks. It is designed primarily for the student but will also be found of assistance to anyone who is "brushing up" on neuroanatomy for advanced study. It must be used in conjunction with a regular textbook of neuroanatomy, for it is not illustrated.

The book is very well printed, well subdivided, and easy to read.

WARREN V. HUBER

Nasal Medication: A Practical Guide. By Noah D. Fabricant, M.D. Octavo of 122 pages, illustrated. Baltimore, Williams & Wilkins Company, 1942. Cloth, \$2.50.

This book is a short practical guide in the complicated subject with which it deals. The author is an experienced investigator contributing a basic work himself and reviewing almost all the relevant literature to date. He cites briefly the work of the best authors and interprets their conclusions, applying them to nasal medication in the only correct way—that is, on an anatomic and physiologic basis.

This work is a splendid guide for rhinologists in particular but should be of great value to all medical practitioners, for nearly all prescribe nasal treat-

ment, frequently in time-honored but nevertheless faulty, or even bad, ways. Some of the author's conclusions are, as he states, open to further work and discussion, but they are essentially so sound that in following his guide we may expect much better nasal medication to result.

CHARLES R. WEETH

Gas Warfare. The Chemical Weapon, Its Use, and Protection Against It. By Colonel Alden H. Waitt. Octavo of 327 pages, illustrated. New York, Duell, Sloan and Pearce, 1942. Cloth, \$2.75.

The author of this book has divided his work into three main parts in order to develop the material in a logical and natural manner.

The first part describes the various types of chemical agents used in modern warfare and explains their mode of action. The second deals with the uses to which such agents may be put in combat service, a subject that will interest the civilian as well as the soldier. The third part presents the various methods for protection against gas attack and ends with the first aid treatment of casualties.

It is an excellent handbook, but much more; it is a fascinating presentation of a subject which in the mind of the average civilian is surrounded by clouds of superstitious fear. It ought to do much in dispelling the terror with which the ordinary citizen regards a gas attack because he will appreciate that for every form of attack there are natural limits and defensive methods.

ALFRED GOERNER

The Clinical Application of the Rorschach Test. By Ruth Bochner, M.A., Florence Halpern, M.A., and Karl M. Bowman, M.D. Octavo of 216 pages. New York, Grune & Stratton, 1942. Cloth, \$3.00.

About twenty years ago a psychiatrist working with psychotic patients used ink blots as a stimulus to elicit the responses from patients. He soon learned that different types of psychotic patients responded differently to these stimuli. Presently he developed this test and applied it on a wider scale so that he was able to evaluate the personality of the individual by means of this particular test. For a while his work was entirely overlooked. However, five years ago considerable interest was shown in this country by many workers in the field of psychiatry and psychology. The test has a wide application and is employed by many psychiatrists and by practically all psychologists. The test itself consists of ten cards each bearing a particular ink spot, and each card is presented to the patient. The interpretation of the patient's response to the visual stimuli and the meaning that each card conveys to him is utilized by the examiner in evaluating the personality of the individual.

The book is written by two psychologists working in the Bellevue Psychiatric Hospital. They give a clear and concise description of the test, its method of interpretation, and its general application. It is

HUMANISM

The Canadian Humanist Gr. . . studying reconstruction and in Canada and other countries, report some thoughts they have assembled in their publication, *Man*.

In discussing "*Humanism and the Making of the Future*," they emphasize that "not one of us is free from responsibility for the making of the future . . . Not one of us is without the power to contribute something to the making of the future."

Humanism is presented by them as being composed of two ideas:

- (1) The value of the individual.
- (2) The responsibility of the individual.

Accordingly, everyone must realize his own value and his own responsibility. Everyone must also appreciate and admit the value of the other person and his individual responsibility.

Stressing this theory, the article states, "One of the great discoveries of today is the persistent teachability of the human being. There is not a moment between birth and death in which the human being cannot acquire new skills. But none of us has developed to the full our imagination, our reason, our spiritual will, our life purpose, our powers of observation, of evaluation, our power to love, our power to heal, or our power to create. None of us has gone 'all out' in the living of this lifetime; none of us knows 'total living' as we might know it. Very few have developed fifty per cent of their natural capacity for experience or assimilation. It is the unlive portion of each individual's life that is his real tragedy."

Deploring the obvious wastes the world has recently experienced in human life and the materials for sustaining human life properly, the article suggests that "we must determine to cooperate with each other in that larger area which is the common life, and tolerate each other in the little area of uniqueness."

Some of these things all have in common are:

"(1) The social structure of the nation. None of us can escape that whether it be conservative, socialistic, or dictatorial. (2) The laws of the nation. None of us can escape them. (3) The economic system of the nation. (4) The educational system of the nation, its schools, libraries and press. (5) The basic nature of the country, its fertility or its nonfertility, its psychic atmosphere and its history. None of us can escape these things."

Thus a large part of our lives is collective—a smaller part is unique (or individualistic).

"It is merely that the small part which is unique is supremely important to us. That is why, in the new society, while our collective needs must be protected, our need for the integrating factor of our personal uniqueness must also be protected. Here Humanism will play its part because of its basic belief in the individual man."

"Humanism conceives a dynamic democracy concerned with the detailed working out of a way of life in which education, training for labour, the right to expression of normal human emotions, are provided for; where marriage and the right to home and family will be based on the 'human demand' not on the 'effective demand' of the ability to pay in cash; where health will be provided for by a sound agriculture and normal living, with recreation, cultural activities and social security."

THE MAPLES INC., ROCKVILLE CENTRE, L. I.

A sanitarium especially for invalids, convalescents, chronic patients, post-operative, special diets, and body building. Six acres of landscaped lawns. Five buildings (two devoted exclusively to private rooms). Resident Physician. Rates \$18 to \$45 Weekly

a useful book and one that will be helpful to the average psychiatrist.

IRVING J. SANDS

Synopsis of *Materia Medica, Toxicology, and Pharmacology for Students and Practitioners of Medicine*. By Forrest R. Davison, B.A. Second edition. Duodecimo of 695 pages, illustrated. St. Louis, C. V. Mosby Company, 1942. Cloth, \$5.75.

In the second edition of this convenient-sized book, the section on sulfonamide drugs has been enlarged, and the revision has been made to conform to the *United States Pharmacopoeia XII*. Drugs are classified mainly as they affect the different systems of the body, as, for example, those acting on the skin or gastrointestinal tract or central or peripheral nervous systems. Under the latter heading, division is made into the autonomic, parasympathetic and sympathetic systems, and parasympathetic ganglia, and the cerebrospinal system, motor and sensory portions. Drugs as they affect each portion are described, in accordance with the general plan of the book.

Adequate sections on vitamins, hormones, serums, vaccines, and biologicals are included. Many references are furnished, and much sound information is presented in a compact form.

W. E. McCOLLOM

Group Differences in Urban Fertility. A Study Derived from the National Health Survey. By Clyde V. Kiser. Octavo of 284 pages, illustrated. Baltimore, Williams & Wilkins Company, 1942. Cloth, \$2.50.

This book is written with striking simplicity and is supplemented by well-compiled data. Fertility rates are analyzed in successive chapters according to nativity, color, area, size of community, occupational status of the head of the family, educational attainments of the wife, family income, patterns of class differences in mental fertility, and ratios of pregnancy, respectively. Though each of the chapters is summarized, the author sees fit to culminate his work by restating his most significant results. None of these is entirely new. However, many heretofore inadequate investigations are enlarged upon and clarified by the author.

Statistical tables and charts used are detailed and instructive. The book is well authenticated by an unusually complete and extensive bibliography of the relevant literature. The volume is an excellent treatise, recommended for those interested in the problem of fertility.

S. L. SIEGLER

The Medical Clinics of North America. Volume 26, No. 5. September, 1942. Octavo. Illustrated. Philadelphia, W. B. Saunders Company, 1942. Published Bi-Monthly (six numbers a year). Cloth, \$16 net; Paper, \$12 net.

These clinics, which come from Boston, are especially good. Particularly commendable are the articles on anemia (Strauss), peripheral vascular diseases (Homans), asthma (Rackemann), arthritis (Bauer), and vitamins (Guy and Ross).

ANDREW M. BABEY

Eat What You Want! A Sensible Guide to Good Health Through Good Eating. By W. W. Bauer, M.D., and Florence M. Bauer. Octavo of 263 pages. New York, Greenberg Publisher, 1942. Cloth, \$2.00.

The main objective of this book is to convince people that good nutrition can be attained without suffering the stigma of dieting. The choice of meals

can be arranged so that it is possible to enjoy good food, good service, and good taste.

The book is written for popular lay consumption. It is light, . . . taking the reader step by step . . . of the daily food requirements. There are 25 sample menus.

MORRIS ANT

Public Health and Preventive Medicine. By Morton C. Kahn, M.A. Volumes One and Two. (Oxford Medical Outline Series). Octavo of 534 pages. New York, Oxford University Press, 1942. Cloth, \$4.00 per set.

This book is prepared in two volumes for convenient handling. It is not a textbook in the usual sense. Rather, it is complementary to the more elaborate books on this topic in that the subject matter is outlined in pithy categorical style.

Transmissible diseases take up 90 per cent of the space. The discussion of each disease is arranged by salient features under which each point is elaborated in numbered order. This arrangement is excellent for the use of students and may make the book handy for practitioners who, in emergency, want facts presented in brief, orderly fashion.

Topics on public health administration, a minor part of the book, are discussed in similar style. This form of presentation, however, is not quite so applicable to those subjects that may have a debatable nature. For this purpose, elaborate textbooks are more appropriate.

ALFRED E. SHIPLEY

Handbook of Hygiene for Students and Practitioners of Medicine. By Joseph W. Bigger, M.D. Second edition. Octavo of 414 pages. Baltimore, Williams & Wilkins Company, 1941. Cloth, \$4.50.

This volume is well arranged and prepared. The subject matter is complete in that it contains information not only for the medical student but also for the general practitioner. Furthermore, this handbook can also be used to great advantage by nurses, social workers and teachers in the public schools. The author has prepared the book in such a way that it is both interesting and complete and at the same time easily understood by the nonmedical person. He stresses the need of health education and makes every effort to impress the reader, and especially the physician, with the part the doctor must play in cooperating with local and national health departments and with the Public Health Service. As a complete and ready reference book this volume deserves a place on the doctor's bookshelf, and indeed in every library, both medical and lay.

SAMUEL ZWERLING

War Medicine: A Symposium. Editor, Winfield S. Pugh, M.D. Octavo of 565 pages, illustrated. New York, Philosophical Library, 1942. Cloth, \$7.50.

This timely volume is well written and is carefully edited and presented from the typographical viewpoint.

The greater part of the volume discusses surgical procedures. The relation of the nonsurgical is presented to show the importance of cooperation between the physician and the surgeon in the care of wounded and sick soldiers.

The need of speed and accuracy to facilitate the transfer of the wounded soldier is stressed. The necessity for immediate and speedy attention to shock and wounds is contrasted with the more leisurely way of civilian practice. Each chapter is devoted to regional injuries, and the minute sur-

gical care in such cases is explained. The need of cooperation on the part of each of the team is emphasized. The text is concise, accurate, understandable, and well presented. It is a useful book, not only for those who may become military surgeons, but also for the civilian doctor.

HENRY M. MOSES

Essentials of General Anaesthesia with Special Reference to Dentistry. by R. R. Macintosh, M.D., and Freda B. Pratt Bannister, M.D. Second edition. Octavo of 334 pages, illustrated. Oxford, England, Blackwell Scientific Publications, Ltd., 1941. Cloth, 25 shillings.

This book starts with an excellent chapter on the theory of anesthesia and the important topic of the physiology of respiration. It then continues with chapters on all the general anesthetics used in surgery, with special emphasis on dental surgery.

Not only is the subject handled carefully and conservatively but also good practical advice is given in a manner which makes one realize that the authors have had a great deal of actual experience. In fact, throughout the book, one is brought to the conclusion that the subject is no more important than the patient. Thus, for instance, there are such excellent chapters as preparation of the patient, premedication of the patient, choice of anesthetic for the patient, the more difficult patient, the handling of children, errors in anesthesia, and what to do in emergencies. In addition, the book is carefully arranged, clearly and logically outlined, and freely and beautifully illustrated with many plates in color, which makes it easy as well as instructive to read.

It is indeed a most commendable storehouse of ready reference for every surgeon, as well as for the dental surgeon, both in private and hospital practice.

OSCAR RODIN

Night of Flame. By Dyson Carter. Octavo of 337 pages. New York, Reynal & Hitchcock, 1942. Cloth, \$2.50.

This is another novel with hospital life as the background for the lives and loves of the dramatic personae. The title comes from the climax of the story, the destruction of the hospital by fire, with loss of life among the patients and the personnel. With a recent catastrophe in a night club still fresh in our memory, it becomes more distressing to learn of equal possibilities in a hospital.

The author, a chemical engineer, has not neglected to let his readers go behind the scenes of the sex life of a hospital, with at least one of the situations being of interest to a Havelock Ellis. We are tempted to paraphrase the introduction of a radio comedian in the observation that "doctors and nurses are the craziest people—in novels."

JOSEPH RAPHAEL

Manual of Clinical Chemistry. By Miriam Reiner, M.Sc. Duodecimo of 296 pages, illustrated. New York, Interscience Publishers, Inc., 1941. Cloth, \$3.00.

This manual may be used as a handy reference in the laboratory. It contains all necessary tests that may be used routinely in a hospital ward and contains a chapter on chemical tests of vitamins A, B₁, and C.

With the variations of the tests and the modifications found by various authorities, it is good to have a manual that is specific and that may be changed frequently as new methods and improved tests are developed.

MORRIS ANT

A TIMELY SUGGESTION

It is not so much a matter of how much material you are ordering today, or what you are ordering, as it is a question of how you are ordering the essential things needed for your practice. Every doctor can help lighten the problems of transportation and shipping by trying to observe some very simple suggestions.

(1) Order a sufficient stock of things that are not perishable to cut down the need for frequent deliveries.

(2) Avoid "rush" orders by purchasing before your stock becomes too low.

(3) Prevent your stock from becoming exhausted by starting to build up your inventory to a ninety days' supply.

(4) Arrange to order as many items at one time as possible to cut down the number of deliveries.

Even though you may practice near the source of your supply, the O.D.T. expects you to cooperate and intimates that future allocation of transportation facilities will slow up deliveries regardless of distance.

Therefore it is for your own advantage to keep a constant check on your supplies and to make regular purchases of as many items as possible at one time rather than to wait until absolute depletion of one item requires a special order.

WPB TELEPHONE REGULATIONS

(Relating to Public Health)

General Conservation Order L-50 (amended September 7, 1942), limiting the use of scarce and critical materials by the wire telephone industry, provides that all agencies engaged in rendering telephone communication service shall make such reservations or additions of facilities as may be necessary:

Section 1095.1 (e) 1. states, "(1) To meet the known or fairly anticipated demands for service essential to persons engaged in direct defense or charged with responsibility for public health, welfare or security including, but not limited to, those in the service categories shown in Schedule A attached; where their employment in direct defense or their responsibilities for public health, welfare, or security require such service for the proper discharge of such duties—

"Schedule A. General Categories of Telephone Service Related to Direct Defense, Public Health, Welfare or Security—1 (a) Public or private organizations directly serving the public safety, health or welfare, such as: hospitals, clinics, sanatoria, physicians, surgeons, dentists, nurses, nurses' registries, veterinarians, ambulance services, manufacturers or distributors (wholesale or retail) of drugs, medical, hospital or dental supplies or equipment; mortuaries, burial service organizations, the American Red Cross and similar agencies—"

SPRINGTIME DISORDERS

Just around the corner is that season of the year which to many of us in our "springtime of life" meant doses of sulphur and molasses. In more peaceful times it stirred visions of roses, hydrangea, petunias, other creatures of gardens, the woods and streams. Millions contracted that mysterious disease—spring fever.

All-in-all, Spring is generally accepted as the best time of the year. Yet scientists are giving the season a sinister aspect—suggesting that mental disorders, suicides and such misbehavior of human beings are more frequent in Spring.

Could that "mental disorder" be the young man's fancy lightly turning?

Child Immunization

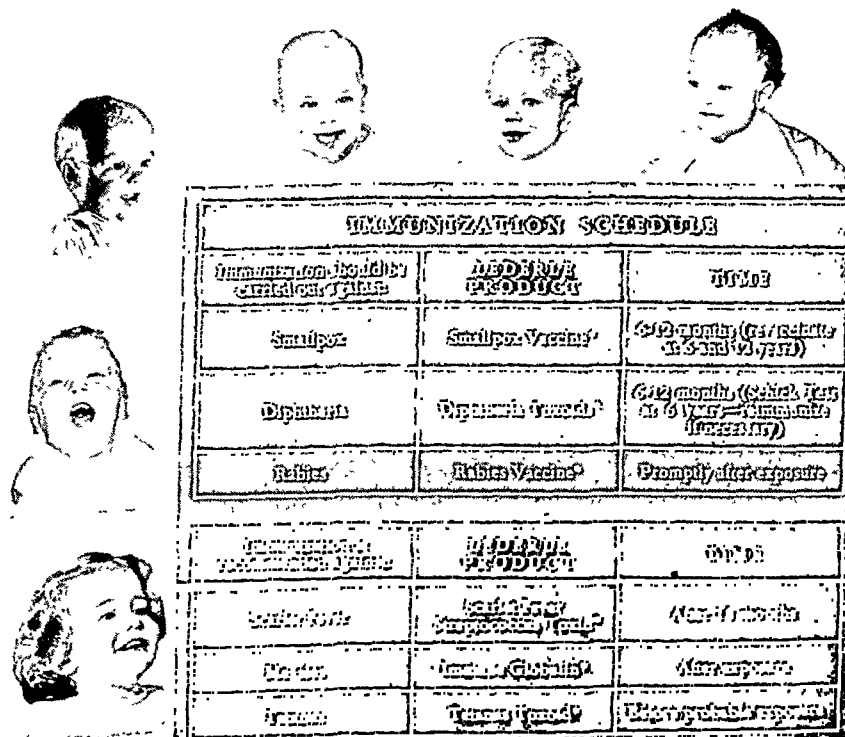

more essential than ever

in War Time . . .

EVERY PRACTITIONER should be on the alert to encourage immunization programs and to urge immunization in his private practice. The migration of families by the thousands, almost universal decrease in home supervision of children, increasing personal contacts throughout industry, and the relative scarcity of physicians combine to increase the likelihood of the spread of infectious diseases.

As an aid in this work Lederle offers many products of established efficacy for the production of active immunity . . .

Specify

ERTRONIZE

NUTRITION RESEARCH

THE ARTHRITIC

The value of ETRON in the treatment of chronic arthritis is repeatedly demonstrated in the rapidly growing list of published articles appearing in current literature.

ETRON*

ETRON, the only high potency, activated, vaporized ergosterol (Whittier Process), is made only in the distinctive two-color gelatin capsule.

ETRON is promoted only through the medical profession.

IMPROVED

OL-VITUM

*Capsules for
Dietary Deficiency
Compensation*

Capsules Containing Vitamins A, B₁, B₂(G), D &

With Niacinamide, Pantothenic Acid and Pyridoxine

COMPARE—Improved OL-VITUM Capsules are a product of the International Vitamin Corporation, which specializes solely in the manufacture of vitamin products. Each capsule contains the established daily requirement for Vitamins A, B₁, B₂, C and D, plus substantial amounts of Niacinamide, Vitamin B₆ and Pantothenic Acid.

Where multiple vitamin deficiencies are indicated, improved OL-VITUM Capsules offer a therapeutically potent and convenient way to assure

the patient adequate vitamin intake at a substantial saving.

COMPARE—Each capsule contains
5000 USP units Vitamin A
500 USP units Vitamin B₁
2000 Micrograms Vitamin B₂ (G)
200 Micrograms Vitamin B₆
600 USP units Vitamin C
1000 USP units Vitamin D
20 Milligrams Niacin Amide
1000 Micrograms Pantothenic Acid

Twenty-five I.V.C. vitamin preparations! the seal of acceptance of the Council Pharmacy and Chemistry of the American Medical Association.

nascent **OXYGEN** for **LEUKORRHEA**

CLINICALLY TESTED*: (a) eliminates unpleasant odor of discharge; (b) cuts down or eliminates irritations inside and without the vagina; (c) reduces quantity and density of the discharge, including that following cauterization... Non-irritating and non-toxic in contradiction to the arsenic and picrate preparations, is equally effective and actually soothing, especially in the (a) infantile vagina, (b) senile vagina, (c) trichomonas vaginalis vaginitis of pregnancy.

*Barrows: N. Y. St. Jr. Med. Vol. 41, 1/15/41

nascent **OXYGEN** for **DRESSINGS**

CLINICALLY TESTED*: As a surgical dressing: gauze, saturated with STA-O-GEN (a) does not adhere to wounds, (b) reduces discharge, (c) eliminates unpleasant odor, (d) wounds heal faster and appear healthier, (e) dressings are easily applied, continue effective longer and cause no burning or pain when changed, (f) there is no irritation of the skin about the wound edge, (g) particularly effective around perianal region in post-operative work (h) stainless.

*Covett: Meet, N. Y. Proc. Soc. 4/15/42

STA-O-GEN is a bland ozonide of olive oil. On application, it releases nascent oxygen continuously for hours—deodorizing, germicidal, fungicidal, healing. Available in Liquid or Ointment; also Vag-I-Caps for leukorrhea prescription. For your convenience, druggists may obtain from any jobber.

FOR SECONDARY AND NUTRITIONAL ANEMIA . . . Use Elixir **VITA-LIV-FERIN**

Each Fluidounce Represents:

Thiamine Hydrochloride (B-1)	8 mg
Iron & Manganese Peptonized	30 gr.
Nicotinic Acid . . .	25 mg
Fresh Liver	3 oz
Representing	
Riboflavin (B-2)	1,000 gamma
Pyridoxin (B-6)	230 gamma
Pantothenic Acid.	2,200 gamma
Filtrate Factor	q s

Containing adequate doses of Iron, Vitamin B Complex factors and the anti-anemic principles of Liver, **Vita-Liv-Ferin** is suggested in cases where the regeneration of hemoglobin is required, as well as promoting growth of children, aiding digestion, stimulating the appetite and as a general nutritional tonic

Vita-Liv-Ferin is miscible with water, milk or fruit juices. This palatable tonic does not nauseate nor disturb the gastric region, neither does it constipate or promote diarrhea

READY AT ALL TIMES TO SAVE YOUR TIME

DEPLETION of hospital personnel has become such a critical problem that strict economy of time is a major concern to all civilian surgeons.

The Singer Surgical Stitching Instrument

has proven clinically that it saves time, labor and material while it effects more rapid and complete closure. From the first stitch to the

last, no needles need be threaded and no needle-holders are employed. The instrument measures a desired length of material, makes the complete stitch, and then cuts the supply thread. Many new interrupted and continuous sutures to improve technique and hasten repair are made available to surgeons. A descriptive brochure will be sent on request.

**THE OLD
VARIABLE
DOSAGE**

us.

**THE NEW
ACCURATE
DOSAGE**

In the past, Iodides in liquid form were assumed to furnish 1 grain of Potassium Iodide in a drop—but drops vary in size and even the solution might vary as much as 30 grains in an ounce. Today, you can be certain of the correct dosage with ENKIDE (Brewer) 15 grain Enteric Coated tablets of Potassium Iodide.

ENKIDE
(BREWER)
for
IODIDE
Administration

ENKIDE is an enteric coated tablet containing 1 gram of Potassium Iodide, U.S.P., that minimizes gastric distress and permits the administration of large doses of Potassium Iodide. Sold on prescription only (\$2.25 for a bottle of 100 tablets) Enkide may be prescribed in accurate doses of 1 to 5 tablets a day, in a modern convenient form easy to take.

CLINICAL VALUE OF MUSCLE EXTRACT

Carnacton *in*

ANGINA PECTORIS ARTERIOSCLEROSIS OBLITERATIVE ARTERIAL DISEASES

Carnacton is a biologically tested extract of *diaphragm muscle* — a powerful, markedly vascularized muscle with a high metabolic rate — most effective for its purpose. Carnacton is not only a vasodilator but also promotes cardiovascular tone and vigor.

In 1 cc. and 2 cc. ampuls — boxes of 12 and 50; vials of 30 cc. for oral use. Send for professional brochure.

CAVENDISH PHARMACEUTICAL CORP., 25 West Broadway, New York

Vioform Inserts

for Trichomonas Vaginitis

VIOFORM, the use of which is already well established in Trichomonas vaginalis vaginitis,^{1, 2, 3} is now offered in convenient, economical lozenges for vaginal insertion. **VIOFORM INSERTS*** are compounded with boric and lactic acid to quickly restore vaginal acidity while the **VIOFORM** (250 mg. per insert) acts to eradicate the parasite itself, the causative

agent. Use of **VIOFORM INSERTS** usually results in a prompt cure.

- Reports attest their lack of toxicity, effectiveness, deodorant qualities and inexpensiveness. **VIOFORM** has long been recognized as a potent amebicide and reliable surgical dusting powder. **VIOFORM INSERTS** are issued in packages of 15.

CLINITEST

VISIT OUR EXHIBIT
BOOTH
74
AT THE ANNUAL MEETING

As Simple as This:

- ① 5 drops urine
- ② 10 drops water

- ③ Drop in tablet
- ④ Allow for reaction, then compare with color scale

OTHER OBVIOUS ADVANTAGES: CLINITEST Tablets generate own heat; therefore no external heat necessary. Each tablet contains an accurately measured amount of reagent; therefore no weighing of reagents, no liquids to spill, no delay.

CLINITEST is reliable—based on same chemical principles as Benedict's, Fehling's, Haines' tests.

Complete sets available through your prescription pharmacy.

WHITE'S MULTI-BETA CAPSULE

**MEET EVERY REQUIREMENT FOR
ADEQUATE B COMPLEX THERAPY:**

- 1 The full adult basic daily requirements (F. D. A.) of the two definitely proved factors—thiamine hydrochloride 1 mg. and riboflavin (B₂) 2 mg.
- 2 The full adult basic daily requirement of Nicotinic Acid (10 mg.) recommended by the Food and Nutrition Board of the National Research Council.
- 3 The balanced proportion of these three factors recommended by the Council on Foods and the Council on Pharmacy and Chemistry.
- 4 Addition of substantial amounts (0.25 mg. each) of pyridoxine hydrochloride and calcium pantothenate—two factors which are essential for laboratory animals, and probably for humans.
- 5 All the other known and unknown components of natural vitamin B complex obtained from 167 mg. of high potency brewers' yeast concentrate.
- 6 Economy and convenience—low cost to the patient; one capsule daily is the average protective dose.

WHITE'S MULTI-BETA (Vitamin B Complex) CAPSULES

White's Multi-Beta Liquid provides the known clinically important factors of vitamin B complex for drop-dosage medication.

• • •

White's Natural B Complex Tablets—the entire B complex derived from rich, natural sources.

White's **PRESCRIPTION** *vitamins*

• Violence during grand movements is pictured by Paul Richer, one of the distinguished artists of medicine, in his *Etudes Cliniques sur L'Hystérie - Eplepsie* (1881).

"A sharp edged weapon which must be used both boldly and deftly."¹

Dilantin[®] sodium (phenytoin sodium) is "recognized as the drug of choice for patients having grand mal or psychomotor seizures. Its usefulness should not be lessened just because its administration requires careful and intelligent supervision by the attending physician. Ignorance or timidity on the part of the doctor has blighted the budding hope of many a patient . . . Epilepsy is a tough disease which laughs at dull weapons."¹

Kapseals Dilantin Sodium (phenytoin sodium) are providing new relief for many epileptic patients. With its use seizures usually decrease in number and sometimes cease entirely. *TRADE MARK REG U S PAT. OFF.

In Secondary Anemia

For treatment of iron deficiency anemia, anorexia and general debilitation following illness or overwork, two valuable reconstructive agents work together in perfect unison when you prescribe

THYDRON

Brand of Hematinic and Tonic

1. Ferrous Sulfate—clinically established as the most advantageous iron compound for therapeutic use. Increases erythrocyte count, raises hemoglobin level quickly with small, well-tolerated dosage.

2. Vitamin B₁—thiamine hydrochloride in pure, crystalline form, stimulates appetite, improves digestion and assimilation, hastens hemoglobin response.

The palatability and economy of Thydron insure cooperation of the patient. Two dosage forms are available:

SYRUP THYDRON—a thoroughly pleasant syrup containing 16 grs. ferrous sulfate and 4.5 mg. (1500 U.S.P. XI units) vitamin B₁ per fluidounce. Suggested dosage is one tablespoonful twice daily *Pint bottles*

TABLETS THYDRON—contain 5 grs. ferrous sulfate and 1.5 mg. (500 U.S.P. XI units) vitamin B₁. Suggested dosage is one tablet three times daily *Bottles of 100*

PROTECT *Skilled* HANDS

The importance of keeping all skilled hands in condition to work at full capacity, particularly during our war time emergency, cannot be over-emphasized. Every pair of hands plays a major role in the victory effort.

Acidolate* skin cleanser is offered to the physician as an aid in the management of those dermatoses which may be irritated by soap. By a process of emulsification, Acidolate destroys the adherent nature of cutaneous soil, and facilitates its removal with water. This same property makes it useful in removing residual ointments, grease, or oils from the hair or skin.

Acidolate is supplied in 8 ounce dispenser bottles and in gallons. It is available through better drug stores everywhere.

Literature and samples will be sent to physicians on request.

Potent-Undiluted NATURAL B COMPLEX

One teaspoonful (5cc.) supplies 1.5 mg. thiamine hydrochloride; 1 mg. riboflavin; 12 mg. of a naturally occurring mixture of niacin and niacin amide; 0.75 mg. pyridoxine hydrochloride and 1.4 mg. pantothenic acid.

LIQUID • B Complex Syrup Squibb

An undiluted rice bran extract, with thiamine and riboflavin added. Extract of Rice Bran is official in U.S.P. XII. The Squibb product meets U.S.P. requirements in every respect except that its specific gravity is slightly higher.

Average daily dose of one heaping teaspoonful (10 grams) supplies 5 mg. thiamine; 2 mg. riboflavin; 20 mg. niacin; 1.6 mg. pyridoxine; 5.3 mg. pantothenic acid; 32 calories.

POWDER • Natuplex-B

Squibb Extract of Natural Vitamin B Complex derived from high-potency brewers' yeast—unfortified, undiluted. Makes possible the administration of the "natural" vitamin B Complex in heavier dosage than hitherto regarded as practicable.

Each tablet contains 5 grains Natuplex-B together with 1 mg. thiamine hydrochloride; 1.5 mg. riboflavin and 10 mg. niacin amide.

TABLETS • B Complex Tablets Squibb

A product of choice for correction of milder forms of B Complex deficiency conditions, and for maintenance. Two tablets supply the full daily allowance of B₁, B₂ and niacin amide as recommended by the Food and Nutrition Board of the National Research Council.

These and other individual and multivitamin products are available from the Squibb Laboratories. Write for the Squibb booklets, "Vitamin B Complex Therapy" and "Squibb Vitamin B Complex Products." Address Professional Service Department, 745 Fifth Avenue, New York.

Manufacturing Chemists to the Medical Profession Since 1858

Is there any help for an overworked doctor?

YES—BIOLAC, because it saves you valuable time.
It's a complete infant formula and there are no extra ingredients to calculate.

Biolac provides completely for all nutritional needs of the young infant except vitamin C.

Prescribe Biolac routinely to reduce the possibility of errors and contamination in formula preparation. It requires only simple dilution with boiled water . . . as you prescribe.

NO LACK IN BIOLAC

Borden's complete infant formula

• Biolac is prepared from whole milk, skim milk, lactose, Vitamin B₁, concentrate of Vitamins A and D from cod liver oil, and ferric citrate. It is evapo-

rated, homogenized, and sterilized. For professional information, write Borden's Prescription Products Division, 350 Madison Avenue, New York City.

Bringing to wartime America the increased significance of GOOD POSTURE

5th ANNUAL
CAMP
TRADE MARK
 NATIONAL POSTURE WEEK
 MAY 3rd TO 8th

TODAY, more emphasis than ever before is being placed upon *good posture* as an essential factor in our nation's well being. That is why, this year, National Posture Week becomes more far-reaching and significant than at any time since its inception . . . Why, this year, it should be of more than usual interest to the medical profession.

"Fitness for Victory"—slogan of this 5th National Posture Week—will ring like

a battle cry from one end of the country to the other. Press, radio, schools, colleges and civic groups will voice the challenge—"How are you standing up to the extra demands of total war . . . are you *fit* to do *your* share for victory?"

We believe that this message will inspire more men and women to better posture . . . will encourage those suffering from poor body mechanics to seek professional advice. We hope the aims and precepts of

this program will warrant the full approval and support of the medical fraternity this year, as in the past.

S. H. CAMP AND COMPANY
 Jackson, Michigan

World's largest manufacturer of scientific supports. Offices in New York; Chicago; Windsor, Ontario; London, England.

Book is 3 1/4 inches by 6 1/4 inches. Printed in blue. Profusely illustrated with skeletal diagrams as above.

FREE A BOOKLET ON POSTURE FOR YOUR PATIENTS

Doctors all over America—particularly in industrial plants and army camps—have ordered thousands of this 16-page ethical booklet. They have expressed satisfaction with the way "Blue Prints for Body Balance" clearly explains authentic posture information to the layman in easy-to-read, non-technical language. Prepared by the Samuel Higby Camp Institute for Better Posture, it can be obtained in any quantities you wish by writing the Samuel Higby Camp Institute for Better Posture. Address: Empire State Building, New York City.

QUICK EMERGENCY AID FOR BURNS

WITH **FOILLE**

Outstanding among the clinical advantages of this water-in-oil emulsion as a first-aid application to affected areas are the following:

First—Foille may be applied immediately *without debridement*.

Second—Foille quickly *controls pain*.

Third—Foille, unlike tanning methods, does not rigidly seal over burned areas.

Fourth—Foille allows needed supuration or sloughing to proceed without interference. Free movement is afforded; there is less danger of contracture; the patient is more comfortable; healing is accelerated.

Because of day-to-day performance in military, civilian and hospital practices, there is a steadily growing demand for

FOILLE

In 2-oz., 4-oz., pints, quarts, gallons, 5-gallon bottles. Distributed through Surgical Supply Houses, Wholesale Druggists, Pharmacists and First Aid Suppliers.

Special Package of Foille in Gelatin Tubules. Designed for physician to carry for emergency use in treatment of small-area burns, furnished complimentary. Write for this and full literature. Additional free clinical product available upon request.

VOLUME 43

APRIL 1, 1943

NUMBER 7

Editorial

Annual Meeting, 1943

It is said of Aldus, the printer, that he placed over the door of his office a placard: "Talk of nothing but business, and despatch that business quickly." This will be the spirit of the Annual Meeting of the Medical Society of the State of New York at Buffalo, May 3-6, 1943.

War medicine and surgery, cumulative experience in wartime practice, new methods, recent researches, demonstrations of various kinds will high-light the meeting. The convention committee and the exhibitors have been continuously at work since the first of the year, planning with all the dreadful virtue of industry in their hearts, toiling by day and far into the night, limited only by the kerosene rationing restrictions, for one of the most exceptional meetings the Society has ever had.

The general session on Tuesday, May 4, will open with "British-American Experiences in Civil Defense," by Col. George Baehr, Chief Medical Officer, Office of Civilian Defense, Washington, D.C. This will be followed by "Summary of the Modern Treatment of War Injuries," by Capt. Reynolds Hayden, M.C., U.S.N., Commandant, 3rd Naval District, New York. Captain Hayden, recently returned from Pearl Harbor, speaks from personal experience. Papers on "Care of Soft Tissue Injuries," "Continuous Caudal Analgesia in Obstetrics—Demonstration of Catheter Technique for Administration," will follow. These are timely subjects in which everybody should be interested.

A "Symposium on Plasma" will follow on Thursday, May 6, and on Wednesday, May 5, the Section on Public Health, Hygiene, and Sanitation will discuss virus diseases of the central nervous system, tropical diseases—a postwar public health program, and military malaria control. On the same day the section on ophthalmology and otolaryngology will hear epidemic keratoconjunctivitis (shipyard eye) discussed. These are but a few of the topics of vital current interest which you will hear about, to say nothing of the scientific exhibits.

No one knows what the future holds. Next year? The year after? Why worry? Put aside anxiety, take out your calendars, mark the dates May 3-6, Buffalo, *must*. You owe something to the community in which you practice. Your attendance at the state meeting will fulfill part of this obligation by refreshing you and bringing you up to date on matters of vital importance to your community's health. It is true that this year the meeting will be all work and no play. There will be no annual banquet as in previous years; there will be difficulties in transport. But what of it? It will be Spring! It will be Spring in Buffalo—

"Whither resorting from the vernal Heat
Shall Old Acquaintance Old Acquaintance
greet,
Under the Branch that leans above the
Wall
To shed his Blossom over head and feet."

Buy War Bonds and Stamps

"Man is an animal of habit"

Proverb

*...and Petrogalar makes it easy to
establish "habit-time" for bowel movement*

Physicians agree, "Habit Time" is the best corrective measure in treating constipation.

As an aid in establishing "Habit Time" . . . Petrogalar has long been favorably known.

An aqueous suspension of mineral oil, Petrogalar adds unabsorbable fluid in the colon. Brings about comfortable elimination with no straining . . . no discomfort.

Unlike plain mineral oil, Petrogalar supplies moisture . . . retains moisture . . . counteracts excessive dehydration.

Miscibility and even dissemination are assured by the fine division of suspended oil globules.

Petrogalar is pleasant to take. It may be thinned with water, milk or fruit juices.

Five types offer latitude of choice in treating a wide range of conditions.

Try Petrogalar on your next group of patients.

*Reg. U. S. Pat. Off. Petrogalar is an aqueous suspension of pure mineral oil. Each 100 cc. of which contains 65 cc. pure mineral oil suspended in a flavored aqueous gel.

Supplied in 5 Types

Promotes "Habit-Time" of Bowel Movement

Conservation of Physicians

Physicians are expendable on the home front as well as on the battlefield. Coronary thrombosis and occlusion, other coronary diseases, angina pectoris, cerebral hemorrhage, arteriosclerosis, cardiovascular renal disease, and chronic nephritis continue to take their unspectacular but inexorable professional toll year after year. These conditions continue to head the list of causes of death among physicians in civilian practice, as we remarked in our February 15 issue. Considered merely as eventual causes of death they are bad enough, but how much do they contribute to impaired efficiency during the years preceding death? Is all of this impairment of function inevitable?¹

During the last half-century the death rate for preventable disease, notably the acute infections, has undergone a pronounced decline, whereas that for the various degenerative diseases has steadily risen. "Longevity marred by an accompaniment of disabling disease," says Piersol,² "...has little to commend it; it is a distinct liability rather than an asset." Stieglitz³ has pointed out that the most important diseases of senescence, such as cardiovascular renal disease, arthritis, diabetes mellitus, and cancer, are best controlled in the two decades preceding old age. If this commences at 60, then 40 is none too early to begin. Physicians will recognize that fact; they will act upon it in the interests of their patients but not in their own interests, apparently. Yet the physician group between the ages of 45 and 65, almost precisely that age group with which something can be done to conserve its own physical and mental efficiency, is right here, now, in the hospitals, in the laboratories, in the foundations, in the doctors' offices, too busy, possibly too indifferent, to act. Sherman's work on diets

is known to them; Minot's work is available; McCay's experiments on rats and their results are available, as Piersol² points out. There is steadily increasing evidence that diet plays an important part in human longevity and in delaying or preventing some of the disorders common to senescence. How has this knowledge affected the physicians themselves? Do they pay much attention to the significance of their own discoveries? Apparently not, judging somewhat from the commonest causes of death, somewhat from ordinary observation.

Studies by Ciocco and Altman⁴ on the patient loads carried by physicians, made for the Procurement and Assignment Service and for the War Manpower Commission, show that withdrawals of men below 45 years of age from a population does not have the same effect as withdrawing men above that age. General practitioners under 45 years of age were found to have a patient load 20 to 50 per cent greater than that of other men between 45 and 64 years of age and more than twice as large as that of general practitioners 65 years and older. This study affords at least a suggestion of the efficiency of the two older groups compared with those under 45, and discloses perhaps the origin of some of the principal causes of death at or near the end of the sixth decade, aided and abetted by faulty diet, insufficient rest, and unremitting pressure.

Surely physicians have something in common with shoemakers' children, the hen who starved on a dung heap, and the proverbially ductile but hydrophobic horse.

Army's 1943 Recruiting Program Will Require 6,900 Physicians*

The 1943 recruiting program of the Surgeon General of the Army calls for the commissioning of 6,900 physicians and approximately 3,000 hospital interns and residents, it is reported in *The Journal of the American Medical Association* for March 13 in an

* This article is reprinted here in full at the request of the A.M.A.

outline of the new procedure of processing physicians, dentists, and veterinarians for the Army. The program also calls for the commissioning of 4,800 dentists and 900 veterinarians.

Physicians will be procured from the following twenty states and the District of Columbia: California, Colorado, Connecticut, Illinois, Iowa, Mary-

Medicine and the State

Disraeli said that it was much easier to be critical than to be correct. To be correct, readily accessible information comes in handy. We are therefore prompted to place before our members certain facts concerning the participation of the State of New York in medical, health, and welfare services. In these services the state, voluntary agencies, and the medical profession conduct a *cooperative enterprise* which, under the name of state medicine, has, at times, been subject to some controversy and criticism. In order that both the critics and the apostles of exactitude may be equally well informed, we list the types of services offered to the citizens of the state from *birth to death* as compiled by the Executive Officer of the Medical Society of the State of New York.

Premarital examination of prospective fathers and mothers

Maternal welfare

(a) Treatment for syphilis

(b) Obstetrical care

(c) Postpartum care

Cardiac disease

All these activities have become so commonplace in the lives of most of us that they are accepted almost as a matter of course. The private practice of medicine continues, as always, *paripassu*; with, to date, little ascertainable recession in the volume of work and even a possible increase because of the vast educational value to the public of these cooperative enterprises. Few men in this state, we believe, would favor or even countenance a restriction of these services; many think that they could be better integrated; some believe that they should be broadened to provide increased service. "We are fortunate," said Dr. George W. Cottis, in 1942, "in this respect: In the protection of public health, in the elimination of disease, in the spreading of medical knowledge, and in the raising of the standards of medical care we have for generations anticipated the demands which are now being so widely publicized. We have led the procession and need not and must not now become followers. We have the knowledge necessary to meet purely medical demands, but leadership requires more than knowledge. It demands an alert understanding of changing conditions and of sociological movements. We must survey the whole field of human needs and set our objectives accordingly. We must be willing to discard *outworn traditions* while steadfastly retaining the ideals and high standards of service which can never be outworn."

Conservation of Physicians

Physicians are expendable on the home front as well as on the battlefield. Coronary thrombosis and occlusion, other coronary diseases, angina pectoris, cerebral hemorrhage, arteriosclerosis, cardiovascular renal disease, and chronic nephritis continue to take their unspectacular but inexorable professional toll year after year. These conditions continue to head the list of causes of death among physicians in civilian practice, as we remarked in our February 15 issue. Considered merely as eventual causes of death they are bad enough, but how much do they contribute to impaired efficiency during the years preceding death? Is all of this impairment of function inevitable?¹

During the last half-century the death rate for preventable disease, notably the acute infections, has undergone a pronounced decline, whereas that for the various degenerative diseases has steadily risen. "Longevity marred by an accompaniment of disabling disease," says Piersol,² "... has little to commend it; it is a distinct liability rather than an asset." Stieglitz³ has pointed out that the most important diseases of senescence, such as cardiovascular renal disease, arthritis, diabetes mellitus, and cancer, are best controlled in the two decades preceding old age. If this commences at 60, then 40 is none too early to begin. Physicians will recognize that fact; they will act upon it in the interests of their patients but not in their own interests, apparently. Yet the physician group between the ages of 45 and 65, almost precisely that age group with which something can be done to conserve its own physical and mental efficiency, is right here, now, in the hospitals, in the laboratories, in the foundations, in the doctors' offices, too busy, possibly too indifferent, to act. Sherman's work on diets

is known to them; Minot's work is available; McCay's experiments on rats and their results are available, as Piersol² points out. There is steadily increasing evidence that diet plays an important part in human longevity and in delaying or preventing some of the disorders common to senescence. How has this knowledge affected the physicians themselves? Do they pay much attention to the significance of their own discoveries? Apparently not, judging somewhat from the commonest causes of death, somewhat from ordinary observation.

Studies by Ciocco and Altman⁴ on the patient loads carried by physicians, made for the Procurement and Assignment Service and for the War Manpower Commission, show that withdrawals of men below 45 years of age from a population does not have the same effect as withdrawing men above that age. General practitioners under 45 years of age were found to have a patient load 20 to 50 per cent greater than that of other men between 45 and 64 years of age and more than twice as large as that of general practitioners 65 years and older. This study affords at least a suggestion of the efficiency of the two older groups compared with those under 45, and discloses perhaps the origin of some of the principal causes of death at or near the end of the sixth decade, aided and abetted by faulty diet, insufficient rest, and unrelenting pressure.

Surely physicians have something in common with shoemakers' children, the hen who starved on a dung heap, and the proverbially ductile but hydrophobic horse.

Army's 1943 Recruiting Program Will Require 6,900 Physicians*

The 1943 recruiting program of the Surgeon General of the Army calls for the commissioning of 6,900 physicians and approximately 3,000 hospital interns and residents, it is reported in *The Journal of the American Medical Association* for March 13 in an

* This article is reprinted here in full at the request of the A.M.A.

outline of the new procedure of processing physicians, dentists, and veterinarians for the Army. The program also calls for the commissioning of 4,800 dentists and 900 veterinarians.

Physicians will be procured from the following twenty states and the District of Columbia: California, Colorado, Connecticut, Illinois, Iowa, Mary-

land, Massachusetts, Minnesota, Missouri, Nebraska, Nevada, New Hampshire, New Jersey, New York, Ohio, Oregon, Pennsylvania, Rhode Island, Vermont, and Wisconsin.

The following states have already contributed more physicians to the armed forces than the sum of their 1942 and 1943 quotas and will not be called on to furnish any more physicians, except interns and residents and except special cases for specific position vacancies, during 1943: Alabama, Arizona, Delaware, Georgia, Idaho, Kentucky, Louisiana, Mississippi, New Mexico, North Carolina, South Carolina, Tennessee, Texas, West Virginia, and Wyoming.

It is stated that at present there will be no procurement of physicians, except interns and residents and in special cases for specific position vacancies, in those states not listed above. There will be no procurement of dentists, except special cases for specific position vacancies, in the following sixteen states: Alabama, Arizona, Arkansas, Delaware, Florida, Georgia, Kentucky, Louisiana, Mississippi, New Mexico, North Carolina, Oklahoma, South Carolina, Tennessee, Texas, and Virginia.

At the present time there are no restrictions on the recruiting of veterinarians.

In the instructions issued by the Army it is pointed out that the Surgeon General has discontinued all medical officer recruiting boards and that under the new procurement program no physician, dentist, or veterinarian will be commissioned in the armed forces of the United States until he has been declared "available" by the Procurement and Assignment Service of the War Manpower Commission.

In each state the Procurement and Assignment Service has set up three state chairmen: medical, dental, and veterinary. Each of these prepares a monthly quota list of physicians, dentists, and veterinarians who are apparently suitable and who are available, for commissioning in the Army of the United States. This list is submitted to the central office of the Procurement and Assignment Service which sends a communication inviting such individuals to apply for service with the armed forces.

On the reply card enclosed with the invitation the individual states his preference for the Army, Navy, or Medical Department of the Air Forces. These reply cards are sent by the potential applicants to the state chairmen of the Procurement and Assignment Service who in turn submit lists of such potential applicants to the Officer Procurement Service of the Army.

On receipt of such lists the officer procurement district office contacts the potential applicant and arranges for an interview regarding a commission.

Applicants will be requested by the officer procurement district office to complete all papers and take all steps required of them within fourteen days of the date of such request. If this is not complied with, a report thereon will be transmitted by the officer procurement district office to the state chairman of the Procurement and Assignment Service.

The decision as to the grade and appointment to be recommended for each candidate rests with the Surgeon General, not with the Officer Procurement Service.

Correspondence

Orthopaedic Surgery and Radiology

To the Members of the Sections of Orthopaedic Surgery and Radiology:

A joint session has been arranged for Wednesday, May 5. It is to be a "Quiz Program" to "stump the experts," using case histories and x-ray films showing interesting and instructive bone and joint pathology.

Drs. H. P. Doub, director of the department of radiology, Henry Ford Hospital, and Raymond W. Lewis, director of the department of radiology, Hospital for Special Surgery, have agreed to act as the experts.

We are asking that the members of these sections contribute to the success of this meeting by sending in suitable cases covering the field of bone and joint pathology. All data pertaining to the diagnosis

should be presented, briefly, together with appropriate x-ray films.

We would like to have this material in advance so that it can be classified and correlated. All of it will be returned promptly. Be sure to identify your material carefully. However, it may be presented in person if you so desire.

This program can be very interesting and worthwhile. Please help make this a successful session by contributing at least one case report.

Very truly yours,

LESLIE R. LINGEMAN, M.D.
Acting Chairman, Section on Radiology

Annual Reports

Medical Society of the State of New York

1942-1943

Report of the President

To the House of Delegates; Gentlemen:

A year ago I began my term of office with deep misgivings. I end it with a sense of thankfulness and of pride in my profession. In spite of the rapid and enormous expansion of our Army and Navy, no conscription of doctors has been necessary. Notwithstanding misleading statements by some high authorities, this state has furnished its full share of medical officers. I think that it is safe to say that the vast majority of physicians in civilian practice today are men who are not available either because of age or physical disabilities. Also it is quite apparent that those of us who are left to care for the civilian population are not shirking hard work. The work of the men who have so unselfishly given their time to the examination of draftees has received little public recognition.

The year has brought all the tribulations which we anticipated and many more which we did not foresee. So many and so varied have been the activities of this Society that I cannot discuss them in detail lest this report be expanded into a volume instead of being covered in the space of a page or two. You will have for your consideration the reports of the many committees who have carried on this work and I shall therefore content myself with the briefest mention of them. The report of the Treasurer will show our loss in income from dues resulting from the enlistment of our members in the armed forces. In spite of this loss in revenue the Society has expanded its activities.

Our office force under the able management of Dr. Irving has rendered great assistance to Procurement and Assignment. The routine work of the Society has been handled smoothly and efficiently. A special committee under the chairmanship of Dr. F. Leslie Sullivan has made an extensive study of the problem of alien physicians and the report of this committee deserves your most careful consideration.

In order to meet wartime needs of medical education Dr. Mitchell and his Committee on Public Health and Education have carried on an extensive program in which the ablest men procurable give instruction on a wide variety of subjects. Dr. Mitchell also arranged important and beneficial conferences during the year with the State Department of Education and the State Department of Health.

A year ago this House favored an active campaign to expand medical indemnity insurance, and this instruction has been ably and enthusiastically obeyed. The three voluntary organizations in Buffalo, Utica, and Brooklyn have all been active and the results are most encouraging. Dr. Baucus has spent much time in presenting this matter to

the District Branches and to county medical societies and he is to be commended for his success in arousing interest in this important matter. I cannot take time to comment on the activities of all of the committees of the Council. It must suffice to say that our committees have all shown a tremendous interest in their work and have functioned with the greatest efficiency.

In the many years in which I have attended meetings of the Council I have never seen so little time wasted in futile discussions and never have I seen a greater volume of work accomplished in so little time.

The Board of Trustees has shown its usual ability in handling the financial affairs of the Society and has worked with fine cooperation with the Council Committee on Finance. The reports of these two bodies speak for themselves.

Since the Society took over the management of the JOURNAL, each year has seen progressive improvement not only in its format and general appearance but in the quality of its contents. This year was no exception. The Society owes a debt of gratitude to Drs. Brennan and Winslow and their committees, to Mr. Dwight Anderson, and to Dr. Laurance D. Redway. The report of the Publications and Publicity Committees should constitute a better eulogy of Mr. Anderson and his work as Business Manager of the JOURNAL and as Director of the Bureau of Public Relations than anything that I can say. I am sure that you all agree with me when I say that the Editorial page of the JOURNAL has been raised by Dr. Redway to a standard equaled by few medical journals and excelled by none.

The brevity with which I have referred to these committees and individuals is not a sign of any lack of appreciation but is due to my desire to have more time to speak to you about our immediate and pressing problems.

It is more apparent now than it was when I spoke on these subjects a year ago that we are in a time of social change greater than the world has seen since Capitalism replaced Feudalism. Social revolution has become a commonplace expression. No man can say how far the changes in our social organization will go before the end of the war but no man can doubt the direction of the trend. Furthermore, it makes no difference whether we favor or dislike the trend. As long as this country remains a democracy, the people will decide. The war itself has already produced many changes but the postwar period will see a vast acceleration in the rate of change.

The precedent established since the last war by the vast extension of hospitalization of all men who wore the uniform twenty-five years ago, regardless of whether they were veterans in the proper sense

of the word and regardless of whether their disability resulted from their service, permits us to envisage what will happen when ten or twelve million men have returned to civilian life. The Veterans hospitals will in themselves require the services of a large percentage of the medical profession.

It is probable that an "American Beveridge Plan" is already being drafted and it is more than probable that some such plan will be effective within a very few years. There is no doubt that the people of this country will become more and more insistent on the privilege of good medical care whether or not they are able to pay for it. Our duty is not to oppose change blindly but to recognize what is inevitable and use our whole energy and leadership to make sure that in so far as change involves medical care it shall be change for the better and not for the worse. Because we alone have the knowledge, we must expect and accept patriotically and cheerfully a great responsibility.

Hundreds of committees already are planning postwar reconstruction of industry, finance, and social service, using experts in every field. In all matters pertaining to public health and medical care we should have a preponderant role. Are we prepared to meet this responsibility? My own belief is that we are not. We have been so preoccupied by our fear of socialized medicine and political control that we have not prepared any long-range and comprehensive plan for the reconstruction of our system of medical care to meet the obviously imminent changes in our social order.

If we were today invited to sit in a conference of postwar planners, could we lay a blue print before them and say, "This is the proposal of organized medicine?"

If we are to lead instead of being chained to the chariots of visionary crusaders, we must at once prepare not one but many blue prints to meet every proposal that may be offered. We may have to face anything from completely socialized medicine to compulsory health insurance.

It should be apparent to everyone that the advances in medical science have produced a paradox. Medicine has services to offer, the value of which is so great that the average wage earner cannot afford to buy them. We have made a high standard of medical care possible. Our immediate concern is to make it available.

I recommend that the House of Delegates set up a special committee of carefully chosen, forward-looking members to study this problem and to prepare a definite program to meet the demands of postwar society without lowering the quality of medical care or sacrificing those high ideals which now as always must control our actions and our relations to society.

In conclusion I must express my appreciation of and thanks for the unfailing encouragement and cooperation which I have received from the Council, Trustees, Committeemen, and Officers during a year of strenuous activity.

GEORGE W. COTTIS, M.D., *President*

March 1, 1943

Report of the Secretary

To the House of Delegates; Gentlemen:

Again the administrative work at the Society has had to proceed at a rate faster than in prewar years and with special attention to matters outside the regular activities. Also, there has been an exceptional call for economy. I am happy to report that Council, Committees, all officials, and employees met this need, not only without diminution of the regular work, but with full performance of extra duties.

Membership.—Elected in 1942 were 796 new members; 264 were reinstated. The net increase for the year, as shown below, was 532.

Membership—December 31, 1941.....	17,781	
New Members—1942.....	796	
Reinstated members—1942.....	264	18,841

Deaths.....	214	
Resignations.....	100	
Licenses Revoked.....	3	317
		18,524

Dropped for nonpayment of dues—December 31, 1942....	211
--	-----

Total Membership, December 31, 1942.....	18,313
--	--------

Honor counties (none of whose members failed of their dues in 1942) include Broome, Chemung, Chenango, Clinton, Columbia, Cortland, Delaware, Franklin, Genesee, Herkimer, Ontario, Orleans, Putnam, Rockland, St. Lawrence, Saratoga, Schoharie, Schuyler, Seneca, Steuben, Tioga, Tompkins, Washington, and Yates.

Coordination of Activities.—The setup of Council Committees has remained the same, with very few changes since your last meeting. A new Subcommittee on Tuberculosis and Chest Diseases (Dr. Charles D. Post, Syracuse, *chairman*; and Drs. Louis C. Kress, Albany; Nelson W. Strohm, Buffalo) was set up under Dr. Mitchell's Committee on Public Health and Education.

The Subcommittee on Maternal and Child Welfare was replaced by two groups, the one for Maternal Welfare, as before, and that for Child Welfare (Dr. Alexander T. Martin, New York, *chairman*; and Drs. Albert D. Kaiser, Rochester; A. Clement Silverman, Syracuse; Paul W. Beaven, Rochester; Charles A. Gordon, Brooklyn). To this new subcommittee has been assigned the work on the School Health Program which had previously been handled by a subcommittee which disbanded when Dr. E. Christopher Wood, *chairman*, entered service. Regional Chairmen in Pediatrics work with this subcommittee as do the Regional Chairmen in Obstetrics with the Maternal Welfare Subcommittee. It is to be noted that one pediatrician sits on the Maternal Welfare Committee and one obstetrician on the Child Welfare Committee, each being *chairman* of his own committee.

A new Council Committee was set up under your instruction to study the Present and Future Status of Foreign Physicians (Dr. F. Leslie Sullivan, Scotia, *chairman*; and Drs. Howard Fox, New York; David A. Haller, Rochester).

The untimely death of Dr. Augustus J. Hambrook, of Troy, *Chairman* of the Council Committee on Public Relations and Economics, was a great loss. Dr. Herbert H. Bauckus, of that Committee, has

taken over the work in admirable fashion. Dr. Charles M. Allaben, of Binghamton, selected by the Council to fill Dr. Hambrook's term, was placed on that Committee.

Leave of absence as councilor was granted to Dr. E. Christopher Wood, of White Plains, when he went into service. Dr. Ralph T. Todd, of Tarrytown, was selected by the Council to fill out Dr. Wood's term as councilor. He was assigned the job as Chairman of the Subcommittee on Medical Relief under Dr. Bauckus' Committee.

The Workmen's Compensation Bureau, ably managed by Dr. David J. Kaliski as director, has had an ever increasing demand on its services.

I wish to congratulate Mr. Dwight Anderson for the splendid result he has accomplished in reducing the cost of JOURNAL production still further in 1942.

War Participation has called for continuation of aid to Selective Service Pre-Induction Boards of the United States Army in the State and help to the State Chairman, Dr. Joe R. Clemmons, of Procurement and Assignment. Your Secretary was glad to have the opportunity to tour the State with Dr. Clemmons last December, meeting with groups of chairmen of County Society Committees on War Participation. This was beneficial on all sides in clearing up pictures, both present and future, particularly with relation to care of civilian population.

Again it is a pleasure to commend the effective-

ness of the Council and Committees; and to record my own sense of privilege to help in the valuable work of the Society.

New York Office.—The decision to postpone publication of the *Directory* has made it possible to bring the New York office force down to a minimum. In addition, impulses of wartime have made it necessary to replace four of the clerical force. This has made additional demands on the regular employees until new members of the force could learn to do their tasks expeditiously. Both the regular employees and the new members of the office staff have evidenced loyalty and deep interest in carrying on their many duties. All concerned have kept their minds on the need for economy.

Remission of State Assessments has also placed increasing work on the New York office staff, as has the compilation and publication in the JOURNAL of an Honor Roll of members in the armed services and the U.S. Public Health Service. Furthermore, the changes in address of members has thus multiplied heavily.

I wish to record my gratitude to the office force for their loyal and devoted work under the excellent supervision of Miss Dougherty.

Respectfully submitted,
PETER IRVING, M.D., Secretary

March 1, 1943

Report of the Treasurer

To the House of Delegates; Gentlemen:

The financial status of the Society is shown on the following pages by excerpts from the annual report of the auditors, Messrs. J. K. Lasser & Co., for the year 1942.

A few of the items in the report merit special attention. During the year our balance has increased about \$51,655. To this should be added the reserve created for future annual meetings, namely, \$3,307, the credit balances for the 1940 and 1941 meetings. This gives a figure of approximately \$54,900 as the increase in our balance.

This increase results from an appreciation in the market value of our securities of about \$8,800, our income from securities of about \$13,000, and from a large excess of operating income over operating expenses, namely, \$32,943. On examining the operating income and expense statement it will be seen that although the operating income was less by over \$16,000 than that of 1941 (in which year were included the credit balances of the 1940 and 1941 annual meetings totaling \$3,307), the operating expense for 1942 was less by over \$37,000 than that of the previous year. This saving was brought about by rigid economy in the management of the affairs of the Society, by the fact that the *Directory* was not published, and by the increased advertising income of the JOURNAL.

Last year, in this report, after showing a favorable balance of about \$19,300 for the year 1941, I was rather pessimistic about the year 1942. As you see, these fears were not realized. Quite the contrary. But perhaps they will be realized in 1943, as more of our members enter the armed services, and if costs go up. However, the Society is in a strong position financially, and should be able to come through without crippling any necessary service or activity.

In closing I wish to thank the members of the office staff who have the keeping of the books and the care of the other financial details of the Society, for the care and accuracy with which they have performed their duties and for their cheerful cooperation.

Respectfully submitted,
KIRBY DWIGHT, M.D., Treasurer

March 3, 1943

Auditors' Statement

We have completed an examination of the balance sheet of the Medical Society of the State of New York as of December 31, 1942, and the statements of income and capital for the year ended with that date, and have reviewed the system of internal control and the accounting procedures of the Society and without making a detailed audit of transactions have examined or tested accounting records of the Society and other supporting evidence by methods and to the extent we deemed appropriate.

In our opinion, the accompanying balance sheet and related statements of income and capital present fairly the position of the Society at December 31, 1942, and the results of its operations for the year ended that date.

Respectfully submitted,
J. K. LASSER & Co.,
Accountants & Auditors

Report of the Board of Trustees

To the House of Delegates; Gentlemen:

The Board of Trustees has the honor to report on its supervision of the financial affairs of the Society since your last meeting on April 27, 1942. This management has continued under the fiscal year—which for the first time corresponded with the calendar year—1942. The Board has found this method very satisfactory.

In December of 1942, the Council prepared and the Board approved, with minor modifications, a budget for the calendar-fiscal-year 1943. In this instance the Board, with eyes open to the increasing drop in dues income because of remission of state assessments for members entering service, decided to scrutinize carefully the experience during the first half of 1943, in case any revision of budget should become wise for the second half of the year. The preparation of the new budget was carried out with the keynote in mind of economy on all sides and in keeping with the custom of holding final expenditures within estimated dues income. The Board, while aware of the House action of 1942 recommending "to the Trustees that they use income from investments if they deem it necessary do do so," has so far found it unnecessary.

The investments of the Society have been, as always, the subject of close and constant study both from the point of view of soundness and of sustained income. Certain securities have been sold and others purchased. In particular, United States Defense Savings Bonds now form a material portion of

the invested funds, as well as United States Treasury Bonds. The Board in making changes in investments has had constant advice of the Chase National Bank.

The Board has met regularly on the same days as the Council—and with only two occasions when a single member had to be absent—thus keeping in close touch with all activities, and it has had close cooperation. The Treasurer, the Assistant Treasurer and the Secretary have sat regularly with the Board, with usually the President, also, and at times the chairman of the Finance Committee of the Council.

The Board has watched with satisfaction the care with which all concerned—Council, committees, officers of the Society—have conducted their work in the light of the letter sent out in January, 1942, by the then chairman of the Board, Dr. William A. Groat, as follows:

"At its meeting on January 8, 1942, the Board of Trustees requested me as its chairman to transmit to the administrative officers of the Society and the chairmen of all Council Committees a memorial urging them to conserve their Society resources by limiting their expenditures.

"This decision was reached after the Board had considered probable diminution in income that would develop from increased remissions of state assessments because of active military and naval service. In addition, the Board felt that rising taxes and interference with ordinary business might so disturb the financial status of other

members that they might be unable to pay their dues. It seems the part of wisdom, therefore, for all concerned with the various Society activities that involve expenditure of money to plan seriously on the cutting down of their outlays and the making of substantial budgetary savings."

This advice has been loyally followed. Due in part to close cooperation of the Council, the economies

put in operation have involved no curtailment of activities.

Respectfully submitted,
WILLIAM H. ROSS, M.D.
THOMAS M. BRENNAN, M.D.
GEORGE W. KOSMAK, M.D.
JAMES F. ROONEY, M.D.
EDWARD R. CUNIFFE, M.D., *Chairman*

Report of the Council

To the House of Delegates; Gentlemen:

Your Council has the honor to report on its executive and administrative management of the affairs of the Society in the period following your last meeting on April 27-30, 1942. The various matters that came before it, actions thereon, and recommendations are here presented in successive "Parts" of this report.

PART I

Postgraduate Education

The Council Committee on Public Health and Education was continued with the same personnel:

Oliver W. H. Mitchell, M.D., *Chairman*, Syracuse
George Baehr, M.D., New York
Charles Dayton Post, M.D., Syracuse

The Committee has carried on its expanded program on postgraduate education, on which it has presented the following report.

REPORT

On May 26, 1942, in New York City the Chairman of the Council Committee on Public Health and Education called a meeting of the Committee with representatives of the State Departments of Health and Labor to discuss plans for postgraduate education for the coming year. Special consideration was given to obstetrics, pediatrics, rheumatic fever, tuberculosis, communicable diseases, syphilis, sulfonamide therapy, war medicine and surgery, cancer, and industrial health. To encourage more clinic sessions it was decided to include the following statement in the *Course Outline Book*: "Upon request, any of the lecturers will substitute a clinic for the lecture if appropriate patients and facilities are available. This information must be given at the time the request for instruction is made." It was felt that more instruction, such as clinics conducted at state hospitals, should be given in tuberculosis. As a result of this discussion, three more course outlines on tuberculosis were included in the *Course Outline Book*.

Following this meeting, letters were sent to all physicians who had arranged courses in the past, requesting them to make any changes in subjects or speakers that they desired, and asking their permission to include the statement referred to above.

Most of the instructors listed in the *Course Outline Book* are connected with the medical schools. Because of the war, some were unable to participate in the program this year.

As a part of the defense program there was included an announcement of a course on the "Medical Aspects of Chemical Warfare." This course is sponsored by the Health Preparedness Commission of the New York State War Council, Medical Division of the Office of Civilian Defense, New York State Department of Health, the 9 medical schools in the state, and the Medical Society of the State of New York. An announcement of lectures on war medicine and surgery prepared by the Subcommittee

on War Medicine and Surgery appears on pages 73 and 74 of the *Course Outline Book*. This announcement does not list the subjects or speakers but states that for those interested this information will be supplied upon request.

As soon as the revised courses were received, 150 copies of the *Course Outline Book* were mimeographed. The *Book* as published contains 53 announcements, including outlines of courses, teaching days, and single lectures on special subjects. Copies of the book were sent to the secretaries of all County Medical Societies, together with a letter noting special subjects offered. It was requested that each desiring instruction notify the as soon as possible. Copies were also sent to the members of the Committee and the Subcommittees, officers of the Medical Society of the State of New York, deans of medical schools, the Commissioner of Health of the New York State Department of Health, and Division Directors, members of the Board of Regents of the University of the State of New York, the Commissioner of Education of the State Education Department and some of the directors of divisions in the Department who are concerned with school health problems, and the Secretary of the Council on Medical Education and Hospitals of the American Medical Association. Requests have been received from several organizations for copies of the *Course Outline Book*. Because of a limited supply the distribution was curtailed to a considerable extent.

Arrangements for postgraduate instruction, either as courses consisting of a series of lectures or as single lectures, were made for thirteen county medical societies. The following is a list of the counties which have had or will have had these meetings:

County	Instruction	No. Lectures
Columbia	General Medicine	5
Cortland	Miscellaneous	4
Jefferson	General Medicine	5
Madison	General Medicine	6
Oneida	{Sulfonamide Therapy	1
	{War Medicine and Surgery	4
Onondaga	Miscellaneous	3
Putnam	Sulfonamide Therapy	1
St. Lawrence	Public Health	1
Seneca	General Medicine	1
Steuben	Sulfonamide Therapy	1
Tioga	Sulfonamide Therapy	4
Tompkins	Miscellaneous	3
Westchester	Obstetrics	2

Regional Meetings and Teaching Days.—Regional Meetings and Teaching Days have proved to be a very popular form of postgraduate instruction. A teaching day consists of a combination of clinics, demonstrations, and lectures. For these meetings, invitations were sent to the memberships of the medical societies in counties adjacent to that in which the instruction was given, or to the membership in certain "Regions" and "Districts" where the meetings were held. This Committee arranged for speakers, and for printing and distribution of programs to county medical societies, medical schools,

Child Welfare.—On July 23, 1942, the Chairman of the Committee on Public Health and Education conferred with representatives of the New York State Section of the American Academy of Pediatrics to discuss the possibility of combining some parts of the Child Welfare Program with the programs of the American Academy of Pediatrics. In view of this request for a separate committee to work with the New York State Section of the American Academy of Pediatrics, the following plan was submitted to the Council by the Chairman of the Committee on Public Health and Education: "Continue the Subcommittee on Maternal Welfare with its present membership—that is, three obstetricians and a pediatrician; appoint a subcommittee on child welfare with the following members: Chairman, the pediatrician who is a member of the Subcommittee on Maternal Welfare; two pediatricians who are now members of the present Subcommittee on School Health Service; abolish the present Committee on School Health Service and assign these duties to the newly created Subcommittee on Child Welfare; for a fourth member of the Subcommittee on Child Welfare, have the Chairman of the Subcommittee on Maternal Welfare." The Council adopted this recommendation and the President, with the approval of the Council, appointed the following to the new Subcommittee on Child Welfare: Alexander T. Martin, M.D., *Chairman*, New York; Paul W. Beaven, M.D., *Vice-Chairman*, Rochester; Charles A. Gordon, M.D., Brooklyn; Albert D. Kaiser, M.D., Rochester; and A. Clement Silverman, M.D., Syracuse.

Regional Chairmen in Pediatrics are as follows, for Regions comprising counties as shown in above list of Regional Chairmen in Obstetrics:

Tuberculosis and Chest Diseases.—The 1942 House of Delegates adopted the following resolution: "In view of the great importance of chest diseases not only to the general practitioner but to a large majority of the various specialties as well, we recommend that the Public Health and Education Committee of the Council create a subcommittee on diseases of the chest."

The Chairman of the Committee on Public Health and Education recommended that instead of a subcommittee on chest diseases there be appointed a subcommittee on tuberculosis and chest diseases under the Council Committee on Public Health and Education. The President, with the approval of the Council, appointed the following members to the Subcommittee on Tuberculosis and Diseases of the Chest: Charles D. Post, M.D., *Chairman*, Syracuse; Louis C. Kress, M.D., Albany; and Nelson W. Strohm, M.D., Buffalo.

Three meetings of the Subcommittee on Tuberculosis and Diseases of the Chest have been held for the purpose of promoting more postgraduate instruction in tuberculosis and diseases of the chest. With the approval of the Council, letters were written to secretaries of county medical societies requesting that they appoint committees or individuals to represent the societies in the field of tuberculosis control. To date 44 replies have been received stating that provision for this service has been made. Letters were sent to the designated representatives explaining that it was the desire of this Subcommittee to stimulate interest in county medical societies regarding case finding and to have each county society, through its designated representative, indicate what is desired in the way of information, postgraduate instruction, or any other means by which this undertaking may be accomplished.

The Chairman of the Subcommittee met with a representative from the State Tuberculosis Conference Committee and a member of the State Department of Health to consider especially the desirability of amending Section 326-A, Public Health Law, in such a manner that more strict control of dangerous and careless patients will be brought about. As a result of this joint session it was decided to make a survey of the open cases in some of the populous areas in the state. The purpose of these surveys is to obtain data regarding supervision and isolation of the open cases.

Plans are being made for a luncheon conference of the representatives of county medical societies and other groups interested in the Tuberculosis Control Program to be held at the time of the Annual Meeting of the Medical Society of the State of New York.

Industrial Health.—The Study Committee on Industrial Health, which is a subcommittee of the Council Committee on Public Health and Education, has the following membership: Herbert H. Bauckus, M.D., *Chairman*, Buffalo; Robert K. Brewer, M.D., Syracuse; John H. Garlock, M.D.,

hospitals, THE NEW YORK STATE JOURNAL OF MEDICINE, *The Journal of the American Medical Association*, and other publications. The Medical Society of the State of New York pays traveling expenses of the speakers, and the honoraria for all speakers are

paid by the Medical Society of the State of New York or the New York State Department of Health. The following is a list of counties where Regional Meetings or Teaching Days have been held or will be held this year:

County	Region	Instruction	No. Lectures
Broome	Sixth District Branch (Broome, Chemung, Chenango, Cortland, Delaware, Otsego, (Schuyler, Tioga, Tompkins)	*Cancer	4
Chemung	Adjacent Counties (Chemung, Schuyler, Steuben, Tioga, Tompkins)	Two Teaching Days: 1. War Medicine and Surgery 2. General Medicine	3 3
Erie	Eighth District Branch (Allegany, Cattaraugus, Chautauqua, Erie, Genesee, Niagara, Orleans, Wyoming)	*Cancer	5
Monroe	Seventh District Branch (Cayuga, Livingston, Monroe, Ontario, Seneca, Steuben, Wayne, Yates)	*Cancer	4
Oneida	Fifth District Branch (Herkimer, Jefferson, Lewis, Madison, Oneida, Onondaga, Oswego)	*Cancer	4
Onondaga	Adjacent Counties (Onondaga, Cayuga, Cortland, Madison, Oswego)	Industrial Health	4
Otsego		Two Teaching Days: 1. Virus Diseases 2. Sulfonamide Therapy	2 4
Schenectady	Region No. 4 (Fulton, Greene, Montgomery, Schenectady, Schoharie, Ulster)	Maternal Welfare	2
St. Lawrence		{Plasma Therapy; War Medicine and Surgery	2
Westchester	Region No. 3 (Duchess, Orange, Putnam, Rockland, Westchester)	Maternal and Child Welfare	5

Public Health matters receiving particular emphasis from the New York State Department of Health and the Medical Society of the State of New York this year have been: cancer, obstetrics, pediatrics, communicable diseases, rheumatic fever, tuberculosis, syphilis, sulfonamide therapy, war medicine and surgery, plasma therapy and whole blood transfusion, and industrial health. The part of the Committee in these activities has to a large extent been in the field of postgraduate instruction. Instruction in many of these subjects has been given and a share of the cost was borne by the New York State Department of Health. The counties and the subjects were the following:

County	Instruction	No. Lectures
Broome	Cancer	5
Chemung	War Medicine and Surgery	3
Columbia	Sulfonamide Therapy	1
	Obstetrics	1
	Pediatrics	1
	Rheumatic Fever	1
Cortland	Pediatrics	1
	War Medicine and Surgery	1
Erie	Plasma Therapy	1
Monroe	Cancer	5
	Cancer	4
Oneida	Cancer	4
	Sulfonamide Therapy	1
Onondaga	War Medicine and Surgery	4
	War Medicine and Surgery	1
Otsego	Industrial Health	4
	Pediatrics	1
Putnam	Sulfonamide Therapy	4
	Sulfonamide Therapy	1
St. Lawrence	Plasma Therapy	2
	War Medicine and Surgery	2
Schenectady	Obstetrics	2
Steuben	Sulfonamide Therapy	1
Tioga	Sulfonamide Therapy	4
Tompkins	War Medicine and Surgery	1
Westchester	Obstetrics and Pediatrics	7

The Committee arranged for 83 lectures, 61 of which were given jointly by the New York State Department of Health and the Medical Society of the State of New York.

PART II

Public Health Activities

Maternal and Child Welfare.—The Committee on Public Health and Education held a meeting in

* Teaching Day Cost borne wholly by N. Y. State Health Dept.

New York City on April 28, 1942, with the Subcommittee on Maternal and Child Welfare, Regional Chairmen in Obstetrics and Pediatrics, and representatives of the New York State Department of Health. Matters which received most attention were:

1. Coordination of the maternal and child welfare activities of the Medical Society of the State of New York and the State Department of Health.
2. Subjects to be included in the Regional programs.
3. More emphasis on pediatrics in Regional programs.
4. The proposed "Consultant Service."

All of these matters were referred to the Committees for further consideration.

The Subcommittee on Maternal Welfare has the following members: Charles A. Gordon, M.D., Chairman, Brooklyn; Alexander T. Martin, M.D., New York City; James K. Quigley, M.D., Rochester; and Ferdinand J. Schoeneck, M.D., Syracuse.

Regional Chairmen in Obstetrics:

1. New York, Richmond, Bronx
George W. Kosmak, M.D., 23 East 93 Street, New York
2. Kings, Queens, Nassau, Suffolk
Harvey B. Matthews, M.D., 643 St. Marks Avenue, Brooklyn
3. Westchester, Rockland, Dutchess, Putnam, Orange
Julian Hawthorne, M.D., Highland Hall Apartment, Rye
4. Schenectady, Fulton, Montgomery, Schoharie, Greene, Ulster
William M. Mallia, M.D., 1364 Union Street, Schenectady
5. Albany, Washington, Saratoga, Columbia, Warren, Rensselaer
Joseph O'C. Kiernan, M.D., 496 Madison Avenue, Albany
6. Clinton, Essex, Franklin, St. Lawrence
Elmer Wessell, M.D., 72 Clinton Street, Plattsburg

New York City on May 13, 1942, to discuss the educational program.

In addition to single lectures given before county medical societies, a Teaching Day was arranged for the Chemung County Medical Society and held in Elmira on June 25, 1942. Notices were sent from this office to the following county medical societies: Chemung, Schuyler, Steuben, Tioga, and Tompkins. The attendance was good, and the meeting was regarded as very successful.

The membership of the Subcommittee on War Medicine and Surgery is as follows: O. W. H. Mitchell, M.D., *Chairman*, Syracuse; Gustave Aufrecht, M.D., New York; Louis H. Bauer, M.D., Hempstead; L. Whittington Gorham, M.D., Albany; Leonard Greenburg, M.D., New York; Leo Mayer, M.D., New York; James E. Perkins, M.D., Albany; Byron Stookey, M.D., New York; and Frederick S. Wetherell, M.D., Syracuse.

Rheumatic Fever.—The Chairman of the Committee on Public Health and Education held several conferences with members of the Subcommittee on Child Welfare regarding the Rheumatic Fever Program. Other conferences were held with Dr. George M. Wheatley, Assistant Medical Director of the Metropolitan Life Insurance Company, regarding publications distributed by the company for lay and medical education on rheumatic fever.

In cooperation with the New York State Department of Health, some instruction on rheumatic fever was presented before county medical societies.

Medical Aspects of Chemical Warfare.—As a result of a conference between the Council Committee on Public Health and Education and representatives of the Office of Civilian Defense, the Health Preparedness Commission of the New York State War Council, and the New York State Department of Health, it was decided to offer instruction in the "Medical Aspects of Chemical Warfare" in New York State and that the best plan would be to operate through the medical schools. The deans of the medical schools readily gave approval and it was decided that each school should send physicians, who were to conduct the programs, to the course on chemical warfare given at the University of Cincinnati. This was done and the funds to meet the expenses of these representatives were supplied by the Health Preparedness Commission of the New York State War Council. The Chairman of the Council Committee on Public Health and Education also attended this course.

The course presented to the medical profession of New York State consists of six hours of lectures and demonstrations under the following main subjects:

1. Review of chemical warfare agents, history, and classification.
2. Pathology, symptomatology, differential diagnosis, and treatment.
3. General protective measures.

The courses were organized in the medical schools because they require the use of special equipment and material which cannot be made easily available at meetings of most of the county medical societies. However, arrangements were made for groups of teachers to present this instruction in a few areas of the state which are remote from medical schools.

An announcement of this instruction appears on pages 17 and 18 of the *Course Outline Book*.

Blood Plasma Therapy and Whole Blood Transfusion.—The Council approved the offering of post-graduate instruction in plasma therapy and whole blood transfusion. The Chairman of the Committee

on Public Health and Education held several meetings with representatives of the New York State Department of Health, the Health Preparedness Commission of the State War Council, the Office of Civilian Defense, and the Association of Public Health Laboratories to discuss the blood plasma program. Preceding the announcement of instruction on plasma therapy and whole blood transfusion, a one-day conference was held at Albany on February 26, 1943. Leading authorities on plasma therapy and whole blood transfusion addressed the physicians who are to present this program. This instruction is offered in a single session or in connection with formal courses or for special or regular meetings of county medical societies. An announcement to be added to the *Course Outline Book* has been prepared and mailed from this office to the secretaries of county medical societies. Twenty-one speakers are available. It is anticipated that this instruction will be much in demand. Some requests for instruction have already been received.

4-H Clubs and Youth Health Activities.—The Chairman of this Subcommittee, Dr. J. G. Fred Hiss, has devoted much time and effort to improving the health program among the 4-H Clubs throughout the state. The cooperative extension service, of which 4-H is a part, is concerned with the welfare of rural people. Health is an important consideration. However, the extension service is not specifically charged with the protection of public health. It does cooperate with agencies which are so charged. Now that we are in a state of "total war" it is imperative that we do everything possible to preserve our health.

For several years 4-H has been guided in its health activities by a state committee made up of club agents, specialists, and members of the 4-H administrative staff, together with representatives of the New York State Department of Health, the New York State Department of Education, the Medical Society of the State of New York, the New York State Dental Society, the American Red Cross, and other interested organizations.

This Committee has recommended and has approved the following 4-H Health Improvement Project:

OBJECTIVES

1. To encourage the correction of remediable defects disclosed by school health inspections or other health examination.
2. To encourage protective immunizations as recommended by health officials.
3. To encourage the acquirement of good habits, knowledge, and skills related to health and safety.
4. To give opportunity for service to the community in the promotion of public health and safety.

PROJECT REQUIREMENTS

(A score sheet has been planned which the local leader can fill out at a club meeting and then return to you.)

- I. Health Examination.....15 points
A health examination must be held at or near the beginning of the club year. If the club member has had a school health inspection at the beginning of the current school year, no other examination is required. If not, an examination may be made by any physician. A club may arrange with a physician for an examination of all the members at some mutu-

New York; David J. Kaliski, M.D., New York; John S. Lawrence, M.D., Rochester; Frederic E. Sondern, M.D., New York; ex-officio: Edward S. Godfrey, M.D., Commissioner of Health, State Department of Health, Albany; and Leonard Greenburg, M.D., Executive Director, Division of Industrial Hygiene, State Department of Labor, New York City.

With the increased importance of industrial health as a potent weapon in the nation's program of conservation of manpower, the Study Committee for Industrial Health found a ready response to the programs and activities which it sponsored during the year. The Committee, which met several times during this period, fully realized the part it could play in developing a new alertness toward the problems of industrial health, not only in the minds of the members of the medical profession, but in the community as well, and consequently made an effort to function as a stimulating force in several of our important war centers.

The key issue before all committees at this time is the question, "How can we best contribute to the winning of the war?" which must be answered by applying study, planning, and activities of a committee of this kind to industrial areas where values can be measured in concrete improvements of industrial health procedures, reducing thereby to a minimum the loss of man-hours from sickness and accidents.

With this in mind the Committee held its first Teaching Day on Industrial Health in May, 1942, in Buffalo. A full report on this meeting is contained in the Annual Report of last year. The broad community participation at this meeting set the pace for other meetings of this kind, and the Teaching Day on Industrial Health which took place in Syracuse in September proved an equally great success in attendance as well as in composition. As a matter of fact, both events proved that there is a relatively greater interest in industrial health on the part of the community than there is on the part of the medical profession, and continuous efforts must be made in the year to come to arouse the members of the county societies to the need of acquainting themselves with the constantly developing and comparatively young science, industrial health.

The Chairman of this Committee helped organize the conference "Community Health in Wartime," which took place in Buffalo during June. Industrial Health and Nutrition in Industry were the sessions prominently featured, and they resulted in vital suggestions and proposals for future programs in this field. For the first time nationally, the sessions brought together physicians, management, and labor in consultation on common problems, and it was here that the now nationally promoted goal of labor-management health committees was first formulated.

The Buffalo District Committee for Industrial Health must be considered a direct outgrowth of this conference. The establishment of this Committee three months ago, headed by the Chairman of the Study Committee on Industrial Health, was further justified by the lively interest not only of the State Society, but also of the American Medical Association, the Division of Industrial Hygiene of the New York State Department of Labor, headed by Dr. Leonard Greenburg, and the Division of Industrial Hygiene of the U.S. Public Health Service, under the direction of J. J. Bloomfield. The cooperation of all these groups through general advice and personal consultation had an important share in the initial success of the Buffalo Committee.

It is to be hoped that other districts will establish similar communities.

Briefly, the Buffalo Committee, which is composed of representatives from management, labor, the medical and nursing professions, and a few pertinent voluntary and official agencies, desires to be a public relations and fact-finding body. It hopes to assist plants in making their health and safety programs efficient and practical, and it aims for a broad educational program within management, labor, and physician groups. Already the Committee has distributed to all plants and unions in the Buffalo-Niagara Area a manual for "Minimum Medical Standards in Industry" for plants of various sizes, together with an informative bulletin on keratoconjunctivitis. An open forum of the Committee, for management and labor representatives, will take place in April.

The Chairman of your Study Committee was fortunate in attending the Fifth Annual Congress of the Council on Industrial Health of the American Medical Association, on January 11-13, 1943. The participation in the sessions of this gathering enabled him to carry back with him three principles which crystallized out of the deliberations at this meeting, and which, in his opinion, must become a guiding factor in the future work of the State Society Study Committee on Industrial Health. They are included here to strengthen the work of this Committee and to serve as a guide to those county societies which are now in the process of developing local committees:

1. The American Medical Association is ready, in terms of policy as an organization, to make industrial health the foremost issue at the present time, as one of the most important contributions to the war effort and the conservation of manpower.
2. The exigencies of the war will require new ways of thinking in applying industrial health planning, a broadening of all previous concepts in industrial health, and an economy of available forces while expanding service.
3. No longer can the health of the workers be considered industry's responsibility alone. It must become a joint effort of management, labor, and the physician, for which labor-management health committees will prove to be the most practical vehicle.

Dental Health.—The Council Committee on Public Health and Education and the Joint Committee on Dental Health conferred with representatives of the Department of Hospitals of New York City, New York State Dental Society, Office of Civilian Defense, Health Preparedness Commission of the State War Council, New York State Department of Health, and the Medical Society of the State of New York, on the possibility of the Medical Society of the State of New York's setting up training courses for dentists in Emergency War Medicine and Surgery.

The Joint Committee on Dental Health has the following members: *New York State Dental Society*—H. Shirley Dwyer, D.D.S., Chairman, Brooklyn; Leuman M. Waugh, D.D.S., New York; and Charles H. McNeely, D.D.S., Brooklyn.

Medical Society of the State of New York—Harry Aranow, M.D., New York; and O. W. H. Mitchell, M.D., Syracuse.

War Medicine and Surgery.—The Committee on Public Health and Education held a meeting with the Subcommittee on War Medicine and Surgery in

schools, it is necessary to decide upon course content and other matters. To assist in this program, the Committee on Public Health and Education held a meeting with the Subcommittee on Child Welfare, the Subcommittee on 4-H Clubs and Youth Health Activities, representatives from the New York State Departments of Health and Education, and the New York State Association of School Physicians. As a result of this meeting, at which the various phases of the problem were discussed, it was decided that the Medical Society of the State of New York should provide two or more representatives to confer, upon request, with those in charge of these programs in the New York State Department of Education. This recommendation was submitted to the Council on February 11, 1943, and was approved.

Several conferences were held by the Chairman of the Committee on Public Health and Education with Dr. Hiram A. Jones, State Director of Physical Fitness of the Office of Physical Fitness of the State War Council, regarding a cooperative program between the Medical Society of the State of New York and several government and voluntary agencies. The plan for providing essential health examinations in connection with the Physical Fitness Program was developed and approved by the Council.

PART IV

Publications

The Publication Committee, as prescribed at your last meeting, started this year with four members: the general manager, the business manager of JOURNAL and the *Directory*, the treasurer, and a trustee, Dr. Thomas M. Brennan. These then selected as literary editor Dr. Laurance D. Redway, who thus became the fifth member. The Committee has held regular and special meetings. Under supervision of the Council the Committee has continued its charge of publications.

Directory.—In accord with your instruction, the *Medical Directory of New York, New Jersey, and Connecticut* was not published in 1942. Also in accord with your action, the Council exercised its discretion, deciding not to start compilation for the next edition until you have again considered the matter at your 1943 meeting.

The Council at its December 10, 1942, meeting formally decided "to recommend to the 1943 House of Delegates that the *Medical Directory of New York, New Jersey, and Connecticut* be not published for the present."

The Council has had in mind not only the need for economy but also the fact that, with many physicians in service and entering service, the addresses would frequently be incorrect and other data incomplete.

Journal.—Editorially the NEW YORK STATE JOURNAL OF MEDICINE has carried on in the customary fashion. Scientific articles numbered 211, with total page content 1,184 out of the overall page content of 2,336 pages. The scientific text is less by a small amount than in 1941, due in part to limitation of total pages to 96 per issue (with the exception of the Convention issue of 160 pages).

In the text, in addition to individual authors' articles, 12 articles have appeared reporting Conferences on Therapeutics and 12 on Diagnostic Conferences. There have been many commendatory comments on these conferences.

Other text pages have been as follows:

Postgraduate Medical Education.....	19 pages
Hospital News.....	20 pages
Medical News.....	67 pages
Woman's Auxiliary.....	13 pages
Medicolegal.....	11 pages
Book Reviews.....	51 pages
Editorials.....	96 pages

As to finances, Mr. Dwight Anderson, Business Manager of the JOURNAL, has given the following report.

REPORT

Journal.—Financially, the Council reports that the JOURNAL in 1942 was produced at the lowest cost in its history—fifty cents per dues-paying member, or a total net cost of \$8,367.27. The net cost in 1941 was \$15,847.58, showing a decrease in cost to the Society in one year of \$7,480.31.

This was accomplished despite increased expense for paper and printing equalling \$1,361.34; and decrease in net returns from reprints of \$502.70. The element in the picture which accounts for the improvement is the increased income from advertising, amounting to \$10,702.48 (after deducting cash discounts, agency commissions, and salesman's commissions).

Two factors contributed to increase this revenue; a rise in advertising rates which became effective January 1, 1942, and an increase of 69 pages of advertising in 1942, as compared with 1941.

Directory.—While *Directory* publication is suspended during the war, the sales of copies to the public continued during 1942, producing \$632.50 income from this source. On December 31, 1942, we had on hand 852 copies. Sales during 1943 are continuing.

Comparison of the net cost of the 1941-1942 *Directory* with that of 1939-1940, according to the audit, shows a net cost, respectively, of \$21,256.67 as compared with \$22,931.58, or a reduction in net cost of the last *Directory* of \$1,674.91. An adjustment for comparison must be made, for the 1941-1942 *Directory* was charged with certain salaries of employees which were not so charged in the former edition, although the services were actually performed. These amounted to \$1,891.66, making a total saving on the net cost of the two *Directories* of \$3,566.47.

Medical Publicity

November 2, 1942, the publishing house of Coward McCann, Inc., New York, issued a book by Dwight Anderson and Margaret Baylous entitled "When Doctors Are Rationed." The Public Relations Bureau undertook the distribution of this book by direct mail and sold 1,852 copies. The publisher's bookstore sales are expected to increase the distribution to a total of 2,852 copies. Revenue from the sale paid all expenses for the cost of books, promotion, royalties, wrapping, and mailing.

Releases.—Releases concerning postgraduate education courses sponsored by the Council Committee on Public Health and Education were sent to newspapers in the following counties: Chemung, Columbia, Cortland, Greene, Onondaga, Schoharie, Schuyler, Steuben, St. Lawrence, Tioga, Tompkins, Ulster, and Westchester.

Other releases included: special release to the press of the state on the response of physicians in New York State to the call of the government for medical officers to enter the armed services; a

- ally convenient time, usually at a saving in cost. A credit of 15 points is given for the examination, regardless of the findings.
- II. Correction of Defects . . . 35 points
Emphasis is to be placed on following the recommendations of the examining physician. If no defects were found on examination and all immunization requirements were met, or if all recommendations have been carried out, or if cases requiring prolonged treatment are under way, a credit of 35 points is given.
- III. Health and Safety Training . . . 30 points
A credit of 30 points is given for satisfactory completion of one or more of the following:
1. First Aid: 4-H or Red Cross
 2. Home Nursing: 4-H or Red Cross
 3. Life Saving and Water Safety: Red Cross Swim Tests
 4. Home and Farm Safety: Red Cross Course
- IV. Community Health and Safety Education . . . 20 points
A credit of 20 points is given for participation in two or more of the following:
1. Exhibit
 2. Demonstration
 3. Posters: Made and displayed 2 posters
 4. A talk on health and safety to a group, or a radio broadcast
 5. Immunization clinic
 6. Vaccination clinic
 7. Sale of Christmas Seals
 8. Milk Month
 9. Posture Week
 10. Child Health Day
 11. Nutrition Week
 12. Other community health and safety observances

Possible score	100 points

PART III

School Health Program

During the year several conferences were held by the Chairman of the Council Committee on Public Health and Education with representatives of the Division of Health and Physical Education of the New York State Department of Education and the New York State Association of School Physicians to discuss plans for improving school health service and health education and increasing the correction of defects.

The Committee on Public Health and Education, the Subcommittee on Child Welfare, and the Subcommittee on 4-H Clubs held a meeting in Syracuse on October 26, 1942, with representatives of the Division of Health and Physical Education of the New York State Department of Education, Assistant Commissioner for Instructional Supervision of the State Department of Education, and the New York State Association of School Physicians. There was general discussion of the School Health Program with special attention given to the following subjects.

1. *Undergraduate Instruction of Medical Students in School Health*—It was the unanimous opinion of this group that the Health Committee of the New York State Board of Regents should confer with the deans of medical schools in New York State to discuss mini-

mum undergraduate instruction in school health.

2. *Postgraduate Instruction in School Health*—It was agreed that more postgraduate instruction in school health should be available for physicians, especially those who are at present in the school services and those who wish to prepare for the school services.
3. *Requirements for Appointment as School Physicians*—It was the unanimous opinion of the group that requirements for physicians devoting less than half time should be considered by the State Department of Education. This advance would receive popular approval and result in financial support in keeping with the character and importance of the work.
4. *The Annual Physical Examination of School Children*—The importance of the annual physical examination as a health educational exercise was stressed. Records were submitted by the State Department of Education showing the number of physical defects discovered each year. The report was compiled in a way which avoided repetition of recorded defects of other years. Corrected defects were also reported. This report of a large percentage of the schools of upstate New York was very informative.
5. *Correction of Remediable Defects*—Attention was directed to the correction of remediable defects, and several proposals were suggested for improvement. It is evident there is need for much closer relationship and better teamwork between the family physician and the school physician.
6. *School Health Committees for County Medical Societies*—While the different organizations at the state level send representatives regularly to interorganizational and interdepartmental conferences, relatively little effort is made to bring representatives of the local—that is, county and city—organizations together. The group decided that the county medical societies should be requested to appoint committees on school health. Such a committee would be a separate one or a subcommittee of the Child Welfare or Public Health Committee. The members of the committee should represent school health, welfare, and other services concerned with school health and child welfare. Such a committee would concern itself with the whole broad subject of school health and would submit reports to the county medical society and probably other organizations. Except for special studies, such as tuberculosis and rheumatic fever, county medical societies have been rarely concerned about the School Health Program. The Committee on Public Health and Education agreed, if the Council approved, to request county societies to appoint committees on school health.

With the approval of the Council, the Committee on Public Health and Education sent letters to the secretaries of county medical societies requesting the appointment of committees to represent the societies in the field of school health. To date, 34 replies have been received stating that provisions have been made for this service.

Now that the New York State Department of Education has made provision for health education in the schools with a formal course in the high

wide plan, the county societies were circularized for an expression of opinion on this question. The great majority of answers was in favor of setting up a state-wide plan, and your Council decided to watch the results of the individual plans for a possible application on a state-wide basis in the coming year.

Both the Utica and the Western New York plans dropped their contract for medical service entirely, and with it any previously existing coinsurance clause, and substituted instead a surgical indemnity contract with a medical rider optionally attached to it. Utica reports noticeable progress in enrollment with this new form of contract. Western New York has only recently finished rewriting its contract, and no promotion has yet started.

A valuable session on medical care programs and labor's specific interests and demands for such plans was held in Buffalo in June. This exchange of opinion resulted in later joint discussion between union leaders and representatives of the Western New York plan for future promotion through organized labor channels, with a promise for labor's participation in the general administration.

Owing to the differences in problems it was found advisable to establish an upstate committee and a southeastern committee on Medical Expense Indemnity Insurance, the latter comprising the metropolitan and southeastern area of New York State. The members of these committees are listed above. Both groups met independently, and valuable and useful information was derived. At a special meeting of the southeastern group an opinion was sought from the county societies represented regarding the possibility of a merger between the three New York City plans: Medical Expense Fund, Inc.; Community Care, Inc.; and Plan B of the Kingsley Roberts group. The southeastern committee has continued its contacts with the three local plans and can report that much attention has been given by these three companies to the suggestions. Further consideration will be given this question.

We want to take this opportunity to thank the members on both these committees for their interest and time given to these problems. Thanks should also go to the managers of the various plans, who assisted greatly by giving us concrete information whenever our joint planning called for it, and by generally cooperating with this subcommittee.

May we say in conclusion that only a united effort on the part of the medical profession will build voluntary prepayment plans? Every individual member carries the same great responsibility in the success of this most important enterprise of organized medicine.

PART VI

Medical Relief

The Council continued the subcommittee with Dr. E. Christopher Wood of White Plains as chairman. When Dr. Wood went into service in the fall of 1942, his substitute as councilor was appointed. The personnel became:

Ralph T. Todd, M.D., *Chairman*.....Tarrytown
 Carlton E. Wertz, M.D.....Buffalo
 F. :Scotia
 T

REPORT

During the month of October, 1942, this Committee lost the services of its able chairman, Dr. E. Christopher Wood, to the service of his country as a

major in the Medical Corps. Last year Dr. Wood, in his Committee report to the House of Delegates, included the "Joint Statement" from the New York Department of Social Welfare and the Medical Society of the State of New York. Whenever problems have arisen necessitating a conference between the Welfare Department and the Medical Society, this "Joint Statement" has been used as the basis for arbitration.

Before Social Security came into being, the doctor caring for the Old Age Assistance patient received his pay directly from the Welfare Department. It is now the policy of the Federal Government to pay the recipient directly, who then in turn pays the doctor for services rendered. In order to cooperate with the Welfare Department so that they may be reimbursed by the Federal Government, Dr. Wood's Committee agreed to this procedure. Dr. Wood reported this fact to the House of Delegates, and stated that "The experience with the plan to date indicates that patients fail to pay physicians for authorized services only in a negligible number of cases." Since this report, your Committee has had reason to doubt this statement. The Welfare Department has been informed of the condition as we believe it to be at the present time. They have agreed to send an itemized bill to the patient of the Old Age group, definitely stating the amount due the doctor. Your Committee hopes that this plan will overcome the present situation. However, it may not. Therefore doctors rendering authorized care and not receiving their proper remuneration should immediately write a letter to this Committee giving the name of the patient, the case number, and all pertinent facts, in order that your Committee may correct this condition at an early date.

In certain areas throughout the state, doctors who customarily had the care of the Welfare patients have been called into the armed services. It is, therefore, essential that the doctors remaining in these areas assume the care of these Welfare patients so that there will be no necessity for any outside agency coming into their communities.

The care of service men's families, while they are in the armed forces, is being considered by the Welfare Department. To date, no provision for this group has been made, but we hope to have a favorable report on this question in the near future.

PART VII

Legislation

The Council Committee, charged with the duty of studying legislation and putting forth the positions taken by the Society, was continued with the same personnel:

John L. Bauer, M.D., *Chairman*.....Brooklyn
 Walter W. Mott, M.D.....White Plains
 Leo F. Simpson, M.D.....Rochester

The Committee makes the following report as of March 1, 1943. A supplementary full report will be ready for the House on May 3, 1943.

REPORTS

The Council Committee on Legislation respectfully submits this preliminary report, a very brief one as requested.

Legislation, which you and your confreres are interested in, legislation which affects vitally your patients—the people—and the practice of medicine, which of itself is altruistic, must be considered most essential this year.

special release to the press of the state calling attention to the increased attendance of physicians in the older age groups at District Branch Meetings.

Bulletins.—The following Club Talk bulletins were published: *Premature Babies; On Starting to School; Ration Tickets for the Doctor; What Is the Truth About Cancer; A Captain Gets Demoted; Share Your Blood with the Boy Next Door; It's Only Measles.*

The mailing list was pruned carefully before the beginning of these mailings in 1942 and was reduced from 819 to 594, eliminating approximately one-third of the names on the list.

District Branch Meetings.—Newspaper releases were sent to the daily press in the counties comprising District Branches concerning the fall meetings held by each District Branch.

Meetings.—Mr. Anderson attended the usual meetings of various Council Committees, the meeting of the A.M.A. at Atlantic City, the Editors' and Secretaries' Meeting in Chicago in November, and the Health Officers' Meeting at Saratoga Springs in June.

Inquiries.—Office inquiries regarding war medicine and doctors in service were numerous during the year. A number of writers, editors, and radio directors applied for and received, information and advice during the year. This report will not be burdened with the details of these except to say that this contact work, which is the essence of public relations, has increased in 1942 over previous years.

Employees.—The turnover in employees in clerical and mechanical work has presented a number of difficult problems, the Army taking Mr. Harold McGinn, who has been in charge of our mimeographing for the past seven years. It has been found practically impossible to fill his place, and the other employees in the office pinch-hit to make the best of it on account of this essential vacancy. Miss Carita Holton went into defense work in a munitions plant in Ohio, and in her we lost an experienced, energetic, and loyal employee. The spirit maintained by those who remain with us in their eagerness to compensate for those who have gone into war work is especially commendable. The ability of the Public Relations Bureau to adapt readily to a series of war disruptions has been due to the resourcefulness of Miss Dorothy L. Kent.

Economies.—The auditor's report for 1942 shows a reduction in the cost of the Public Relations Bureau of \$6,805.75 during 1942; from \$21,438.90 in 1941 to \$14,633.15 in 1942. This saving is made up principally of the following economies: \$1,791.79 less for stationery, postage, and recordings; printing pamphlets and bulletins, \$2,205.24 less; and \$2,412.45 less for radio activities conducted in 1941 but not undertaken in 1942.

PART V

Nonprofit Medical Expense Insurance

The Subcommittee of the Council Committee on Public Relations and Economics has continued its work in this field with the same personnel:

Herbert H. Bauckus, M.D., *Chairman*.... Buffalo
Walter T. Dannreuther, M.D..... New York
William Hale, M.D..... Utica

In addition, at the request of this committee, the Council approved the appointment of an additional subcommittee to study and advise on this subject as it pertains to the metropolitan New York area and

the surrounding counties (17 in all). This personnel is:

William B. Rawls, M.D., *Chairman*.... New York
Walter T. Dannreuther, M.D..... New York
Abraham Koplowitz, M.D..... Brooklyn
Milton J. Goodfriend, M.D..... Bronx

The following is the report from this expanded subcommittee:

REPORT

This being the third annual report of this subcommittee, your Chairman begs permission for a few introductory remarks.

In taking stock of the activities of these three years, we must be able to evaluate positive as well as negative aspects of our work. On the positive side we note that today the principle of voluntary prepayment methods for medical care, sponsored by organized medicine, has become generally accepted. Three of the functioning plans in New York State received this year the official endorsement of the State Society. Scarcely anywhere is there a doubt left as to the usefulness of these plans. Harmonious working relations have at all times existed between the proponents of the plans and the New York State Department of Insurance and the Medical Society of the State of New York. For the last year the stage has been set for a successful performance.

It is here that we must take notice of some of the negative aspects. Despite the wholehearted support from the leaders of our State Society, there has been but little acceleration of the promotion of these plans by the members of the profession. This, to a great extent, accounts for the lack of interest on the part of the public, which in many instances knows little about the plans and has inquired little about them.

Fundamental principles and problems of reorientation regarding the role of the plans in the community—as they were outlined in the last annual report—were not applied in the desirable degree. Questions of consumer participation in the administration as a means of involving large groups were still left pending. The result, therefore, has been a negligible growth in number as compared with the potential subscriber group in an industrial state such as New York. Little initiative was shown by the respective administrative boards to relate the use of the plans to the need of widespread medical care as a necessary part in the war effort, and as a means of the democratic rationing of physicians for the largest possible group of people.

The country is looking toward our plans as a test of the workability of voluntary programs for medical care. Only concrete results in terms of figures of enrollment will be considered a valid argument. While there may be a number of good reasons for the delay of these results—such as reorganization, new forms of contracts, or adjustment of fee schedules—these must not continue to delay the growth of the plans at a time when the country as a whole is geared to the utmost speed and efficiency in all matters.

In reporting on the state-wide developments we want to mention first that nearly all District Branches featured a discussion of Medical Expense Indemnity Insurance at their annual meetings. The high level of these discussions showed that with only slight effort new inroads could be made in rallying the members around the promotion of the existing plans.

Since this exchange of thoughts brought out a widespread interest in the organization of a state-

thought of the Council and although he did not find the method practicable at the present, he would keep it on file. In the opinion of the Committee, some such plan may yet have to be adopted if the armed forces are to make a much greater drain on the medical profession of the country.

At the time of the gas embargo, your Committee Chairman and Dr. Irving endeavored to ease the situation for doctors by contacting the O.P.A. authorities. Help was promised, but the embargo terminated before any results were obtained. Again, when all gas sales were banned over a week end, the same two took the matter up and were assured that doctors would be permitted gas and that the embargo was not intended to prevent necessary use of cars by physicians.

When all car owners were restricted to the possession of only five tires per car, protests were received from certain upstate counties, and authority was desired for permission to keep snow tires in addition. Again, Dr. Irving and the Chairman interceded with the State O.P.A., inviting their attention to the fact that doctors had to make emergency calls, often at night, and that the time involved putting on chains might mean the difference between life and death. As a result, a ruling was issued permitting doctors to retain their snow tires.

The most important function of the Committee has been a liaison relation between the State Procurement and Assignment Committee and the County War Participation Committees, as well as the coordination of the activities of those committees.

The State Chairman of Procurement and Assignment, Colonel Kopetzky, resigned at the time of the last meeting of the House and was replaced by Dr. Henry W. Cave. He, in turn, was replaced by Dr. Joe R. Clemmons, and Dr. Cave became Chairman of the Second Service Area Committee, replacing Dr. Arthur W. Booth. Our contacts with all of these gentlemen have been most pleasant, and we have always found them most cooperative, anxious to serve the interests of the civilian population as well as to furnish a pool of physicians for the Army and Navy. Our thanks are expressed to them.

New York State has been criticized as lagging behind in furnishing its quota of physicians for the armed forces. Your Committee feels that this is to a large extent unjustified. A survey conducted on July 1 proved that there were more men in service than the number for which we had been given credit. In addition, several thousand men had been cleared by their local committees who had not been examined or called. On September 1 another survey was conducted which indicated that considerable progress had been made and that New York would probably reach its quota by the end of the year.

A later estimate of the situation is somewhat confused. The National Committee gave us credit, on January 1, for having only 6,900 doctors in service, whereas our quota was 8,600. However, their figures were admittedly six weeks behind, and, furthermore, no credit had been given to us for men entering the United States Public Health Service. Inasmuch as many men who were already in service and had been for some time, were still receiving requests to report for examination, it is apparent that 6,900 was not a fair estimate of the situation. Your Committee believes, on this evidence it has at hand, that New York has practically met its quota.

The quota for 1943 was set at 3,900, but this included the 1,700 supposed not to have been met in

1942, or approximately 2,200 additional men called for. This quota will have to be met largely from the metropolitan areas, as the other areas have already been stripped of all physicians who can be spared. There are over 3,000 noncitizen physicians in the state who are not eligible for commissions, and, while these have been included in our medical population, the fact that they cannot be used in supplying our quota has not been considered. Hence, it will be difficult to find 2,200 additional physically qualified physicians who can be spared. It must be done, however.

At the request of your Committee, Dr. Joe R. Clemmons, State Chairman of Procurement and Assignment, made a trip upstate to interview the County Society Committees. He was accompanied by Dr. Irving, who represented the chairman of the State Society Committee. This trip was productive of much good, in that it cleared up many misunderstandings and difficulties. There had been a tendency upstate to declare physicians available without consideration of the local needs. Originally, Procurement and Assignment was set up with a chairman and a vice-chairman, and the state was more or less divided between them. This led to confusion and conflict of policy. The Society owes a debt of gratitude to Dr. Don S. Childs, the former vice-chairman, for his conscientious, painstaking work, but it is felt that the situation will be handled in the future with greater satisfaction to all and with less confusion, with one man responsible for the whole state. Hence, there is now a chairman and no vice-chairman.

A further survey has been made to determine how many areas are in need of physicians. This survey revealed that 38 physicians could be used in rural areas. However, most of these areas never have had physicians, and it is doubtful whether a physician could make a living in most of them because the population is scattered and neighboring communities are called in for medical care. Therefore, very few physicians are actually needed for relocation, and Dr. Clemmons is endeavoring to supply those places in need from a pool he has available. Certainly New York State does not need to import physicians from other states. While we may have difficulty in supplying our military quota, we have an ample number of physicians who have either been rejected physically, or who are not eligible for commissions, to furnish any needed replacements within the state and possibly to relieve shortages in other states if called upon.

Your Committee does not approve of lowering the high standards of New York State in order to permit physicians from states with less high standards to come in and practice, and in our opinion it is not necessary. However, in order to meet any possible emergency, and to cooperate with the Man Power Commission, a bill has been introduced into the legislature at the instance of the Mailer Commission. This bill provides, in substance, that during the emergency the Governor may declare emergency health and sanitation areas within the state, and the Commissioner of Health, in cooperation with the local board or boards of health or welfare agencies, is empowered to designate, appoint, employ, and supervise such necessary medical and health personnel and to take such other steps as may be required to meet such inadequacies as may exist.

This gives no one the right to practice medicine permanently, and the law will automatically terminate with the emergency. It is merely a reasonable extension of existing authority granted to the

You can readily understand that the chairmen of the county legislative committees had that feeling, *when you learn that, with odds against them, they met in Albany on February 19 and held again their annual conference.* It took seventeen hours to travel from Buffalo to Albany; only local doctors of Albany used their automobiles.

Meetings and telephone conversations have taken place with different groups or individuals keenly interested in legislative problems.

At the conference in Albany, 33 of the 61 county medical societies were actively represented. Our Executive Officer, Dr. Joseph S. Lawrence, issued, on February 20, Bulletin No. 4, in which was a comprehensive detailed recital of the actions taken by the conference on all bills discussed. This Bulletin is already in the hands of all those known to be interested. Dr. Lawrence is willing to send a copy to anyone upon request. Your Legislative Committee, with the Executive Officer, numbers only four, but including the county legislative committees, it is of great strength and numbers. Will you not personally consider what a magnificent job could be accomplished if every member—every one of you—took some part in promoting desirable legislation? If you have any questions or any requests, if you have any information to be transmitted, will you not immediately contact either Dr. Lawrence, any member of the State Legislative Committee, or the chairman of your county committee? Cooperation is being given. We appeal especially for cooperation and coordination, a relation of purpose and action, resulting in true harmony. Your legislators and your political leaders, the real "county bosses," are ready and willing to meet with you. A timely discussion may very well bring about their active support. Queens County arranged a dinner conference, and the real political leaders and legislators attended. If you are holding such conferences, please write in about them.

Since the meeting of the House of Delegates, time and interest have been given to prepare legislation helpful to the Procurement and Assignment Committee for the purpose of studying the problem of providing physicians for districts inadequately supplied with medical care. The various states have been asked to lower their educational standards, allowing real reciprocity, and so permitting the Procurement and Assignment Service to move the doctor at will. The *Mahoney-Mauller Bill* was drafted to save the standards of New York State and to contribute valuably to the Federal Government's problem. This bill permits the Governor to handle any problem of inadequacy which may arise and so makes it unnecessary for physicians from other states to practice even temporarily in New York State, relieving the Federal government of all concern.

The *Beveridge Report* is obtainable, and if you have not already read it, you should do so at once. Dr. Lawrence has accumulated many facts relative to socialized medicine, and we hope that he will shortly submit them to all of us, so that we may compare these facts concerning New York State medicine with the *Beveridge Report*.

The *Sullivan X-ray Bill As. Int. 97*—as introduced—all of us can wholeheartedly support. The bill would declare radiology the practice of medicine and would exclude those practicing radiology who are not physicians. But this bill has been amended. Various individuals and groups, laboratories and chiropractors, outside the practice of medicine, are to be favored. All engaged in practicing radiology

up to the time this bill takes effect, if passed, will be excepted from the effect of the law. Does this amendment not defeat the very purpose of the bill?

Constant inroads in the practice of medicine! Constant lowering of educational standards! The best thought and effort of the highest type of citizens, ruthlessly put aside or depreciated!

The physiotherapists very modestly wish to practice physiotherapy (not to administer drugs but to practice medicine without the supervision of a duly licensed physician except in the treatment of quarantinable diseases). Originally, this was a group of only 25 qualified technicians permitted to become registered physiotherapists. It has grown to the large number of 468 registered and not necessarily qualified, 418 without examination.

They confide that they have been learning diagnosis from the many physicians who have prescribed physiotherapy for their patients and referred the cases to them. Who are these many physicians who have been supervising the physiotherapists? Or have they not rather been practicing without the law?

At the time of the Annual Meeting of the State Medical Society you will receive a later, detailed, supplementary report.

PART VIII

War Participation

The Council transmits with approval the following report of its Committee on War Participation. The Committee was reorganized immediately after the meeting of the House of Delegates in April, 1942, and the following personnel were appointed:

Louis H. Bauer, M.D., *Chairman* . . . Hempstead
Henry W. Cave, M.D. New York City
Norman S. Moore, M.D. Ithaca
Samuel J. Kopetzky, M.D., *ex officio*, New York City

The Committee, originally known as the "Medical Preparedness Committee," changed its name, by vote of the Council in January, 1943, to the "War Participation Committee." This was done at the request of the American Medical Association Committee, in order that all similar committees should have the same name.

REPORTS

Few formal meetings of the Committee were held, but much work has been entailed, nevertheless. There have been constant requests from Selective Service Headquarters to replace physicians no longer available on local Selective Service Boards and Advisory Committees to those Boards. All of these have been cleared through the respective County Society Committees before recommendations for appointments have been made. This work has been handled almost entirely in a routine fashion by Dr. Irving's office, with reference to the Chairman of the Committee only when a more controversial point was at issue. This has speeded action and has saved the Committee a tremendous amount of work. The Committee is very grateful to Dr. Irving and his staff for their wholehearted cooperation.

The report for the Economical Use of Medical Personnel submitted to the last House was forwarded by the Council to the Surgeon General of the Army, who replied that he appreciated the

decreasing the number of days lost through illness or fatigue. The industrial physician will have to give more attention to the problems of accident prevention and the determination of occupational disease, which are important factors in maintaining our industrial plants at maximum efficiency levels. Physicians treating compensation accidents and illness should constantly bear in mind the vital importance of returning patients to work at the earliest possible moment consistent with proper treatment and the safety of the individual.

Estimate the need for additional Industrial Health Service. Recommendations of Council on Industrial Health, A M A.

- A. A note should be sent to industry throughout the State, preferably by the executive secretary of the State Chamber of Commerce of the State Manufacturers' Association, that if a plant contemplates additional medical service, application for personnel should be made to the County Medical Society Committee on Industrial Health, which in turn should.

1. Decide whether the need is valid
2. Decide whether the need can be met locally

The crux of the whole voluntary plan rests on the ability to exhaust local resources first. Certainly such a procedure involves least dislocation of physicians.

- B. If no local resources are available, the request should be referred to the State Chairman of Procurement and Assignment, who, with the help of the State Committee on Industrial Health and other agencies listed above, will attempt to locate and assign the nearest competent volunteer.

- C. If no resources exist in the State, the regional or national Procurement and Assignment Service may be helpful, or the Council on Industrial Health of the A M A can act as a clearing house for placement of physicians in industry.

X-ray Examinations.—The advisability of setting up examining boards for applicants for radiology ratings has been amply proved by the results of examinations held in the metropolitan area during the past two years. Six examinations were held in 1942, and 20 applicants were examined. Of these, 6 passed the examination, 14 failed, and one applicant, on learning the scope of the examination, withdrew. It is extremely important that physicians should be thoroughly qualified before receiving a rating either for diagnostic or therapeutic radiology. Workmen's Compensation Boards should not grant a radiologic rating merely on the basis of possession of apparatus or the fact that the physician holds himself out to be experienced in this field. Radiology requires thorough training and extended experience. The opinion of the radiologist is of prime importance in diagnosis and unless such opinion is based upon thorough training and extended experience, the treatment of the claimant as well as the adjudication of the claim for disability may be improper. The results of the examination show that the majority of physicians who apply for examination are not well prepared. It seems, therefore, that the county Society Compensation Boards should not grant a rating in radiology unless the applicant for such rating measures up to the standards set by the State Committee as a guide to the local county committees. Furthermore, unless it can be shown that the individual has had some experience and basic train-

ing in radiology, he should not be encouraged to submit to the examination. The State Committee is prepared to offer the services of expert examiners to local county medical societies on request.

The radiologists who have served as an examining committee in the metropolitan area deserve the thanks and appreciation of the profession for the manner in which they have conducted these examinations during the past few years.

Specialty Ratings.—In other specialties it is becoming apparent that the granting of specialty ratings must be based upon high standards. While the diploma of the National Boards may be accepted as evidence of qualification, the local county society boards may require, in addition, evidence of experience in private practice before granting specialty ratings. The standards set up by the State Committee as guides to local county medical society committees provide for the acceptance of the diploma of the National Boards, where such boards require a practical as well as a theoretic examination. In the larger cities active affiliation with hospital services in an independent position is frequently one evidence of qualification. However, there is no uniformity of hospital position nomenclature. A full attendingship in one institution may imply less qualification and experience than a minor attending position in another institution. Consideration should be given to the size of the hospital, the amount of work assigned to the applicant, and the question of whether this work is performed with or without supervision. During the past few years it has become necessary for certain compensation boards to ascertain the technical ability of a physician applying for a rating in one of the surgical specialties, especially where such individual was not actively connected with a recognized hospital. Members of the Board itself, or of its advisory qualifying committees, in the specialties, were appointed to witness one or more operations performed by the applicant and to inquire into the manner of preparing the case, and diagnostic procedures and diagnostic inquiry, in addition to the reporting of facts concerning the individual's training, hospital internship or residency and experience, a rating was given or denied. It is recommended that this procedure be adopted more widely in order that a rating be not given to an applicant not thoroughly prepared both from a theoretic and practical aspect.

Ratings of Refugee Physicians.—The question of the granting of ratings to refugee physicians has required considerable thought. Where such refugee had an outstanding reputation, and his ability and character were well known, and adjudged satisfactory by the compensation committee or board, a rating was given, provided the individual had become associated with one or more hospitals and had become experienced in American methods of medical practice. In most instances, however, it has been impossible to verify the credentials and qualifications of such foreign physicians, as expressed in their application blanks. Until such physicians become associated with local hospitals and dispensaries and their professional qualifications can be scrutinized by competent and objective physicians, it is impossible to grant them specialty ratings. The same standards that apply to American physicians should apply to the qualification of refugee physicians, but the boards may require, particularly for specialty ratings, that the physician's qualifications be verified by personal contacts in this State.

Symbol Ratings.—For a number of years we have recommended simplification of ratings. This matter

Governor a year ago, and will cover any possible, unforeseen emergency which could arise from the war; yet it does not open wide the doors for ill-trained personnel, now or in the future, and hence protects the public in two ways—first, by providing for possible shortages of medical care and by insuring the public adequate care by properly trained and supervised personnel.

Your Committee recommends:

1. That all County Medical Societies continue their War Participation Committees and that they function in close liaison with the State Committee and with Procurement and Assignment.
2. That these Committees see to it that industrial plants be adequately safeguarded from a medical standpoint.
3. That these Committees safeguard civilian welfare as well as furnish a pool for the Army and Navy.
4. That hospital staffs and teaching institutions be protected by declaring minimum necessary personnel as "essential."
5. That shortages in medical personnel developing from general increases in population or from expansion of industrial plants be reported promptly to Procurement and Assignment so that such shortages may be relieved.
6. That the Committees representing those Counties which have not yet met their quotas take every step possible to induce eligible physicians to enter the service so that New York may meet whatever demands are made upon it.
7. That all physicians be urged to do welfare work regardless of whether or not they have done so heretofore so that the indigent population may not be neglected but will continue to receive the medical care that the Society has always insisted they have.
8. That the Society give a vote of thanks to Dr. Henry W. Cave and Dr. Joe R. Clemmons for their wholehearted cooperation with the State Society and for their eminent fairness in handling their difficult assignments.

PART IX

Workmen's Compensation

The State Committee on Workmen's Compensation—Dr. Clarence G. Bandler, New York City, *chairman*; Dr. Joseph C. O'Gorman, Buffalo; and Dr. David J. Kaliski, director, New York City (also director of the Workmen's Compensation Bureau)—has presented the following report which is submitted with the approval of the Council.

Owing to the necessity of conserving space, this year, the report is condensed and abbreviated, and a more complete report will be prepared and presented to the House of Delegates.

REPORT

Number Qualified.—To date 20,166 physicians have been qualified and recommended for license by the county medical societies' Compensation Boards. In addition, 297 physicians have been qualified by the Homeopathic Board and 372 by the Osteopathic Board.

The number qualified in each county follows:

Albany, 301; Allegany, 42; Bronx, 2,086; Broome, 222; Cattaraugus, 82; Cayuga, 71; Chautauqua, 114; Chemung, 01; Chenango, 41; Clinton, 48; Columbia, 42; Cortland,

43; Delaware, 53; Dutchess, 150; Erie, 1,028; Essex, 36; Franklin, 67; Fulton, 68; Genesee, 54; Greene, 43; Herkimer, 60; Jefferson, 109; Kings, 3,662; Lewis, 23; Livingston, 50; Madison, 41; Monroe, 542; Montgomery, 62; New York, 5,336; Nassau, 539; Niagara, 176; Oneida, 237; Onondaga, 420; Ontario, 103; Orange, 165; Orleans, 29; Oswego, 74; Otsego, 66; Putnam, 16; Queens, 1,316; Richmond, 137; Rensselaer, 134; Rockland, 97; Saratoga, 70; Schenectady, 120; Schoharie, 30; Schuylar, 15; Seneca, 27; Steuben, 89; Suffolk, 202; Sullivan, 71; St. Lawrence, 94; Tioga, 40; Tompkins, 71; Ulster, 110; Warren, 58; Washington, 50; Wayne, 67; Westchester, 882; Wyoming, 45; and Yates, 27.

Physicians in the War.—The number of physicians available for compensation practice has been depleted by the entrance of many physicians into the armed services. Up to the present time we have no knowledge of any shortage of physicians available for compensation practice in any part of the State. A number of Federal projects have been in operation throughout the State for the construction of camps and other military and naval establishments which have caused temporary derangement in the quota of physicians in particular areas. Most of these, however, have been completed or are in process of completion.

Aside from the increase in the civil personnel of these establishments there will be no great strain on the medical resources of the areas involved. Owing to the increase in industrial activity incident to the war effort in many parts of the State there has been a considerable increase in industrial accidents and, to a lesser degree, of occupational diseases. Our reports indicate that in certain areas this may amount to 35 or 40 per cent, but we are pleased to note that there is adequate medical personnel to cover the situation. Most of the medium- and larger-sized industrial establishments have recognized the advisability of providing medical supervision for the plants; and there has been an increased demand for physicians who have had training in industrial medicine and surgery, including the broader fields of disease and accident prevention, safety methods, etc.

There is a growing demand for physicians who have had special training in this relatively new specialty, and recognition of this fact has led to an increase in postgraduate special courses on the part of various universities and colleges. The State Medical Society and the local county societies have given increasing attention to educational programs designed to acquaint physicians with industrial medicine and to prepare them better for the control and supervision of industrial establishments. It is important to recognize the need for closer cooperation between employers and representatives of the public, including Labor, with the medical profession to the end that greater attention be given to the health and welfare of industrial workers. The greater participation of women in industry and the tendency to employ handicapped individuals and persons beyond normal working age are added factors in determining the need for closer medical supervision, not only of the large- and medium-sized industrial establishments but also of the smaller ones which, up to the present time, have not given much attention to the health of workers. It is of vital importance at this time that the health of workers be kept at the highest possible level in order to avoid loss of time due to illness. Absenteeism has been attributed in some part to illness, but there is no proof that such loss of time is not due in a larger measure to factors other than illness. The problem of nutrition of the working people has come to the forefront and is of vital importance in maintaining the highest level of working efficiency and in

is, of course, the Department of Labor through referees or the Industrial Board. But some other mechanism such as suggested must be devised to meet the situation created by the nonfiling of so many bona fide claims for medical care in no-lost-time cases.

Medical Bills in "Noncompensable" Cases.—Under date of February 9, 1943, Mr. Ralph R. Boyer, Director of the Division of Workmen's Compensation, addressed a letter to Mr. Henry D. Sayer, General Manager of the Compensation Insurance Rating Board, bringing the problem of resolving disputes as to medical bills in the noncompensable type of accident (no time lost, less than seven days lost, no file indexed) to his attention, and requesting a conference of all parties of interest with the insurance carriers and self-insurers, at which time the problem could be considered fundamentally. A date for this conference has not as yet been set.

Arbitrations.—Under the provisions of Section 13-g of the Workmen's Compensation Law, arbitration is provided when a carrier or employer has objected to the value of the doctor's services within the period of thirty days of the submission of the bill. The law as now worded does not force an employer to arbitrate a disputed bill nor does it provide any way of collecting such a bill should the employer refuse to arbitrate. While it is true that most insurance carriers do avail themselves of the opportunity of arbitration, this practice is less common among self-insurers and particularly among municipalities and other smaller communities which are self-insured and are subject to the provisions of the Workmen's Compensation Law.

Only recently have we been able to obtain the cooperation of the Board of Transportation of the City of New York to submit to arbitration. In many instances in which self-insurers have failed to object to a bill within thirty days in a compensable case and the bill, under Section 13-g, is presumed to be the fair and reasonable value of the services rendered, the bill is not collectable without court action.

We again urge an amendment to this section of the law as suggested by the Law Reform Committee of the Bar Association and introduced into the Legislature in the year 1941-1942. This bill failed of passage, but we understand that it will again be introduced this year. Its passage should be facilitated in every way, as it removes from litigation, through the civil courts, many bills, especially those small in amount.

For a number of years we have urged that no physician permit a carrier or employer to reduce a bill and offer an amount in settlement that is not consistent with the services rendered and the fees allowed by the fee schedule. We have also urged that no employer be permitted to take the 5 per cent discount for payment within thirty days of the receipt of bill when the bill is paid after the lapse of this period. We have requested physicians to bring to the attention of this Bureau specific instances of such action on the part of employers or carriers so that this abuse can be corrected. The threat of arbitration should not deter a physician from demanding full payment where the bill is a just one and in accordance with the fee schedule. Few responsible insurance carriers indulge in this practice, and all instances of this sort reported to this office will bring prompt amelioration.

Arbitration is an equitable procedure devoid of delay and fair to both sides. It removes from the civil courts numerous controversies over the value of medical services which are best determined by an

arbitration board of practicing physicians and specialists familiar with medical practice and with the compensation law. It is our opinion that arbitration is not sufficiently resorted to by employers and carriers, especially in the case of certain physicians whose bills are regularly objected to but rarely arbitrated. An investigation is now being conducted to determine upon what basis such bills are settled and how frequently the bills of certain physicians are settled without arbitration. Insurance carriers and employers should have a greater interest in submitting bills that they consider inequitable and improper to the scrutiny of the arbitration committee, rather than settling them under these circumstances. While it is not the function of the arbitration committee to do more than determine the reasonable value of the physician's service in accordance with the spirit and letter of the Workmen's Compensation Law and the fee schedule, the presence at arbitration of physicians, repeatedly, would enable the County Compensation committees to take such action as they deem proper and in accordance with the provisions of the law, should any improper practice be revealed.

It has been stated that the threat of arbitration has deterred certain physicians from treating compensation cases to the extent that such cases deserve, but it is not believed that this is often the case. Experience shows that most physicians, once they have accepted a patient for treatment under the Workmen's Compensation Law, fulfill their responsibilities to the claimant, even though at times some may be charged with unduly prolonging treatment.

Insurance carriers and employers should be made to conform to the rules of the Department of Labor regarding the informing of physicians of results of their medical examinations in the event that the carrier or employer believes the treatment should be stopped. This matter was gone into in detail in our previous reports, but we have reason to believe that employers and carriers still do not always state the reasons for refusing to authorize further treatment in protracted cases where their medical examination reveals that no further treatment is necessary. Unquestionably, prompt hearing before the Department of Labor and the avoidance of postponement or adjournment of hearings would materially curtail treatment in certain types of cases. The physician has an obligation to treat a patient until he has recovered from his injury or has reached the maximum benefit to be obtained from medical care. The constant postponement of hearings and the putting off of the determination of the degree of disability undoubtedly frequently of treatment until the Department of Labor has reached a verdict. A physician alone should not be made to carry the onus of prolonging treatment where the dilatory actions of others are to blame. We have frequently urged physicians not to use physical therapeutic procedures when such procedures are not indicated or when they have reached their maximum efficiency in the rehabilitation of the claimant. It is especially important when our country is at war that manpower be conserved and that time lost from work be reduced to the minimum. The procedures in the Department of Labor, as well as in the physician's office, should be mobilized to return the worker at the earliest possible moment to his former occupation or to some other useful occupation in accordance with his physical status.

During the year 1942 there were held 89 arbitration sessions in the metropolitan area and 11 in other

was taken up in great detail in our report of 1942. Symbol M-17 has now been designated for the sub-specialty of thoracic surgery and standards of specialty qualifications have been drawn up to cover this field.

Special Communications.—On May 27, 1942, Bulletin No. 44 was promulgated, dealing with the necessity for physicians applying for x-ray examinations to have had a definite amount of training in this field before being certified for examination by the county medical society Compensation Boards or committees.

Unpaid Bills, Claimant Absent at Hearing.—On July 10, 1942, Bulletin No. 45 was issued, requesting information from physicians throughout the State as to the number of bills withheld from payment by employers or insurance carriers because the claimant did not appear at a hearing to determine the compensability of the workingman's claim. Attention was drawn to the fact that numerous employees who had suffered accidents might be inducted into service before controversial claims were adjudicated by the Department of Labor, and that physicians should attempt to ascertain this fact in order to facilitate prompt action on the claim by the Department of Labor by notifying the Department of Labor of the possibility of the early induction of the claimants. Furthermore, numerous claimants were either inducted into the service or left the State to work in defense plants in other parts of the country and were not available for hearings. It was hoped to ascertain the number of such bills outstanding. It is believed that the number is substantial, but as yet we have not obtained definite figures. In this connection we have been informed that the number of compensation cases open and pending before the Division of Workmen's Compensation in New York City increased from 46,477 at the end of 1940 to 54,567 on December 31, 1941. This increase of a little more than 8,000 open cases is equivalent to the work normally accomplished by two full-time referees.

During the year 1940 approximately 1,348,000 papers were received by the Department; during the year 1941 this number increased to 1,542,000. Those papers for which there were no cases indexed were filed in what is called "no claim file." The amount of correspondence, reported accidents, etc., in these files has grown tremendously. (Accidents reported for the year 1942 aggregate of 713,741 as compared with 635,983 for the year 1941.) Finally, when the case folder is assembled it is necessary to search the "no claim file" to collect all the papers previously received. This requires considerable time and personnel and accounts in a measure for the increase in the number of cases on which no hearing is held.

In other words, unless a claimant insists upon a hearing in a no-lost-time case, the case may be closed without the actual determination of compensability of the claim. In a majority of these cases the insurance carrier or employer, having received the report of an accident from the employer, usually pays the doctor's bill. During the past year or two, however, there has been a tendency on the part of certain insurance carriers not to pay such bills and in some instances even to submit a controversy form requiring a hearing, knowing that in some instances the employee will not want to waste a day's pay to attend a hearing or is not available for a hearing. In many instances it has been necessary to demand payment for medical services from the individual, and this in turn forced the claimant to file a claim to arrange a hearing so as to have his medical bill paid by the

carrier if said claim was declared compensable.

On December 10, 1942, your Director addressed a letter to the former Industrial Commissioner, Miss Frieda Miller, bringing all these facts to her attention and requesting an investigation of the Department of Labor in regard to their policy of not filing more forms (indexing files), especially in no-lost-time cases where medical services had been rendered. Your Director urged an agreement with the insurance carriers and employers to pay all such bills in no-lost-time cases, or to arbitrate them where there were sufficient grounds for arbitration; failing which all such cases should be placed on the calendar for a hearing. The Industrial Commissioner replied on December 24, requesting further information as to the number of cases involved and felt that the problem should be approached from a factual basis in order to determine the stature of the problem. Incidentally, our records indicate that we have been concerned with this problem since the very beginning of the amended law in 1935 and have had numerous hearings before the Commissioner on this question, but to no avail.

It was frequently brought to the attention of the Department of Labor that the referees, in closing cases, frequently used the expression "Disallowed—disability less than seven days," or "Case closed—no wages lost." It was felt that this was not a proper action, for under the provisions of Section 25 an award must be made to reimburse the employer if such reimbursement is requested or, in the alternative, to reimburse the claimant therefor. On February 14, 1941, the Industrial Board adopted a resolution which instructed referees that in all cases in which disability was less than seven days they should make the following finding: "No compensation due—disability less than seven days—case closed." This implied that no compensation was due for time lost in excess of seven days, but that there might be an outstanding bill for medical services. Your Director urged additional action to the effect that the referee in every case should ascertain before closing the case whether medical treatment had been rendered and to add to the phrase "no compensation due" the additional phrase, "bill for medical care pending." This would indicate to the insurance carrier that such bill, if not already paid, was pending, and under these conditions the carrier should be urged to pay the bill or to demand a hearing on the question of the necessity of the medical care rendered or its relationship to the accident sustained. It should be borne in mind that the cost of medical care as indicated by the medical bill for services rendered is as much a part of the "compensation" due the claimant as is payment for time lost and has been so held by the highest courts of this State. Physicians therefore should look through their files and report to this office all cases which have been closed without payment of medical bills on the part of the employer or insurance carrier.

The only possible solution of this problem, should the Department of Labor find it impossible to extend its facilities to include such claims, would be to enlarge the scope of arbitration procedures in order to include outstanding bills in all cases in which accident was reported but no case index was filed by the Department of Labor where the employer or insurance carrier did not dispute the accident or notice. This would leave to the arbitrators the determination of the necessity for medical care, causal relationship, etc., should these points be raised by the employer or insurance carrier. The proper place for the determination of issues of causal relationship

is, of course, the Department of Labor through referees or the Industrial Board. But some other mechanism such as suggested must be devised to meet the situation created by the nonfiling of so many bona fide claims for medical care in no-lost-time cases.

Medical Bills in "Noncompensable" Cases.—Under date of February 9, 1943, Mr. Ralph R. Boyer, Director of the Division of Workmen's Compensation, addressed a letter to Mr. Henry D. Sayer, General Manager of the Compensation Insurance Rating Board, bringing the problem of resolving disputes as to medical bills in the noncompensable type of accident (no time lost, less than seven days lost, no file indexed) to his attention, and requesting a conference of all parties of interest with the insurance carriers and self-insurers, at which time the problem could be considered fundamentally. A date for this conference has not as yet been set.

Arbitrations.—Under the provisions of Section 13-g of the Workmen's Compensation Law, arbitration is provided when a carrier or employer has objected to the value of the doctor's services within the period of thirty days of the submission of the bill. The law as now worded does not force an employer to arbitrate a disputed bill nor does it provide any way of collecting such a bill should the employer refuse to arbitrate. While it is true that most insurance carriers do avail themselves of the opportunity of arbitration, this practice is less common among self-insurers and particularly among municipalities and other smaller communities which are self-insured and are subject to the provisions of the Workmen's Compensation Law.

Only recently have we been able to obtain the cooperation of the Board of Transportation of the City of New York to submit to arbitration. In many instances in which self-insurers have failed to object to a bill within thirty days in a compensable case and the bill, under Section 13-g, is presumed to be the fair and reasonable value of the services rendered, the bill is not collectable without court action.

We again urge an amendment to this section of the law as suggested by the Law Reform Committee of the Bar Association and introduced into the Legislature in the year 1941-1942. This bill failed of passage, but we understand that it will again be introduced this year. Its passage should be facilitated in every way, as it removes from litigation, through the civil courts, many bills, especially those small in amount.

For a number of years we have urged that no physician permit a carrier or employer to reduce a bill and offer an amount in settlement that is not consistent with the services rendered and the fees allowed by the fee schedule. We have also urged that no employer be permitted to take the 5 per cent discount for payment within thirty days of the receipt of bill when the bill is paid after the lapse of this period. We have requested physicians to bring to the attention of this Bureau specific instances of such action on the part of employers or carriers so that this abuse can be corrected. The threat of arbitration should not deter a physician from demanding full payment where the bill is a just one and in accordance with the fee schedule. Few responsible insurance carriers indulge in this practice, and

reported to this office will

Arbitration is an equitable procedure devoid of delay and fair to both sides. It removes from the civil courts numerous controversies over the value of medical services which are best determined by an

arbitration board of practicing physicians and specialists familiar with medical practice and with the compensation law. It is our opinion that arbitration is not sufficiently resorted to by employers and carriers, especially in the case of certain physicians whose bills are regularly objected to but rarely arbitrated. An investigation is now being conducted to determine upon what basis such bills are settled and how frequently the bills of certain physicians are settled without arbitration. Insurance carriers and employers should have a greater interest in submitting bills that they consider inequitable and improper to the scrutiny of the arbitration committee, rather than settling them under these circumstances. While it is not the function of the arbitration committee to do more than determine the reasonable value of the physician's service in accordance with the spirit and letter of the Workmen's Compensation Law and the fee schedule, the presence at arbitration of physicians, repeatedly, would enable the County Compensation committees to take such action as they deem proper and in accordance with the provisions of the law, should any improper practice be revealed.

It has been stated that the threat of arbitration has deterred certain physicians from treating compensation cases to the extent that such cases deserve, but it is not believed that this is often the case. Experience shows that most physicians, once they have accepted a patient for treatment under the Workmen's Compensation Law, fulfill their responsibilities to the claimant, even though at times some may be charged with unduly prolonging treatment.

Insurance carriers and employers should be made to conform to the rules of the Department of Labor regarding the informing of physicians of results of their medical examinations in the event that the carrier or employer believes the treatment should be stopped. This matter was gone into in detail in our previous reports, but we have reason to believe that employers and carriers still do not always state the reasons for refusing to authorize further treatment in protracted cases where their medical examination reveals that no further treatment is necessary. Unquestionably, prompt hearing before the Department of Labor and the avoidance of postponement or adjournment of hearings would materially curtail treatment in certain types of cases. The physician has an obligation to treat a patient until he has recovered from his injury or has reached the maximum benefit to be obtained from medical care. The constant postponement of hearings and the putting off of the determination of the degree of disability undoubtedly frequently requires continuation of treatment or observation by the attending physician until the Department of Labor has reached a verdict. A physician alone should not be made to carry the onus of prolonging treatment where the dilatory actions of others are to blame. We have frequently urged physicians not to use physical therapeutic procedures when such procedures are not indicated or when they have reached their maximum efficiency in the rehabilitation of the claimant. It is especially important when our country is at war that manpower be conserved and that time lost from work be reduced to the minimum. The procedures in the Department of Labor, as well as in the physician's office, should be mobilized to return the worker at the earliest possible moment to his former occupation or to some other useful occupation in accordance with his physical status.

During the year 1942 there were held 89 arbitration sessions in the metropolitan area and 11 in other

parts of the State. In the metropolitan area, 688 cases were arbitrated; up-state 51 were arbitrated. In a total of 739 bills, arbitration awards were held in all but 52. The amount in dispute in the metropolitan area was \$70,816.98, and the awards totaled \$37,879.48. This includes the cases in which no awards were made. In the upstate areas the amount in dispute was \$5,744.10, and the amount awarded, \$3,052.

It is interesting to note that the amount of the awards, including those cases in which no awards were made, ran close to 50 per cent in all areas of the State. This means that many bills were paid in full, others only in part. In numerous instances, part of the bills had been paid before arbitration and the balance subjected to arbitration. In 516 instances, bills scheduled for arbitration were settled at the time of arbitration without the necessity of a hearing.

Qualifications of Physicians.—The reader is referred to our report of last year, and to the report of the year prior to that, on the question of limited qualifications.

Wherever in the fee schedule the rule calls for payment of a fee to a "specialist" there arises a situation as to how the practitioner with a limited specialty rating, not a so-called "full specialist," shall be paid.

In view of the fact that the fee paid to a surgical specialist for a complete examination or consultation is a minimum of \$10.00, it is our opinion that where a surgeon with an XA rating is qualified to act as consultant and to accept patients from other physicians for operations, he should, when acting in this capacity, receive the same fee as the consultant with the SA rating. He should also receive the fees stipulated in the schedule for various surgical procedures. The question arises as to the fairness of the previous limitation by agreement of referrals to SA men only. In view of the shortage of physicians in various parts of the State, and, further, because of the fact that an "A" rating requires high surgical qualifications according to our standards, consideration must be given to a revision of our rules, which have applied particularly to the larger cities, on the limitation of referrals and consultations to men with the SA rating.

Since the XA surgeon is well qualified, although not as experienced in all instances as the SA surgeon, we believe that for the average uncomplicated surgical condition the services of the XA man should be made available, especially for such operations as herniotomies. No surgeon has been or should have been given an XA rating who is not qualified to operate on such a case. Otherwise, he is not entitled to the XA rating. Furthermore, it would seem that our rule permitting a surgeon with an XA rating to operate on patients who come to him directly but not to accept referred cases is ambiguous. If the XA surgeon is competent to operate on a hernia patient who comes to him directly, he is just as competent to operate on this type of patient referred to him by another physician. Occasionally there may be doubt as to the qualification of the XA man to accept for consultation or treatment a certain patient. On the whole, this question would have to be decided in nonemergencies by reference to the county society Compensation Committee which has qualified the physician. They are in possession of all the credentials and know his limitations. The employer or insurance carrier may learn with dispatch whether, in the opinion of the compensation board which qualified him, the particular physician is experienced enough to cope with a certain situa-

tion. It is recommended that this practice, which is now frequently used in the large cities, be more universally adopted.

Since the fees for specialists in branches other than surgery are higher for the specialist than for the limited specialist, the question frequently arises as to what fees to pay an XE man, for example. If a physician so qualified treats an eye condition, should he be paid the specialist rates for consultation and operation, or a part of these fees? It is our opinion that the same rule that applies in regard to consultations and referred cases should apply in the case of the XE man. The ophthalmologist must be qualified in order to obtain the XE rating. In rural areas where the XE man is often the only ophthalmologist available, we believe he should be paid the full specialist's fee for all work done within his specialty, including operative procedures. Here again the XE rating should not be given unless the physician, although not always confining himself exclusively to his specialty, is well qualified in accordance with the standards set up for ophthalmologists. In a large measure the same rule should apply to other physicians who have been given limited qualifications based on the extent of special practice rather than upon the limitation of professional ability. We know that certain insurance carriers have been in the habit of settling bills of certain XE men in large cities by paying them a fee of \$5.00 for the first examination, the full fee for operative procedures, and regular practitioners' rates for subsequent visits. The question arises whether this practice should not be stopped and full payments made where the services are satisfactory.

Physicians who have been given limited qualifications in the various cities should prepare themselves for the obtaining of full specialty ratings as soon as possible and in accordance with the rules of qualification laid down by the county medical societies' compensation boards. In rural areas where physicians are thoroughly qualified the compensation committees might consider granting full specialty ratings, even though the specialist does a small percentage of work outside his specialty. In these circumstances a good rule to follow is to base a decision as to the specialist rating on whether the individual is regarded by his colleagues as especially qualified and is a consultant in his specialty in private practice. Nobody knows this better than the local compensation boards in the smaller counties.

Consultation or Complete Examination Fee Before Operation.—A certain insurance carrier fairly regularly objects to paying a fee for a complete examination by a surgeon examining a referred or direct patient in whom operation is subsequently deemed advisable and the operation is performed by the consultant. It is our opinion that such fee is justifiable and not included in the operation fee. Where the examination was required and was complete as indicated in the schedule, the surgeon or other specialist should be paid as if the consultation or examination were unconnected with the subsequent operation.

Administrative Procedure—Department of Labor.—We would again strongly urge that the Department of Labor change its administrative procedure so that a copy of the medical examination of the medical examiner of the Department of Labor be sent to the patient's attending physician. At present such reports are stamped with a notice to the claimant to show the report to the doctor. This is not always done and the physician may be in ignorance of the ruling of the referee and the opinion

of the medical examiner, especially where the question of the necessity for further treatment arises. Were this procedure adopted, physicians could immediately contact the employer or insurance carrier and argue out the question of the need for further treatment or submit the case to a third well-qualified physician mutually agreeable to both parties.

As matters now stand we repeat our admonition of last year:

Physicians should be on the alert and should request such reports from claimants after hearings and medical examinations at the Department of Labor. These reports should be retained as part of the physician's record. Where the report contains a recommendation concerning medical treatment with which the physician does not agree, he should in writing notify both the employer or insurance carrier and the Department of Labor of his opinion and recommend that the patient demand another hearing, to which the attending physician may be subpoenaed to appear by the claimant or, if he cannot appear, provide the claimant with the necessary factual data on which his opinion as to medical treatment is based.

We again strongly recommend a change of procedure for examination by the medical examiner of the Department of Labor on the question of the necessity for treatment.*

Wherever possible under present conditions no opinion should be given in the absence of full and complete data furnished by the attending physician. He should, furthermore, be notified in advance by the employer or insurance carrier that this issue will be raised at the time of the hearing or examination. Wherever possible the attending physician's presence should be required if he has not in advance agreed that treatment may be stopped or if the claimant himself insists upon further treatment. The ultimate solution of this difficult and vexing problem will depend upon the creation of the boards of experts employed by the Department of Labor on a full- or part-time basis, preferably the latter. They should be advisory to the referees and the Industrial Board on questions of treatment and concerning other problems related to the adjudication of the claim from a medical standpoint. These recommendations were originally made by the Medical Society of the State of New York to the commission appointed by Governor Lehman in 1932 to study and report on the medical administration of the Workmen's Compensation Law.

Section 13(d).—We again urge consideration of the further extension under Section 13(d) of the use of impartial specialists in the determination of causal relationship and compensation in difficult cases.

"Under Section 13(d) the Industrial Board or referee upon the recommendation of the chief medical examiner of the Division of Workmen's Compensation of the Department of Labor, when hearing a claim for compensation, may require examination of any claimant by a physician especially qualified with respect to the diagnosis or treatment of the disability for which compensation is claimed and may require a report from such physician on the diagnosis, the causal relationship between the alleged injury and subsequent disability, proper treatment, and the extent of the disability of such claimant. These so-called 'impartial specialists' are designated by the Commissioner from a panel of especially qualified physicians submitted by the Compensation Boards of the various county medical societies.

These lists may be added to from time to time if the Commissioner requires additional names. The employer or his insurance carrier pays for such examinations in an amount set by the Industrial Commissioner.

"It was hoped when this addition to the Workmen's Compensation Law was made in 1935 that impartial experts would frequently be called upon by the Department of Labor to decide difficult medical problems confronting the referees and the Industrial Board. Experience proved, however, that in spite of the large number of controverted cases before the Department such impartial examinations have been held relatively infrequently. Rarely have more than 300 such examinations been held in the entire State in any one year in all specialties.

"When the revision of the Law was studied in 1932, it was the opinion of the State Medical Society Committee that boards of experts should be set up by the Department of Labor in the various specialties, either on a full-time or part-time basis, to consider medical controversies and act in an advisory capacity to the referees on the problems presented involving causal relationship, degree of disability, necessity for medical treatment, and other medical questions involving industrial accidents and diseases. Instead of boards of experts, the above panel of 'impartial experts' was provided for in the Law, and in our opinion this procedure has not added materially to the effectiveness with which claims are settled by the Department of Labor. Furthermore, in recent years the ordinary medical examiners of the Department of Labor have been asked on numerous occasions to decide the question of the necessity for further treatment of a claimant, a task for which they are not generally fitted either by training or experience. Furthermore, owing to the limitations of time and space, they are unable adequately to review the history of the case and make an adequate survey of the problem presented and render an opinion that can do justice to all parties in interest.**

Department of Labor.—In our report last year we made certain recommendations for improvement in the procedure of the Department of Labor. During the latter months of Governor Lehman's term the Moreland Act Commission was appointed, headed by Judge William F. Bleakley and Mr. H. T. Stichman, counsel. The Commission is now making a thorough investigation of Workmen's Compensation procedure in this State. Therefore, we shall not at this time comment further on certain administrative procedures in the Labor Department which affect the medical care of claimants.

Miss Frieda S. Miller, Industrial Commissioner, resigned, and Mr. Michael Murphy, the Deputy Commissioner is now Acting Commissioner, pending the appointment of an Industrial Commissioner by Governor Dewey.

In view of the pending investigation, which we have reason to believe will be thorough in nature and scope, we deem it inadvisable to make any recommendations for new legislative enactments affecting Workmen's Compensation but advise awaiting the result of the Moreland Act Commission's work. We hope to have an opportunity to participate at an opportune time in whatever meetings are held by the Commission.

* We refer the reader to the Benjamin Report, cited later in this article.

** See Benjamin Report.

Mr. Edward Corsi has recently been appointed Chairman of the Industrial Board of the Department of Labor by Governor Dewey.

Medical Examination vs. Medical Inspection (The conflict between Section 13-a(4) and Section 13-j(1)).—Under the provisions of Section 13-a(4) the carrier or employer must give notice to the attending physician before conducting a medical examination. If the claimant is not confined to a hospital, such notice must also be given to him and, if he is represented, to his attorney or other representative. The place of examination must be reasonably convenient to the claimant or his physician. Examination shall not be made without the claimant's physician being present unless he waives such right. No representative of the parties, other than the physician of each, shall be present at such examination except by mutual consent. Any report of such examination duly certified shall be filed with the Department of Labor or the employer or carrier. Refusal on the part of a claimant to submit to such an examination may bar him from recovering compensation for any period during which he has refused to submit to such examination.

Section 13-j(1) refers to medical or surgical treatment by insurance carriers or employers. After indicating that an insurance carrier or employer shall not participate in the treatment of injured workmen, the section states that it may employ medical inspectors to examine compensation cases periodically while under treatment and report on the adequacy of medical care and other matters relative to the medical conduct of the case. There are no other provisions requiring notice to the physician or examination in his presence or any indication of the place at which the claimant is to be examined. This medical inspection must be made by a physician who may question the claimant in general as to his condition, and the actual medical examination may be nothing more than an observation.

This essentially is the difference between the medical examination under Section 13-a(4) and Section 13-j(1). Carriers usually agree that the medical inspection is primarily a routine check-up. Usually the medical inspector will not remove bandages or dressings or interfere in any way with the treatment being rendered by the attending physician. The difference between the "examination" and the "inspection" is not clearly defined, however.

Many insurance carriers assume that any medical examination is an inspection and do not give notice of same to the attending physician. Frequently the medical inspection is the preliminary to the referral of the claimant to a specialist for more complete examination. Furthermore, it is cheaper for the carrier to have a medical inspection under Section 13-j(1) than to have a complete medical examination under Section 13-a(4), where the physician's presence is required. The medical inspection may also be used to obtain certain confidential information in the absence of the attending physician. There is no penalty under Section 13-j(1) if the claimant refuses to appear for the medical inspection. There is a penalty provided in Section 13-a(4) as given above. In order to apply the penalty, the carrier would have to invite the attending physician to be present, and then, if the claimant refused examination, the Department of Labor could enforce the penalty. It is true that claimants rarely raise any objection to the inspection and physicians only infrequently, especially if the carrier has the courtesy to notify the physician that they wish an inspection. Failure to grant either an examination or an inspection usually

results in the early stages of the case in the controversy of the claim before the Department of Labor, requiring a hearing. While it is incumbent upon every insurance carrier to file a report with the Department under rules laid down by the Labor Department, effective February 27, 1942, the Compensation Insurance Rating Board, speaking for the carriers, objected on a number of grounds to these filing requirements, alleging that the reports were paid for by the carriers and were their property. Another objection was that the filing would compel the employer or carrier to expose to the claimant or his representative the defense in an improper claim and the disclosure of confidential material needed in the defense of the claim. The ruling of the Board was modified so as not to require the filing of reports of medical inspections under Section 13-j(1).

This again brings up the question as to the difference between a "medical inspection" under Section 13-j(1) and a "physical examination" of the claimant under Section 13-a(4). The claimant's representative could, of course, request the referee to direct the carrier to produce the report of the "inspecting" doctor, and where the carrier did not accede voluntarily the referee might indicate to the claimant that he could obtain his own medical evidence, which under a recent ruling might have to be at the claimant's own expense if for evidential purposes. In some instances, however, the referee would direct the carrier to produce the evidence. There should be a clarification of the difference between medical examination under Section 13-a(4) and the medical inspection under Section 13-j(1) and the necessity of filing the latter report with the Department of Labor. It is our opinion that the spirit of the law at least would indicate that any medical examination or inspection by the employer or carrier should be conducted under the provisions of Section 13-a(4) and that Section 13-j(1) is merely an addendum to the rule which prohibits a carrier from engaging in medical practice, though entitling him to examine the claimant under certain specified conditions.

Fees for Testimony at Hearings.—Under date of June 7, 1940, the Industrial Board ruled that "a physician, other than the attending physician, who testifies at hearings or examines claimants or participates in examinations for evidential material for compensation hearing purposes only, may accept fees for such services from claimants or employers or carriers. In no event shall this fee be fixed by the referee."

Section 13-f, paragraph 2, states, "whenever his attendance at a hearing is required, the physician of the injured employee shall be entitled to receive a fee from the employer or carrier in an amount to be fixed by the Commissioner (i.e., the referee), in addition to any fee payable under Section 120."

Under the free-choice principle, a claimant has the services of an authorized physician and specialist at his disposal. Before the law was changed in 1935 medical representation at hearings was confined mainly to physicians employed or authorized by the insurance carriers and employers. In controverted cases the referee, on recommendation of the chief medical examiner of the Department of Labor, may submit the case to an impartial specialist for examination and report, and this examiner may subsequently be called in for cross-examination by the claimant. However, the appointment of "especially qualified" physicians is not carried out to any extent at this time. Therefore, it would seem that the claimant is entitled not only to treatment but also to the services of a specialist as a part of the expense

incurred as a result of his injury to determine the extent of his injuries and disability, in order to protect his claim before the Department of Labor. Claimants these days are more frequently represented by lawyers or claim representatives than heretofore, but there is still a large percentage who have no legal representative. It would seem that in accordance with the spirit of Section 13-f(2) the referee should be the deciding factor as to whether the specialist called in for the purpose of examining the claimant, and aiding him in the presentation of his claim, should be paid. Even though the claimant may have a representative, he may be unable to pay for the services of a specialist. It is true that the attending physician may foresee the necessity of establishing the claim by expert testimony, in addition to his own, and may call in a specialist during the treatment of the case—under which circumstances the specialist could then be considered one of the attending physicians. Under these circumstances there would be no bar to the payment under the present rule of the Industrial Board.

Insurance carriers are able to employ one or more experts, and to refuse the payment for testimony of at least one of the claimant's experts would put him to great disadvantage. Therefore, it would seem that the rule of the Industrial Board works a hardship in certain instances and should be rescinded, with appropriate recommendations to control any abuse on the part of claimants and claim representatives in calling more specialists than necessary or when unnecessary. We believe the rule should be based upon the necessity of expert testimony to establish a particular claim.

Chairman, Osteopathic Society Compensation Board.—Dr. C. M. Bancroft has retired as Chairman of the Compensation Law Board of the New York State Osteopathic Society, and Dr. Melvin B. Hasbrouck, 90 State Street, Albany, New York, has been appointed in his place. We are pleased to report that we may expect the same close cooperation from Dr. Hasbrouck that we have always received from Dr. Bancroft, who represented his Society ably and conscientiously within the spirit of the Workmen's Compensation Law.

Routine Duties of Workmen's Compensation Bureau.—Owing to the limitations of space, we will not attempt to comment on the routine duties of the Bureau during the past year. Because of the war, these have increased to a large extent and have resulted in the receipt of many more communications from Compensation Boards and individual physicians throughout the State than in previous years.

We are happy to report that despite the entrance of many officials of the county medical societies into the armed forces, other physicians have been appointed to replace those who entered service and the work of Compensation Boards is proceeding satisfactorily.

As usual your Director attended hearings before the Industrial Board and the Industrial Council of the Department of Labor, and numerous conferences with the Insurance Carriers' Organization.

In addition, your Director has attended meetings called by various committees of the State Medical Society, the Council, and other groups, as well as those of the Legislative Committee. The Bureau has been particularly active in the arbitration of bills of physicians who went into service and invites inquiries from physicians who are about to enter the services and wish to have their rights under the law protected.

First Aid Stations.—The attention of Compensation Boards throughout the State is called to the

necessity of vigilance regarding medical bureaus and first aid stations. Medical bureaus licensed by the Department of Labor on recommendation of the Compensation Committees of the county medical societies should be inspected from time to time to see that they are run in accordance with the provisions of the law and that medical care and the attendance of physicians are adequate. Attention should be given to practices of first aid stations which are not entitled under the law to treat Workmen's Compensation cases beyond the emergency or first aid visit. All instances where plants having established first aid bureaus are believed to be violating the Compensation Law should be immediately reported to this office for investigation.

Some provision should be made in our Compensation and Public Health Laws to govern first aid stations as to equipment, personnel, and scope of practice. There is none at the present time. Provision should also be made to include first aid stations under the Workmen's Compensation Law so that they may be subject to medical supervision.

Medical societies' Compensation Boards should be vigilant in investigating reports that employers or medical bureaus are violating the spirit of the Workmen's Compensation Law regarding free choice. An injured employee who waives his right to free choice and elects to be treated in a medical bureau or by a physician of the employer's choice may at any time select his own physician or specialist. Any complaint that this freedom of choice is being denied a claimant should be investigated and this Bureau will afford any help possible in correcting the situation.

Cost of Maintaining Medical Practice.—In answer to Communication No. 48 (which was supplementary to Communications No. 39 and No. 45) addressed to the county medical societies on January 15, 1943, in which we requested additional information concerning the cost of maintaining medical practice and of all items entering into this cost, we have thus far received replies from 20 county medical societies. The majority of these indicate the basis for an increase which we have requested from the Industrial Commissioner and support such demand for an increase. Owing to the change of administration, it was deemed inadvisable to submit this additional information to the acting Industrial Commissioner. A comprehensive investigation is being made of the administration of the Workmen's Compensation Law in all its ramifications by the Moreland Act Commission, which will have a bearing on our request for increased fees. We are prepared at the opportune moment to press our claim for an increase and for removal of the discount allowed by the previous Commissioner for payment of bills within the thirty-day period after their submission.

Interns and Assistants to Surgeons.—Because of the shortage of interns, many hospitals are so undermanned in this respect that no interns are available for assistance at operation in private and semiprivate cases, including compensation cases. It will be necessary, therefore, for physicians operating on compensation cases to call to assist them qualified physicians who will be entitled to a fee for surgical assistance under the Workmen's Compensation Law in accordance with Item 15.*

The above condition prevails principally in the smaller communities throughout the State and has not as yet become very acute in the larger cities.

* See exceptions under Items 375, 376, 380, 381, now under discussion with the Compensation Insurance Rating Board.

This is in accordance with the rule that wherever hospital interns are available, private assistants, except under most unusual circumstances, are not to be called in.

Report of Hon. Robert M. Benjamin.—The report of the Hon. Robert M. Benjamin as Commissioner, under Section 8 of the Executive Law on Administrative Adjudication in the State of New York, is in press at the time of this writing.

It is a comprehensive review of Administrative procedures under the Workmen's Compensation Law, consisting of some 380 pages. The report is replete with information concerning every aspect of the administration of the Law from the standpoint of the claimant, his legal or lay referee, the physician who treated him, the insurance carrier or employer, and the various divisions of the Department of Labor and the Industrial Council. It goes into the question of the appointment of at least one physician member of the Industrial Board, as well as the appointment of physician referees. The report does not recommend the adoption of these suggestions and gives the reason for such opinion.

In respect to the medical bureau of the Division of Workmen's Compensation, the report states: "It is of paramount importance that a claimant leave an examination by a State doctor with the feeling that the examination has been fair and that he has been treated with decent consideration. It is not too much to say that failure at this point is likely to destroy a claimant's confidence in the fairness of the whole compensation procedure. Without minimizing the importance of the manner and conduct of referees, it may be pointed out that the circumstances of a physical examination emphasize the importance of these factors in the contact between a claimant and the medical representative of the State. Observation discloses that there is considerable room for improvement. It is recommended, among other things, that civil service examinations take account of the special qualities of interest and temperament that are necessary for the most satisfactory performance of a State doctor's work."

It was further recommended that additional types of medical specialists be included in the personnel. The Department already has a board of experts on dust diseases and silicosis, and one or more of the physicians of the Department have special aptitudes, but so far there are no specially qualified physicians assigned to the Department who are recognized experts in such fields as neurology, psychiatry, orthopaedic surgery, roentgenology, internal medicine, etc.

The determinations of the necessity for further medical care at present are under the jurisdiction of referees of the Department of Labor, who may, after a hearing, authorize medical care. Under Section 19 of the Labor Law, a decision of a referee is deemed the decision of the Industrial Board; therefore, it would seem that the decisions as to medical care and authorization under section 13-a(5) be within the province of the Industrial Board. The problem presented by section 19-b of the Workmen's Compensation Law is more complicated. This section antedates the free-choice amendment of 1935, according to the Benjamin Report, which gives to an injured employee the right to select any physician authorized by the Industrial Commissioner to render medical care. Under these amendments, the statutes provide that medical care should be furnished by the employer or carrier, and the employee could secure care by a physician of his

own choice, at the expense of the employer or carrier, only if they failed to provide medical care within the statutory period. The Commissioner reports: "The free-choice amendment should logically have included, but did not include, an amendment of Section 19-b. This section provides that a State doctor may recommend certain treatment, and that the referee shall direct the employer or carrier to provide such treatment, but without designating the particular physician or hospital to provide same. Obviously the provisions of Section 19-b are meaningless in the context of the free choice amendment. They have nevertheless been relied on to some extent to justify the present practice of referees in deciding questions of further medical care both with respect to items covered by Section 13-a(5) and with respect to other items. While the reliance is recognized to be legally feeble, the practice of participation by referees in the decision of such questions appears to be a desirable element in the solution of the problem of further medical care." The report then goes on to state: "It is recommended that Section 19-b be amended to eliminate the practice referred to above, and to substitute therefor (though probably not in the same section) provision empowering the Industrial Board (that is, the Board itself or the referees) to decide that further medical care, of a kind to be specified in its decision, is necessary, and providing that such a decision shall be binding in any arbitration proceeding under Section 13-g, as to the necessity of that kind of treatment (but not as to the extent of the treatment of that kind rendered, or as to the amount of the charge therefor)."

The report further states that the relation of the proposed new statutory provisions to the provisions of Section 13-a(5) should be noted. Section 13-a(5) provides that with respect to certain items of medical care the claimant's physician or hospital shall receive no compensation unless such care has been authorized by the employer or the Department (or unless such authorization has been unreasonably withheld, or unless such services are required in an emergency).

"It is not intended by the new statutory provisions to extend to other items a requirement of proper authorization as a condition of the physician's or hospital's right to receive payment. It is intended by the proposed provisions to empower the industrial board to decide, with respect to all items of further medical care, the question whether or not care of that kind is necessary, when that question is submitted for its decision. Under the proposed new statutes, as has been noted, questions as to the extent of treatment and the charge therefor will remain open for arbitration where they arise. Such questions may, in certain circumstances, also arise in cases under Section 13-a(5)." Further, "The purpose of the proposed statute is clear. It is to give assurance to the claimant's physician or hospital in a proper case that medical care of a particular kind will be compensated, and thus to assure that there will be no reluctance on the part of the physician or hospital to provide such care for fear that payment may later be refused on the ground that the care was not necessary. The removal of such doubts by agreement on questions of further medical care between the claimant's physician or hospital and the carrier's physician is to be encouraged, but there will undoubtedly continue to be cases where no such agreement can be reached; and it is to meet such cases that the recommendation is made to validate by statute the existing practice of referee decision."

Reference to our reports will indicate that we have, of the problem of authorization under Section 13-a(5) and the question of the necessity for further medical care. We have frequently urged that where no agreement can be reached between the attending physician, whose duty it is to render medical care, and the physician of the employer or carrier, who serves the interest of his employer, there should be resort to the Industrial Board of the Department of Labor for a final decision. This is in accordance with the amendment to the Workmen's Compensation Law offered by the Law Reform Committee of the Bar Association in 1942, which failed to pass. It requires, however, a proper and expert medical staff available to the Industrial Board and the referees, who will make a careful and unburied examination of the claimant, taking into consideration the history and record of the case and the opinion of the attending physician before rendering a decision. In certain types of cases it is our experience that there must be a final body to decide on the necessity and continuation of treatment. This would expedite the determination of functional disability by referees and hasten the judicial procedure before the Department of Labor.

The report continues: "The administration of Workmen's Compensation in New York has a history of more than twenty-five years. The present study of the procedural aspects of that administration has shown what is, generally speaking, a history of development in the right direction. Various elements of the procedure are clearly subject to improvement; but it is to be recognized also that a great deal has already been achieved after considerable effort and experimentation, and that such effort and experimentation are continuing.

"The importance of continuing development in the right direction is obvious. In every year for a considerable period of years, well over 100,000 injured employees have come into direct contact with the compensation system, and as many as 400,000 more have knowingly or unknowingly come within the jurisdiction or scrutiny of those administering the system, through the filing of an attending physician's report of an industrial accident or of one of the other reports that have been described. The system results in the payment of, roughly, \$45,000,000 a year by way of direct money benefits and medical benefits; and the cost of administering the system is roughly \$1,500,000 a year."

We believe it has been amply proved that the free-choice principle has been a forward step in Workmen's Compensation legislation. It has drawn into the service of injured claimants practically all of the best qualified physicians in the profession, and has given the claimant the services of a physician in whom he can have confidence both with respect to medical care and to the adjudication of his claim before the Department. There are ample means of protecting the interests of employers and carriers under existing law and proposed amendments to the law if only employers and carriers would avail themselves of them. The constituted compensation committees or boards of medical societies are eager to carry out their responsibilities with respect to improper medical practice and other dereliction on the part of physicians, but in this duty they require the support and cooperation of employers and insurance carriers. This cooperation is invited to the end that the free-choice principle may operate to the benefit of all parties of interest and particularly with a view of keeping within reasonable bounds the cost of

medical care which, ultimately, is borne by the consumer.

Joint Committee.—For some time we have urged the formation of a joint committee consisting of representatives of the insurance carriers, self-insurers, this Committee to serve as a forum to discuss our mutual problems and expedite the administration and technical details of the Workmen's Compensation Law. Up to this time we have not been able to effect such a relationship and strongly urge it as an important step in the direction of fostering better cooperation between the medical professional and the above groups.

Procedures Regarding Compensation.—We must again request the cooperation of all authorized physicians in their own interest in the following procedures:

1. Filing of the C-4 report within forty-eight hours with the insurance carrier and the Department of Labor. If the carrier is not known, or if the employer is a self-insurer, send reports to the employer as well as to the Department of Labor, and request the employer to forward same to carrier at once.
2. File C-4 report within fifteen days in as much detail as possible. If the case has been completed in a few visits, the C-4 report alone may be submitted at once and marked *final* and may, under these circumstances, take the place of a C-104.
3. File progress reports every three or four weeks, even if not requested to do so, and if physical therapeutic treatments are to be prolonged beyond the \$25 limit, make such request on a C-14 report, giving reasons for the request.
4. Do not fail to request authorization, in writing, for operations or consultations over \$25, or x-ray or laboratory examination over \$10. Even in an emergency where such authorization is not required, it is advisable to inform the employer or carrier of the procedure.
5. Send bills promptly and fully itemized. In protracted cases, send bills periodically.
6. Keep copies of all reports and correspondence, and when communicating by telephone ascertain the name of the person spoken to and record same.
7. When accepting a case previously treated by another physician, personally contact said physician and confirm the transfer by letter as required by the regulations.
8. In all old cases returning for treatment, file additional C-4 reports at once. In old cases, where patient was treated by another physician, contact said physician and insurance carrier and learn the facts about the standing of the claim and previous medical, x-ray, and laboratory examination. File reports promptly.
9. Consultants should send reports on their own stationery to the attending physician, insurance carrier or employer, and the Labor Department. Authorization should be obtained for x-ray and laboratory procedures in excess of \$10, and in doubtful cases the carrier or employer should be contacted to determine whether such examinations have not been made recently. This avoids duplication, unnecessary expense, and disputes over bills.
10. Where the patient is referred by a claim representative or attorney for evidential purposes, demand a fee for examination in accordance with Labor Department regulations.
11. Where the patient was injured by a third party and a third party action is imminent, ascertain from the patient's attorney or carrier the date of the beginning of the third-party action. Make

This is in accordance with the rule that wherever hospital interns are available, private assistants, except under most unusual circumstances, are not to be called in.

Report of Hon. Robert M. Benjamin.—The report of the Hon. Robert M. Benjamin as Commissioner, under Section 8 of the Executive Law on Administrative Adjudication in the State of New York, is in press at the time of this writing.

It is a comprehensive review of Administrative procedures under the Workmen's Compensation Law, consisting of some 380 pages. The report is replete with information concerning every aspect of the administration of the Law from the standpoint of the claimant, his legal or lay referee, the physician who treated him, the insurance carrier or employer, and the various divisions of the Department of Labor and the Industrial Council. It goes into the question of the appointment of at least one physician member of the Industrial Board, as well as the appointment of physician referees. The report does not recommend the adoption of these suggestions and gives the reason for such opinion.

In respect to the medical bureau of the Division of Workmen's Compensation, the report states: "It is of paramount importance that a claimant leave an examination by a State doctor with the feeling that the examination has been fair and that he has been treated with decent consideration. It is not too much to say that failure at this point is likely to destroy a claimant's confidence in the fairness of the whole compensation procedure. Without minimizing the importance of the manner and conduct of referees, it may be pointed out that the circumstances of a physical examination emphasize the importance of these factors in the contact between a claimant and the medical representative of the State. Observation discloses that there is considerable room for improvement. It is recommended, among other things, that civil service examinations take account of the special qualities of interest and temperament that are necessary for the most satisfactory performance of a State doctor's work."

It was further recommended that additional types of medical specialists be included in the personnel. The Department already has a board of experts on dust diseases and silicosis, and one or more of the physicians of the Department have special aptitudes, but so far there are no specially qualified physicians assigned to the Department who are recognized experts in such fields as neurology, psychiatry, orthopaedic surgery, roentgenology, internal medicine, etc.

The determinations of the necessity for further medical care at present are under the jurisdiction of referees of the Department of Labor, who may, after a hearing, authorize medical care. Under Section 19 of the Labor Law, a decision of a referee is deemed the decision of the Industrial Board; therefore, it would seem that the decisions as to medical care and authorization under section 13-a(5) be within the province of the Industrial Board. The problem presented by section 19-b of the Workmen's Compensation Law is more complicated. This section antedates the free-choice amendment of 1935, according to the Benjamin Report, which gives to an injured employee the right to select any physician authorized by the Industrial Commissioner to render medical care. Under these amendments, the statutes provide that medical care should be furnished by the employer or carrier, and the employee could secure care by a physician of his

own choice, at the expense of the employer orrier, only if they failed to provide medical within the statutory period. The Commissioner reports: "The free-choice amendment should logic have included, but did not include, an amendment Section 19-b. This section provides that a S doctor may recommend certain treatment, and the referee shall direct the employer or carrier provide such treatment, but without designating particular physician or hospital to provide sa Obviously the provisions of Section 19-b are mean less in the context of the free choice amendm They have nevertheless been relied on to some tent to justify the present practice of referees deciding questions of further medical care both v respect to items covered by Section 13-a(5) and v respect to other items. While the reliance is rec nized to be legally feeble, the practice of partici tion by referees in the decision of such questions pears to be a desirable element in the solution of problem of further medical care." The report tl goes on to state: "It is recommended that Sect 19-b be amended to eliminate the practice refer to above, and to substitute therefor (though pr ably not in the same section) provision empower the Industrial Board (that is, the Board itself or t referees) to decide that further medical care, of kind to be specified in its decision, is necessar and providing that such a decision shall be bindi in any arbitration proceeding under Section 13- as to the necessity of that kind of treatment (b not as to the extent of the treatment of that kin rendered, or as to the amount of the charge ther for)."

The report further states that the relation of tl proposed new statutory provisions to the provisio of Section 13-a(5) should be noted. Section 13-a(provides that with respect to certain items of medic care the claimant's physician or hospital shall r ceive no compensation unless such care has bee authorized by the employer or the Department (unless such authorization has been unreasonable withheld, or unless such services are required in a emergency).

"It is not intended by the new statutory provision to extend to other items a requirement of prop authorization as a condition of the physician's c hospital's right to receive payment. It is intende by the proposed provisions to empower the indus trial board to decide, with respect to all items o further medical care, the question whether or no care of that kind is necessary, when that question i submitted for its decision. Under the proposed nev statutes, as has been noted, questions as to the exten of treatment and the charge therefor will remain open for arbitration where they arise. Such ques tions may, in certain circumstances, also arise in cases under Section 13-a(5)." Further, "The pur pose of the proposed statute is clear. It is to give assurance to the claimant's physician or hospital in a proper case that medical care of a particular kind will be compensated, and thus to assure that there will be no reluctance on the part of the physician or hospital to provide such care for fear that payment may later be refused on the ground that the care wa not necessary. The removal of such doubts by agreement on questions of further medical care be tween the claimant's physician or hospital and the carrier's physician is to be encouraged, but there will undoubtedly continue to be cases where no such agreement can be reached; and it is to meet such cases that the recommendation is made to validate by statute the existing practice of referee decision."

ministration, is to provide medical care for indigent migratory workers.

Coroner System.—Attention was directed to the need of improvement in the coroners' system in the State of New York, with the main idea that post-mortem examinations should be conducted by properly trained pathologists. The subject was also taken up with the Legislative Committee, the New York State Association of Public Health Laboratories, and the New York State Association of Funeral Directors.

The Public Relations and Economics Committee is, of course, much interested in the work of the Legislative Committee and the Committee on Publicity, and it was much pleased to note the public benefit from the activities of these important Committees.

The Public Relations and Economics Committee is aware that at all times the relationship of organized medicine with the people of this country should result in that honest and open understanding so necessary and helpful to progress in public health. Now that we are in this great struggle of winning the war, our unselfish efforts and cooperation will be all the more sustaining and comforting to the citizens whom it is our duty and privilege to serve. Thought, of course, has been given to the status of medicine after the peace. Inquiry made on a wide scale brings usually a heart-felt response from the individual, the family, and the home—"We are sorry we lost our doctor, but they need him. We hope he returns soon." May this be true.

PART XI

Status of Foreign Physicians

The Council has carried out the directions laid down at your 1942 meeting to:

1. "Make a study of the present and possibly the contingent future problem confronting the public and the medical profession.
2. Formulate a plan
 - (a) "Taking into consideration the protection of the public."
 - (b) "For the preservation of the standards of the medical profession."
 - (c) "The safeguarding of the rights and legal interests of the members of that profession."
 - (d) "With humane consideration of the situation of the emigre noncitizen physician."

3. "Present the report of such studies and their recommendations for the solution thereof and the means for its accomplishment, both present and future, at the next meeting of this House of Delegates."

4. "That the Council take such steps in the interim between this and the next meeting of this House of Delegates to properly safeguard the medical interests of the armed forces of the United States, the State of New York, the public health and welfare, and the existing standards of the profession of medicine."

A committee was appointed consisting of: F. Leslie Sullivan, M.D., *Chairman*, Scotia; Howard Fox, M.D., New York; David A. Haller, M.D., Rochester.

The Committee made a factual study which was published in the January 15, 1942, issue of the *NEW YORK STATE JOURNAL OF MEDICINE*, after submission to the Council. Reprints will be distributed

before the Meeting—with notations of certain minor corrections.

The Council adopted the following recommendations made by its Committee:

- "1. There should be continued coordination between the State and County War Participation Committees and Procurement and Assignment to preserve a favorable balance of medical personnel throughout the State to protect the man who goes into service.
- "2. Through the combined activities of Procurement and Assignment, War Participation Committees, and the Public Relations Committees of the State Society and the counties, the Council shall make itself cognizant of the areas where medical manpower shortage might prevail and do all in its power through these committees to persuade selected physicians to move into these areas for the benefit of the public health and the protection of the man in active service.
- "3. Change the State Education Law, Sec. 1256, Ch. 1, to read: 'is more than 21 and a citizen of the United States.' Delete 'or has declared his intentions of becoming a citizen'; or change the requirements by rule of the Board of Regents. This recommendation is made with consideration that such a move will be made at the opportune time.
- "4. First, as Dr. Cottis suggested, we should increase the school loads, to put out more native physicians as far as this is possible; second, let the public know that the State Medical Society is not desirous of lowering the quantity of physicians and surgeons but rather to maintain their quality.
- "5. That Procurement and Assignment, in line with the refore published, 1,000 of the state's approximate 3,000 licensed emigres. This, with 'humane consideration,' would equal the percentage of native physicians already utilized for military service."

In regard to recommendation No. 3, the Council referred this to its Legislative Committee with the understanding that the Committee would exercise its discretion and judgment as to an "opportune time" for legislation involving such a change in the Medical Practice Act.

PART XII

Miscellaneous

Travel Expenses of Delegates to A.M.A.—The Council recommends that Chapter X of the Bylaws be amended to allow delegates to the American Medical Association the usual travel expenses such as are allowed to members of Council, Trustees, Censors, and members of Committees, instead of only "railroad transportation and Pullman accommodations." To that end the Council submits the following amendment:

In Chapter X, Section 1, of the Bylaws delete the sentence which reads: "The delegates to the American Medical Association who have attended each session of the House of Delegates of that Association and who shall have filed with the Secretary evidence of such attendance shall be allowed the actual cost of railroad transportation and Pullman accommodations to the place of meeting and return."; and insert in its place the

arrangements with claimant for payment of all medical services from this date.

12. If claimants are within the draft age, ascertain at once from the carrier whether the claim will be controverted on the question of accident, notice, or causal relationship and arrange for an early hearing by the Department of Labor before claimant is inducted.

13. Take a careful history in every case, and if there is any doubt as to whether the claimant was injured in the course of his employment, contact the employer and verify the accident. Where the employer denies liability, a fee may be accepted from claimant with the understanding that same will be returned after a hearing before the Department of Labor if the case is declared compensable. In all doubtful cases give the patient the benefit of the doubt and render medical care pending determination by the Labor Department. If possible, obtain written authorization from employer where patient is referred by employer and compensability seems doubtful.

14. Where a fee in excess of the minimum is warranted, notify the carrier or employer at once and state the reasons. After emergency operation, notify the carrier or employer of reasons for fee in excess of the minimum and request in writing authorization for same.

15. Keep up to date on unpaid bills and request arbitration forms if objection is made by carrier and bill is not settled within a reasonable period.

16. If you fail to get cooperation in any of the above procedures, bring matters to the attention of your Compensation Committee or to this Board at once.

Appreciation.—Your Director wishes to acknowledge the loyalty and efficiency of the work of the office staff, without which the work of the Bureau could not have been conducted at its present level of efficiency.

A word of commendation is due to the representatives of the Compensation Insurance Rating Board, especially Mr. Henry D. Sayer, Mr. I. Sofferman, and Miss Elizabeth V. Doogan, for their cooperation, and Mr. Ralph R. Boyer and Mr. Hugh J. Murphy of the Department of Labor, and to those claim representatives of insurance carriers who have co-operated with this Bureau throughout the year in helping to solve the many difficult problems confronting us.

PART X

Public Relations and Economics

The Council Committee on Public Relations and Economics was continued with the same personnel:

Augustus J. Hambrook, M.D., *Chairman*... Troy
Herbert H. Bauckus, M.D. Buffalo
Harry Aranow, M.D. New York

Owing to the illness of Dr. Hambrook, Dr. Bauckus was appointed cochairman, later, after Dr. Hambrook's death, succeeding him as chairman. The Committee then consisted of:

Herbert H. Bauckus, M.D. Buffalo
Harry Aranow, M.D. New York
Charles M. Allaben, M.D. Binghamton

This Committee presents the following report.

REPORTS

The work of the Committee during the year was unfortunately interrupted by the untimely death of

its Chairman, Augustus J. Hambrook, M.D. The loyalty and qualifications of Dr. Hambrook are, of course, well known to the medical profession of New York State. We sincerely regret his loss, and we cherish his memory.

Of course the most important work of the organized medical profession has been its part in promoting the winning of the war. All of our efforts have directly or indirectly been concerned with this humane undertaking. The subjects of medical preparedness (war participation), procurement and assignment, and democratic rationing of physicians were studied in connection with many of the other Committees of the Council.

Reference is herewith invited to the report of the War Participation Committee, under the capable chairmanship of Dr. Louis H. Bauer.

Nursing Shortages.—Early in March the Committee met with the New York State Nursing Council for War Service. This meeting resulted in a free exchange of opinion to enable the country to obtain the maximum amount of service from the much needed but limited nursing personnel. Further conferences will be held relating to the important nursing problem.

Workmen's Compensation Problems.—During the year several conferences were held with Dr. David J. Kaliski, Director of the Workmen's Compensation Bureau. As a result of the discussions, a memorandum was sent to each county society calling attention to the need for adhering to a minimum Workmen's Compensation Fee Schedule as a standard of evaluation for medical services. This question was regarded as especially important in dealing with medical services rendered to groups. The Committee considered the question raised by last year's House over the advisability of raising some of the items in the Workmen's Compensation Fee Schedule now in effect in this state. This subject is under the study and consideration of the Workmen's Compensation Committee. There was also discussion regarding the present status of the practice and law calling for free choice of physician in compensation work. It might be pointed out that now, when all physicians are very busy and industrial services are in great demand, the inclination of the practitioner is to be not much concerned about the matter. However, it would be well to guard against untoward practices in the free choice question lest it become a habit with industries. We probably will not always have the industrial activity and demand for services that we now have.

Intern Insurance.—With the cooperation of the Director of the Bureau of Workmen's Compensation, an opinion was obtained from our Counsel which in effect classified interns and resident physicians in hospitals as coming under the Workmen's Compensation Act when affected by accident or other compensable disease.

Industrial Examinations.—The Committee adopted a resolution, which was approved by the Council, re-emphasizing its code of ethics to the effect that the rejection or demotion of any person shall be based solely upon accepted medical and scientific criteria in industrial physical examinations. A copy of this resolution was sent to each county society.

Farm Worker Problem.—During the year the Chairman was appointed, on the recommendation of the President and the Council, a member of the Board of the Atlantic Seaboard Migratory Agricultural Worker's Health Committee. The purpose of this Board, supported by the Farm Security Ad-

WAACS, WAVES, SPARS, or "WAMS" (Women's Reserve of the U.S. Marine Corps).

Suggestions for Component County Medical Societies.—The Council received from the County Secretaries Conference on December 2, 1942, certain recommendations, which it adopted and passed on to the county societies.

The first is a suggestion that county medical societies have their delegates to the House report back to their county societies on the meeting of the House.

The second is that the county societies, when transferring members, indicate Workmen's Compensation qualifications, and also send a copy of the original application blank for membership. It was understood that if a county society did not have a copy of the application blank in its file the New York Office of the State Society could be asked to furnish one to the receiving county society.

PART XIII

Malpractice Defense and Insurance

The Council Committee on Malpractice Defense and Insurance was continued as follows:

Clarence G. Bandler, M.D., *Chairman*..... New York
Murray M. Gardner, M.D..... Watertown
Andrew Sloan, M.D..... Utica
Peter Irving, M.D., *ex officio*..... New York
Kirby Dwight, M.D., *ex officio*..... New York
The Council transmits the Committee report.

REPORT

The Committee on Malpractice Defense and Insurance recommended to the Council of the Society, after a complete review of the operating costs of the Group Plan of Malpractice Insurance had been made, that it would be necessary to increase the annual base rate premium on account of the upward trend in the loss experienced. Accordingly the Council, at its meeting on April 28, 1942, approved an increase in the base rate to \$32, effective as of July 1, 1942.

The premiums for limits in excess of the minimum \$5,000 have been sufficient to carry the cost of all losses in excess of that minimum and, therefore, no increase in the excess limit rates was necessary. Thus the rates for all limits of insurance reflect only the \$4.00 increase in the base rate.

It was determined, however, that because the loss costs for the settlement of claims and suits for "cosmetic" plastic surgery were abnormally excessive and because the hazard of x-ray therapy necessitated an additional surcharge, it was deemed advisable to change the rates for "cosmetic" plastic surgery by an additional surcharge of 50 per cent. No change in rate was recommended where surgery is performed for pathologic, traumatic, or congenital conditions.

Your Committee announced that arrangements were completed by Mr. H. F. Wanvig, Indemnity Representative, with the Yorkshire Indemnity Company, carrier of the Group Plan of Malpractice Insurance, whereby a reduction of 50 per cent has been made in the annual premium rates for doctors serving in the military or naval forces of the United States, effective November 1, 1942.

Under the agreement with the insurance company, the assured, upon entering the service, may now procure an endorsement for attachment to his certificate of insurance, stating that the insurance provided thereunder is limited to claims or suits arising out of professional services rendered or which should have

been rendered to persons in the armed forces of the United States, or in an emergency to civilian patients while the assured is practicing as a member of the armed forces; and, furthermore, it is understood and agreed that coverage is extended to the assured to cover the liability of the named assured for acts arising out of the appointment by him of another physician to substitute for him in private practice while he is in the armed forces, providing said physician is a member of the Medical Society of the State of New York and is individually insured in the group plan of the Society.

A person in the military service may claim that an officer of the medical corps has in some manner been guilty of malpractice in treating or examining him in the line of duty. A similar claim for alleged malpractice may be pressed against an examining physician for a local Selective Service Board by a selectee called before that board. The fact that a person is in the military service, or is in the course of being inducted therein, does not prevent him from asserting his civil rights so long as the interest of the service or of national defense is not concerned. Hence, the Judge Advocate General of the Army has held, quite properly, that members of the army are entitled to the same civil rights of action with reference to suits for malpractice or negligence as they would have in civil life. Without doubt the same degree of care, diligence, and professional ability required of any physician with respect to the care of patients in civilian life is required by law of a medical officer of the army or of an examining physician for a local board in his care or examination of a member of the service or of a selectee called for the purposes of induction. For a departure from such standards resulting in harm to the patient the medical officer or the examining physician would be liable in a civil suit by the aggrieved patient the same as though both the patient and the physician were in civil life. The medical officer, then, in the army, and the physician acting for a local Selective Service Board by virtue of his service or function, stands in no different position with respect to answerability to his patients from that of a physician acting solely in a civil capacity.

A word of caution should be sounded for physicians going into military service and who have arranged with an associate to carry on their practices during their absence and who assume that under such arrangement they would have no malpractice liability to their patients. It seems most likely that the doctor left in charge of the practice would be held as the agent of the member whose practice is being covered and any action on account of the acts of the agent would probably be brought against both doctors. For this reason and as a factor of security, it is recommended that any doctor who has been or may be called for military activity should retain his Society's malpractice insurance and defense.

For those members engaged in the specialty of administering x-ray therapy only, attention is again called to the special annual base rate premium of only \$30. A special endorsement may be procured as follows:

"In consideration of the premium charged for this certificate of insurance, it is hereby understood and agreed that the insurance granted under this certificate shall extend to and cover only the assured's liability on account of the use of x-ray apparatus for therapeutic treatment or the prescription of dosage therefor."

following sentence: "The delegates to the American Medical Association who have attended each session of the House of Delegates of that Association and who shall have filed with the Secretary evidence of such attendance shall be allowed traveling expenses."

Nominations.—The Council, on official request of the Secretary of the Committee on Grievances, nominated for appointment to succeed Dr. Terry M. Townsend, deceased, as a member of the Committee on Grievances of the State Department of Education, Dr. Walter P. Anderton, of New York. Dr. Anderton was appointed to complete Dr. Townsend's unexpired term.

The Council, on request of the Department of Education, nominated as a representative of the Medical Society of the State of New York, Dr. O. W. H. Mitchell, of Syracuse, to succeed Dr. Augustus J. Hambrook, deceased, as a member of the Board of Regents Advisory Council on Health and Physical Education. Dr. Mitchell was duly appointed.

The Council, on request nominated Dr. Peter Irving, of New York, and Dr. Herbert H. Bauckus, of Buffalo, to sit on the new State Nursing Council for War Service. Both have been elected to membership on that Nursing Council.

The Council, on request, nominated Dr. George R. Critchlow, of Buffalo, to succeed himself as a member of the Nurse Advisory Council of the State Department of Education, on expiration of his term on December 31, 1942. Dr. Critchlow was duly appointed.

The Council, in accord with your previous action, submitted a list of seventeen nominees to the Annual Meeting of the Physicians' Home, Inc., from which directors were selected.

Office Administration and Policies.—The personnel of the Committee on Office Administration and Policies has been, under the formula you laid down last year, the General Manager, the Business Manager of JOURNAL and DIRECTOR, the literary editor, the Treasurer, and a Trustee appointed by the President, Dr. Kosmak, who was selected as Chairman by the Committee.

The Committee has held regular meetings with the Publication Committee, considering various matters. In particular, it has gone over the data of all replacement employees recommended for permanent employment, passing on their suitability. In this connection, the Committee adopted the policy of having pre-employment examinations made in the effort to discover physical difficulties that might interfere with work and, in particular, to exclude tuberculosis.

Careful and full personnel files are now in operation and are accessible to the Executives.

The Committee has investigated several employee pension systems but has taken no action along this line.

U.S. Pharmacopeial Convention.—An adjourned meeting of the 1940 Pharmacopeial meeting was held for the purpose of acting upon the Proposed Constitution and Bylaws drawn up by a Committee on Revision of the Constitution and Bylaws in accordance with a resolution passed at the meeting in Washington, D.C., on April 1, 1940.

Dr. A. F. R. Andresen, one of the delegates representing the Medical Society of the State of New York, made the following report:

"An opinion by an eminent legal authority" was read, which declared that it would be illegal to act upon the proposed constitution at this time and that all the meeting could do would be to receive

it, with one small change being made, as indicated in the attached pamphlet. The principal change from the old constitution consist in a revision of the list of participating organizations, limiting each to one delegate or alternate, and allowing a delegate to represent only one organization. There is also provision for special meetings when required and a simplified requirement for amendments.

"The Bylaws were permitted to be acted upon, but had to be amended to conform to the old constitution, which will be in effect until the new one is adopted in 1950. The Bylaws and the mimeographed amendments enclosed in the pamphlet were adopted practically as presented, with a few minor changes in wording. It was agreed that the new Bylaws shall not be enforced until the Convention of 1950. They make a radical change in procedure, largely guided by Morris Fishbein's presence on the Committee. It is hoped that the many abuses of former days will be eliminated. The personnel of the Board of Trustees will be improved and its powers extended. The General Committee on Revision of the Pharmacopeia and its Executive Committee, the real backbone of the Convention, is completely reorganized. Instead of nominations by caucus, a nominating committee consisting largely of chairmen of subcommittees will present nominations based on recommendations in writing from the constituent organizations, which will be printed and will include a description of the qualifications of each candidate. Nominations from the floor will also be included in the printed ballot together with their qualifications, and elections of officers, trustees, and members of the Committee on Revision will be by printed ballot. A Director of Pharmacopeial Revision will be elected by the Board of Trustees, will be on salary, will preside at meetings, and will organize subcommittees (probably 10) to cover various phases of revision. Every precaution will be taken to make sure that only scientific, well-informed, and serious workers will serve on these subcommittees.

"If the new Constitution and Bylaws are adopted in 1950 as planned, a radical change in its personnel and management will have been effected, which it is hoped will increase its prestige and extend its usefulness."

Leaves of Absence.—The Council has granted to officials and a committee member of the Society "leaves of absence" while in service, as follows:

E. Christopher Wood, M.D., White Plains, Councilor.

Robert C. Peale, M.D., Olean, President of Eighth District Branch.

H. Walden Retan, M.D., Syracuse, Chairman, Section on Gastroenterology and Proctology.

Foster C. Rulson, M.D., Syracuse, Chairman, Section on Radiology.

E. Forrest Merrill, M.D., New York, Vice-Chairman, Section on Radiology.

Ralph Almout, M.D., New York, member of Committee on Hard of Hearing and the Deaf.

Remission of State Assessments for Members in Service.—The Council has continued to waive payment of State Society assessments upon request of the county societies for members entering the U.S. Army and Navy, and the U.S. Public Health Service (as a wartime service). To these it recently added service on full time of members in the auxiliaries of Army, Navy, Coast Guard, and Marine Corps—the

that it would not undertake to tell the Surgeons General how to set standards for admission to their Medical Reserve Corps.

Delegates to 150th Annual Meeting of the Connecticut State Medical Society (Section 40).—The President, with the approval of the Council, appointed Dr. Walter W. Mott, of White Plains, and Dr. Peter Irving, of New York, as delegates. Doctors Mott and Irving attended, and reported a very interesting meeting with emphasis on historical addresses.

Nonprofit Medical Expense Indemnity Insurance (Section 39).—The House adopted recommendations of its Reference Committee as follows:

"That the Subcommittee on Medical Expense Insurance continue its work on the following precepts:

"1. That all county medical societies be contacted and assisted and immediately urged to cooperate with approved plans.

"2. That the State Medical Society, through its Subcommittee, give all aid at its command to help these county medical societies succeed with this work.

"3. That the principles of nonprofit medical insurance be re-emphasized as adopted in the 1941 report.

"4. That intense energy be used to obtain a larger number of subscribers among the low-income groups.

"5. That hospitalization and medical care plans remain independent of each other.

"6. That the members of this House shall act as individual spokesmen to interest the Comitiae Minora and Economic Committees of the component medical societies in nonprofit medical insurance.

"By acting now the members of the Medical Society of the State of New York will continue to offer good medical service on a high ethical scale to all of its patients. The medical profession must immediately unite in the effort to make a plan for voluntary cash indemnity successful.

"Therefore, it is recommended that the three plans now functioning in this state—The Western New York Plan, Inc., Medical and Surgical Care, Inc., and Medical Expense Fund of New York, Inc.—be approved by this House of Delegates."

This was referred by the Council to its Subcommittee on Medical Expense Insurance.

Use of Income from Investments (Section 46).—The House recommended "to the Trustees that they use the income from investments, if they deem it necessary to do so."

(See Trustees' Report.)

1943 Annual Meeting in Buffalo (Section 48).—The House looked "with favor upon the invitation of the Medical Society of the County of Erie to hold its 1943 Annual Meeting in Buffalo, and would recommend the Council be apprised of our action."

The Council decided to hold the 1943 Meeting in Buffalo.

Medical Relief—Direct Payment of Medical Fees (Section 49).—The House adopted a resolution as follows:

"WHEREAS, under the Social Security Act payments for medical care given to recipients-of-aid from the Blind, Old Age, and Dependent Chil-

dren's divisions of the Department of Social Welfare can no longer be made to physicians directly, but, instead, these payments must be made to the patient; and

"WHEREAS, this method of payment has worked a hardship on the physicians who have rendered medical care to these persons by forcing them to make one or more additional calls to collect their bills; and

"WHEREAS, in New York City it has been proven that nearly 5 per cent of these patients have not paid their doctors for medical care rendered with the money which the State Department of Social Welfare gave them, but instead have spent the money for other uses; and

"WHEREAS, we are informed by the New York City Department of Welfare that this percentage is only a fraction of the number of patients who did not pay their physicians for medical care, as shown by the great many complaints from physicians who have telephoned to that Department, rather than written letters which could be submitted in evidence; and

"WHEREAS, a similar resolution was introduced into the House of Delegates of the Medical Society of the State of New York at Buffalo, in 1941, at which time it was agreed that the State Society would carefully watch the experiment of using this method of payment; and

"WHEREAS, we feel that in New York City this experiment has not been a success; therefore be it

Resolved, that the New York State Medical Society, through its Delegates to the American Medical Association, request that the American Medical Association
initiated to
Act so that
ients-of-aid
from any government agency may be paid directly
by that agency."

The delegates to the House of Delegates of the American Medical Association introduced a similar resolution, in which it was thought well to request the A.M.A. House to consider having legislation initiated. The A.M.A. House decided against initiation of such legislation.

Recognition of Services of Civilian Doctors at Pearl Harbor (Section 55).—The House adopted the following resolution:

"WHEREAS, the civilian physicians and surgeons of the Honolulu Medical Society rendered a great service during the Pearl Harbor Attack on December 7, 1941; and

"WHEREAS, at the outset of the emergency they promptly responded to a call for aid from the Tripler General Hospital of the Army, and by their surgical skill and unremitting efforts rendered great aid to the wounded; and

"WHEREAS, by this service a new chapter was added to the successful treatment of war casualties and certain surgical procedures were established which will result in the saving of many lives and limbs from war injuries; and

"WHEREAS, their service was the more outstanding because only a few of them had ever been under fire, and by their courage and stamina they did much to aid the morale of the wounded, of the hospital personnel, and of the civilian population; and

"WHEREAS, the services of the physicians and surgeons were recognized in the official Roberts Report of the Attack by the statement that 92

The Yorkshire Indemnity Company appreciates the continued confidence reposed in it by the Medical Society of the State of New York and wishes to assure the participants in the Group Plan that their interests are always given careful consideration. Whether members continue in civilian practice or have been called into the military and naval services, the company will faithfully safeguard all who are insured and protected by its policies. Your Com-

mittee wishes to emphasize again the fact that the Yorkshire Indemnity Company is a New York State Corporation completely under the jurisdiction of the Superintendent of Insurance, who has stated that "all of its assets are held within the United States." The reliability, as well as the stability, of the Yorkshire Indemnity Company is unquestioned, and our confidence in the Group Plan should remain unchallenged.

Résumé of Instructions of the 1942 House of Delegates and Actions Thereon of Council, Trustees, and Officers

There follows a summary (of "index" type) of the different instructions issued by the House at its meeting on April 27 and 28, 1942. The significant portions alone of the different resolutions are quoted.

The term "section" with a number following each heading refers to the minutes of the 1942 House published in the June 15 and July 1, 1942, issues of the NEW YORK STATE JOURNAL OF MEDICINE.

In each instance the action on the instruction is indicated.

Tuberculosis Conference Committee (Section 33).—The House changed two of the "suggestions," Nos. 7 and 8, that were agreed upon by the Council and Conference Committee.

No. 7 (Original) "Patients, who, in the opinion of the health officer or his representative, for various reasons (contacts, etc.) should have a thorough physical examination including x-ray, as a part of the tuberculosis control program, should be rendered x-ray service without direct cost to themselves."

(New) "Only medically indigent patients or contacts referred by the family physician, who, in the opinion of the health officer or his representative, for various reasons (contacts, etc.) should have a thorough physical examination, including x-ray, as a part of the tuberculosis control program, should be rendered x-ray service without direct cost to themselves."

No. 8 (Original) "All x-ray examinations at federal, state, or municipal hospitals should be done without direct cost to the patient."

(New) "All x-ray examinations at federal, state, or municipal hospitals, including municipal health facilities, should be done without direct cost to the patient."

These two revisions were submitted to the Tuberculosis Conference Committee, which took no formal action. So far, no questions have come to attention that relate to these aspects of tuberculosis control in the state.

Historical Data (Section 34).—The House approved a suggestion that there be undertaken "the compilation of historical data, manuscripts, archives, biographic sketches, memoirs, scientific and practical contributions of this Society during this unprecedented war period."

The Council referred this matter to the Publication Committee, which has not as yet found a way to accomplish the full objectives stated. In this connection, the cutting down of office force makes the full task difficult.

Directory Publication (Sections 34, 46).—The House decided that the *Directory* be not published in 1942 and gave the Council discretion as to further postponement.

The Council, in its discretion, recommends to the 1943 House of Delegates that the *Directory* be not published in 1943 (Council Report—Part IV).

Elimination of Required Certification of Checks for Narcotic Tax Registration (Section 36).—The House adopted the following resolution:

"Resolved, that the Medical Society of the State of New York protest against the requirement that checks for purchase of special tax stamps in connection with dispensing and prescribing opium or coca leaves or any compound, manufacture, salt, derivative, or preparation thereof, are required to be certified; and be it further

"Resolved, that the delegates from the Medical Society of the State of New York to the House of Delegates of the American Medical Association are hereby instructed to introduce a resolution at the 1942 session embodying this protest, and urging the American Medical Association to take emphatic and persistent steps toward the elimination of the requirement for certification of checks previously mentioned in this resolution; and be it further

"Resolved, that copies of this resolution be sent to important local and national dentist, veterinary, pharmacist, manufacturing chemist, and banker organizations, inasmuch as members of such organizations are also affected by the unnecessary labor of certification of small checks."

A similar resolution was presented by the delegates to the 1942 House of Delegates of the American Medical Association and adopted.

Women Physicians in Medical Reserve Corps of Army and Navy (Section 37).—The House adopted the following resolution:

"Resolved, that the delegates from New York County be instructed to ask the House of Delegates to go on record again this year and ask the American Medical Association to aid one of its minority groups by endorsing and aiding women physicians in obtaining commissions in the Medical Reserve Corps of the United States Army and Navy."

A similar resolution was introduced by the delegates to the 1942 House of Delegates of the American Medical Association, which defeated it on the ground

that it would not undertake to tell the Surgeons General how to set standards for admission to their Medical Reserve Corps.

Delegates to 150th Annual Meeting of the Connecticut State Medical Society (Section 40).—The President, with the approval of the Council, appointed Dr. Walter W. Mott, of White Plains, and Dr. Peter Irving, of New York, as delegates. Doctors Mott and Irving attended, and reported a very interesting meeting with emphasis on historical addresses.

Nonprofit Medical Expense Indemnity Insurance (Section 39).—The House adopted recommendations of its Reference Committee as follows:

"That the Subcommittee on Medical Expense Insurance continue its work on the following precepts:

"1. That all county medical societies be contacted and assisted and immediately urged to cooperate with approved plans.

"2. That the State Medical Society, through its Subcommittee, give all aid at its command to help these county medical societies succeed with this work.

"3. That the principles of nonprofit medical insurance be re-emphasized as adopted in the 1941 report.

"4. That intense energy be used to obtain a larger number of subscribers among the low-income groups.

"5. That hospitalization and medical care plans remain independent of each other.

"6. That the members of this House shall act as individual spokesmen to interest the Comitiae Minora and Economic Committees of the component medical societies in nonprofit medical insurance.

"By acting now the members of the Medical Society of the State of New York will continue to offer good medical service on a high ethical scale to all of its patients. The medical profession must immediately unite in the effort to make a plan for voluntary cash indemnity successful.

"Therefore, it is recommended that the three plans now functioning in this state—The Western New York Plan, Inc., Medical and Surgical Care, Inc., and Medical Expense Fund of New York, Inc.—be approved by this House of Delegates."

This was referred by the Council to its Subcommittee on Medical Expense Insurance.

Use of Income from Investments (Section 46).—The House recommended "to the Trustees that they use the income from investments, if they deem it necessary to do so."

(See Trustees' Report.)

1943 Annual Meeting in Buffalo (Section 48).—The House looked "with favor upon the invitation of the Medical Society of the County of Erie to hold its 1943 Annual Meeting in Buffalo, and would recommend the Council be apprised of our action."

The Council decided to hold the 1943 Meeting in Buffalo.

Medical Relief—Direct Payment of Medical Fees (Section 49).—The House adopted a resolution as follows:

"WHEREAS, under the Social Security Act payments for medical care given to recipients-of-aid from the Blind, Old Age, and Dependent Chil-

dren's divisions of the Department of Social Welfare can no longer be made to physicians directly, but, instead, these payments must be made to the patient; and

"WHEREAS, this method of payment has worked a hardship on the physicians who have rendered medical care to these persons by forcing them to make one or more additional calls to collect their bills; and

"WHEREAS, in New York City it has been proven that nearly 5 per cent of these patients have not paid their doctors for medical care rendered with the money which the State Department of Social Welfare gave them, but instead have spent the money for other uses; and

"WHEREAS, we are informed by the New York City Department of Welfare that this percentage is only a fraction of the number of patients who did not pay their physicians for medical care, as shown by the great many complaints from physicians who have telephoned to that Department, rather than written letters which could be submitted in evidence; and

"WHEREAS, a similar resolution was introduced into the House of Delegates of the Medical Society of the State of New York at Buffalo, in 1941, at which time it was agreed that the State Society would carefully watch the experiment of using this method of payment; and

"WHEREAS, we feel that in New York City this experiment has not been a success; therefore be it

"Resolved, that the New York State Medical Society, through its Delegates to the American Medical Association, request that the American Medical Association have legislation initiated to provide a change in the Social Security Act so that persons rendering medical care to recipients-of-aid from any government agency may be paid directly by that agency."

The delegates to the House of Delegates of the American Medical Association introduced a similar resolution, in which it was thought well to request the A.M.A. House to consider having legislation initiated. The A.M.A. House decided against initiation of such legislation.

Recognition of Services of Civilian Doctors at Pearl Harbor (Section 55).—The House adopted the following resolution:

"WHEREAS, the civilian physicians and surgeons of the Honolulu Medical Society rendered a great service during the Pearl Harbor Attack on December 7, 1941; and

"WHEREAS, at the outset of the emergency they promptly responded to a call for aid from the Tripler General Hospital of the Army, and by their surgical skill and unremitting efforts rendered great aid to the wounded; and

"WHEREAS, by this service a new chapter was added to the successful treatment of war casualties and certain surgical procedures were established which will result in the saving of many lives and limbs from war injuries; and

"WHEREAS, their service was the more outstanding because only a few of them had ever been under fire, and by their courage and stamina they did much to aid the morale of the wounded, of the hospital personnel, and of the civilian population; and

"WHEREAS, the services of the physicians and surgeons were recognized in the official Roberts Report of the Attack by the statement that 92

per cent of the medical profession were available on that eventful historic occasion; therefore be it
"Resolved, that the Medical Society of the State of New York recognize their response to emergency duty and desires to pay a tribute to their demonstration of the traditional willingness of our profession to act promptly and skillfully in all national emergencies."

A similar resolution was presented to the House of Delegates of the American Medical Association by our delegates, and adopted.

Copies of the resolution of the State Society were sent to the Honolulu Medical Society and the Surgeons General of the U.S. Army and Navy.

Financial Aid to County Societies for Medical Preparedness Work (Section 65).—The House referred to the Council the question whether financial aid should be rendered by the State Society to county societies for medical preparedness work.

The Council has taken no action.

Invitation to American Medical Association to New York City in 1945 (Section 65).—The House issued an invitation to the American Medical Association for its 1945 Annual Meeting.

A resolution was introduced in the House of Delegates of the American Medical Association, and New York won over an invitation from Atlantic City.

Extension of Medical Care to Indigents in Their Homes (Section 87).—Continued study by the Council of the following resolution was directed by the House:

"WHEREAS, both the President and the President-elect in their addresses to this House have emphasized the probability of changes in the medical practice of the future and have urged upon us a constructive viewpoint, and

"WHEREAS, in the proceedings of this House emphasis has been laid on the problems of the future relations of the doctor and his private patients, but no thought has been expressed relevant to the present pressing problems of the doctor and the medically indigent, and

"WHEREAS, it is predictable that those in charge of postwar reconstruction will urge an expansion of present allegedly inadequate hospital and dispensary facilities; this because it will furnish a type of employment and will meet but little opposition from the politically-minded because of its sentimental appeal, and

"WHEREAS, the experience of the City of New York during the last fifteen years with a population that has been stationary and a 100 per cent increase in the provision of facilities for the care of medically indigent has shown that construction cannot keep pace with the demand, and

"WHEREAS, the cost per capita for such medical care is close to \$7.00 per day when the hospital census is 100 per cent or over, and would probably be \$8.00 or \$9.00 a day if an ideal census of 80 per cent were attainable, and

"WHEREAS, the home and family have been described as keystones in the arch of democracy and that the removal of the indigent sick from their homes except in cases of real necessity tends to break down the morale of the family unit, by relieving them of the necessity of caring for their own; and

"WHEREAS, it is becoming increasingly difficult to secure the services of competent physicians

or physicians in the clinics of the hospitals in large communities without the promise of compensation; and

"WHEREAS, after the war, with the demobilization of probably 45,000 physicians in the younger age groups who will probably be well organized and in a position to demand security for themselves and their families; and

"WHEREAS, unless forward-looking measures are now taken, they will return to find themselves in a more highly competitive field; and

"WHEREAS, it has been demonstrated in the *Hospital Survey of New York*, Volume II, 1937, that the care of medical indigents in their home, particularly convalescent and custodial care, after a complete hospital work-up and necessary care through the assignment of clinic physicians or other private practitioners to the care of these individuals at a designated and acceptable fee per visit will result in a much smaller cost to the municipalities and will furnish a welcome remuneration to our demobilized physicians; and

"WHEREAS, the State Department of Public Welfare is now enabled to make a contribution to the cost of the care of medical indigents throughout the State; therefore be it

"Resolved, that the Council initiate forward-looking studies toward the attainment of a more satisfactory care of medical indigents from the point of view of both the State and the physician and for the revival of a sense of responsibility for the care of their sick, aged, and crippled by the family."

This resolution was referred to the Subcommittee on Medical Relief. The subject is under observation of the Committee.

School Health Program (Section 47).—The House adopted the following resolution:

"We recommend that the Council, through its Subcommittee, continue its efforts to bring about the changes whereby supervision of health and health problems among children of school age be under the charge of physicians. If this cannot be achieved through the cooperation of the State Education Department, we recommend that further steps be taken, particularly efforts to bring the matter to the attention of Parent-Teacher Associations, to the bodies interested in the school health problem, and to the public in general; and if necessary through attempts to secure legislative action."

This has been kept in mind in negotiations with the authorities, both by the former Subcommittee on School Health Program and by its successor, the Subcommittee on Child Welfare of the Council Committee on Public Health and Education.

Discriminations in Employment of Minority Racial Groups (Section 67).—In connection with opposition to discriminations of the kind indicated, the House referred to the Council the matter of advertisements from Becton, Dickinson & Company, East Rutherford, New Jersey.

Study showed that no advertising had been in the *JOURNAL* or the *Directory*. Therefore, no action was needed.

Foreign Physicians.—Present and Future Status (Section 88).—The House adopted the following resolution:

"Resolved, that the Council take such steps in the interim between this and the next meeting of

this House of Delegates as to properly safeguard the medical interests of the armed forces of the United States, the State of New York, the public health and welfare, and the existing standards of the profession of medicine."

The President, with the approval of the Council, appointed a committee to study this matter. (See Council Report, Part XI.)

Workmen's Compensation Fee Schedule (Section 70).—The House approved a resolution as follows:

"Resolved, that the Delegates from the Medical Society of the County of Albany be instructed to introduce a resolution at the next meeting of the House of Delegates to the effect that the Council of the Medical Society of the State of New York through its appropriate representatives take immediate steps to review the present fee schedule with the Commissioner of Labor with a view of increasing the minimum fees now established by law (suggested increase, 25 per cent), and that the component county societies be informed from time to time of the status of these proposed negotiations with the Commissioner of Labor."
(See Council Report, Part IX.)

Subcommittee on Tuberculosis and Diseases of the Chest (Section 86).—The House adopted a resolution:

"WHEREAS, at the 1941 meeting of the House of Delegates in Buffalo, New York, a resolution was introduced asking for a session on chest diseases by the New York State Chapter of the American College of Chest Physicians; and

"WHEREAS, the House of Delegates' Reference Committee on New Business gave serious consideration to this resolution by recommending to the House of Delegates that a symposium on chest diseases to be furnished by the New York State Chapter of the American College of Chest Physicians be included at a general session of the Annual Convention in 1942; and

"WHEREAS, the New York State Chapter of the American College of Chest Physicians have respectfully requested that a subcommittee on chest diseases of the Council Committee on Public Health and Education be established; therefore be it

"Resolved, that the House of Delegates of the Medical Society of the State of New York establish such a subcommittee."

After due consideration, the Council adopted a recommendation of its Committee on Public Health and Education that there be appointed a Subcommittee on Tuberculosis and Diseases of the Chest working under the Public Health Committee. (See Council Report, Part II.)

Respectfully submitted,
PETER IRVING, M.D., *Secretary*

Report of the Counsel

To the House of Delegates; Gentlemen:

Your Counsel herewith submits his report of the activities of the Legal Department of the Medical Society of the State of New York for the period from February 1, 1942, to and including January 31, 1943.

More than ever before, because of an acute paper shortage, brevity is the objective to be sought in the making of a report of this character. Thus, only the barest outline of the work done in our Department can be given. This, of course, does not give any adequate picture of the work done or the responsibility assumed by our Department.

In making his report, your Counsel adheres to the convenient category employed in previous years whereby his activities have been divided into three main divisions: (a) the actual handling of malpractice actions before courts and juries and in the appellate tribunals; (b) counsel work with officers, committees, and individual members of the Society; and (c) legislative advice and activities.

Litigation.—We again call to the attention of the membership the dangers attendant upon careless, hasty, and unjustified criticism by one physician of the work of another. Many malpractice actions stem from just such criticism. The matter cannot be disposed of by saying that the criticising physician in many instances does not intend that his remarks shall result in a malpractice action. When the criticism has been made, the damage has been done.

We again call to the attention of your membership the ever present hazard of a malpractice action to the practicing physician. It should always be remembered that the rights of physicians in malpractice actions are in the hands of lay jurors, who frequently are influenced by factors that do not go to the merits of the case. In theory, sympathy, passion, prejudice, or bias has no place in the jury box. In practice, unfortunately, verdicts are frequently rendered where these elements, or some of

them, are not only present, but, indeed, are responsible for the verdict.

In this connection it should be noted that your Society has taken cognizance of these conditions and has sponsored a Group Plan of insurance. The splendid record of the Group Plan speaks for itself. It deserves and should receive the loyal support of every member of the Society. It has been in operation for over twenty years and its outstanding success is a matter of record.

At this point mention should be made of the Yorkshire Indemnity Company, the carrier under your Group Plan. This Company is entering its eighth year as such carrier. It has, in every way, lived up to all of its obligations and, in addition, has demonstrated its genuine and enthusiastic interest in the successful operation of our Group Plan. Appreciation should be recorded of the cooperation furnished by Mr. Horace Crowell, Jr., Claim Agent of The Yorkshire Indemnity Company, with whom your Counsel and office staff are in almost daily conference and consultation.

Mention should also be made of the splendid work of your Insurance Committee, headed by Dr. Clarence G. Bandler. We have conferred on a number of occasions during the reporting period with Dr. Bandler with relation to the problems before the Insurance Committee.

For many years in these reports I have had occasion to mention the splendid work of my associates, Mr. William F. Martin and Mr. Thomas H. Clearwater. I do so again this year.

For fifteen years Mr. Martin has been associated with me in the defense of malpractice actions. He is well and favorably known throughout the entire State. Your Counsel has received from all parts of the State, from judges, lawyers, and doctors, expressions of approval of Mr. Martin's fine ability as an advocate, and also his splendid personal qualities.

per cent of the medical profession were available on that eventful historic occasion; therefore be it
"Resolved, that the Medical Society of the State of New York recognize their response to emergency duty and desires to pay a tribute to their demonstration of the traditional willingness of our profession to act promptly and skillfully in all national emergencies."

A similar resolution was presented to the House of Delegates of the American Medical Association by our delegates, and adopted.

Copies of the resolution of the State Society were sent to the Honolulu Medical Society and the Surgeons General of the U.S. Army and Navy.

Financial Aid to County Societies for Medical Preparedness Work (Section 65).—The House referred to the Council the question whether financial aid should be rendered by the State Society to county societies for medical preparedness work.

The Council has taken no action.

Invitation to American Medical Association to New York City in 1945 (Section 65).—The House issued an invitation to the American Medical Association for its 1945 Annual Meeting.

A resolution was introduced in the House of Delegates of the American Medical Association, and New York won over an invitation from Atlantic City.

Extension of Medical Care to Indigents in Their Homes (Section 87).—Continued study by the Council of the following resolution was directed by the House:

"WHEREAS, both the President and the President-elect in their addresses to this House have emphasized the probability of changes in the medical practice of the future and have urged upon us a constructive viewpoint, and

"WHEREAS, in the proceedings of this House emphasis has been laid on the problems of the future relations of the doctor and his private patients, but no thought has been expressed relevant to the present pressing problems of the doctor and the medically indigent, and

"WHEREAS, it is predictable that those in charge of postwar reconstruction will urge an expansion of present allegedly inadequate hospital and dispensary facilities; this because it will furnish a type of employment and will meet but little opposition from the politically-minded because of its sentimental appeal, and

"WHEREAS, the experience of the City of New York during the last fifteen years with a population that has been stationary and a 100 per cent increase in the provision of facilities for the care of medically indigent has shown that construction cannot keep pace with the demand, and

"WHEREAS, the cost per capita for such medical care is close to \$7.00 per day when the hospital census is 100 per cent or over, and would probably be \$8.00 or \$9.00 a day if an ideal census of 80 per cent were attainable, and

"WHEREAS, the home and family have been described as keystones in the arch of democracy and that the removal of the indigent sick from their homes except in cases of real necessity tends to break down the morale of the family unit, by relieving them of the necessity of caring for their own; and

"WHEREAS, it is becoming increasingly difficult to secure the services of competent physicians

or physicians in the clinics of the hospitals in large communities without the promise of compensation; and

"WHEREAS, after the war, with the demobilization of probably 45,000 physicians in the younger age groups who will probably be well organized and in a position to demand security for themselves and their families; and

"WHEREAS, unless forward-looking measures are now taken, they will return to find themselves in a more highly competitive field; and

"WHEREAS, it has been demonstrated in the *Hospital Survey of New York*, Volume II, 1937, that the care of medical indigents in their home, particularly convalescent and custodial care, after a complete hospital work-up and necessary care through the assignment of clinic physicians or other private practitioners to the care of these individuals at a designated and acceptable fee per visit will result in a much smaller cost to the municipalities and will furnish a welcome remuneration to our demobilized physicians; and

"WHEREAS, the State Department of Public Welfare is now enabled to make a contribution to the cost of the care of medical indigents throughout the State; therefore be it

"Resolved, that the Council initiate forward-looking studies toward the attainment of a more satisfactory care of medical indigents from the point of view of both the State and the physician and for the revival of a sense of responsibility for the care of their sick, aged, and crippled by the family."

This resolution was referred to the Subcommittee on Medical Relief. The subject is under observation of the Committee.

School Health Program (Section 47).—The House adopted the following resolution:

"We recommend that the Council, through its Subcommittee, continue its efforts to bring about the changes whereby supervision of health and health problems among children of school age be under the charge of physicians. If this cannot be achieved through the cooperation of the State Education Department, we recommend that further steps be taken, particularly efforts to bring the matter to the attention of Parent-Teacher Associations, to the bodies interested in the school health problem, and to the public in general; and if necessary through attempts to secure legislative action."

This has been kept in mind in negotiations with the authorities, both by the former Subcommittee on School Health Program and by its successor, the Subcommittee on Child Welfare of the Council Committee on Public Health and Education.

Discriminations in Employment of Minority Racial Groups (Section 67).—In connection with opposition to discriminations of the kind indicated, the House referred to the Council the matter of advertisements from Becton, Dickinson & Company, East Rutherford, New Jersey.

Study showed that no advertising had been in the *JOURNAL* or the *Directory*. Therefore, no action was needed.

Foreign Physicians.—Present and Future Status (Section 88).—The House adopted the following resolution:

"Resolved, that the Council take such steps in the interim between this and the next meeting of

Mr. Clearwater attended the Annual Conference of the Council Committee on Legislation with the Chairmen of the County Society Legislation Committees, held at Albany.

Conclusion.—Your Counsel closes this report, as he has in other years, by expressing his deep appreciation for the work of his office staff, and he also wishes to note with grateful thanks the advice and assistance of the members of your Society who have

helped us, both in court and in consultation, in the defense of malpractice actions.

Without the cooperation and assistance of all concerned, it would not have been possible for your Counsel to obtain the results shown in this report.

Respectfully submitted,
LORENZ J. BROSNAN, Counsel

January 31, 1943

Report of the Board of Censors

To the House of Delegates; Gentlemen:

On December 10, 1942, the Board of Censors of the Medical Society of the State of New York heard an appeal from a previous decision of the Board of Censors of the Medical Society of the County of Queens rejecting the application of a former member, Dr. E. Paul Adel, for reinstatement to membership in the said county society.

There were present at the Board: Dr. George W. Cottis, Dr. Alexander N. Selman, Dr. William W. Woodruff, Dr. Norman S. Moore, Dr. Benjamin J. Slater, and Dr. Peter Irving. There were also present the Appellant, with legal counsel, and the

Chairman of the Board of Censors of the Medical Society of the County of Queens, also with legal counsel.

The censors carefully considered the record and heard the oral testimony of witnesses of both parties. After due deliberation, they unanimously held that the ruling appeared, rejecting the application of Dr. E. Paul Adel for readmission to membership in the Medical Society of the County of Queens, in all respects, be affirmed.

Respectfully submitted,
PETER IRVING, M.D., Secretary

March 1, 1943

Amendments to Constitution and Bylaws

To the House of Delegates; Gentlemen:

At your last meeting, notice was given of 4 amendments to the Constitution and Bylaws which will come before you for action at your coming meeting on May 3, 1943. In accord with the Constitution, these are published in advance of the meeting.

These do not go to a Reference Committee but are to be considered by the House as a whole. Under the Constitution, "a two-thirds vote of the members of the House of Delegates present and voting shall be necessary for adoption."

The first is an amendment to Chapter X of the Bylaws which is entitled "Expenses."

Delete the following phrases that have to do with approval of expense vouchers by the Board of Trustees before payment.

1. In the sentence reading "Proper vouchers must be filed with the Secretary" delete the following:

"and approved by the Board of Trustees."

2. Delete the sentence reading:

"The vouchers of such expense shall be approved by the Board of Trustees before payment."

3. In the seventh line above the end of the section, as printed in the 1941 printing of Constitution and Bylaws, delete the phrase:

"and approved by the Board of Trustees."

Add at the end of the section the following sentence:

"Payment of all these expenses shall be made under directions of the Board of Trustees."

With these deletions and this addition, Chapter X as amended will then read:

Chapter X—Expenses

"Section 1. Allowances for expenses incurred in the actual performance of official duties by officers, members of the Council, the Board of

Trustees, of the Board of Censors and committees, and delegates to the American Medical Association shall be made in conformity with the following conditions: The President shall be allowed a per diem and expenses when engaged upon official business. All other officers shall be allowed traveling expenses when engaged upon official business. Members of the Council, of the Board of Trustees, and of the Board of Censors, shall be allowed traveling expenses. Members of committees of the Council and all special committees of the Society shall be allowed traveling expenses. Presidents of the District Branches sitting in the House of Delegates shall be allowed necessary expenses. There shall be no allowance made for the expenses, traveling or otherwise, for any committee appointed pursuant to Chapter XI of these Bylaws. Proper vouchers must be filed with the secretary before any of the above allowances are made. The delegates to the American Medical Association who have attended each session of the House of Delegates of that Association and who shall have filed with the secretary evidence of such attendance shall be allowed the actual cost of railroad transportation and Pullman accommodations to the place of meeting and return. Each district branch shall be entitled to receive a sum not to exceed \$200, exclusive of the work done by the secretary regarding notices, programs, etc., to defray the expenses of holding the annual meeting of such district branch, provided a proper statement of such expense shall have been presented to the secretary. All bills, claims, or vouchers herein provided for shall be filed within thirty days after the date of the incurring of such expense. This time may be extended for any cause by the Board of Trustees and such extension shall not exceed ninety days. Payment of all these expenses shall be made under directions of the Board of Trustees."

The second is an amendment to Section I of Chapter II, as follows:

TABLE 1.—NUMBER OF SUITS INSTITUTED AND DISPOSED OF IN 1942-1943

Mr. Thomas H. Clearwater, the Attorney for your Society, is well known to your membership and to your officers and committeemen. Mr. Clearwater is a gentleman of exceptional ability and character and has rendered to the Society and to your Counsel at all times the fullest measure of cooperation and support.

We cannot leave this subject without paying tribute to the splendid spirit of industry, loyalty, and devotion manifested by your Counsel's entire staff, both legal and clerical.

With this preliminary statement we note that there were commenced within the present reporting period 120 cases. These figures, of course, do not include a number of claims outstanding, on which suit may ultimately be brought. Of equal importance with the actual work of litigation is the preventative work done by your Counsel and his office staff. Throughout the year we are in consultation with many claimants and their attorneys, and frequently we have been successful in demonstrating to them that in fact and in law no valid claim exists. Thus these claims never reach a suit stage.

Table 1 shows that during the present reporting period we disposed of 164 cases. Forty-eight of these cases were settled and 111 terminated successfully in favor of the physician. In 5 cases there were judgments for the plaintiff.

We note from Table 1 that there were pending as of January 31, 1943, 369 cases.

Counsel Work.—During the period of this report, your Counsel, as in the past, prepared for the Society's JOURNAL articles in the nature of editorial comment dealing with interesting cases decided by courts and also including two articles upon the extremely important Soldiers' and Sailors' Civil Relief Act. Your Counsel has also prepared for publication in the JOURNAL a number of inquiries and answers thereto, relating to legal questions considered to be of general interest to the profession and has digested for the JOURNAL certain cases handled by your Counsel considered to be of interest.

Your Counsel is pleased to learn from the members of your Society from time to time that these reports

and articles are found to be interesting and instructive. In addition to his other duties, your Counsel receives frequent requests for opinions, both oral and in writing, on topics too numerous to refer to in detail within the limited space of this report. A few of the matters upon which advice has been given during the past year are the following:

Administration of injections by nurses; use of drugs of unknown nature; marriage of persons with positive Wassermann reactions; confidential nature of x-ray films; medical services rendered under contract; examination of hospital records by lay persons; leases and military service; operative consents; venereal disease and employment; contracts with substitute physicians; hospitals' duty to accept patients; licenses of foreign physicians; hospitals' control over its professional staff; scope of practice of nursing; assistance to physicians by persons other than nurses; liability of Army physicians; diathermy treatment by assistant; sterilization of patients; responsibility for acts of interns; fee of anesthetist; consent to plastic surgery; interns and Workmen's Compensation; physician and nurse anesthetists; physician's liability for acts of subordinates; employment of anesthetist by physician.

Other Counsel Activities.—Your Counsel, acting with the Committee on Bylaws, examined various proposed amendments to the Constitution and Bylaws of a number of component county societies and has rendered advice and made suggestions in connection therewith.

Your Counsel drew the contracts between Mr. Kent Lighty and the State Society with reference to advertising matter in the NEW YORK STATE JOURNAL OF MEDICINE, the *Medical Directory of New York, New Jersey, and Connecticut*, and the Commercial Exhibits, and conferred with the members of the Publication Committee with reference to the situation resulting from the death of Mr. Lighty.

Your Counsel drew the contract between the Society and Dr. Joseph S. Lawrence, its Executive Officer.

Your Counsel also drew the contract between the Society and Mr. Dwight Anderson, as director of the Public Relations Bureau and business manager of the NEW YORK STATE JOURNAL OF MEDICINE and the *Medical Directory of New York, New Jersey, and Connecticut*.

Your Counsel has conferred at various times with members of the various committees on certain phases of their work.

Your Counsel attends and advises at the regular meetings of the Council of your Society.

Your Counsel is constantly in communication by telephone and letter with Dr. Peter Irving, secretary and general manager of the Society, and with Mr. Dwight Anderson with regard to the many questions which arise almost daily in connection with their work.

It should also be noted that daily telephone calls from members of the Society come to your Counsel and his office staff. These calls require advice and assistance on various problems. Many of these telephone inquiries present emergency situations which cannot be handled by correspondence.

Legislative Advice and Activities.—During the period of time that the Legislature was in session in 1942, and at the opening of the 1943 session, your Counsel examined certain bills affecting the medical profession and gave advice with respect thereto, and conferred also with the Executive Officer of the Society regarding such bills on various occasions.

At the morning session, we were addressed first by Dr. Thomas A. McGoldrick, Chairman of the Brooklyn Branch of the National Physicians Committee, Chairman of the Committee on Military and Naval Affairs and Civilian Defense of the Medical Society of the County of Kings, and President-Elect of the Medical Society of the State of New York.

Dr. McGoldrick's topic was "Recent Trends in the Economics of Medicine." He was followed by Dr. Henry W. Cave, Director of the Procurement and Assignment Service of the Second Service Command, who spoke on "The Procurement and Assignment Service as It Affects Physicians."

Dr. Joe R. Clemmons and Dr. Louis H. Bauer led the discussion of Dr. Cave's paper.

The luncheon session was attended by sixty members of the four component county societies and about an equal number of members of the four woman's auxiliaries.

Present also at the luncheon were the following officials of the Medical Society of the State of New York: Dr. Peter Irving, Secretary and General Manager; Dr. Joseph Lawrence, Executive Officer; Dr. Louis H. Bauer, Speaker of the House of Delegates; and Mr. Dwight Anderson, Director, Public Relations Bureau.

We were much honored in having Dr. George W. Cottis, President of the Medical Society of the State of New York, as the guest speaker at this session. Dr. Cottis presented a masterly paper on "Medicine of the Future—Evolution or Revolution."

The nominating committee presented the names of the following physicians for office for the ensuing two years: president, Dr. Francis G. Riley, Jamaica; first vice-president, Dr. John B. D'Albora, Brooklyn; second vice-president, Dr. Charles W. Martin, Woodmere; secretary-treasurer, Dr. Charles F. McCarty, Brooklyn.

On motion, duly seconded, these gentlemen were unanimously elected.

Seated at the speaker's table at the luncheon were the following representatives of the woman's auxiliaries: Mrs. J. Emerson Noll, president, New York State Woman's Auxiliary; Mrs. J. S. Kice, chairman, National Committee on Legislation; Mrs. William J. Godfrey, president, Queens County Woman's Auxiliary; Mrs. John L. Bauer, president, Kings County Woman's Auxiliary; Mrs. Arthur D. Jacques, president, Nassau County Woman's Auxiliary; Mrs. George P. Bergmann, president, Suffolk County Woman's Auxiliary.

The afternoon session, devoted to war injuries, was ably covered by Dr. Charles E. Bove, former director of surgery at the American Hospital in Paris, whose topic was "The Treatment of War Burns," and Dr. Irwin E. Siris, assistant professor of surgery, New York University School of Medicine and attending surgeon at Bellevue Hospital, who talked on "The Emergency Treatment and Transportation of Fractures." Excellent moving pictures accompanied this talk.

In spite of the difficulties of restricted traveling and the absence of many members who are serving in the armed forces, the meeting was regarded as highly successful by everyone who attended.

Respectfully submitted,

BURDGE P. MACLEAN, M.D., *President*
March 2, 1943

Third District Branch

To the House of Delegates; Gentlemen:

The annual meeting of the Third District Branch was held at the Wolfert's Roost Country Club, Al-

bany, New York, in September, 1942, with an excellent attendance.

Among the speakers was Dr. Louis H. Bauer, of Hempstead, who gave an exceptionally fine talk on aviation medicine. President George W. Cottis was also present and gave to the members of the Third District a very direct talk on our position in present-day affairs.

The main speaker was the Honorable Judge William H. Wadhams, who held the audience spellbound with an address on France and India. It was generally conceded that this was the finest talk that has been heard at a district branch meeting.

The Third District Branch has cooperated exceedingly well with the Office of Procurement and Assignment and has furnished more than its quota of doctors to the armed service.

At the business section of the meeting, Dr. Stephen H. Curtis was elected president, and Dr. Homer L. Nelms was elected first vice-president.

Respectfully submitted,

MAHLON H. ATKINSON, M.D., *President*
March 2, 1943

Fourth District Branch

To the House of Delegates; Gentlemen:

The thirty-sixth annual meeting of the Fourth District Branch of the Medical Society of the State of New York was called to order at 11:30 A.M. on Friday, September 18, 1942, in the Nurses' Home at the Mary McClellan Hospital in Cambridge, New York.

The program was divided into two parts. The first was given over to a report by various officers of the State Society on the activities and functions of the Society. On this part of the program, Dr. Peter Irving, the Secretary, was the first speaker. He outlined the Society organization, explained the duties of the Council and Committees, and told how they worked. Dr. Joseph Lawrence, the Executive Officer, followed, speaking of the importance of the Committee on Legislation. He stressed the fact that it is incumbent upon all members and also upon all of the various county societies, as well as the State Society, to keep informed on all legislative matters dealing with medicine. Dr. O. W. H. Mitchell, of Syracuse, the chairman of the Committee on Public Health and Education, described the various programs being carried on by his Committee and pointed out that it is possible for his Committee to help any community in the state that is anxious to have postgraduate instruction. Dr. Floyd S. Winslow of Rochester, chairman of the Committee on Medical Publicity, spoke on the importance of proper publicity and, among other things, recommended to the members of the Society the new book by Mr. Dwight Anderson and Miss Margaret Baylous, *When Doctors Are Rationed*. Dr. Herbert H. Bauckus, of Buffalo, chairman of the Committee on Public Relations and Economics, discussed the importance of giving thought to satisfactory public relations. Dr. David Kaliski, of New York, director of the Workmen's Compensation Bureau, spoke on the work of the Bureau. He stated that a new fee schedule is being negotiated with the carrier and that to this end it is extremely important that doctors advise the Bureau of the increases in their own cost of practice. Mr. Thomas H. Clearwater, speaking for Mr. Brosnan, our Counsel, covered the subject of Malpractice Defense and Insurance. He stressed the importance of maintaining a policy even while in service, and he also reported that the change of the master policy to the

"Section 1. The House of Delegates shall be composed of (a) Delegates elected by the component County Medical Societies; (b) Officers of the Society and other members of the Council and of the Board of Trustees; (c) the Presidents of the District Branches sitting as District Delegates; and (d) *a representative from each Scientific Section to be elected by each such Section*. Past-Presidents of the Society shall be life members of the House of Delegates. Each component County Society shall be entitled to elect as many delegates as there shall be State Assembly Districts in such county at the time of the election, but each component County Medical Society shall be entitled to elect at least one delegate. A component Society representing by its name more than one county shall be entitled to as many delegates as there are Assembly Districts in the counties named in the title of such society."

The third adds a new Article, No. XIV, to the Constitution; and the fourth adds a new Section, No. 4, to Chapter XII of the Bylaws.

Article XIV

Medical Benevolence Fund

"There shall be created a Benevolence Fund under the terms and conditions outlined in Chapter XII, Article 4, of the Bylaws. For this purpose there shall be appropriated by the Trustees out of the funds of the Society a sum not to exceed fifty cents per active member per year, to be set aside by the Treasurer as a special fund for the purpose of this Article. This fund shall be kept separate and invested or distributed by direction of the Board of Trustees of the Society under rules and regulations approved by the latter. The fund shall be used only for the relief

of pecuniary distress of sick or aged members who are or have been active members in good standing of the Society."

Chapter XII, Section 4 Special Committees

"Section 4—The President of the Society shall appoint, immediately after the Annual Meeting, a special committee of five to be known as the *Special Committee on Benevolence of the Medical Society of the State of New York*, consisting of two members from the Board of Trustees to be selected by the Chairman of the latter, the Treasurer, the Secretary, and a representative from the Woman's Auxiliary of the State Society to be selected by its President. This Committee shall select its own Chairman and have absolute jurisdiction over the distribution of such funds as have been allotted by the Society's Finance Committee from current income after appropriation by the Board of Trustees. No moneys shall be paid except on warrants signed by the Chairman of the Committee and the Treasurer. The Committee shall formulate rules and regulations for the acceptance of beneficiaries for consideration and approval by the Council. It may solicit subscriptions, donations, and legacies to be added to the principal of the Benevolence Fund. It shall present a detailed audit of receipts and expenditures, included in an annual report of its activities to the Council and the House of Delegates."

Respectfully submitted,
LOUIS H. BAUER, M.D., *Speaker*
PETER IRVING, M.D., *Secretary*

March 1, 1943

Reports of the District Branches

First District Branch

To the House of Delegates; Gentlemen:

The First District Branch held its annual meeting on Wednesday, October 7, 1942, at Yonkers, New York, at St. Joseph's Hospital.

The exigencies of war, with its concomitant uncertainties, caused a deviation from the policy of the past few years. Instead of the one-day postgraduate and refresher course that has come to be the usual procedure in the district, and with a feeling that there had been many lectures on war surgery, it was decided that in this instance the meeting would cater to the needs of those physicians remaining at home, many of whom will have been brought back from partial retirement to the field of the general practitioner.

Dr. Raphael Kurzkrok, of New York City, spoke on the "Status of Modern Estrogen Therapy." Dr. Byron P. Stookey, of New York City, spoke on "Low Back and Sciatic Pain: Its Relation to Neurosurgery," with special reference to the syndrome of nucleus pulposus. Other speakers were Dr. Lloyd F. Craver, of New York City, who spoke on "The Scope of Modern Radiotherapy," and Dr. Harry Gold, of New York City, who explained the "Newer Advances in Digitalis Therapy." Dr. Gold brought forth several revolutionary ideas in the pharmacology of digitalis.

Those attending the meeting were luncheon guests of the hospital. Dr. George Cottis, president of the

State Society, gave an interesting talk urging the medical profession to reappraise its position in a changing world and asserted that "the wave of world revolution having broken out on our own shores, all of us doctors must consider what lies ahead of us."

Dr. Henry W. Cave, in charge of Procurement and Assignment for the Second Service Command, explained the needs of the armed forces and medicine's response to the country's call. Dr. Joe R. Clemmons, in charge of Procurement and Assignment for New York State, described the requirements that the physicians of this state must meet.

The following officers were elected to guide the district for the term 1943 to 1945: Dr. James G. Morrissey, Yonkers, president; Dr. Scott L. Smith, Poughkeepsie, first vice-president; Dr. Harold F. Morrison, Tuxedo Park, second vice-president; Dr. Henry W. Miller, Brewster, treasurer; Dr. Isidore J. Landsman, Bronx, secretary.

Respectfully submitted,
ALEXANDER N. SELMAN, M.D., *President*
March 2, 1943

Second District Branch

To the House of Delegates; Gentlemen:

The annual meeting of the Second District Branch was held at the Garden City Hotel, Garden City, on October 28, 1942.

At the morning session, we were addressed first by Dr. Thomas A. McGoldrick, Chairman of the Brooklyn Branch of the National Physicians Committee, Chairman of the Committee on Military and Naval Affairs and Civilian Defense of the Medical Society of the County of Kings, and President-Elect of the Medical Society of the State of New York.

Dr. McGoldrick's topic was "Recent Trends in the Economics of Medicine." He was followed by Dr. Henry W. Cave, Director of the Procurement and Assignment Service of the Second Service Command, who spoke on "The Procurement and Assignment Service as It Affects Physicians."

Dr. Joe R. Clemmons and Dr. Louis H. Bauer led the discussion of Dr. Cave's paper.

The luncheon session was attended by sixty members of the four component county societies and about an equal number of members of the four woman's auxiliaries.

Present also at the luncheon were the following officials of the Medical Society of the State of New York: Dr. Peter Irving, Secretary and General Manager; Dr. Joseph Lawrence, Executive Officer; Dr. Louis H. Bauer, Speaker of the House of Delegates; and Mr. Dwight Anderson, Director, Public Relations Bureau.

We were much honored in having Dr. George W. Cottis, President of the Medical Society of the State of New York, as the guest speaker at this session. Dr. Cottis presented a masterly paper on "Medicine of the Future—Evolution or Revolution."

The nominating committee presented the names of the following physicians for office for the ensuing two years: president, Dr. Francis G. Riley, Jamaica; first vice-president, Dr. John B. D'Albora, Brooklyn; second vice-president, Dr. Charles W. Martin, Woodmere; secretary-treasurer, Dr. Charles F. McCarty, Brooklyn.

On motion, duly seconded, these gentlemen were unanimously elected.

Seated at the speaker's table at the luncheon were the following representatives of the woman's auxiliaries: Mrs. J. Emerson Noll, president, New York State Woman's Auxiliary; Mrs. J. S. Kice, chairman, National Committee on Legislation; Mrs. William J. Godfrey, president, Queens County Woman's Auxiliary; Mrs. John L. Bauer, president, Kings County Woman's Auxiliary; Mrs. Arthur D. Jacques, president, Nassau County Woman's Auxiliary; Mrs. George P. Bergmann, president, Suffolk County Woman's Auxiliary.

The afternoon session, devoted to war injuries, was ably covered by Dr. Charles E. Bove, former director of surgery at the American Hospital in Paris, whose topic was "The Treatment of War Burns," and Dr. Irwin E. Siris, assistant professor of surgery, New York University School of Medicine and attending surgeon at Bellevue Hospital, who talked on "The Emergency Treatment and Transportation of Fractures." Excellent moving pictures accompanied this talk.

In spite of the difficulties of restricted traveling and the absence of many members who are serving in the armed forces, the meeting was regarded as highly successful by everyone who attended.

Fourth District Branch

To the House of Delegates; Gentlemen:

The thirty-sixth annual meeting of the Fourth District Branch of the Medical Society of the State of New York was called to order at 11:30 A.M. on Friday, September 18, 1942, in the Nurses' Home at the Mary McClellan Hospital in Cambridge, New York.

The program was divided into two parts. The first was given over to a report by various officers of the State Society on the activities and functions of the Society. On this part of the program, Dr. Peter Irving, the Secretary, was the first speaker. He outlined the Society organization, explained the duties of the Council and Committees, and told how they worked. Dr. Joseph Lawrence, the Executive Officer, followed, speaking of the importance of the Committee on Legislation. He stressed the fact that it is incumbent upon all members and also upon all of the various county societies, as well as the State Society, to keep informed on all legislative matters dealing with medicine. Dr. O. W. H. Mitchell, of Syracuse, the chairman of the Committee on Public Health and Education, described the various programs being carried on by his Committee and pointed out that it is possible for his Committee to help any community in the state that is anxious to have postgraduate instruction. Dr. Floyd S. Winslow of Rochester, chairman of the Committee on Medical Publicity, spoke on the importance of proper publicity and, among other things, recommended to the members of the Society the new book by Mr. Dwight Anderson and Miss Margaret Baylous, *When Doctors Are Rationed*. Dr. Herbert H. Bauckus, of Buffalo, chairman of the Committee on Public Relations and Economics, discussed the importance of giving thought to satisfactory public relations. Dr. David Kaliski, of New York, director of the Workmen's Compensation Bureau, spoke on the work of the Bureau. He stated that a new fee schedule is being negotiated with the carrier and that to this end it is extremely important that doctors advise the Bureau of the increases in their own cost of practice. Mr. Thomas H. Clearwater, speaking for Mr. Bro-man, our Counsel, covered the subject of Malpractice Defense and Insurance. He stressed the importance of maintaining a policy even while in service, and he also reported that the change of the master policy to the

Yorkshire Indemnity has worked very well. These officers answered many questions from the floor.

On the afternoon session there were two scientific papers. The first was by Dr. Robert Levy, of New York, who spoke on "Cardiac Pain—Its Significance and Treatment." During this talk he stressed the relationship between cardiac pain and insufficient oxygenation of the myocardium. In support of this he mentioned the work that has been done with low-oxygen mixtures as a diagnostic aid in suspected coronary disease. He also demonstrated the efficiency of aminophylline in controlling symptoms. Dr. John M. Swan, of Rochester, the executive secretary of the New York State Committee of the American Society for the Control of Cancer, Inc., discussed the cancer problem and brought up the work of the group of Rochester hospitals, showing the number of five- and ten-year cures. This was followed by a lively discussion. During the meeting there were two other talks which were not scheduled but which were nevertheless very much worth while. The first was by Major Edward K. Reid, director of the Medical Officers Recruiting Board of the State of New York. He spoke of the functions of the Procurement and Assignment Service and stated that their problem was now almost entirely complete, that there were very few physicians of the age group certified as available by their county boards who had not yet been placed. He also justified the earlier advice to the younger men to get in service, saying that on the fifteenth of the month he had received a telegram that commissions in a grade higher than First Lieutenant were no longer to be awarded. Dr. Lee Preston, Chief Medical Officer of the New York State War Council, also spoke and told of the plans of the Council. He stated that the Emergency Medical Service in the various communities had been crippled because of men constantly being called to the colors. However, he said that this condition was practically over, and very soon it should be possible to settle upon a stable organization.

At the beginning of the afternoon session a nominating committee, composed of Dr. Morris Maslon, of Glens Falls, Dr. Denver M. Vickers, of Cambridge, and Dr. J. Woods Price, of Saranac Lake, reported a slate of officers for the next two years. The officers were: president, Dr. Harold A. Peck, of Glens Falls; first vice-president, Dr. Frank Finney, of Malone; second vice-president, Dr. Denver M. Vickers, of Cambridge; secretary, Dr. F. Leslie Sullivan, of Scotia; treasurer, Dr. Gilberto S. Pesquera, of Mount McGregor.

A delicious luncheon was served in the dining room of the Nurses' Home, where the members of the Society and the Auxiliary were the guests of the Mary McClellan Hospital.

The annual banquet was held at the Cambridge House at 7:00 P.M. Preceding the presidential address, a short talk was given by Dr. Silas J. Banker, of Fort Edward, who had been president of the Fourth District Branch at the time it last met in Washington County—namely, at Fort Edward in 1913. Other short talks were made by Dr. Raymond G. Perkins, of Malone; Mrs. Emerson Noll, President of the Woman's Auxiliary of the New York State Medical Society, and also presidents of the county societies and other State officers who were present. Dr. George W. Cottis, President of the State Society, discussed the role of organized medicine during the present crisis and in the years after the war. He brought up many of the problems in detail and admonished us to think seriously about

their solution. Following his talk, Dr. William V. Cone, chief of the Neurosurgical Service of Montreal Neurological Institute and formerly Lieutenant-Colonel in the Canadian Medical Corps, spoke on "The Role of the Special Hospital in War." Dr. Cone's talk was a brilliant plea for more special hospitals, such as neurosurgic ones, for the care of the wounded, rather than having all injuries taken care of in general hospitals.

The attendance was small, the registration being 55, of whom 40 were from the district. As was to be expected, there were very few of the younger men present.

Respectfully submitted,

WILLIAM WARRINER WOODRUFF, M.D., *President*
March 2, 1943

Fifth District Branch

To the House of Delegates; Gentlemen:

The annual meeting of the Fifth District Branch was held Thursday, September 24, 1942, at the Teugega Club at Rome. There were 58 members present.

The program was opened at 10:00 A.M. with an interesting paper on "Care of the Aged in Civilian Defense" by Dr. James W. W. Dimon, of Utica. There followed two talks on wartime medicine, both of an up-to-date nature. Dr. Emmett A. Dooley, assistant clinical professor of surgery, New York Post-Graduate Medical School, spoke on "The Treatment of Burns"; and Dr. Leon E. Sutton, professor of clinical surgery at the Syracuse University College of Medicine, went into "The Problem of Healing in Deep Burns." Both of these presentations were excellent. The discussion which followed was both profitable and interesting.

At the luncheon, President Cottis gave an address on modern trends in sociology and the need of the medical profession to get into the driver's seat to make sure that the wisest course be followed in such fashion as to make the most of new things.

In the afternoon, Dr. Carl A. Peterson, assistant attending surgeon at the New York Post-Graduate Hospital, read a paper on "The Care of Head Injuries." Dr. Herbert H. Bauckus, of Buffalo, spoke, as chairman of the Council Committee on Public Relations and Economics, on "The Care of the Sick and Medical Expense Indemnity Insurance." Dr. Bauckus made it clear that the Council is eager to see this type of nonprofit insurance promoted more widely and more fully throughout the state.

Respectfully submitted,

EDWARD C. REIFENSTEIN, *President*

March 1, 1943

Sixth District Branch

To the House of Delegates; Gentlemen:

The thirty-sixth annual meeting of the Sixth District Branch of the Medical Society of the State of New York was held at the International Business Machines Country Club at Endicott, New York, on Wednesday, September 16, 1942. The attendance was 82.

The first wartime meeting of the Society in twenty-four years registered a sharp decline in registration. However, the usual interest of those present made the small attendance but slightly noticed.

The program of the morning session was as follows: "Treatment of the Aged" by Dr. Ernst P.

Boas, associate attending physician at Mount Sinai Hospital, New York City; "Nutrition: Survey of Recent Findings and a Discussion of General Problems" by Dr. L. A. Maynard, director of the School of Nutrition, Cornell University, Ithaca; and "Progress Report of Medical Recruiting in the Sixth District Area" by Major Edward K. Reid, U.S. Army.

At the afternoon session a symposium on Medical Indemnity Insurance was held. This method of presentation of a subject was an innovation, highly successful. The panel consisted of Dr. Frederick M. Miller, Jr., of Utica, Dr. Harvey P. Hoffman, of Buffalo, and Dr. Frederick E. Elliott, of Brooklyn. The chairman of the meeting acted as coordinator. Each speaker on the panel spoke for twenty minutes. The chairman then called for questions from the floor. He referred them to panel participants for answer. Many questions were asked, resulting in a thorough discussion of the subject.

At the conclusion of the symposium, Dr. W. D. Ludlum gave a brief report on the objectives of the National Physicians Committee. Following a discussion of this report, the meeting was adjourned.

Respectfully submitted,
NORMAN S. MOORE, M.D., *President*

March 2, 1943

Seventh District Branch

To the House of Delegates; Gentlemen:

The annual meeting of the Seventh District Branch was held on Wednesday, September 23, 1942, at the Academy of Medicine in Rochester. There were 218 members present.

The meeting was called to order at 9:45 A.M., and motion sound pictures were shown, for which the films had been provided by the British Information Services. They brought home to the physician-problems which they may meet both in the war and in civilian life. Their titles follow: "London Fire Raids," "London Can Take It," "Lofoten Raid," "Morning Paper," "Three in a Shell Hole," and "Historic Record."

Two papers were then read on subjects of ever pressing interest. Dr. Nolan D. C. Lewis, professor of psychiatry, College of Physicians and Surgeons, Columbia University, spoke on "The Psychological Problems of Age." He brought out the fact that the older members of the profession must now bear an ever increasing burden in caring for civilian health.

Dr. Cornelius P. Rhoads, director, Memorial Hospital, New York City, then spoke on "The Modern Conception and Treatment of Cancer," bringing the audience up to date on the cancer problem.

After luncheon, officers of the State Medical Society were introduced: Dr. Joseph S. Lawrence, Executive Officer; Mr. Dwight Anderson, Director of the Bureau of Public Relations; Dr. Peter Irving,

Secretary and General Manager; and Dr. George W. Cottis, President. Dr. Cottis expressed his deep conviction that the profession should keep in step with modern sociologic trends in order to take leadership in finding the best ways to succeed in caring for the sick.

Then the scientific program was continued with a forum discussion on four papers, "Blood Plasma" by Dr. Joseph W. Howland, "Burns" by Dr. James S. Houck, "Fractures" by Dr. Joseph P. Henry, and "Shock" by Dr. Maurice Barnard. Dr. Leo J. Simpson acted as chairman of the panel and called on Dr. John Detoro, Dr. Earle Mahoney, Dr. Henry Crawford, and Dr. Fred A. Bryan. This was an outstanding discussion in civilian defense problems with the latest medical information clearly described.

Respectfully submitted,
BENJAMIN J. SLATER, M.D., *President*
March 1, 1943

Eighth District Branch

To the House of Delegates; Gentlemen:

The thirty-seventh annual meeting of the Eighth District Branch was held on Thursday, October 1, 1942, at the Veterans Facility Building in Batavia. There were 97 members present.

The morning session opened at 10:00 A.M. with a symposium of "Effects of War Gases." Dr. Stephen J. Walczak, Dr. Ramsdell Gurney, and Dr. Harvey P. Hoffman, of Buffalo, discussed this important subject in up-to-date fashion.

Dr. Herbert H. Baucus, of Buffalo, Chairman of the Public Relations and Economics Committee of the Council, then spoke on the subject of "Medical Expense Indemnity Insurance." He expressed the great desire of the State Society administration, to effect further promotion of this nonprofit insurance than has so far occurred in New York.

At the luncheon, officers of the State Medical Society, past and present, were introduced. President Cottis spoke of the need for the medical profession to concern itself with changing sociologic trends in such a way as to lead in ensuring real medical care in the future.

In the afternoon Dr. William D. Stroud, professor of cardiology, Jefferson Medical College, Philadelphia, read a paper on "Cardiac Pain." Dr. Herman E. Pearce, Jr., assistant professor of surgery, University of Rochester School of Medicine and Dentistry, gave a talk illustrated by lantern slides on "Peripheral Vascular Diseases."

Since Dr. Robert C. Peale, President of the Branch, is absent on leave from his State Society duties for service in the Army, reporting on County activities falls to me as vice-president.

Respectfully submitted,
PETER J. DI NATALE, M.D., *Vice-President*

March 1, 1943

1943 Annual Meeting

Medical Society of the State of New York

May 3, 4, 5, 6—The Hotel Statler, Buffalo

House of Delegates

The regular Annual Meeting of the House of Delegates of the Medical Society of the State of New York will be called to order at 10:00 A.M. on Monday, May 3, in the Assembly Room on the Seventeenth Floor.

In accordance with Chapter II, Section 3, of the Bylaws, the House will assemble according to the following schedule:

MONDAY, MAY 3, 1943
10:00 A.M. and 3:00 P.M.
TUESDAY, MAY 4, 1943
9:00 A.M. and 1:00 P.M.

At the last adjourned session (1:00 P.M., Tuesday), the election of officers, councilors, trustees, and delegates will occur in accordance with Chapter III, Section I, of the revised Bylaws.

LOUIS H. BAUER, M.D., *Speaker*
PETER IRVING, M.D., *Secretary*

137th Annual Meeting

This year a change of meeting time for the Annual Meeting has been set following the decision to have no banquet. The Annual Meeting will take place at 2:30 P.M., or as near thereafter as possible, following adjournment of the last session of the House of Delegates. The place will be the Seventeenth Floor. The Society will be called to order by the President, with reading of the minutes by the Secretary.

GEORGE W. COTTIS, M.D., *President*
PETER IRVING, M.D., *Secretary*

Registration

Registration will be held in the Hotel—for delegates on Monday, May 3, after 9:00 A.M.; for members, on Monday, Tuesday, Wednesday, and Thursday, May 3, 4, 5, 6, from 9:00 A.M. to 6:00 P.M.

Exhibits

Scientific and Technical exhibits will be located in the Hotel.

Scientific Motion Pictures will be shown.

Scientific Sessions

General Sessions on Tuesday and Thursday afternoons. Section and Session meetings will be held on Tuesday morning, Wednesday morning and afternoon, and Thursday morning.

Civilian Defense in New York State

A dinner meeting on Civilian Defense will be held on Tuesday, May 4, at 7:00 P.M., in the Ballroom, under the auspices of the Medical Society of the State of New York, the Office of Civilian Defense, and the Second Service Command and the Health Preparedness Commission of the State of New York. Tickets may be secured at the registration desk.

New York State Association of School Physicians

This year the School Physicians, on invitation, will hold meetings in the afternoon and evening of Monday, May 3, with a dinner to be arranged. (See page 674 for program.)

Tuberculosis Luncheon

The Subcommittee on Tuberculosis and Chest Diseases will hold a luncheon at 12:00 NOON, Wednesday, May 5, in the Chinese Room. All those concerned with tuberculosis from state and local aspects will be welcome.

Woman's Auxiliary

See April 15 issue for the program.

Scientific Program

The Committee:

D. Dexter Davis, M.D., *Chairman*, Brooklyn; and
Chairman of Sections and Sessions

GENERAL SESSIONS

(*Dr. Davis presiding*)

The presentations at these Sessions will consist of one-half hour lectures, without discussion. The meetings will start promptly at the hour specified. Members are requested to be in their seats at least five minutes in advance of the meeting time.

Tuesday, May 4—2:30 P.M.

Hotel Statler, Assembly Room, 17th Floor

1. "British and American Experiences in Civil Defense" Colonel George Baehr, Chief Medical Officer, Office of Civilian Defense, Washington, D.C.
2. "Summary of the Modern Treatment of War Injuries"
Captain Reynolds Hayden, M.C., U.S.N.,
Commandant Third Naval District, New York
3. "Care of Soft Tissue Injuries"
Forrest Young, M.D., Assistant Professor of Surgery, University of Rochester, School of Medicine, Rochester
4. "Continuous Caudal Analgesia in Obstetrics: Demonstration of Catheter Technic for Administration"
(The A. Walter Suiter Lectureship. . . . This will be the fifth lecture to be delivered under this lectureship fund.)
Francis R. Irving, M.D., Professor of Clinical Obstetrics, Syracuse University, College of Medicine, Syracuse
C. Albertson Lippencott, M.D., Syracuse
Frank Meyer, M.D., Syracuse

Thursday, May 6—2:00 P.M.

Hotel Statler, Assembly Room, 17th Floor

SYMPOSIUM

PLASMA

1. "The Physiologic Aspects of Shock and Its Treatment with Plasma and Other Blood Substitutes"
H. Necheles, M.D., Ph.D., Professorial Lecturer, Department of Physiology, University of Chicago, Chicago, Illinois
2. "Laboratory Aspects of the Preparation and Biologic Control of Plasma"
A. Milzer, M.S., Ph.D., Associate in Research and Production Bacteriologist of Serum Center, Michael Reese Hospital, Chicago, Illinois
3. "Principles and Methods of Desiccation of Plasma"
F. Oppenheimer, Ph.D., Physicist in charge of Production and Research of the Serum Center, Michael Reese Hospital, Chicago, Illinois
4. "The Clinical Application of Plasma"
Sidney O. Levinson, M.D., Director of The Samuel Deutsch Convalescent Serum Center, and Chairman, Blood Plasma Committee, Civilian Defense, Metropolitan Chicago Area, Chicago, Illinois

SECTIONS

All papers read before the Society by members become the property of the Society. The original copy of each paper shall be left with the secretary of the section.

Discussers should have their remarks typed, double-spaced, and hand them to the secretary.

Time limits: Twenty minutes for each paper, five minutes for individual discussion.

Section meetings shall begin promptly at the hour specified.

SECTION ON
ANESTHESIOLOGY

Chairman . . Clifford E. McElwain, M.D., Syracuse
Vice-Chairman . . . F. Paul Ansbro, M.D., Brooklyn
Secretary Milton C. Peterson, M.D., New York

Tuesday, May 4—10:00 A.M.
Hotel Statler, Room 310

Address of Welcome

John H. Evans, M.D., Buffalo

Chairman's Address: "Anesthesiology and the Autonomic Nervous System"

F. Paul Ansbro, M.D., Brooklyn

1. "The Narcotic Properties of Carbon Dioxide"
M. H. SeEVERS, M.D., Ann Arbor, Michigan
(By invitation)
Discussion: E. A. ROVENSTINE, M.D., New York
2. "Anesthesia for the Aged"
Evelyn Apogi, M.D., New York (By invitation)
Discussion: Charles J. Wells, M.D., Syracuse
3. "Prolonged Intravenous Pentothal Anesthesia for Military Surgery"
Captain Barnett A. Greene, M.C., A.U.S.,
Fort Monmouth, New Jersey
Discussion: Rose M. Lenahan, M.D., Buffalo

Wednesday, May 5—2:00 P.M.
Hotel Statler, Room 310

1. "Anesthesia for Thoracic Surgery"
Benjamin E. Etsten, M.D., Albany
Discussion: Lorenzo J. Pico, M.D., Brooklyn
2. (Title to be announced later)
Major Stevens J. Martin, M.C., A.U.S.,
New York
Discussion: Henry K. Beecher, M.D., Boston,
Massachusetts (By invitation)

ROUND-TABLE DISCUSSION
ANESTHESIOLOGY AS APPLIED TO WAR
CASUALTIES

Paul M. Wood, M.D., New York, Chairman
Virginia Apgar, M.D., New York
John C. Dessloch, M.D., Rochester
Clarence J. Durshordwe, M.D., Buffalo
E. A. Rovenstine, M.D., New York

SECTION ON
DERMATOLOGY AND SYPHILOLOGY

Chairman . . Rudolph Ruedemann, Jr., M.D., Albany
Secretary Maurice J. Costello, M.D., New York

Wednesday, May 5—10:00 A.M.
Hotel Statler, Room 306

1. "Crude Liver Extract as a Supportive Measure in Arseno—or Heavy Metal Therapy"
Girsch D. Astrachan, M.D., New York
Discussion: Paul Gross, M.D., New York
2. "Tuberculous Lesions of the Skin"
Anthony C. Cipollaro, M.D., New York
3. "Cutaneous Moniliasis"
Paul E. Bechet, M.D., New York
Discussion: Royal M. Montgomery, M.D.,
New York
4. "Occupational Acnes"
Louis Schwartz, M.D., Bethesda, Maryland
(By invitation)
Discussion: Louis Tulipan, M.D., New York

Thursday, May 6—10:00 A.M.
Hotel Statler, Room 306

1. "Eczema Vaccinatum"
Frank C. Combes, M.D., New York
Howard T. Behrman, M.D., New York
Discussion: Maurice J. Costello, M.D., New
York
2. "Cutaneous Eruptions Produced by Sulfonamides: A Report of Two Cases of Bullous Eruption Following the Administration of Sulfonamide Drugs, One of Which Resembled Pemphigus Vulgaris"
David Bloom, M.D., New York
3. "Fever as an Adjuvant to Specific Therapy in Syphilis"
Evan W. Thomas, M.D., New York
Discussion: Harry C. Saunders, M.D., New
York
4. "The Significance of Absent Pharyngeal and Corneal Reflexes in Cutaneous Diseases"
Thomas N. Graham, M.D., New York
George M. Lewis, M.D., New York
Discussion: Howard Fox, M.D., New York
5. "The Etiology of Psoriasis"
Arthur E. Goldfarb, M.D., New York

SECTION ON GASTROENTEROLOGY AND PROCTOLOGY

Chairman.....
H. Walden Retan, M.D., Syracuse (In Service)
 Vice-Chairman.....F. Leslie Sullivan, M.D., Scotia
 Secretary.....Stockton Kimball, M.D., Buffalo

Tuesday, May 4—10:00 A.M.
 Hotel Statler, Room 306

1. "Fat and Vitamin A Absorption in Sprue"
 David Adlersberg, M.D., New York
 Discussion: Henry A. Rafsky, M.D., New York
2. "The Treatment of Peptic Ulcer"
 Edward F. Driscoll, M.D., Buffalo
 Abraham H. Aaron, M.D., Buffalo
 Discussion: John D. Stewart, M.D., Buffalo
3. "The Treatment of Gallbladder Disease"
 Albert F. R. Andresen, M.D., Brooklyn
 Discussion: I. Harris Levy, M.D., Syracuse
4. "The Diagnosis and Treatment of Lympho-granuloma Venereum of Colon, Rectum, and Anus"
 Charles B. Jones, M.D., Brooklyn
 Discussion: Descum D. McKenney, M.D., Buffalo

Wednesday, May 5—2:00 P.M.
 Hotel Statler, Room 306

SYMPOSIUM CARCINOMA OF THE COLON AND RECTUM

1. "Carcinoma of the Colon: Diagnostic Criteria for Early Recognition"
 Burrill B. Crohn, M.D., New York
 Discussion: Ralph J. McMahon, M.D., John-son City
2. "The Diagnostic and Therapeutic Value of X-ray in Carcinoma of the Colon"
 Edward C. Koenig, M.D., Buffalo
 Gordon J. Culver, M.D., Buffalo
 Discussion: Kencil L. Mitton, M.D., Schenectady
3. "Carcinoma of the Large Intestine"
 Frederick F. McGauley, M.D., Schenectady
 Discussion: Arthur M. Dickinson, M.D., Albany
4. "Peritonitis Secondary to Perforation in Carcinoma of the Colon"
 Philip D. Allen, M.D., New York
 Discussion: William S. Brady, M.D., Utica

SECTION ON INDUSTRIAL MEDICINE AND SURGERY

Chairman... Leonard Greenburg, M.D., New York
 Secretary... Orvis H. Brenenstuhel, M.D., Albany

This program is designed to answer questions which may be raised on the subject of industrial medical services by any of the speakers or any of the members of the audience. As a result of this discussion, we should be able to come away from the meeting with a report which later might be printed in the JOURNAL and which would serve as a guide to this problem in the State of New York.

The first three papers are to be presented in brief form and are to serve as a background for a general discussion of all phases of the problem of industrial medical services.

Tuesday, May 4—10:00 A.M.
 Hotel Statler, Room 308

SYMPOSIUM MEDICAL SERVICES IN INDUSTRY

1. "The Functions of the Industrial Medical Service"
2. "The Industrial Medical Provisions for Various Sizes of Plants, Both Personnel and Physical Equipment"
3. "The Integration of the Industrial Medical Services with Medical Services in the Community and the Social Agencies of the Community"

Wednesday, May 5—2:00 P.M.
 Hotel Statler, Room 308

1. "The Nutrition of the Industrial Worker and Industry's Part in This Problem"
2. "What Shall We Do About Physical Defects in the General Population?"
3. "The Medical Aspects of Absenteeism in Industry"

SECTION ON MEDICINE

Chairman... J. Stanley Kenney, M.D., New York
 Vice-Chairman.....
Frederic W. Holcomb, M.D., Kingston
 Secretary... Julian M. Freston, M.D., New York

Wednesday, May 5—10:00 A.M.
 Hotel Statler, Assembly Room, 17th Floor
 JOINT MEETING WITH THE SECTION ON
 SURGERY
 (See Section on Surgery)

Thursday, May 6—10:00 A.M.
 Hotel Statler, Room 310

1. "Treatment of Pneumonia with Sodium Sulfa-pyridine and Sodium Sulfathiazole Administered Orally"
 Elmer H. Loughlin, M.D., Brooklyn
 Richard H. Bennett, M.D., Brooklyn
 Samuel H. Spitz, M.D., Brooklyn
 Mary E. Flanagan, B.S., Brooklyn
2. "Light Transition Forms Between Mental Health and Mental Disease"
 B. Liber, M.D., New York
3. "Preventive Aspects of Coronary Disease"
 Milton Plotz, M.D., Brooklyn
4. "New Objective (Photoelectric) Method for the Determination of Circulation Time"
 Benjamin Jablons, M.D., New York
 Jules Cohen, M.D., New York (By invitation)
 M. Y. Swirsky, M.D., New York (By invitation)

SECTION ON NEUROLOGY AND PSYCHIATRY

Chairman... Noble R. Chambers, M.D., Syracuse
 Secretary... Angus M. Frantz, M.D., New York

Wednesday, May 5—10:00 A.M.
 Hotel Statler, Room 308

1. "Bilateral Blindness Due to Lesions in Both Occipital Lobes"

SECTIONS

All papers read before the Society by members become the property of the Society. The original copy of each paper shall be left with the secretary of the section.

Discussers should have their remarks typed, double-spaced, and hand them to the secretary.

Time limits: Twenty minutes for each paper, five minutes for individual discussion.

Section meetings shall begin promptly at the hour specified.

SECTION ON
ANESTHESIOLOGY

Chairman... Clifford E. McElwain, M.D., Syracuse
Vice-Chairman... F. Paul Ansbro, M.D., Brooklyn
Secretary... Milton C. Peterson, M.D., New York

Tuesday, May 4—10:00 A.M.
Hotel Statler, Room 310

Address of Welcome

John H. Evans, M.D., Buffalo

Chairman's Address: "Anesthesiology and the Autonomic Nervous System"
F. Paul Ansbro, M.D., Brooklyn

1. "The Narcotic Properties of Carbon Dioxide"
M. H. SeEVERS, M.D., Ann Arbor, Michigan
(By invitation)
Discussion: E. A. ROVENSTINE, M.D., New York
2. "Anesthesia for the Aged"
Evelyn Apogi, M.D., New York (By invitation)
Discussion: Charles J. Wells, M.D., Syracuse
3. "Prolonged Intravenous Pentothal Anesthesia for Military Surgery"
Captain Barnett A. Greene, M.C., A.U.S.,
Fort Monmouth, New Jersey
Discussion: Rose M. Lenahan, M.D., Buffalo

Wednesday, May 5—2:00 P.M.
Hotel Statler, Room 310

1. "Anesthesia for Thoracic Surgery"
Benjamin E. Etsten, M.D., Albany
Discussion: Lorenzo J. Pico, M.D., Brooklyn
2. (Title to be announced later)
Major Stevens J. Martin, M.C., A.U.S.,
New York
Discussion: Henry K. Beecher, M.D., Boston,
Massachusetts (By invitation)

ROUND-TABLE DISCUSSION
ANESTHESIOLOGY AS APPLIED TO WAR
CASUALTIES

Paul M. Wood, M.D., New York, Chairman
Virginia Apgar, M.D., New York
John C. Dessloch, M.D., Rochester
Clarence J. Durshordwe, M.D., Buffalo
E. A. Rovenstine, M.D., New York

SECTION ON
DERMATOLOGY AND SYPHILOLOGY

Chairman... Rudolph Ruedemann, Jr., M.D., Albany
Secretary... Maurice J. Costello, M.D., New York

Wednesday, May 5—10:00 A.M.
Hotel Statler, Room 308

1. "Crude Liver Extract as a Supportive Measure in Arseno—or Heavy Metal Therapy"
Girsch D. Astrachan, M.D., New York
Discussion: Paul Gross, M.D., New York
2. "Tuberculous Lesions of the Skin"
Anthony C. Cipollaro, M.D., New York
3. "Cutaneous Moniliasis"
Paul E. Bechet, M.D., New York
Discussion: Royal M. Montgomery, M.D.,
New York
4. "Occupational Aenes"
Louis Schwartz, M.D., Bethesda, Maryland
(By invitation)
Discussion: Louis Tulipan, M.D., New York

Thursday, May 6—10:00 A.M.
Hotel Statler, Room 306

1. "Eczema Vaccinatum"
Frank C. Combes, M.D., New York
Howard T. Behrman, M.D., New York
Discussion: Maurice J. Costello, M.D., New York
2. "Cutaneous Eruptions Produced by Sulfonamides: A Report of Two Cases of Bullous Eruption Following the Administration of Sulfonamide Drugs, One of Which Resembled Pemphigus Vulgaris"
David Bloom, M.D., New York
3. "Fever as an Adjuvant to Specific Therapy in Syphilis"
Evan W. Thomas, M.D., New York
Discussion: Harry C. Saunders, M.D., New York
4. "The Significance of Absent Pharyngeal and Corneal Reflexes in Cutaneous Diseases"
Thomas N. Graham, M.D., New York
George M. Lewis, M.D., New York
Discussion: Howard Fox, M.D., New York
5. "The Etiology of Psoriasis"
Arthur E. Goldfarb, M.D., New York

SECTION ON GASTROENTEROLOGY AND PROCTOLOGY

Chairman.....H. Walden Retan, M.D., Syracuse (In Service)
Vice-Chairman.....F. Leslie Sullivan, M.D., Scotia
Secretary.....Stockton Kimball, M.D., Buffalo

Tuesday, May 4—10:00 A.M.
Hotel Statler, Room 306

1. "Fat and Vitamin A Absorption in Sprue"
David Adlersberg, M.D., New York
Discussion: Henry A. Rafsky, M.D., New York
2. "The Treatment of Peptic Ulcer"
Edward F. Driscoll, M.D., Buffalo
Abraham H. Aaron, M.D., Buffalo
Discussion: John D. Stewart, M.D., Buffalo
3. "The Treatment of Gallbladder Disease"
Albert F. R. Andresen, M.D., Brooklyn
Discussion: I. Harris Levy, M.D., Syracuse
4. "The Diagnosis and Treatment of Lymphogranuloma Venereum of Colon, Rectum, and Anus"
Charles B. Jones, M.D., Brooklyn
Discussion: Descum D. McKenney, M.D., Buffalo

Wednesday, May 5—2:00 P.M.
Hotel Statler, Room 306

SYMPOSIUM CARCINOMA OF THE COLON AND RECTUM

1. "Carcinoma of the Colon: Diagnostic Criteria for Early Recognition"
Burrill B. Crohn, M.D., New York
Discussion: Ralph J. McMahon, M.D., John-son City
2. "The Diagnostic and Therapeutic Value of X-ray in Carcinoma of the Colon"
Edward C. Koenig, M.D., Buffalo

SECTION ON NEUROLOGY AND PSYCHIATRY

Chairman...Noble R. Chambers, M.D., Syracuse
Secretary....Angus M. Frantz, M.D., New York

Wednesday, May 5—10:00 A.M.
Hotel Statler, Room 308

1. "Bilateral Blindness Due to Lesions in Both Occipital Lobes"

Joseph C. Yaskin, M.D., Philadelphia, Pennsylvania (By invitation)

Henry Alsop Riley, M.D., New York

Helene E. Riggs, M.D., Philadelphia, Pennsylvania (By invitation)

A. S. Tornay, M.D., Philadelphia, Pennsylvania (By invitation)

Open Discussion

2. "Experiences with 500 Cases of Personally Studied Peripheral Facial Paralysis"

Lt. Comm. Harold R. Merwarth, M.C., U.S.N.R., Brooklyn

3. "Ménière's Syndrome, Its Mechanism and Management"

Miles Atkinson, M.D., New York

Open Discussion

4. "Twenty Years with Treatment of Trigeminal Neuralgias"

Henry Ward Williams, M.D., Rochester

Discussion: Wallace B. Hamby, M.D., Buffalo

Thursday, May 6—10:00 A.M.

Hotel Statler, Room 308

SYMPOSIUM

ELECTROSHOCK THERAPY

1. and 2. "Electroshock Therapy in Manic Depressive Psychoses"

Margaret T. Ross, M.D., Canandaigua

"A Study of over 2,000 Cases of Electrofit-Treated Patients"

David J. Impastato, M.D., New York

Renato J. Almansi, M.D., New York

Discussion opened by Eugene N. Boudreau, M.D., Syracuse

3. "Emotional Factors in Alcoholism"

Edward B. Allen, M.D., White Plains

Discussion: Albert B. Siewers, M.D., Syracuse

4. "Postconcussion Syndrome—Evaluation of the Organic Factors and Prognosis"

Peter G. Denker, M.D., New York

Discussion: G. Kirby Collier, M.D., Rochester

SECTION ON

OBSTETRICS AND GYNECOLOGY

Chairman.....Louis A. Siegel, M.D., Buffalo

Secretary.....Edward A. Bullard, M.D., New York

Tuesday, May 4—10:00 A.M.

Hotel Statler, Iroquois Room, Mezzanine Floor

1. "The Significance of Increased Menstrual Bleeding in Women over Forty"

Clyde L. Randall, M.D., Buffalo

Discussion: Stuart B. Blakely, M.D., Binghamton

2. "Sixteen Years' Experience with Placenta Praevia, Emphasizing Conservative Therapy"

Ward L. Ekas, M.D., Rochester

Discussion: Francis C. Goldsborough, M.D., Buffalo

3. "The Effect of the Antepartum Administration of Quinine on Labor"

Andrew A. Marchetti, M.D., New York

Alberta Kuder, M.A., New York (By invitation)

Lieutenant Leston E. Fitch, M.C., U.S.N.R., New York (By invitation)

Discussion: George W. Kosmak, M.D., New York

Wednesday, May 5—2:00 P.M.

Hotel Statler, Assembly Room, 17th Floor

1. "The Management of Carcinoma of the Body of the Uterus"

James A. Corscaden, M.D., New York

Discussion: William H. Wehr, M.D., Buffalo

2. "Cesarian Sections"

James P. Marr, M.D., New York

Discussion: Claude E. Heaton, M.D., New York

3. "Version and Breech Delivery"

Milton G. Potter, M.D., Buffalo

Discussion: James K. Quigley, M.D., Rochester; and Francis R. Irving, M.D., Syracuse

4. "Chronic Endocervicitis—A Critical Survey of Its Treatment"

Mortimer N. Hyams, M.D., New York

Discussion: Harvey B. Matthews, M.D., Brooklyn

SECTION ON

OPHTHALMOLOGY AND OTOLARYNGOLOGY

Chairman.....H. W. Cowper, M.D., Buffalo

Secretary....James E. McAskill, M.D., Watertown

Wednesday, May 5—9:00 A.M.

Hotel Statler, Room 302

1. "Bilateral Uveitis with Poliosis, Vitiligo, etc.—A Theory as to Cause"

Elliott B. Hague, M.D., Buffalo

Discussion: Thurber Le Win, M.D., Buffalo

2. "Epidemic Keratoconjunctivitis"

Arthur J. Bedell, M.D., Albany

Discussion: Major Murray Saunders, M.C., New York (By invitation)

3. "Gas Injuries"

Francis Heed Adler, M.D., Philadelphia, Pennsylvania (By invitation)

Discussion: Alson E. Braley, M.D., New York

4. "Early Recognition and Management of Glaucoma"

Harry S. Gradle, M.D., Chicago, Illinois (By invitation)

Discussion: Algernon B. Reese, M.D., New York

5. "Corneal Diseases with Lowered Vitality"

Ralph I. Lloyd, M.D., Brooklyn

Discussion: Arno E. Town, M.D., New York

Thursday, May 6—10:00 A.M.

Hotel Statler, Room 302

1. "General Discussion of Tumors of the Nose and Nasopharynx"

Andrew A. Eggston, M.D., New York

Discussion: Daniel S. Cuning, M.D., New York

2. "Dermatologic Diseases Frequently Encountered by Otolaryngologists"

A. Benson Cannon, M.D., New York

Discussion: Walter L. Mattick, M.D., Buffalo

3. "TREATMENT OF CANCER OF THE LARYNX BY SURGERY AND IRRADIATION"

"Criteria for Selection of Treatment and Analysis of End Results"

Chevalier L. Jackson, M.D., Philadelphia, Pennsylvania (By invitation)

1. "Otolaryngologic Problems of Aviation"
Captain Page Northington, M.C., U.S.N.R.,
New York
Discussion: Louis Hopewell Bauer, M.D.,
Hempstead

SECTION ON ORTHOPAEDIC SURGERY

Chairman.....R. Plato Schwartz, M.D., Rochester
Secretary...Roscoe D. Severance, M.D., Syracuse

Wednesday, May 5—10:00 A.M.

Hotel Statler, Iroquois Room, Mezzanine Floor

JOINT MEETING WITH THE SECTION ON RADIOLOGY (See Section on Radiology)

Thursday, May 6—10:00 A.M.

Hotel Statler, Assembly Room, 17th Floor

1. "Use of Sulfonamides in Treatment of Acute Osteomyelitis in Children"
David E. Robertson, M.D., Toronto, Ontario
(By invitation)
Discussion opened by William Ward Plummer,
M.D., Buffalo
2. "New Developments in Infantile Paralysis"
Don W. Gudakunst, M.D., New York (By
invitation)
3. "The Degree, the Extent and Mechanism of
Muscle Spasm in Infantile Paralysis"
Harry D. Bouman, M.D., Rochester (By in-
vitation)
Discussion of both papers opened by R. Plato
Schwartz, M.D., Rochester

SECTION ON PATHOLOGY AND CLINICAL PATHOLOGY

Chairman....Ralph G. Stillman, M.D., New York
Vice-Chairman...Ward H. Cook, M.D., Yonkers
Secretary.....M. J. Fein, M.D., New York

Tuesday, May 4—10:00 A.M.

Hotel Statler, Room 304

(Program in process of arrangement)

Wednesday, May 5—2:00 P.M.

Hotel Statler, Room 304

(Program in process of arrangement)

FRESH TISSUE DEMONSTRATION

A demonstration on fresh tissue will occur at
suitable times on the Seventeenth Floor.

SECTION ON PEDIATRICS

Chairman.....William J. Orr, M.D., Buffalo
Vice-Chairman.....
.....A. Clement Silverman, M.D., Syracuse
Secretary.....Carl H. Laws, M.D., Brooklyn

Wednesday, May 5—10:00 A.M.

Hotel Statler, Room 304

1. "Early Diagnosis and Early Treatment of Con-
genital Dislocation of the Hips"
Frederick R. Thompson, M.D., New York
2. "Potentation of Sulfonamides; Experimental
and Clinical Studies"
Irwin Neter, M.D., Buffalo

3. "Recent Advances in the Diagnosis and Treat-
ment of Whooping Cough"
William L. Bradford, M.D., Rochester
4. (Title to be announced later)
Thomas D. Dublin, M.D., New York

Thursday, May 6—9:30 A.M.

Hotel Statler, Room 304

1. "The Use of Finely Divided Meat Particles as
the Protein Basis for Milk Substitutes in In-
fantile Eczema"
Jerome Glaser, M.D., Rochester

SYMPOSIUM RHEUMATIC FEVER

1. "A Clinical Syndrome in Children Resembling
Rheumatic Fever"
Albert D. Kaiser, M.D., Rochester
2. "Public Health Aspects of Rheumatic Fever"
George M. Wheatley, M.D., New York

SECTION ON PUBLIC HEALTH, HYGIENE, AND SANITATION

Chairman..Burdge P. MacLean, M.D., Huntington
Vice-Chairman.....
.....Arthur M. Johnson, M.D., Rochester
Secretary.....Frank E. Coughlin, M.D., Albany

Tuesday, May 4—10:00 A.M.

Hotel Statler, Room 302

Lt. Col. Paul F. Russell, M.C., A.U.S.,
Washington, D. C. (By invitation)
Discussion: William T. Clark, M.D., Buffalo
4. "A Hotel Outbreak of Gastroenteritis Due to
Salmonella Derby"
Frank E. Coughlin, M.D., Albany
Discussion: Miss Marion B. Coleman, Albany
(By invitation)

SECTION ON RADIOLOGY

Chairman.....
... Foster C. Rulison, M.D., Syracuse (In Service)
Vice-Chairman.....
... E. Forrest Merrill, M.D., New York (In Service)
Secretary.... Leslie R. Lingeman, M.D., Rochester

Wednesday, May 5—10:00 A.M.

Hotel Statler, Iroquois Room, Mezzanine Floor

JOINT MEETING WITH THE SECTION ON ORTHOPAEDIC SURGERY

This joint session has been arranged as a "Quiz Program" to "Stump the experts" using case histories and x-ray films.

We have been fortunate in obtaining the services of two outstanding men in this field: Dr. Howard P. Doub, past-president of the Radiological Society of North America, editor of *Radiology*, and longtime director of the Department of Radiology, Henry Ford Hospital; and Dr. Raymond W. Lewis, director of the Department of Radiology of the Hospital for Special Surgery.

Help make this meeting a success by sending in your interesting and difficult cases.

Identify your material carefully so that it may be returned.

Thursday, May 6—10:00 A.M.

Hotel Statler, Room 301

1. "Diagnosis, Treatment, and End Results in Malignant Tumors of the Nasal Sinuses"
G. Allen Robinson, M.D., New York
Discussion: Andrew H. Dowdy, M.D., Rochester; and Walter L. Mattick, M.D., Buffalo
2. "X-Ray Studies of the Cervical Spine"
Lee A. Hadley, M.D., Syracuse
Discussion: Henry Ward Williams, M.D., Rochester
3. "Treatment of Nonpyogenic Infections with Radiation Therapy"
Ira I. Kaplan, M.D., New York
Discussion: Reinhardt C. Wende, M.D., Buffalo

INTERMISSION

4. "Bone Infarcts and Aseptic Necrosis in Caisson and Noncaisson Workers"
Henry K. Taylor, M.D., New York
Discussion: William A. Walker, M.D., New York
5. "Tissue Dose Estimation in Combined Roentgen and Radium Therapy for Carcinoma of the Cervix"
William E. Howes, M.D., Brooklyn
Discussion: William Harris, M.D., New York

6. "X-Ray Diagnosis of Bronchogenic Carcinoma"
G. Newton Scatchard, M.D., Buffalo
Discussion: Herman E. Bozer, M.D., Buffalo; and Leon J. Leahy, M.D., Buffalo

SECTION ON SURGERY

Chairman.....
..... William Crawford White, M.D., New York
Secretary..... W. J. Merle Scott, M.D., Rochester

Wednesday, May 5—10:00 A.M.

Hotel Statler, Assembly Room, 17th Floor

JOINT MEETING WITH THE SECTION ON MEDICINE

1. "Clinical Types of Coronary Insufficiency and Their Recognition"
Robert L. Levy, M.D., New York
2. "The Principles Concerning the Surgical Approach to the Treatment of Angina Pectoris"
Lt. Col. Claude S. Beck, M.D., Cleveland, Ohio (By invitation)
3. "Advances in Diagnosis and Treatment of Pancreatic Disease"
Joseph H. Pratt, M.D., Boston, Massachusetts (By invitation)
4. "The Surgical Treatment of Patent Ductus Arteriosus"
Robert E. Gross, M.D., Boston, Massachusetts (By invitation)
Discussion on Joint Session to be opened by Alfred H. Noehren, M.D., Buffalo

Thursday, May 6—10:00 A.M.

Hotel Statler, Room 304

1. "Surgical Aspects of Gastric Ulcer"
John D. Stewart, M.D., Buffalo
2. "Methods of Treatment of Arterial Embolism"
Frederick S. Wetherell, M.D., Syracuse
3. "Acute Cholecystitis"
Beverly C. Smith, M.D., New York
4. "Management of Injuries to the Common Bile Duct"
Herman E. Pearse, M.D., Rochester

SECTION ON UROLOGY

Chairman..... J. Sydney Ritter, M.D., New York
Vice-Chairman.....
..... A. Laurence Parlow, M.D., Rochester
Secretary..... George E. Slotkin, M.D., Buffalo

Tuesday, May 4—10:00 A.M.

Hotel Statler, Room 303

SYMPOSIUM

VENEREAL DISEASES IN REGARD TO THE ARMED FORCES

1. "Syphilis Control at the Beginning of World War II"
R. A. Vonderlehr, M.D., Assistant Surgeon General, Division of Venereal Diseases, U.S. Public Health Service, Washington, D.C.
(By invitation)

2. "Venereal Diseases—A Navy Problem"
Lt. Comm. Leo A. Shifrin, M.C., U.S.N.R.,
Camp Allen, Virginia
3. "Venereal Disease Control as Applied to the Army"
Major William Bisher, M.C., Camp Lee,
Virginia
Discussion of Symposium: Captain Anthony
J. Cerrato, M.C., Camp Blanding, Florida;
and Stafford L. Warren, M.D., Rochester

Wednesday, May 5—2:00 P.M.
Hotel Statler, Room 303

1. "Complete Avulsion of the Skin of the Penis and Scrotum"
Leon E. Sutton, M.D., Syracuse

2. "Congenital and Acquired Obstructions at the Vesical Neck in Children"
J. Sydney Ritter, M.D., New York
Samuel E. Kramer, M.D., New York
3. "The Incidence of Gross Renal Lesions in Cases of Hypertension"
Paul W. Aschner, M.D., Brooklyn
Bernard S. Epstein, M.D., Brooklyn
Harry Mandelbaum, M.D., Brooklyn
4. "The Cure of Certain Cases of Peyronie's Disease by Operative Intervention"
Oswald S. Lowsley, M.D., New York
Discussion: Meredith F. Campbell, M.D.,
New York; A. Laurence Parlow, M.D., Rochester;
Roy B. Henline, M.D., New York; and
George E. Slotkin, M.D., Buffalo

SESSIONS

SESSION ON HISTORY OF MEDICINE

- Chairman.....
.....George Rosen, M.D., Brooklyn (In Service)
Vice-Chairman.....
.....Edward F. Hartung, M.D., New York
Secretary....Judson B. Gilbert, M.D., Schenectady

Wednesday, May 5—4:00 P.M.
Hotel Statler, Rooms 418 and 420

1. "The Birth of Medical Education in Upstate New York"
T. Wood Clarke, M.D., Utica
2. "Eponyms in the History of Cancer"
Judson B. Gilbert, M.D., Schenectady

SESSION ON PHYSICAL THERAPY

- Chairman...Joseph A. E. Syracuse, M.D., Buffalo
Secretary...Kristian G. Hansson, M.D., New York

Tuesday, May 4—10:00 A.M.
Hotel Statler, Room 301

- Address: "The Role of Physical Medicine in Treatment of War Casualties"
Joseph A. E. Syracuse, M.D., Buffalo
1. "Problems in Early Physical Treatment of Poliomyelitis"

- Jessie Wright, M.D., Pittsburgh, Pennsylvania (By invitation)
Discussion: Kristian G. Hansson, M.D., New York; and Francis J. Gustina, M.D., Buffalo
2. "Physical Therapy in Peripheral Nerve Injuries"
Richard Kovacs, M.D., New York
Discussion: Wallace B. Hamby, M.D., Buffalo; and Albert A. Gartner, M.D., Buffalo
 3. "Fever and Sulfadiazine Therapy in Refractory Gonorrhea"
Lieutenant Sidney Licht, M.C., A.U.S., Fort Devens, Massachusetts
Discussion: Stafford Warren, M.D., Rochester; Madge C. L. McGuinness, M.D., New York; and George E. Slotkin, M.D., Buffalo

Luncheon

(Time and place to be announced at end of session)

Demonstrations and Inspections—2:00 to 5:00 P.M.

Physical Therapy Department, Millard Fillmore Hospital, 875 Lafayette Avenue
Tamara von Friesen, M.D., Director
Physical Therapy Department, Crippled Children's Guild, 936 Delaware Avenue
Orpah Cable, R.N., Director
Physical Therapy Department, E. J. Meyer Memorial Hospital, 462 Grider Street
Sarkis J. Anthony, M.D., Acting Director

(Arrangement for transportation to above institutions will be announced)

3. "Military Malaria Control"
Lt. Col. Paul F. Russell, M.C., A.U.S.,
Washington, D. C. (By invitation)
Discussion: William T. Clark, M.D., Buffalo
4. "A Hotel Outbreak of Gastroenteritis Due to Salmonella Derby"
Frank E. Coughlin, M.D., Albany
Discussion: Miss Marion B. Coleman, Albany
(By invitation)

SECTION ON RADIOLOGY

- Chairman..... Foster C. Rulison, M.D., Syracuse (In Service)
Vice-Chairman..... E. Forrest Merrill, M.D., New York (In Service)
Secretary..... Leslie R. Lingeman, M.D., Rochester

Wednesday, May 5—10:00 A.M.

Hotel Statler, Iroquois Room, Mezzanine Floor

JOINT MEETING WITH THE SECTION ON ORTHOPAEDIC SURGERY

This joint session has been arranged as a "Quiz Program" to "Stump the experts" using case histories and x-ray films.

We have been fortunate in obtaining the services of two outstanding men in this field: Dr. Howard P. Doub, past-president of the Radiological Society of North America, editor of *Radiology*, and long-time director of the Department of Radiology, Henry Ford Hospital; and Dr. Raymond W. Lewis, director of the Department of Radiology of the Hospital for Special Surgery.

Help make this meeting a success by sending in your interesting and difficult cases.

Identify your material carefully so that it may be returned.

Thursday, May 6—10:00 A.M.

Hotel Statler, Room 301

1. "Diagnosis, Treatment, and End Results in Malignant Tumors of the Nasal Sinuses"
G. Allen Robinson, M.D., New York
Discussion: Andrew H. Dowdy, M.D., Rochester; and Walter L. Mattick, M.D., Buffalo
2. "X-Ray Studies of the Cervical Spine"
Lee A. Hadley, M.D., Syracuse
Discussion: Henry Ward Williams, M.D., Rochester
3. "Treatment of Nonpyogenic Infections with Radiation Therapy"
Ira I. Kaplan, M.D., New York
Discussion: Reinhardt C. Wende, M.D., Buffalo

INTERMISSION

4. "Bone Infarcts and Aseptic Necrosis in Caisson and Noncaisson Workers"
Henry K. Taylor, M.D., New York
Discussion: William A. Walker, M.D., New York
5. "Tissue Dose Estimation in Combined Roentgen and Radium Therapy for Carcinoma of the Cervix"
William E. Howes, M.D., Brooklyn
Discussion: William Harris, M.D., New York

6. "X-Ray Diagnosis of Bronchogenic Carcinoma"
G. Newton Scatchard, M.D., Buffalo
Discussion: Herman E. Bozer, M.D., Buffalo; and Leon J. Leahy, M.D., Buffalo

SECTION ON SURGERY

- Chairman..... William Crawford White, M.D., New York
Secretary..... W. J. Merle Scott, M.D., Rochester

Wednesday, May 5—10:00 A.M.

Hotel Statler, Assembly Room, 17th Floor

JOINT MEETING WITH THE SECTION ON MEDICINE

1. "Clinical Types of Coronary Insufficiency and Their Recognition"
Robert L. Levy, M.D., New York
2. "The Principles Concerning the Surgical Approach to the Treatment of Angina Pectoris"
Lt. Col. Claude S. Beck, M.D., Cleveland, Ohio (By invitation)
3. "Advances in Diagnosis and Treatment of Pancreatic Disease"
Joseph H. Pratt, M.D., Boston, Massachusetts (By invitation)
4. "The Surgical Treatment of Patent Ductus Arteriosus"
Robert E. Gross, M.D., Boston, Massachusetts (By invitation)
Discussion on Joint Session to be opened by Alfred H. Noehren, M.D., Buffalo

Thursday, May 6—10:00 A.M.

Hotel Statler, Room 304

1. "Surgical Aspects of Gastric Ulcer"
John D. Stewart, M.D., Buffalo
2. "Methods of Treatment of Arterial Embolism"
Frederick S. Wetherell, M.D., Syracuse
3. "Acute Cholecystitis"
Beverly C. Smith, M.D., New York
4. "Management of Injuries to the Common Bile Duct"
Herman E. Pearse, M.D., Rochester

SECTION ON UROLOGY

- Chairman..... J. Sydney Ritter, M.D., New York
Vice-Chairman..... A. Laurence Parlow, M.D., Rochester
Secretary..... George E. Slotkin, M.D., Buffalo

Tuesday, May 4—10:00 A.M.

Hotel Statler, Room 303

SYMPOSIUM

VENEREAL DISEASES IN REGARD TO THE ARMED FORCES

1. "Syphilis Control at the Beginning of World War II"
R. A. Vonderlehr, M.D., Assistant Surgeon General, Division of Venereal Diseases, U.S. Public Health Service, Washington, D.C. (By invitation)

is determined with a stop-watch or recording galvanometer and represents time elapsing from injection to deflection of needle.

Samuel J. Kopetzky, M.D.
Ralph Almour, M.D.
Murray B. Gordon, M.D.
Julius W. Bell, M.D.

CLINICS (DRY) ON

1. SIGMOID SINUS THROMBOSIS
2. OTITIS MEDIA IN PEDIATRICS
3. NONOPERATIVE TREATMENT OF PARANASAL SINUSITIS

Abraham L. Kornzweig, M.D.
Mount Sinai Hospital
New York

EMBRYOLOGIC DEVELOPMENT OF THE CORNEA, SCLERA, AND CORNEO-SCLERAL JUNCTION

Microphotographs of cross-sections of the eye at different stages of fetal life. The development of the cornea, sclera, and corneo-scleral junction from the the age of five weeks up to term is shown. Several new concepts of the importance of the corneo-scleral junction are advanced. A theory as to the possible early onset of progressive myopia is demonstrated. Developmental anomalies affecting these structures are shown. Microscopic slides and plaster models are used for demonstration.

Richard Kovacs, M.D.
New York Polyclinic Medical School and Hospital
Louis P. Biro, M.D.
Goldwater Memorial Hospital
New York

HISTORY OF PHYSICAL THERAPY

Photographs, drawings, and charts showing the development of electrotherapy, light therapy, hydrotherapy, and mechanotherapy from the early days to the present time.

Maxwell Maltz, M.D.
West Side Hospital and Dispensary
New York

WAR PLASTIC SURGERY

The exhibit shows the author's methods of repairing recent wounds of the face, deformities due to burns, and an original technic that can be used to reconstruct fingers lost through trauma. (Motion pictures)

Michael Levitan, M.D.
Clarence A. Greenleaf, M.D.
New York State Association of School Physicians
Rome

SCHOOL HEALTH

School Health Service and Education

Scientific and other posters on school health, school forms, tabulations, auditory and visual equipment used in the examination of school children.

New York State Commission for the Blind

Ruth B. McCoy
New York

NEW YORK STATE COMMISSION FOR THE BLIND

The prevention service of the New York State Commission for the Blind points out, through a series of posters, the relationship between a vision conservation program and national defense. (Motion picture)

National, State, and Local Tuberculosis Associations

A. CHEST X-RAY METHODS

Exhibit shows comparison of various methods of making chest roentgenograms in private practice and for mass surveys with brief comments on advantages and disadvantages of each method.

B. TECHNICAL ERRORS IN CHEST ROENTGENOGRAPHY

Three chest x-ray plates are exhibited which the visitor studies for errors. After he has formed his opinion, he places over the film a hinged, plexiglass cover which shows the actual errors in technic.

State Department of Education

Albany

NEW YORK STATE MEDICAL LIBRARY

Posters, books, and journals. One of the Library Staff will be present to answer all questions concerning the facilities and services of the Library.

Medical Society of the State of New York Subcommittee on Tuberculosis and Diseases of the Chest

and

New York State Department of Health

NEOPLASMS OF THE CHEST BENIGN AND MALIGNANT

This exhibit portrays by means of transparencies various neoplasms which occur in the lungs, including two cases of primary carcinoma of the lung treated by surgery which are now clinically well, lesions due to metastasis from carcinoma and sarcoma, Hodgkin's disease, lymphatic and myelogenous leukemia, neurofibroma and echinococcus cyst. The material for this exhibit has been furnished by the Tumor clinics of the Buffalo General Hospital and the Edward J. Meyer Memorial Hospital of Buffalo.

EPIDEMIC KERATOCONJUNCTIVITIS

The recent appearance of epidemic keratoconjunctivitis in the eastern states has created considerable interest on the part of physicians, health officials, and industrial and military authorities because of its important clinical features. This display includes colored slides and charts. In addition, material concerning the isolation of the causative virus and pertinent observations on the epidemiology of the disease are presented.

FAT AND VITAMIN A ABSORPTION IN SPRUE

Case histories, roentgenograms, and graphs illustrate the relationship between the severity of the case, the clinical course, the results of therapy, and the behavior of the Fat and Vitamin A absorption tests. These tests permit in some cases the differentiation between sprue and jejuno-ileitis.

Morton I. Berson, M.D.

Downtown Hospital
New York

TRAUMATIC INJURY AND PLASTIC REPAIR

The exhibit presents, by means of colored lantern slides, transparencies, diagrams, models, and moulages, the surgical procedures of various types of skin and cartilage grafts employed in the reconstruction of extensive cicatricial scars due to burns, construction of auricle for traumatic loss, correction of bony depressions of the face and skull, and other disfigurements with end results. (Motion pictures)

THE PATHOLOGY OF ARTHRITIS

The exhibit consists of moulages, drawings, and transparencies of gross and microscopic sections demonstrating the pathologic changes which occur in the synovial membrane, articular cartilage, and subcondral bone in rheumatoid, degenerative, and infective arthritis. Of particular interest are the very early formation of synovial pannus and early changes in the articular cartilage. The material used for this study is taken from cases of chronic arthritis in man, supplemented by cases of arthritic joints in animals.

PHOTOELECTRIC DETERMINATION OF CIRCULATION TIME

Light source which transmits light through translucent tissues on a photoelectric cell connected with a sensitive galvanometer. Intravenous injection of nontoxic dye modifies light transmission causing a deflection of galvanometer needle. Circulation time

shown and demonstrated on live animals. Classification of gases will be emphasized and the various methods of combating each group will be demonstrated. During the meeting the entire 6-hour course in War Gases arranged jointly by the State Medical Society and the Office of Civilian Defense will be given. In order to provide adequate space, advance registration will be appreciated. Write directly to Dr. Stephen L. Walczak, 4 West Parade Avenue, Buffalo, New York.

Tropical Diseases

Various health and governmental organizations are arranging an exhibit of tropical diseases with special reference to cause, symptoms, diagnosis, and treatment. This exhibit is considered important because of the probability of infection of some of our overseas troops with this type of disease.

American National Red Cross
Albert A. Sharpe, M.D.
New York

RED CROSS FIRST AID DEMONSTRATIONS

There will be several daily demonstrations of the courses of First Aid Instruction being given to lay people. It is felt that it is important that doctors know of what is being taught and the methods used.

Beth Israel Hospital
and
Polyclinic Hospital
New York

CHRONIC NASAL SINUSITIS

Exhibit demonstrates by means of models, charts, case records, and roentgenograms the various techniques employed in ascertaining the factors significant in a chronic sinus involvement.

Technics of treatment, such as allergic desensitization, autogenous vaccine therapy, ionization, Proetz suction displacement, and the Elliott apparatus are illustrated in some detail. The Elliott treatment, an important physical therapy device, has considerable value in its ability to provide local heat to the sinus area.

Results of six years of study of patients with chronic nasal sinusitis are exhibited. The exhibits emphasize the conclusion that successful results can be obtained by careful attention to the multiple factors involved in a chronic sinusitis with treatment making use of the many modalities and therapeutic techniques available today.

New York

BONE INFARCTS AND ASEPTIC NECROSIS

Exhibit consists of bone infarcts and areas of aseptic necrosis found in caisson and noncaisson workers. The lesions are identical in appearance and cannot be differentiated one from the other. The lesions may involve the articular and nonarticular portions of bone. They may be single or multiple, and often bilateral.

Abner I. Weisman, M.D.
Jewish Memorial Hospital
New York

A. HUMAN REPRODUCTION IN WARTIME: A COMPREHENSIVE STUDY OF STERILITY AND FERTILITY

The exhibit consists of a comparative study of the rise in birth rate during the two World Wars. The etiologic factors, reasons for differences, and advanced strides in sterility studies are explained. The role played by the medical profession and the veterinary workers in the field of propagation of the human species is unfolded. A proper evaluation of the importance of the male factors in a barren marriage is included.

B. THE XENOPUS FROG TEST IN THE EARLY DIAGNOSIS OF PREGNANCY (Motion Picture)

J. Eastman Sheehan, M.D.
New York Polyclinic Medical School and Hospital
New York

PLASTIC REPARATIVE SURGERY

Presentation of colored casts and photographs for the treatment of war wounds and burns, from the author's experiences in Spain and England. Presentation of the various apparatus and instruments used in the treatment for the several types of fractures of the upper and lower jaws. A full demonstration of prosthetic dentures will be presented showing the part they play in the replacement of the parts through loss or disfigurement.

George M. Wheatley, M.D.
Metropolitan Life Insurance Company
New York

IMPACT OF WAR ON VITAL STATISTICS

The exhibit consists of a series of placards showing the effects of war on: (1) age composition of population; (2) marriage rates; (3) birth rates; (4) tuberculosis death rates.

WAR GAS DEMONSTRATIONS

A complete exhibit and course in War Gas Instruction is jointly arranged. Actual gases will be

Ciba Pharmaceutical Products, Inc., Summit, New Jersey (Booth 4), cordially invite physicians to visit their booth where the well-known products of Ciba are on display. Three new additions to the fine line of Ciba pharmaceuticals merit your attention: Biotose, Trasentine-Phenobarbital, and Privine. A well-informed representative of the company will be in attendance to supply information on any Ciba preparation.

The Coca-Cola Company, Atlanta, Georgia (Booth 66). "Coca-Cola" will be available to the delegates of the convention with the compliments of The Coca-Cola Company.

The Cream of Wheat Corporation, Minneapolis, Minnesota (Booth 64).

The Denver Chemical Mfg. Co., New York (Booth 48). Galatest, the dry reagent for the instantaneous detection of urine sugar, will be exhibited. Now used routinely by many leading hospitals, medical departments of industries, and more and more private practitioners. Accurate, simple, speedy, economical. Accepted for advertising in the *Journal of the American Medical Association*.

Doak Company, Inc., Cleveland, Ohio (Booth 5).

The Doho Chemical Corporation, New York (Booth 18), Animated Pathological Ear Exhibit—the Auragan Exhibit consists of a model of the human auricle 4 feet high, together with a series of 24 three-dimensional ear drums, modeled under the supervision of outstanding otologists. Each of these drums depicts a different pathologic condition based upon actual case observation and prepared, in so far as possible, with strict scientific accuracy so as to be highly instructive and interesting to all physicians.

Duke Laboratories, Inc., Stamford, Connecticut (Booth 2), will demonstrate the original American-made, stretchable, adhesive-surfaced bandage, Elastoplast, Elastoplast Coverlets, and Mediplast—products used routinely in practically all of the defense industries. Also on display will be Nivea Creme, Nivea Skin Oil, and Basis Soap—the prescriber's cosmetics.

Effervescent Products, Inc., Elkhart, Indiana (Booth 74). Demonstration of urine-sugar analysis by the new Clinitest Tablet Method—reliable, simple, fast, single tests being made in less than one minute. A sensitive qualitative test giving dependable quantitative estimations up to 2 per cent. The standard Clinitest—Tablet itself evolves the required heat.

J. H. Emerson Company, Cambridge, Massachusetts (Booth 56)

C. B. Fleet Co., Inc., Lynchburg, Virginia (Booth 57).

General Electric X-Ray Corp., Chicago (Booth 65).

Gerber Products Company, Fremont, Michigan (Booth 54). The complete line of Gerber Baby Foods will be on display. There are 2 precooked dry cereals, one a wheat, the other an oatmeal cereal, 18 strained foods, and 10 chopped foods. Booklets available for distribution to mothers or patients on special diets, as well as professional literature, will be sent to registrants for examination.

Otis E. Glidden & Co., Inc., Evanston, Illinois (Booth 73). Obtain latest information on improved Zymenol. Brewers Yeast Content has been increased to 45 per cent by volume and Mineral Oil Content reduced. Zymenol is now more than ever a uniformly effective, twofold natural therapy in either the irritant, unstable, or stagnant bowel on teaspoon dosage.

Hanovia Chemical & Mfg. Company, Newark, New Jersey (Booth 17), will display a complete line of high-pressure, self-lighting ultraviolet quartz lamp for body and oral application; also ultraviolet Safe-T-Aire equipment for air sanitation. Courteous and competent representatives will be on hand to explain their application and various requirements.

Hoffmann-La Roche, Inc., Nutley, New Jersey (Booth 24). War shortages of atropine and belladonna have greatly increased physicians' interest in Syntropan. This antispasmodic will be one of the featured products in the Roche exhibit. The many uses for which Prostigmin has proved to be effective will also be described by representatives of the Roche Medical Division, who will be in attendance. Other pharmaceutical prescription specialties emanating from Roche Park, including Sodium Alurate, will also be displayed.

Holland-Rantos Company, Inc., New York (Booth 35), will exhibit at their booth contraceptive specialties. These will include Koromex diaphragms, jellies, H-R Emulsion cream, and the new package, the Koromex Set Complete. Please be sure to examine it. This is a complete ideally suited for either prescriber or patient purposes. Hospital specialties consisting of waterproof garments and bedding, utilizing rubber substitutes, will be featured under the trade names Rantomist Lawn, Rantoflan, and Rantoplast. Worthy of special attention will be the Rantex surgical masks made of special vegetable fiber paper.

Horlick's Malted Milk Corporation, Racine, Wisconsin (Booth 26), cordially invites you to visit their booth and enjoy a refreshing serving of chocolate malted milk. This palatable, delicious, and easily digested food-drink is indicated as a supplement to liquid and semiliquid diets. It is basic nutrition because it is a scientifically well-balanced combination of proteins and carbohydrates of full-cream milk and choice grains.

Jeffrey-Fell Company, Buffalo, New York (Booths 13 and 14). In Booth 13 will be displayed Castle Sterilizers of various styles and sizes; the latest in cabinet models, colors, and designs, perfection in modern sterilization. Ritter office equipment ultra-

Technical Exhibits

Hotel Statler, Seventeenth Floor

AT THIS "War Medicine" meeting, the technical exhibits will prove to be of great interest. New developments and products in many fields will be on display. Space allotted to these exhibits has been reduced this year to make room for the Fresh Tissue Exhibit, the Chemical Warfare Demonstration, and other features of unusual significance in wartime.

Descriptions of the Technical Exhibits appear below in alphabetical order. Necessarily brief, they give only a fraction of the information to be obtained by a personal visit. You pass through the exhibits on the way to meetings of the House of Delegates, General Sessions, Combined Surgery and Medicine, and other meetings scheduled for the Seventeenth Floor auditorium.

Admission to all exhibits and scientific sessions is limited to those wearing official badges, which can be obtained at the Registration Desk.

Bilhuber-Knoll Corp., Orange, New Jersey (Booth 72). The "Council Accepted" prescription chemicals of Bilhuber-Knoll find an important place in wartime medicine because of their proved effectiveness and dependability. Metrazol, the respiratory and circulatory restorative; Theocalcin, diuretic and myocardial stimulant; and Dilaudid, analgesic and cough sedative, are receiving increasing use by the Army, Navy, and other governmental agencies. You will find these useful for your everyday prescriptions.

The Borden Company, New York (Booth 40).

Brewer & Company, Inc., Worcester, Massachusetts (Booth 44). Brewer & Company developed for the treatment of coronary artery disease, in 1937, the first enteric-coated tablet of Theobromine Sodium Acetate (Thesodate) for prophylactic relief; and, in 1941, Thesodate Gelatin Capsules for supplementary relief of angina pectoris. In 1940 Brewer & Company presented *Lausmin Enteric-Coated Tablets* and Gelatin Capsules for the relief of bronchial asthma. Brewer & Company, first pharmaceutical house in New England to capsule their own vitamin capsules, produces Deratol, 50,000 U. S. P. Units of Vitamin D obtained from Irradiated Ergosterol. Brewer & Company also offer a basic line of ampules to the medical profession. In 1941, Codeine Phosphate Tablets, $\frac{1}{4}$ grain, enteric-coated, were developed for the relief of useless coughs. Information and literature may be obtained at the Brewer exhibit about their specialties and other vitamin products.

Burroughs Wellcome & Co. (U.S.A.), Inc., New York (Booth 25), presents a representative group of fine chemicals and pharmaceutical preparations, together with new and important therapeutic agents of special interest to the medical profession.

Cambridge Instrument Company, Inc., (Booth 67). The great increase in cardiac cases due to anxiety and overwork incidental to the times makes the Cambridge Instrument Company exhibit of cardiac diagnostic instruments particularly timely. In their booth they will feature, as part of a complete

exhibit of cardiac diagnostic instruments, the compact, lightweight, portable "Simpli-Trol" model Electrocardiograph-Stethograph that produces electrocardiogram and stethogram separately or simultaneously. Cambridge Electrocardiographs for large or small hospital, research laboratory, clinic, or private office will also be demonstrated at their exhibit.

Camel Cigarettes, New York (Booths 49 and 50), will exhibit large detailed photographs of equipment used in comparative tests of the five largest-selling brands of cigarettes. Representatives will be available to discuss research. Trans-Lux News will be supplied throughout the meeting.

S. H. Camp & Company, Jackson, Michigan (Booth 23), will use as the central theme of their exhibit a series of life size sculptured models depicting the Anatomy of Pregnancy. Besides the complete line of Camp prenatal and postnatal supports, others for orthopaedic, visceroprotosis and postoperative requirements will be shown. Experts from the Camp staff will be in attendance.

CAMP

Carnation Company, Oconomowoc, Wisconsin (Booths 31 and 32), will display an interesting model of the famous Carnation Milk Farm where cattle breeding and feeding experiments are carried on for the purpose of improving the dairy herds supplying the many Carnation evaporating plants. The story of the careful processing of Irradiated Carnation Milk is also told in an interesting manner.

Chatham Pharmaceuticals, Inc., Newark, New Jersey (Booth 53), will exhibit two products. Aluminum—chemically nonreactive colloidal alumina, supplied in easy-to-swallow gelatin capsules. It provides convenient, palatable, and effective medication for the gastric hyperacidity or ulcer patient. Koagamin—a rapidly effective and dependable hemostatic for parenteral use.

and Theelol; antisiphilitic agents, such as Mapharsen and Thio-Bismol; posterior lobe preparations, including Pituitrin, Pitocin, and Pitressin; and various adrenalin chloride preparations.

Pet Milk Sales Corporation, St. Louis, Missouri (Booths 69 and 70), will display an actual working model of a milk condensing plant in miniature. This exhibit offers an opportunity to obtain information about the production of Irradiated Pet Milk, its uses in infant feeding, and the time-saving Pet Milk services available to physicians. Miniature Pet Milk cans will be given to each physician who visits the Pet Milk Booth.

Petrogalar Laboratories, Inc., Chicago (Booth 52), cordially invites physicians to visit their exhibit, where a new and enlightening story on Petrogalar, an aqueous suspension of mineral oil, will be related. Beautifully colored anatomic drawings and new literature may be had upon request from our professional representatives who will be in constant attendance.

Philip Morris & Co., Ltd., Inc., New York (Booth 61), will demonstrate the method by which it was found that Philip Morris Cigarettes, in which diethylene glycol is used as the hygroscopic agent, are less irritating than other cigarettes. Their representative will be happy to discuss researches on this subject and problems on the physiologic effects of smoking.

The Chas. H. Phillips Co. Division, New York (Booth 12) will feature at their exhibit Phillips' Milk of Magnesia (liquid and tablet forms) and Haley's M-O, standards in the field of alkaline laxative therapy. Physicians are invited to visit their booth to receive samples of these famous products.

Picker X-Ray Corporation, New York (Booth 34), will show the U.S. Army Field Unit as well as the Light Weight Air Corps Unit, of which they are exclusive manufacturers. This display of military medical equipment will be accompanied by a selection of interesting and authentic photographs showing the use of this apparatus under actual wartime conditions.

The Radium Emanation Corporation, New York (Booth 47), will exhibit a wide variety of instruments and applicators used in modern radium therapy, including permanent and removable composite, leak-proof Radon Seeds. The advantages of these seeds will be demonstrated by magnified sections showing their construction in detail.

Riedel-de Haen, Inc., New York (Booth 46). With the increasing use of bile acid therapy, physicians will find it valuable to visit their booth. Representatives are especially well posted in this rapidly developing field and will welcome the opportunity to discuss the therapeutic application of Riedel-de Haen's pure bile acid products, Decholin, Degalol, and Cholmodin.

S.M.A. Corporation, Chicago (Booth 43). Among the technical exhibits at the convention this year is an interesting display which represents the selection of infant feeding and vitamin products of the S.M.A. Corporation. Physicians who visit this exhibit may obtain complete information, as well as samples, of S-M-A Powder and the special milk preparations—Protein S-M-A (Acidulated), Alerdex, and Hypo-Allergic Milk.

Sandoz Chemical Works, Inc., New York (Booth 71). Physicians will be interested in Gynergen (ergotamine tartrate) for the dramatic relief of migraine headache. Recently released products include Syrup Neo-Calglucon (calcium gluconogalactogluconate), a palatable, highly concentrated preparation for oral calcium therapy readily absorbed from the digestive tract; Cedilanid, a stable preparation of lanatoside C, a crystalline glycoside from digitalis lanata not present in purpurea. Other members of the Sandoz group of pure cardioactive glycosides include Digilanid, Strophosid, Scillaren, and Scillaren-B. Also displayed are Bellergal, Belladenal, and Bellafoline—sedatives of the neurovegetative system; Calglucon Effervescent Tablets and Chocolate Flavored Tablets, the original calcium gluconate products; Neo-Calglucon Ampuls, the improved preparation for parenteral calcium therapy.

W. B. Saunders Company, Philadelphia (Booth 77), will exhibit their complete line of books, including such new ones as the *Mayo Clinic Volume*, Lundy's *Anesthesia*, Wharton's *Gynecology*, *The Military Medical and Surgical Manuals*, *Official U.S. Public Health Service Industrial Hygiene Manual*, *Strieglitz's Geriatrics*, *Cutting's Therapeutics*, *Dry's Cardiology*, *Rehfuß's Indigestion*, *Weiss and English's Psychosomatic Medicine*, and many others. New editions of DeLee's *Obstetrics* (revised and largely rewritten by Dr. J. P. Greenhill), *Todd and Sanford's Clinical Diagnosis by Laboratory Methods*, and *Wechsler's Clinical Neurology*.

G. D. Searle & Co., Chicago (Booth 38), will show a number of new products of Searle Research, which has contributed so much to the recent armamentarium of the physician. Products such as Searle Aminophylline, Metamucil, Ketochol, Furmerane, Floraquin, Gonadophysin, Tetrathione, and Pava-trine are results of this research, which has been greatly expanded in the new Searle Research Laboratories. An illustration of the new laboratories will be featured in the exhibit.

Sharp & Dohme, Inc., Philadelphia (Booth 41), will feature "Lyovac" Normal Human Plasma, other "Lyovac" biologicals and biologic specialties. There will also be on display pharmaceutical specialties including "Sulfasuxidine," succinylsulfathiazole, "Delvalin" Sodium, "Propadrine" Hydrochloride products, "Rabellon," "Depropanex," and "Prohexinol." A cordial welcome awaits all visitors.

Singer Sewing Machine Company, New York (Booths 9, 10, and 11).

Smith, Kline & French Laboratories, Philadelphia (Booth 75). Our representatives will gladly discuss the indications and potentialities of Benzedrine

stylish, sturdy construction, modern and simplified operation. Completes the doctor's successful technique. Purveyors to the medical profession over fifty years, displaying a varied and select assortment of high-grade instruments, both chrome and stainless steel. Furniture for office and clinic; sundries that are demanded to simplify and perfect the exacting work of the medical profession. Scientific apparatus for medical laboratories and many other items of interest to the profession will be displayed in Booth 14.

Jones Metabolism Equipment Company, New York (Booth 58).

"The 'Junket' Folks," Chr. Hansen's Laboratory, Inc., Little Falls, New York (Booth 62). Enlarged photos illustrate graphically the action of the rennet enzyme in forming softer, finer milk curds. Display of "Junket" Brand Food Products. Free literature describes dietary uses of rennet-custards in infant, child, convalescent, or postoperative feeding. Well-informed attendant on duty at all times.

Kellogg Company, Battle Creek, Michigan (Booth 21). All Kellogg ready-to-eat cereals either are made from whole grains or are restored to whole-grain nutritive value. Kellogg's Pep (whole wheat flakes) is made from the whole grain and in addition has been fortified with vitamins B, and D. Corn Flakes and Rice Krispies may be included freely in wheat-free and low residue diets. Nutrition folders and further information about these products available at Kellogg exhibit.

Keystone View Company, Meadville, Pennsylvania (Booth 22). Orthoptic training materials shown for the first time feature this exhibit. These are in the form of transparencies for major amblyoscopes and vision-training stereographs for stereoscope, Telescopocular, and Tel-Eye-Trainer. Information concerning Keystone Industrial Visual Safety and other visual screening tests will also be available.

Lederle Laboratories, Inc., New York (Booth 76), are featuring their products for immunization and maintenance of child health, their vitamins, poison ivy, and hay fever items. Spotlighted will be a display on the Vollmer Tuberculin Patch Test. The exhibit will be in charge of staff representatives. Literature and samples will be available for distribution.

Eli Lilly and Company, Indianapolis, Indiana (Booth 1). The Lilly exhibit is presented as a mark of respect for the Medical Society of the State of New York. Many Lilly products will be shown and attending Lilly medical service representatives will be pleased to aid physicians whenever possible.

J. B. Lippincott Company, Philadelphia (Booth 36). Ferguson's *Surgery of the Ambulatory Patient* is Lippincott's headliner. Other important new books: Strecker's *Fundamentals of Psychiatry*, Kampmeier's *Essentials of Syphilology*, and Sappington's *Essentials of Industrial Health*. A new sixth edition of Karsner's *Human Pathology* and a new fourth edition of Thorek's *Surgical Errors and Safeguards* are also in the display.

Loeser Laboratory, Inc., New York (Booth 16).

The Maltine Company, New York (Booth 51), will have on display many of the products for which they have been known since 1875—Maltine with Cod Liver Oil, Maltine Plain, and Malto-Yerbine. Also displayed will be newer products which are the result of the latest research undertaken at the Maltine Research Laboratories, particularly Proloid, Tedral, and Depancol.

Mead Johnson & Company, Evansville (Booths 27 and 28). *Servamus Fidem* means "We Are Keeping the Faith." Almost every physician thinks of Mead Johnson & Company as the maker of Dextri-Maltose, Pabulum, Oleum Percomorphum, and other infant diet materials, but not all physicians are aware of the many helpful services this progressive company offers physicians. A visit to their exhibit will be time well spent.

Medical Film Guild, New York (Booths 7 and 8).

The Wm. S. Merrell Company, Cincinnati, Ohio (Booth 33), will feature Nitranitol, for medical management of essential hypertension, the Beta-Concemin high potency vitamin B complex products, and other modern therapeutic agents of broad usefulness to the practicing physician. Members and guests of the Society are cordially invited to visit the Merrell booth.

Mutual Pharmacal Company, Inc., Syracuse, New York (Booth 6), will exhibit special tablet products such as: Liv-Ferin, Vita-Liv-Ferin, Ferrous Sulfate with Vitamins, Vitamin D Capsules, ABCDG Capsules, Elixir and Tablets of Thiamin Chloride, Ascorbic Acid, Nicotinic Acid, and other products of special interest.

National Live Stock and Meat Board, Chicago (Booth 30), will display a large Nutrition Yardstick which shows how a diet based on the pattern set up by the National Nutrition Program meets all of the nutritional requirements. Nutrition literature, including copies of the small "Yardstick," will be available.

Nutrition Research Laboratories, Chicago (Booths 59 and 60), will have an entirely new exhibit, incorporating the use of transparencies, wax models, and clinical films, graphically outlining the value of Ertron in the treatment of chronic arthritis. The film is new and is being shown for the first time to members of the Medical Society of the State of New York. Companion products shown will be Bezon, whole natural vitamin B complex, in capsule form, and Pendron, the complete vitamin arch.

Ortho Products, Inc., Linden, New Jersey (Booth 63), will feature the scientific background of Ortho-Gynol, Ortho-Creme, and Ortho Diaphragms. Latest reprints and published reports on clinic studies on modern methods of the control of fertility may be obtained at the exhibit.

Parke, Davis & Company, Detroit, Michigan (Booth 42), will feature the sex hormones, Theelin

and Theelol; antisyphilitic agents, such as Mapharsen and Thio-Bismol; posterior lobe preparations, including Pituitrin, Pitocin, and Pitressin; and various adrenalin chloride preparations.

Pet Milk Sales Corporation, St. Louis, Missouri (Booths 69 and 70), will display an actual working model of a milk condensing plant in miniature. This exhibit offers an opportunity to obtain information about the production of Irradiated Pet Milk, its uses in infant feeding, and the time-saving Pet Milk services available to physicians. Miniature Pet Milk cans will be given to each physician who visits the Pet Milk Booth.

Petrogalar Laboratories, Inc., Chicago (Booth 52), cordially invites physicians to visit their exhibit, where a new and enlightening story on Petrogalar, an aqueous suspension of mineral oil, will be related. Beautifully colored anatomic drawings and new literature may be had upon request from our professional representatives who will be in constant attendance.

Philip Morris & Co., Ltd., Inc., New York (Booth 61), will demonstrate the method by which it was found that Philip Morris Cigarettes, in which diethylene glycol is used as the hygroscopic agent, are less irritating than other cigarettes. Their representative will be happy to discuss researches on this subject and problems on the physiologic effects of smoking.

The Chas. H. Phillips Co. Division, New York (Booth 12) will feature at their exhibit Phillips' Milk of Magnesia (liquid and tablet forms) and Haley's M-O, standards in the field of alkaline laxative therapy. Physicians are invited to visit their booth to receive samples of these famous products.

Picker X-Ray Corporation, New York (Booth 34), will show the U.S. Army Field Unit as well as the Light Weight Air Corps Unit, of which they are exclusive manufacturers. This display of military medical equipment will be accompanied by a selection of interesting and authentic photographs showing the use of this apparatus under actual wartime conditions.

The Radium Emanation Corporation, New York (Booth 47), will exhibit a wide variety of instruments and applicators used in modern radium therapy, including permanent and removable composite, leak-proof Radon Seeds. The advantages of these seeds will be demonstrated by magnified sections showing their construction in detail.

Riedel-de Haen, Inc., New York (Booth 46). With the increasing use of bile acid therapy, physicians will find it valuable to visit their booth. Representatives are especially well posted in this rapidly developing field and will welcome the opportunity to discuss the therapeutic application of Riedel-de Haen's pure bile acid products, Decholin, Degalol, and Cholmodin.

S.M.A. Corporation, Chicago (Booth 43). Among the technical exhibits at the convention this year is an interesting display which represents the selection of infant feeding and vitamin products of the S.M.A. Corporation. Physicians who visit this exhibit may obtain complete information, as well as samples, of S-M-A Powder and the special milk preparations—Protein S-M-A (Acidulated), Alerdex, and Hypo-Allergic Milk.

Sandoz Chemical Works, Inc., New York (Booth 71). Physicians will be interested in Gynergen (ergotamine tartrate) for the dramatic relief of migraine headache. Recently released products include Syrup Neo-Calglucon (calcium gluconogalactogluconate), a palatable, highly concentrated preparation for oral calcium therapy readily absorbed from the digestive tract; Cedilanid, a stable preparation of lanatoside C, a crystalline glycoside from digitalis lanata not present in purpurea. Other members of the Sandoz group of pure cardioactive glycosides include Digilanid, Strophosid, Scillaren, and Scillaren-B. Also displayed are Bellergal, Belladenal, and Bellafoline—sedatives of the neurovegetative system; Calglucon Effervescent Tablets and Chocolate Flavored Tablets, the original calcium gluconate products; Neo-Calglucon Ampuls, the improved preparation for parenteral calcium therapy.

W. B. Saunders Company, Philadelphia (Booth 77), will exhibit their complete line of books, including such new ones as the *Mayo Clinic Volume*, Lundy's *Anesthesia*, Wharton's *Gynecology*, *The Military Medical and Surgical Manuals*, *Official U.S. Public Health Service Industrial Hygiene Manual*, Stieglitz's *Geriatrics*, Cutting's *Therapeutics*, Dry's *Cardiology*, Rehfuess' *Indigestion*, Weiss and English's *Psychosomatic Medicine*, and many others. New editions of DeLee's *Obstetrics* (revised and largely rewritten by Dr. J. P. Greenhill), Todd and Sanford's *Clinical Diagnosis by Laboratory Methods*, and Wechsler's *Clinical Neurology*.

G. D. Searle & Co., Chicago (Booth 38), will show a number of new products of Searle Research, which has contributed so much to the recent armamentarium of the physician. Products such as Searle Aminophylline, Metamucil, Ketochol, Furmerane, Floraquin, Gonadophysin, Tetrathione, and Pavarine are results of this research, which has been greatly expanded in the new Searle Research Laboratories. An illustration of the new laboratories will be featured in the exhibit.

Sharp & Dohme, Inc., Philadelphia (Booth 41), will feature "Lyovac" Normal Human Plasma, other "Lyovac" biologicals and biologic specialties. There will also be on display pharmaceutical specialties including "Sulfasuxidine," succinylsulfathiazole, "Delvinal" Sodium, "Propadrine" Hydrochloride products, "Rabellon," "Depropanex," and "Prohexinol." A cordial welcome awaits all visitors.

Singer Sewing Machine Company, New York (Booths 9, 10, and 11).

Smith, Kline & French Laboratories, Philadelphia (Booth 75). Our representatives will gladly discuss the indications and potentialities of Benzedrine

POTENCIES UP!

NO increase in price!

- VITAMINS B₁-B₂(G)-C SUBSTANTIALLY *increased*
- NIACINAMIDE, important B Complex member, *added*

VI-SYNERAL is an excellent vitamin-mineral dietary supplement—in step with advancing nutrition research.

VI-SYNERAL is personally used and widely recommended by physicians because of its effectiveness and because it is now conceded that deficiencies in vitamins and minerals are usually multiple. We have pioneered multiple vitamin-mineral therapy since 1935.

VI-SYNERAL contains:

VITAMINS: A-B₁-B₂(G)-C-D-E-Niacinamide and B Complex factors.

MINERALS: Calcium, Phosphorus, Iron, Iodine, Manganese, Magnesium, Copper, Zinc.

... in a separate Funk-Dubin balance for each age group: (1) ADULTS, (2) INFANTS and CHILDREN—up to 6, (3) CHILDREN and ADOLESCENTS—6 to 16, (4) EXPECTANT and NURSING MOTHERS, and (5) SPECIAL GROUP (Middle-aged and Aged).

LITERATURE AND SAMPLE UPON REQUEST

U. S. VITAMIN CORPORATION
NEW YORK, N. Y.

VITAMINS ALONE ARE NOT ENOUGH!

BECAUSE VITAMINS ARE BETTER UTILIZED WITH MINERALS
VI-SYNERAL SUPPLIES BOTH!

Sulfate Tablets in depressive states; as an adjunct in the treatment of alcoholism; and in postencephalitic parkinsonism and narcolepsy. Benzedrine Inhaler, N.N.R., "Paredrine Hydrobromide Aqueous," "Paredrine"-Sulfathiazole Suspension, Eskay's Pantaplex, and Pragmasul will also be exhibited.

Spencer Incorporated, New Haven, Connecticut (Booth 55). An interesting moving postural exhibit featuring individually designed supports for abdomen, back, and breasts. Spencer Supports are prescribed as an aid to treatment for the following: hernia; visceroptosis with symptoms; postoperative; back conditions; maternity and postpartum; obesity; movable kidney; breast conditions; and certain forms of heart disease. Samples on display.

E. R. Squibb & Sons, New York (Booth 39), will feature a number of new chemotherapeutic specialties, as well as the latest additions to their line of vitamin, glandular, and biologic products. Well-informed Squibb representatives will be on hand to welcome you and to furnish any information desired on the products displayed.

R. J. Strassenburgh Company, Rochester, New York (Booth 29).

Tampax Incorporated, New York (Booth 15).

U.S. Vitamin Corporation, New York (Booth 68).

Wallace & Tiernan Products, Inc., Belleville, New Jersey (Booth 19). Azochloramid (Chloroazodin U.S.P.) is a Council Accepted, effectively bactericidal organic chloramine of low toxicity for the treatment of wound infections. Motion pictures of several surgical technics and procedures, including plastic,

orthopaedic, peripheral vascular, and general surgery will be shown. Visit their booths and register. Their representatives will welcome your questions.

White Laboratories, Inc., Newark, New Jersey (Booth 3). Within recent years tremendous advances in vitamin research have added a wealth of clinical data to our knowledge of nutrition. The intense interest of the laity in the vitamins—often, unfortunately, confused and misled by unauthoritative lay advertising and uninformed "information"—can be properly controlled by the physician's interpretation of the actual usefulness of the vitamins to his patients. In its booth, White Laboratories, Inc., presents its complete line of ethically promoted, clinically reputable vitamin preparations. Qualified representatives are in attendance to discuss with you the use of White's products in vitamin prophylaxis and therapy. Descriptive literature is available for your review and a cordial welcome awaits you.

Winthrop Chemical Co., Inc., New York (Booth 45), extends a cordial invitation to visit their exhibit, where representatives will gladly discuss the latest therapeutic contributions made by this firm.

John Wyeth & Brother, Inc., Philadelphia (Booth 37).

Zimmer Manufacturing Company, Warsaw, Indiana (Booth 20), will exhibit the regular line of fracture equipment, and in addition the popular Luck Bone Saw and all of its attachments. Various other items that have been standardized by the U.S. Army and Navy will be on exhibition. The new Screw and Plate Container Outfit will also be on display, along with new instruments which have recently been designed by Dr. Walter P. Blount and Austin T. Moore.

TECHNIC OF LIPIODOL INSTILLATION

BRONCHOGRAPHY

Method of Forestier

In the visualization of the bronchial tree, the pernasal method described by Forestier* in 1934 possesses several advantages. No special instruments are required; the patient is subjected to a minimum of discomfort; the technic is easily carried out. The tongue is pulled forward, thus closing the upper end of the esophagus. A topical anesthetic solution is instilled into one nostril with the head tilted back at an angle of 45°. The solution

finds its way through the open glottis into the trachea and bronchi. The warmed Lipiodol is instilled after five minutes, and the position of the patient is adjusted according to the portion of the bronchial tree which is to be visualized. With Lipiodol (iodized poppyseed oil containing 40 per cent iodine in chemical combination), brilliant roentgenograms of the bronchial tree ramifications are produced, affording a valuable aid in diagnosis.

Wrong method; fluid entering esophagus when tongue is not pulled forward.

Correct method; the path followed by fluid when tongue is pulled forward.

The head in correct position, showing method of instilling fluid into nostril.

The complete description of the method of Forestier* in bronchography, as well as the many other valuable applications of Lipiodology, are graphically presented in a new brochure "The Applicability of

Lipiodol in Roentgenography and the Technic of its Use." Physicians are invited to send for a complimentary copy.

when rest has been *unsuccessful*

The vasodilator action of Erythrol Tetranitrate suggests it as an adjunct to rest and other measures when these have been unsuccessful in controlling arterial hypertension. Producing a vasodilatation which persists for several hours, following the administration of a single, therapeutically effective dose, Erythrol Tetranitrate causes a reduction in blood pressure sufficiently prolonged so that administration three times daily may maintain the re-

duction. It may be prescribed over a protracted period with sustained effect.

By dilating the peripheral arterioles, Erythrol Tetranitrate tends not only to decrease stress of excessive pressure on arterial walls, but also to relieve the burden on the heart. Although the causative mechanism remains unaltered, a more favorable circulatory condition is established.

Women's Medical Society of New York State

Annual Meeting, Buffalo—May 2-3, 1943

Headquarters, Hotel Statler

THE thirty-seventh Annual Meeting of the Women's Medical Society of New York State will be held in Buffalo, May 2-3

There will be a tea at the Hotel Statler, Sunday, May 2, from 4 00 to 6 00 P M

The regular annual meeting will be held on Monday morning, May 3.

The program for Monday is as follows: 9 30 A M.—Registration; 10 00 A M to 12 00 Noon—Business Session; 1 00 P M.—Luncheon

From 2 00 to 5 00 P M. the following scientific session has been planned: "The Physical Therapy Prescription," Jessie D. Wright, M D, Pittsburgh, Pennsylvania, with discussion by Florence E Warner, M D, of Binghamton, Madge C L Mc-

Guinness, M D, of New York City and Tamara von Friesen, M D, of Buffalo, "Shock Therapy in the Treatment of Mental Diseases," Jennie D Klein, M D, Buffalo; "Prevention and Early Diagnosis of Cancer," Zoe Allison Johnston, M D, Pittsburgh, Pennsylvania

Dinner will be held at the Hotel Statler on Monday at 7 00 P M. The speakers will be Marguerite P. McCarthy, M D, President of the Women's Medical Society of New York State, Greetings, President of the American Medical Women's Association—"Experiences in England," Florence L Warner, M D, Binghamton

Pruritus Ani

"with its torture of sleepless nights,
exasperating annoyance, and the sapping
of nerve poise and courage^(*) . . ."

No patient need suffer the torturing discomfort of pruritus ani, either at night or during business hours. Through the use of Calmitol Ointment, welcome relief is obtained for many hours. Thus restful sleep and recuperation follow, obviating the nervous irritability of sleeplessness. Easily carried about and applied when required, Calmitol Ointment may be used any time when the pruritus recurs. By breaking the vicious cycle of a lowered cutaneous threshold induced by sleeplessness and fatigue, Calmitol reduces the severity of attacks and facilitates corrective therapy. Physicians are invited to send for samples.

New York, N. Y.

CALMITOL

THE DEPENDABLE ANTI-PRURITIC

Calmitol exerts its antipruritic influence by blocking cutaneous receptor organs and nerve endings. Its active ingredients are chlor-iodo-camphoric aldehyde, levo-hyosine oleinate, and menthol, incorporated in an alcohol-chloroform-ether vehicle. Calmitol is protective, bacteriostatic, and induces mild active hyperemia.

Woman's Auxiliary

To the Medical Society of the State of New York

SPRING is here!

God bless the heart of sunshine
That smiles the clouds away,
And sets a star of fresh-born hope
In someone's sky each day.
God bless all words of kindness
That lift the heart from gloom,
And in life's barren places
Plant flowers of love to bloom.

Let each of us be sure that our county news is in the spring issue.

The spring board meeting was held in Albany, February 15-16, at the DeWitt Clinton Hotel. At a

dinner meeting on February 15 at the hotel, Mrs. Noll, our president, greeted us in her charming manner, and after dinner, the members went to a session of the State Senate. On February 16, shortly after 9:30 A.M., the president called the board meeting to order. Reports were given from the State officers, chairman, and county presidents. The reports showed that all the auxiliaries are growing, that many new members have been taken in, and that all are busy in Red Cross work.

The Convention chairman, Mrs. William Rennie, gave her report for the Convention, to be held in Buffalo, May 3-6. Watch the JOURNAL for more news regarding the Convention.

County News

Herkimer. The February meeting was held at the Dyett Tea Room at Ilion. Mrs. Murray presided in the absence of the president. Mrs. Buckbee, of Dolgeville, was asked to represent Herkimer County at the board meeting. A nominating committee was appointed to present a slate at the April meeting. Red Cross sewing was done by all members after the meeting.

Kings. Women of the Kings County auxiliary have formed their own Red Cross Unit, meeting every Monday and Wednesday from 10 A.M. to 4 P.M. Layettes, hospital gowns, and surgical dressings are made.

Nassau. Mrs. Arthur Jacques welcomed Mrs. Abner Morris of Hewlett into the auxiliary. Owing to the ban on pleasure driving, meetings are canceled for the present. However, the executive board will meet once a month as usual, and all future activities will be announced by the board. At present, Nassau County is doing a great deal of work on Child Welfare Schools and on home defense.

Saratoga. At the meeting of the county auxiliary Mrs. James F. Roohan, president, praised the work of the public health nurses of Saratoga County. Splendid reports were given to the auxiliary members, showing the work that the health nurses are doing. Mrs. Roohan gave a short résumé of the bills to be brought up by the legislation committee and of the work being done by Mrs. Alfred Madden, state chairman of legislation. Mrs. Madden deserves a great deal of credit for her splendid work. The auxiliary does machine sewing once a week for the hospital.

All Auxiliary Members—You are all welcome to the Annual Convention to be held this May 3-6 at the Hotel Statler in Buffalo. Make your reservations early. I am sure we all want to renew our old acquaintances, make new ones, and keep the Auxiliary banner flying high at a time when we are needed so much. Let each one make a big effort to be there and make this convention a success.

See You At The Convention

The Woman's Auxiliary to the Medical Society of the State of New York will hold its Annual Convention in Buffalo, May 3-6, in conjunction with the Annual Meeting of the State Society.

The program will be published in the April 15 issue of the JOURNAL.

ARGYROL

SAFE EVEN IN THE CAVITIES

Effective Antisepsis without Toxicity: Decongestion without Vasoconstriction.

The fact that ARGYROL has been employed repeatedly in the sinuses, the renal pelvis, and the bladder with good effect, and always without undesirable toxic effects, is evidence of its complete freedom from systemic toxicity. But ARGYROL also has many other advantages which make it truly "the mucous membrane antiseptic of choice."

No Ciliary Injury. The "ciliary sweep" is a vital factor in throwing off upper respiratory infections. ARGYROL, despite its protective consistency, does not injure ciliary action.

Decongestion Without Vasoconstriction. It is a common observation that the continued use of vasoconstrictors may lead to sogginess

and loss of tissue resiliency. ARGYROL lessens turgescence but induces no powerful artificial vasoconstriction.

Unique Physical Properties. ARGYROL is more than just a chemical germ-killer. Its mechanical action is detergent and pus-dislodging. It is demulcent, soothing and inflammation-dispelling. It effects a "physiological washing of the mucous surface."

ARGYROL'S colloidal dispersion is finer, and the hydrogen ion concentration and silver ion concentration of ARGYROL solutions are carefully and properly regulated, so that solutions of ARGYROL in any strength from 1% to 50% are equally bland and non-irritating.

A. C. BARNES COMPANY, NEW BRUNSWICK, N. J.

ANTISEPTIC EFFICIENCY PLUS

1. SOOTHING AND INFLAMMATION-DISPELLING PROPERTIES
2. NO CILIARY INJURY—NO TISSUE IRRITATION
3. NO SYSTEMIC TOXICITY
4. NO PULMONARY COMPLICATIONS
5. DECONGESTION WITHOUT VASOCONSTRICTION

SPECIFY THE ORIGINAL ARGYROL PACKAGE

AURAL, ORAL, AND LARYNGEAL TUBERCULOSIS

G. E. WILSON, M.D., Saranac Lake, New York

THIS paper will be of most interest to the otolaryngologist who has had meager experience with the tuberculous. It is not designed to bring forth anything new or striking. However, I trust that even those specialists who have spent much time in the field of tuberculosis may find something of interest in my experiences as compared with their own.

Tuberculosis of the middle ear is thought to be secondary to pulmonary tuberculosis, which disease has been positively diagnosed in every case of tuberculous otitis media that I have seen—and these patients have been adults with few exceptions. Two of the women, who both developed the condition after thoracoplasty operation, were so unfortunate as to have been deaf in the opposite ear following childhood exanthemata. This aural complication occurs in roughly 5 per cent of lung phthisis cases. Some of these patients have also had laryngeal tuberculosis as an accompaniment, which makes the prognosis more serious. This complication nearly always occurs in cases with active pulmonary lesions but appears occasionally in quiescent cases.

The onset is usually insidious and painless, or with only dull aching. An acute painful type has been described, but I have never encountered it. In long-standing cases with secondary infection, pain and soreness may become definite. Acute pyogenic infections of the middle ear may occur in tuberculous patients. Whether the pathway of infection in tuberculous otitis media is by blood, lymph, or through the eustachian tube by bacillus-laden sputum forced there during cough, is not definitely known. Proctor and Lindsay's¹ recent work favors the hematogenous route.

Early symptoms are discomfort of the ear, stuffiness, slight but progressive impairment of hearing, and later, in some cases, tinnitus. By the time the patient consults an otologist the tympanic membrane is thickened and appears dull red with the usual sharp landmarks rounded or less distinct. In most cases the drum ruptures spontaneously without pain in from one day to several weeks after definite establishment of symptoms and signs. The immediate discharge is thin and watery, or flocculent, but this soon becomes thick and purulent, though not profuse, and continues indefinitely, especially after secondary infection takes place. Multiple perforations have been described but mostly I have

seen a single one, usually in the anterior inferior quadrant, although it may occur in any part of the drum. It usually enlarges, with destruction of membrana tympani. Occasionally I have seen two perforations which have coalesced, but seldom more than two. Perforations are said to be ruptured tubercles. In the rare cases, which do not respond to treatment, bony necrosis may occur. Marginal perforations are suggestive of this, and if it happens, the ossicles may be destroyed and there may be an invasion of mastoid or labyrinth. Sequestra have been described, but they have not occurred in my cases. I have had occasion to operate upon but one tuberculous mastoid. Facial paralysis has occurred in two patients; one cleared without treatment, and the other continued until death from the far-advanced progressive lung lesion. Cholesteatoma develop in very few long-standing cases. Meningitis and brain abscess have been reported as extensions of this disease, but I have never met these serious metastases. Tubercle bacilli sometimes may be found in direct smear, and sometimes by culture or guinea pig inoculation of the aural pus. If granulations are accessible in the middle ear, a positive biopsy would be conclusive. Pathologically the diseased tissues show round cell infiltration, giant cells, tubercles, granulations, and necrosis or fibrosis as the disease progresses or retrogresses.

After spontaneous perforation the local treatment is practically the same as that for chronic purulent otitis media of pyogenic origin; namely, cleansing, followed by the use of antiseptic solutions, such as, boric acid, bichloride of mercury, and alcohol drops, or Calot's solution, or sulfonamides (locally and systemically). The discharge gradually ceases after a period of three to six months or longer, leaving a dry ear with much scar tissue and a marked loss of hearing, which is likely to be permanent with only slight improvement over the ensuing years. Occasionally this type of ear does not yield to treatment, but discharges for a long period with the ever-present danger of intracranial complications. I have not used vaccines or tuberculin or zinc ionization. Cox and Dwyer,² in reporting 25 cases of tuberculous otitis media, found tuberculin effective in treatment. They stated that 15 per cent of all discharging ears in childhood are tuberculous and that often the organisms are bovine. In children the disease is frequently extensive and destructive to the temporal bone. I seldom see such

SCHOOL'S OUT ...3 HOURS 'TIL SUPPERTIME

Eating between meals or "piecing" can become a bad habit that spoils the appetite for regular meals.

But the active, rapidly growing child usually is better off if his or her "between-meals" hunger is satisfied.

Horlick's is ideal at such times because it combines basic nutrition in a palatable liquid form which is so readily digested that it does not tend to destroy the appetite for the next full meal.

For the normal as well as the undernourished child—at meals and, if necessary, between meals—remember

[Continued from page 680]

children, although my only operation for tuberculous mastoid was in a boy of eight. In adults the disease usually limits itself to the middle ear. My experience with ultraviolet light (local and general) in this disease has been disappointing, although this modality has been praised by Strandberg³ and by Weinstein and Bendove.⁴ Nor have I found any advantage in myringotomy before spontaneous perforation because the drum is partially lost in most cases anyway, while in a few cases, if the tympanic membrane has not been lanced, it is saved intact as the disease resolves. The hearing, of course, remains greatly diminished in any event. Tuberculosis of the petrous apex has been reported (Grabscheid⁵). It is necessary to differentiate tuberculous otitis media from syphilis, which is rare in the middle ear, and from pyogenic chronic purulent otitis media.

The prognosis is favorable in most cases, and there is usually little disturbing effect on the general health or the pulmonary condition. I have never known tuberculous otitis media to be the cause of death. Building up the general health and being sure that the lung condition is properly and specifically treated help to overcome the activity of the aural lesion. The most menacing end result is the extreme loss of hearing. Almost always the involvement is unilateral, but I have encountered a few bilateral cases.

My experience with tuberculosis of the intranasal passages and the paranasal sinuses has been limited. Nasal tuberculosis has, however, been reported by Vandever⁶ and by Terry.⁷ Hersh⁸ described a case of tuberculous right antrum and reviewed the literature, listing others by Gleitsmann,⁹ Coakley,¹⁰ and Kechwick.¹¹

Oral tuberculosis I have encountered fairly often, although it is rare in comparison with laryngeal disease. Its appearance is marked by lesions of the gums, cheeks, soft palate, uvula, tongue, tonsils, pillars, and pharynx, independent of involvement of the larynx. They begin as small superficial erosions which develop into shallow ulcerations of varying extent. In the infrequent cases with simultaneous oral and laryngeal lesions, the prognosis is worse than either would be alone. Oral lesions are thought to be always secondary to pulmonary phthisis, and the end results of treatment are usually good, provided that the pulmonary disease is also handled intelligently. Whether the infection arises through implantation from tubercle bacilli in sputum or is blood-borne is not definitely known. Local measures of treatment are: electrocautery, light therapy, and topical applications, of which silver nitrate seems to be best. Light therapy has proved more valuable in these lesions because of their easy accessibility. The Kro-

mayer lamp and the cold quartz lamp have aided from both palliative and curative standpoints. Again, however, most reliance must be placed on galvanocautery, which should be used cautiously and not too frequently. Isolated ulcers in the pharynx will heal, but pharyngeal involvement extending upward from tuberculous disease in the larynx is hopeless. Smears and cultures are often positive but may be unreliable for diagnosis because of possible contamination from bacilli in sputum. Biopsy followed by cauterization of the wound may be necessary for diagnosis, but in general the laryngologist can make the diagnosis from inspection alone, together with the history, especially if the patient is known to have pulmonary tuberculosis. Syphilis, malignancy, and Vincent's disease must be ruled out. Martin and Koepf's¹² five patients with tuberculosis of the gums and cheeks were all men, and most of my patients have been men. It is fair to assume that if these lesions are in patients with fibrotic pulmonary tuberculosis, the prognosis is favorable because of better resistance and healing power. Conversely, hematogenous lesions offer a grave prognosis. Farber, Friedland, and Jacobs¹³ have recently reported nine cases of tuberculosis of the tongue, mostly far advanced. Literature on tuberculosis of the tonsils is abundant (Weller,¹⁴ Long,¹⁵ and Alpert¹⁶).

Tuberculosis of the larynx has decreased in incidence more than 50 per cent during the past ten or twelve years because of the extensively increasing use of collapse therapy in pulmonary tuberculosis, to which disease the laryngeal involvement is always secondary. Pneumothorax, phrenic nerve interruption, and thoracoplasty are used early and often. Laryngeal lesions seldom appear after such treatment is instituted and, if already present, they are likely to improve along with the lung condition and the general health, especially if sputa become negative. Dworetzky¹⁷ and Cooper and Benson¹⁸ have stressed these measures in the treatment of laryngopulmonary tuberculosis. Early pulmonary diagnosis with immediate specific treatment is another factor in the prevention of tubercle deposit in the larynx. McConkey¹⁹ has advanced the intake of Vitamin C as a preventive factor in patients taking cod liver oil and tomato juice.

The disease is insidious—often without definite manifestation—and frequent laryngeal examinations should be made in patients with pulmonary tuberculosis. Frank symptoms occur only with active disease, and pain or soreness is noted after the laryngeal lesion has progressed beyond the minimal stage. Hoarseness occurs when the vocal cords are involved or when a pathologic condition in the posterior commissure hinders

An Invitation
from
PHILIP MORRIS

We extend to you a cordial invitation to visit our exhibit at the meeting of the Medical Society of the State of New York, Booth No. 61. You will find our exhibit of considerable interest, both for your own smoking pleasure and your professional work.

It will demonstrate scientific methods used to determine the influence of hygroscopic agents on irritation due to smoking. It will demonstrate the distinct advantages of Philip Morris over cigarettes made by the ordinary method of manufacture.

Philip Morris & Co. Ltd., Inc., 119 Fifth Ave., N.Y.

[Continued from page 682]

approximation. The voice may remain good, with the vocal cords normal in appearance even though the disease is far advanced in the epiglottis, arytenoids, and aryepiglottic folds. Discomfort in the throat and early fatigue of the voice are common. Pain and smarting, referred to the ears when fruit juices are swallowed, suggest erosion, ulceration, or sometimes edema of the epiglottis or arytenoids. Aphonia, dysphagia, odynphagia, and dyspnea occur in advanced cases. Cough, dryness, and tickling are exasperating, and sometimes there is regurgitation of fluids and semisolids through the nose on attempting to swallow.

Mirror laryngoscopy will suffice for diagnosis. Taylor and Nathanson,²⁰ Pancoast,²¹ and others have shown characteristic changes by x-ray, but such examinations are not needed for diagnosis. Pallor or hyperemia of laryngeal tissues is simply part of the picture of the patient's general condition, although unilateral congestion of a vocal cord is significant. Infiltration, edema, erosion, ulceration, etc., can determine diagnosis. It is important to learn by x-ray the patient's lung condition and also to find out whether the sputum contains tubercle bacilli. Presence of one or more of the five cardinal signs and symptoms of tuberculosis, as outlined by Heise and Brown²²—namely, tubercle bacilli in the sputum, hemoptysis, pleurisy with effusion, rales in the upper half of the lung, and x-ray findings characteristic of tuberculosis—will aid in the case of a doubtful diagnosis. Along with others, I have thought for years that the most frequent site of initial lesion in tuberculous laryngitis was the posterior commissure, but in going over all my cases, I found the vocal cords (one or both) to be the first site involved most often. If the change is unilateral, it is significant in early diagnosis. Hyperemia, infiltration, erosion, and ulceration (sometimes irregular mouse-eaten edges of cords) are successive stages. The posterior commissure is second in frequency and manifests itself by infiltration with roughness, vegetations (tuberculomata), or erosion of all or part of the area, more marked to one side of the midline. Next are the epiglottis and arytenoids, which are about equal in frequency. Rarely the ventricular band or ventricle harbors the first implantation of tubercle. Massive advanced laryngeal tuberculosis may be any combination of changes named or the entire larynx may be involved in the pathologic process with usually a predominance of disease on one side—and not necessarily the side of the greatest lung involvement.

Tuberculosis of the larynx is usually slow and chronic, but it may be acute, fulminating, and rapidly fatal, especially in hematogenous tuber-

culosis of the lungs and larynx. Central or intrinsic lesions involve posterior commissure, vocal cords, ventricular bands, and ventricles, whereas peripheral or extrinsic lesions attack the epiglottis, aryepiglottic folds, and arytenoids. Intrinsic involvement offers a favorable prognosis; extrinsic lesions are unfavorable or doubtful, and mixed lesions (intrinsic and extrinsic) are often fatal. These types are early, moderately advanced or far advanced and, of course, moderately advanced and far-advanced laryngeal lesions occur mostly in patients suffering from far-advanced pulmonary disease.

The years of greatest incidence are 18 to 35, as in pulmonary tuberculosis, and the disease is more prevalent in men. Today's lowered incidence shows less than 5 per cent in minimal pulmonary tuberculosis, less than 10 per cent in moderately advanced, and less than 20 per cent in far advanced. Laryngeal tuberculosis is considered always secondary to pulmonary tuberculosis.

Consensus of opinion as to the pathway of infection of the larynx favors direct invasion by tubercle bacilli from sputum. Most patients have positive sputum (in Dworetzky's²³ series 91 per cent had positive sputum; in McMurray's²⁴ series 65 per cent of the patients with positive sputum who died had autopsy evidence of laryngeal tuberculosis). Negative sputum cases do develop the disease, such as cases of hematogenous pulmonary tuberculosis. Myerson²⁵ concurs in this belief. Sputum cultured or injected into guinea pigs sometimes proves positive. In patients with no sputum, the gastric contents should be searched for tubercle bacilli. Greene²⁶ suggested that intrinsic lesions are sputum infections, whereas extrinsic lesions may be blood-borne. I believe that most laryngeal lesions begin as surface infections from tubercle bacilli in pulmonary tuberculosis of the bronchogenic type, whereas a small proportion are blood-borne deposits in cases of the hematogenous type. Syphilis and carcinoma are the diseases usually to be excluded in differentiation. Laboratory tests, biopsies, chest x-rays, etc., should not be spared. Neoplasms of the vocal cords are especially difficult to diagnose; anterior location for tumor and posterior site for tuberculosis cannot be accepted alone. Cancer of the epiglottis closely simulates tuberculosis.

Paralyzed vocal cords may occur in a tuberculous larynx, or without laryngeal disease, owing to pressure on a recurrent laryngeal nerve in the chest, as from tuberculous glands, carcinoma of the lung, or subclavian or aortic disease. Prognosis in laryngeal tuberculosis depends greatly upon the type and extent of the lung lesion, as

Sterile Shaker Packages Sulfanilamide, H.W. & D.

OUR total output of 5 gram Sterile Shaker Packages of Crystalline Sulfanilamide, 30-80 mesh, developed by our research staff in cooperation with military authorities for the treatment of wounds in combat zones, has previously been requisitioned for military needs (totaling more than thirty million packages).

Completion of our new Sulfanilamide Division plant ahead of schedule and the resulting increased production has now made it possible for us to supply these packages for civilian medical use.

We will now accept orders for Sterile Shaker Packages of Crystalline Sulfanilamide.

The package will be available only by or on the prescription of a physician.

Complete information and prices on request.

well as upon the institution of prompt specific treatment for lungs and larynx. Aural or oral tuberculosis in conjunction with laryngeal disease adds to the gravity and so does pregnancy. Recurrence after complete healing is rare, but it may take place in patients with exacerbation of lung disease.

It is my belief that local treatment is of inestimable value and that it saves many lives. Electrocautery is the most effective weapon against this disease. I have used it extensively for many years with increasingly good results, for it has produced healing in numerous cases and has alleviated much pain and suffering. Patients in whom the laryngeal condition was far advanced and who had remained unimproved through weeks of watchful waiting, have been healed dramatically and comparatively quickly by this facility. I have but rarely had to resort to alcohol injections of the superior laryngeal nerve for relief of pain. Cutting operations (such as amputation of the epiglottis) and curettage are seldom practiced today. Galvanocautery will accomplish better results—more slowly but safely—for the blood vessels are sealed, making the spread of the disease less likely.

I do not use electrocautery in minimal laryngeal lesions, except occasionally to destroy interarytenoid vegetations which interfere with approximation of the vocal cords, as most early cases will heal without cautery. I use the cautery in most moderately advanced lesions (unless confined to the cords alone), and in nearly all advanced cases except when there is high temperature and emaciation. Even these latter are sometimes cauterized to relieve pain, but there is always the danger of sloughing. Best results are obtained if the pulmonary lesion is quiescent or not too active. The better the general physical condition of the patient, the brighter the outlook for the healing of the larynx.

It is more practical to perform galvanocautery by the indirect method (local anesthesia, of course) in the office and at the bedside. Direct laryngoscopy is too formidable and hardly practical for debilitated patients in whom the larynx is very sore and who have to be cauterized repeatedly. Employing only sharp-pointed electrodes simplifies the operation, as one can use them for puncturing infiltrated, edematous, or ulcerated areas, for searing erosions, and for eradicating small tuberculomas or cutting through the bases of vegetations in the posterior commissure. (It is rarely necessary to cauterize vocal cords.) Usually four to eight punctures, or more, are made $\frac{1}{8}$ to $\frac{1}{4}$ inch apart and about $\frac{1}{8}$ inch deep at two-, three-, and four-week intervals for a period of three months to one year, according to

the type of case, etc. Deep punctures must not be made into muscular areas, such as the ventricular bands and posterior commissure because of the danger of causing stenosis, or into the crico-arytenoid joint, thereby risking ankylosis. Preliminary sedatives are not necessary, and severe reactions are uncommon. Tracheotomy has been necessary only three times in eighteen years. Myerson²⁷ reported this procedure more often, some of his patients improving temporarily because of rest of the larynx. Healed larynxes often show distortion and deformity or partial destruction of the vocal cords, but in practically every patient whose larynx heals, the voice will return.

Light therapy has been of little value to me in treating the larynx. I have used natural sunlight and artificial light of many forms for local application in the larynx and for general bodily exposures, i.e., for universal light bath, air-cooled mercury vapor arc lamps, carbon arc lamp units, and natural sunlight solariums, one open and one enclosed with vitra glass; for local treatment, the Kromayer lamp, cold quartz lamp (quartz mercury vapor glow), and the Verba laryngoscope. All are so seldom employed now that I have forgotten the physics of light. Experience in timing eliminates danger to the lungs in general bodily exposures. Voice rest is important.

Topical applications, although not curative, do cleanse the larynx and lessen the cough. No medicines are specific, and I have not had any success with local use of chaulmoogra oil or cod-liver oil. Vegetable oils are used as vehicles for guaiacol and other soothing instillations. Cocaine, butyn, pontocaine, or larocaine are sprayed locally before meals in severely painful larynxes; hypodermic narcotics are reserved for suffering terminal cases. Tuberculin is seldom used. Vaccines, radium, roentgen rays, high frequency current and sulfonamides have not won spurs in this malady.

Blood examinations (red, white, differential, hemoglobin) and sedimentation rates are a distinct aid in control and prognosis. Comprehensive understanding of pulmonary tuberculosis is of great value to the laryngologist, as is close cooperation with the pulmonary specialist, the roentgenologist, and in some cases the thoracic surgeon.

In closing I should like to mention the fact that laryngeal tuberculosis has rarely been present in cases submitted for bronchoscopy to determine a tuberculous ulcer or stenosis in the tracheobronchial tree—at the most, only slight infiltrations of one or both vocal cords. I believe this concurs with the experiences of most investigators, although one or two reports a

Discussion

Dr. M. C. Myerson, New York City—Dr. Wilson has just given us a comprehensive picture of tuberculosis of the larynx. Because of his wide experience with this condition, his papers are always worth while. In a paper such as this, however, it is impossible to cover every phase of the disease.

Very few cases of tuberculosis of the larynx have the same type of lesion in the same locations. The various manifestations of this disease are more likely to occur in certain parts of the larynx than in others. Moreover, the lesions are more likely to be extensive and diffuse rather than single and isolated.

It must be borne in mind that tuberculosis is essentially a self-healing disease. By that I mean that the individual either has the ability to heal or has not. While it is true that the cautery is of great value in stimulating the reparative process, it is a fact, nevertheless, that neither cautery nor anything else will help the lesion that cannot form fibrous tissue.

Also of importance is the fact that stenosis of the larynx due to tuberculous disease and which requires tracheotomy is not necessarily fatal. We have treated many such patients who have been alive for varying periods of years.

The oft-repeated statement that early diagnosis means a more favorable prognosis is fallacious. It is not the time of recognition that is important; it is, rather, the nature and extent of the involvement. A patient may have an unrecognized benign lesion in the larynx for a long time which will heal spontaneously. On the other hand, another may present a very extensive involvement, which, even though recognized early, gradually or rapidly evolves into a widespread and disintegrating process which terminates fatally.

In closing, may I make a plea for a greater interest among otolaryngologists in this disease? At the present time, there is a relatively small number of men in this country who have paid any attention to tuberculosis of the larynx.

Case Report

ADULT INTUSSUSCEPTION OF TUBERCULOUS ORIGIN

ABRAHAM BOLKER, M.D., and CHARLES E. HAMILTON, M.D., Brooklyn

NUMEROUS reports are encountered in the literature illustrating the fact that tubercular patients are no different from others in being subject to the same abdominal emergencies, some of them of rare occurrence. Not infrequently the possibility of a tuberculous enterocolitis precludes the diagnosis of an acute abdominal condition that necessitates surgical intervention.

Intussusception in the adult is a relatively uncommon condition. Approximately 5 to 10 per cent of all cases occur in adults. The usual causative agents in their observed order of frequency are tumors of the intestinal tract, benign and malignant; Meckel's diverticulum; inflammation of the vermiform appendix; trauma; ulcerations associated with typhoid, dysentery, and tuberculosis; and simple ulcers.

The classical picture of intussusception of acute nature in the infant is rarely seen in the adult. In the latter, the symptoms usually extend over weeks or months. Vomiting is seen only in rare cases, but colicky, abdominal pain may continue for months. Mucous discharge from the bowel is not so constantly present. The fact that in the adult the obstruction is often incomplete explains why in many cases the diagnosis is difficult. The difficulty in establishing an early diagnosis is a great factor in the high mortality associated with intussusception in the adult.

Although the course of intussusception in the adult is very apt to be chronic rather than acute, the treatment, once the diagnosis is established, is the same as it is for the child—namely, immediate surgery. The dangers of procrastination are as great in the adult as they are in the child. However, in a protracted case the prognosis in the adult is better in view of the greater ability of the adult to withstand the associated toxemia.

Eliot and Corscaden,* in a report on a review of 300 cases of intussusception in adults, state that among them were 5 cases due to typhoid ulceration, 6 associated with dysenteric ulcers, 8 with tuberculous involvement, and at least 3 instances of intussusception with what are described as simple inflammatory ulcers.

To our knowledge there has been no case reported in the literature of intussusception in a patient over 50 years of age associated with a tuberculous ulcer of the intestine as its cause.

Case Report

T. M., a 55-year-old Irish salesman, was admitted to Kings County Hospital on December 30,

From the Division of Tuberculosis Kings County Hospital, Brooklyn.

* Eliot E., and Corscaden, J. A.: *Ann. Surg.* 53: 169 (Jan.) 1911.

1937. His family history was negative. The patient was comparatively well until three weeks prior to admission when he caught cold, developed a temperature of 103 F., associated with generalized weakness, anorexia, and some pain in the right chest. He had lost 20 pounds during his illness. There were no complaints referable to the gastrointestinal tract.

On admission the blood pressure was 120/70, temperature 101 F., pulse 88, respiration 20, weight 110 pounds. Findings were essentially limited to the chest and were those of a caseous pneumonic tuberculosis of the right upper lobe with signs of cavitation. There were no masses, palpable organs, or tenderness. A chest x-ray taken on January 11, 1937, revealed a moderately advanced caseous pneumonic tuberculosis of the right upper lobe with a cavity $2\frac{1}{2}$ inches in diameter *in situ* and a submiliary spread extending downward from the cavity and occupying the greater portion of the right upper lobe.

Laboratory Findings.—The laboratory findings were as follows: December 31, 1937—urine, negative; blood count, red blood corpuscles, 3,140,000 per cu./mm., white blood corpuscles, 7,700, per cu./mm.; polymorphonuclears, 68 per cent; lymphocytes, 32 per cent; hemoglobin, 57 per cent. January 1, 1938—sedimentation rate, 24 mm. in fifteen minutes. February 2—laryngoscopic examination, negative; sputa and gastric washing specimens were positive for tubercle bacilli.

The disease ran a febrile course, the temperature ranging between 98.2 F., and 101.2 F. There was no significant change in the general condition of the patient. The bowels were regular, and diarrhea was noted on only one occasion.

In view of the nature and location of the pulmonary pathology, the presence of tubercle in the sputa and gastrics, it was deemed wise to start an artificial right pneumothorax. After seven treatments pneumothorax had to be abandoned on February 25, 1938, because of the ineffectiveness of the collapse, the upper third of the right lung being adherent to the chest wall. The patient was kept at absolute bed rest with a sandbag on the right upper chest. He had no complaints of significance.

On March 3, 1938, he experienced severe cramp-like pain diffusely through the abdomen, vomited once, and had sour eructations. The temperature was 99 F., pulse 84, respirations 20. The abdomen was tympanitic throughout, with some tenseness of the musculature. There was no tenderness, rebound, or rigidity in any portion of the abdomen. Two dram doses of paregoric yielded no relief. A plain tap-water enema was given with fairly good results. The pain was relieved for 1 hour, only to return and become more or less constant. The following day, March 4, the patient vomited bile-stained material several times. He had anorexia, took sparingly of fluids, and slept little. The pain

Enemies Unseen But for the Microscope

For Bausch & Lomb Instruments essential to Victory—priorities govern delivery schedules

BAUSCH & LOMB
OPTICAL CO. • ROCHESTER, N. Y.

Bausch & Lomb microscopes are helping to keep America's workers and fighters healthy. Into a world otherwise invisible, men with microscopes seek out the enemy that hides in the water, the soil and the air. . . . help to keep fighting men in fighting trim. At home their work protects America's industrial army. Bausch & Lomb development of the mass production of optical instruments first made quality microscopes available to all. This experience today makes possible the mass production of optical fire control instruments that help make America's fighting forces the best equipped in the world.

IN WHOOPING COUGH

ELIXIR BROMAURATE IS A UNIQUE REMEDY OF UNIQUE MERIT

Cuts short the period of the illness, relieves the distressing cough and gives the child rest and sleep. Also valuable in other PERSISTENT COUGHS and in BRONCHITIS and BRONCHIAL ASTHMA. In four-ounce original bottles. A teaspoonful every 3 or 4 hours.

GOLD PHARMACAL Co., New York

Say you saw it in the NEW YORK STATE JOURNAL OF MEDICINE

[Continued from page 690]

continued and there was no significant change in the physical findings of the abdomen. He was given intravenous calcium, glucose infusions, and sedation.

There having been no bowel movement since the enema on March 3, on the morning of March 5, a glycerin enema was administered. This was returned practically clear, except for a few hard, small fecal masses, with no blood. The temperature was 98.6 F., pulse 100 to 110, and respirations 24 to 30. The white blood corpuscles now numbered 18,000; polymorphonuclears, 93 per cent; lymphocytes, 7 per cent.

Later in the day, about three hours after a milk and molasses enema, a liquid stool was passed, pink in color and strongly positive for occult blood by benzidine reaction. The abdomen was rounded, coils of intestine were visible, but peristalsis was not noted. On auscultation a small amount of tinkling was heard over the lower abdomen. No active peristalsis was heard. The abdomen was soft, there being no rigidity or tenderness present.

A flat x-ray of the abdomen revealed dilatation of the loops of the small bowel in the proximal half of the abdomen, indicative of dynamic obstruction of the intestine below this point.

The opinion of the surgical service was that the patient had a small bowel obstruction of unknown cause. Operation was performed by Dr. John Rayeroff on March 6, at 3:30 A.M. and an intussusception was discovered involving the last 12 to 14 inches of the ileum, protruding through the ileocecal valve and filling the dome of the cecum. Its origin was in a disc-shaped broken-down tuberculous ulcer, 2 inches in diameter, possibly from a Peyer's patch, which was approximately 1 foot from the ileocecal junction. This occupied the entire lumen of the bowel except for the mesenteric attachment. The bowel in this region was definitely necrotic, and there were areas of necrosis from this area to within 4 inches of the ileocecal junction. All the layers of the intestinal wall except the serosa were necrotic and devitalized. There were numerous enlarged glands in the mesentery. All the ileum visible was greatly distended. There was a pint of free fluid of straw color within the abdominal cavity. The appendix was normal.

The intussusception was reduced by "milking out" the ileum. As the color of the intestine did not change after hot applications, a foot of the ileum was resected and the proximal and distal ends brought together by a side-to-side anastomosis, leaving a stoma which admitted two fingers. The patient was returned to the ward in a favorable condition.

On the day following the operation, his temperature rose to 101.6 F., pulse 140, respirations 26. The general condition appeared satisfactory. There was no cyanosis or dyspnea. The patient had no complaints.

On March 8, the second day after operation, the temperature rose to 103.6 F., pulse 140, respirations

30. The abdomen was moderately distended. His condition grew worse rapidly, and he died on March 8, at 2:35 P.M.

Autopsy Findings.—The right pleural cavity contained 400 cc. of clear straw-colored fluid. There were numerous tough fibrinous adhesions which bound the greater portion of both lungs to the chest wall. On cut section the right upper lobe revealed a fibrocaceous tuberculosis, honeycombed with small cavities containing creamy, purulent material. The right upper bronchus was almost completely occluded as it entered the consolidated upper lobe. The left lung presented a moderate degree of emphysema. There were no areas of caseation or nodule formation. The lung was fairly crepitant.

The tracheobronchial nodes were moderately enlarged and anthracotic. The mucosa lining the trachea and main bronchi was hyperemic but otherwise normal.

The mucosal and serosal surfaces of the duodenum and jejunum were normal throughout.

The lower end of the ileum was the site of a recent surgical anastomosis, side to side. The stoma of the anastomosis readily admitted three fingers. The anastomosis had been closed by continuous sutures, all of which had held firmly. There was no evidence of leakage or perforation. The wound edges were healed and free from hyperemia. The mucosal surface of the anastomosed area was pale gray and free from ulceration or hyperemia.

At a point 20 cm. proximal to the anastomosis there were numerous ovoid, discrete ulcerations of the mucosal surface of the ileum. These were shallow, being less than 1 mm. deep, and could not be discerned on the serosal surface of the bowel. The floor of the ulcers was smooth and there was no evidence of granulation tissue. The remainder of the ileum was normal.

The mucosal surface of the entire large bowel was moderately hyperemic and free from ulceration. The appendix was normal. The mesenteric lymph nodes were markedly enlarged and on cut section the surface revealed many soft, pinkish-gray nodular masses. There was no evidence of calcification.

Summary

1. A case of intussusception in a male, 55 years of age, with origin in a tuberculous ulcer of the ileum is presented.
2. The clinical and operative findings are described.
3. The pertinent autopsy findings are given.
4. The literature is reviewed.
5. It is stressed that tubercular patients are subject to the usual and rare surgical emergencies as encountered in the nontubercular individuals.

SHORT BLACKOUT

A sorrowing widow, having a memorial erected in memory of her late husband, had the following inscription carved on it:

"Good-bye, Henry, my light has gone out."

Three months later when she remarried, some wit added to the inscription:

"But I have struck another match."

Medical Protection Against Gas Outlined

AMONG plans now being made for possible war emergencies is one for civilian defense against gas, a plan that is being put into operation on a nation-wide scale, enlisting the services of physicians from every locality. The plan is being developed by the Medical Division of the Office of Civilian Defense. Courses have been presented for physicians selected from the faculties of medical schools to be trained as instructors in the medical aspects of chemical warfare. Arrangements are now being made for the presentation of courses by these instructors in their own medical schools.

Training for nonmedical personnel is provided in Gas Specialist Courses which since early December have been presented monthly at War Department Civilian Protection Schools. These schools are located at Amherst College, Amherst, Massachusetts; Purdue University, Lafayette, Indiana; Loyola University, New Orleans; Occidental College, Los Angeles, California; Stanford University, Palo Alto, California; and the University of Washington, Seattle, Washington.

The Gas Protection Service of the U.S. Citizens Defense Corps has been organized as follows: The Medical Division of the Office of Civilian Defense has a Gas Protection Section responsible for organization and training for gas defense. This section functions through the nine Civilian Defense Regions, which are coterminous with the Service Commands of the U.S. Army. Regional Gas Officers have been designated for several of the coastal regions to supervise and assist the State Gas Consultants and the Senior Gas Officers of defense councils in the organization of state and local programs. The Senior Gas Officer trains Gas Reconnaissance Agents who serve in each zone of the city. These men are responsible for the identification of the agent, the collection of samples, the prevention of casualties, the delimiting of gassed areas, and for cooperation with the Emergency Medical Service, the Health Department, and other agencies concerned in protection against gas.

Instructions to members of the U.S. Citizens Defense Corps on their duties in gas defense have been issued by the U.S. Office of Civilian Defense in Operations Letter No. 104 (Supplement 3 to Operations Letter No. 42), dated January 11.

The duties to be performed before, during, and after gas attacks are outlined for the following individuals and groups: State Gas Consultant, Senior Gas Officer, Assistant Gas Officers, Gas Reconnaissance Agents, Laundry Officer, Commander of the Citizens Defense Corps, Incident Officer, Air Raid Wardens, Police Services, Fire Services, Emergency Medical Service, local Health Department, Public Works, Public Utilities, Transportation Services, and Emergency Welfare Services.

For the Emergency Medical Service the duties are set forth as follows:

Duties before gas attack:

1. Plan with assistance of Senior Gas Officer for the establishment of gas cleansing stations for cleansing gassed patients with other injuries and for cleansing of civilian protection personnel. Each hospital of 150 beds or more should be provided with a cleansing station. Cleansing stations should be available in the ratio of one per 50,000

population and should be located at smaller hospitals or casualty stations where 150-bed hospitals are not available in this ratio.

2. Recruit, train, and assign personnel to gas cleansing stations for cleansing services.

3. Provide instruction, in cooperation with the Senior Gas Officer, for general public and civilian protection personnel in self-protection and self-cleansing (Operations Letter 46)

4. Provide for instruction of physicians in diagnosis and treatment of chemical casualties.

5. Assist hospitals in planning for handling of gas casualties.

6. Assure adequate distribution of protective clothing and gas masks and other protective equipment to members of mobile medical teams, and train personnel in their use.

7. Make provision for training drivers of ambulances and sitting case cars in protection of their equipment against liquid-gas contamination; inform them of arrangements for vehicle decontamination by Emergency Public Works Service.

8. Arrange for the protection from contamination of the equipment used to transport contaminated casualties in so far as it is possible.

Duties during gas attack:

1. Upon advice of the Senior Gas Officer and under the orders of the Commander, man the gas cleansing stations.

2. Advise other services of the U.S. Citizens Defense Corps in regard to first aid cleansing of their personnel.

3. Assign a mobile medical team to gas cleansing stations for first aid.

Duties after gas attack:

1. Evaluate the effectiveness of the cleansing procedures which have been used.

2. Provide follow-up treatment of patients.

3. Prepare inventory of protective equipment available for use in future attacks and obtain additional equipment as necessary.

4. Cleanse bodies of the dead to facilitate identification.

Important functions assigned to the health department in the local program of gas defense are as follows

Duties before gas attack

1. Provide for analyses for war gases in samples of food and water. These tests may be performed in a local health department if laboratory facilities are adequate. In such case it is desirable to utilize the same laboratory facilities for the analysis of war gases of air and other materials. Where laboratory facilities other than those of the local health department are more suitable for use in the analysis of war gases, arrangements should be made by the local health department for the analysis of samples of water and food.

2. Advise the Senior Gas Officer regarding the nature of instructions to the public concerning precautions to be taken in the event of water-supply contamination. Such instructions are to be promulgated by the health officer.

3. Cooperate with waterworks officials in planning for the protection and decontamination of the water supply.

Duties during gas attack:

1. Collect samples of food and water for laboratory analysis if contamination is suspected.

2. Inform the public regarding contamination of food and water supplies, including recommendations in regard to self-protection.

Duties after gas attack:

1. Decontaminate, destroy, or otherwise provide for the handling and disposal of contaminated food supplies.

2. Assist the waterworks in the treatment of contaminated water supplies.

3. Advise the Senior Gas Officer in regard to the safety of the public water and food supplies and inform the public

[Continued on page 696]

IN THE CORRECTION OF *Subclinical Deficiencies*

From the many factors which have been shown to be responsible for nutritional deficiencies, it is clear that more than vitamins and minerals are usually needed for satisfactory correction. Thus the choice of therapeutic measures employed becomes a matter of considerable importance.

New Improved Ovaltine was developed for the prevention and treatment of a wide range of subnutritional states. This delicious food drink provides generous amounts not only of vitamins, but minerals, proteins, and

caloric food energy as well. It therefore exerts an over-all therapeutic influence which goes far beyond that produced by the administration of only one group of nutrients. Ovaltine proves highly effective, especially when the deficiency state involves proteins and minerals as well as vitamins. Ovaltine is palatable and easily digested, a factor of importance in malnourished patients with capricious appetites and easily deranged digestive mechanisms. ★ The Wander Co. 360 N. Michigan Ave., Chicago, Illinois.

regarding contamination of such supplies, and methods of dealing with it.

4. Obtain reports of analyses of samples of water or food and take appropriate action. Save specimens of contaminated water and food for transmission whenever necessary to a Chemical Warfare Service or other laboratory, by the Senior Gas Officer.

Gas masks are now being distributed to the personnel of the protective services. As a guide to local distribution and care of masks, the U.S. Office of Civilian Defense issued Operations Letter No. 106, January 20.

It is recommended that masks be distributed among the protective services of the U.S. Citizens Defense Corps in approximately the following proportions: staff, 12.5 per cent; fire service, 10.5; police service, 18.5; air raid warden service, 30; rescue service, 1.5; medical service, 12.5; public works, 9; and public utilities, 5.5.

Masks should be kept at the post where the protective personnel will assemble during drills or enemy action, not carried by them during their daily activities, the Operations Letter advises. It is recommended also that about 20 per cent of the

masks allocated to each service be stored as a reserve. It is important that the reserves be decentralized as a safeguard against destruction by fire or bombing and also to permit rapid distribution in case of an emergency.

The directive points out that since valuable and critical materials are used in the manufacture of gas masks, the utmost care must be exercised in the handling, distribution, and storage. No person should receive a mask until he has been trained in its use and care, including proper storage, it is advised.

Storage must be in a cool, dry place, and masks should be kept from contact with sunlight, oils, and corrosive liquids and vapors. After use, masks should not be worn by another individual without proper sterilization, instructions for which are given in the OCD publication "Protection Against Gas."

Repair of masks is not to be attempted locally except in case of extreme necessity, the Operations Letter states. Broken and defective masks or those with exhausted canisters should be collected by the local Property Officer and returned to OCD Supply Depots for repair and replacement.

Award for Research on Alcoholism

AN AWARD of \$1,000 will be made this year by the Research Council on Problems of Alcohol for outstanding work on alcoholism during 1943. Rules for the competition are as follows:

1. The research for which the award will be granted must contribute new knowledge, in some branch of medicine, biology, or sociology, important to the understanding, prevention, or treatment of alcoholism.

2. Any scientist in the United States, Canada, or Latin America is eligible for the award.

3. The project may have been inaugurated at any time in the past or during the year 1943, provided (a) that a substantial part of the work be carried on during the year 1943, (b) that it be developed to a point at which significant conclusions are possible before the end of the year, and (c) that a report on the work has not been previously announced and described before a scientific body or previously published.

4. It is desirable, but not necessary, that those planning to work for the award send to the Council . . . a statement of such intention. If the Council receives such information, it can be helpful in the prevention of undesirable duplication of effort. If a research project is conceived and inaugurated later in the year, 1943, a statement of intention may be sent to the Council at a later date.

5. A report on the work and resulting conclusions must be submitted to the Research Council on

Problems of Alcohol on or before February 15, 1944. The Council will provide an outline for use in the preparation of reports.

6. The award will be in cash, and will be given to an individual scientist whose work is judged sufficiently outstanding and significant to merit the award.

7. The Committee of Award will consist of five persons—an officer of the American Association for the Advancement of Science, and four representatives of the Scientific Committee of the Research Council on Problems of Alcohol.

8. If the Committee is not convinced of the outstanding merit of the research done during 1943, as described in reports submitted, it may, at its discretion, postpone the award until another year, or until such time as work of such merit has been performed.

The Council will send on request, to any scientist, an outline of basic policies governing its research program, lists of Council studies (completed, under way, and contemplated), and information regarding the studies of other agencies.

Scientists planning to do research in connection with the award may send a statement of intention to

County News

Kings County

In response to an appeal by Dr. John J. Gainey, president of the county society, several hundred Brooklyn doctors donated their blood to the Army and Navy during the recent "doctors' week" for blood donations.

Supervising the campaign to enlist Brooklyn physicians as blood donors were Dr. Charles McCarty, secretary and director of medical activities of the Kings County Medical Society, and Dr. Eugene Marzullo, chairman of the Brooklyn Red

Cross Blood Donor Service and of the society's public health committee.*

. . .

According to an announcement made recently by the War Department, one of the heroes in the battles now being fought in New Guinea is a former Brooklyn doctor, Capt. Rafael R. Gamso. Capt. Gamso, a graduate of Baylor University Medical School, was awarded a silver star for gallantry in action.

OVER-ALL DESIGN OF EVOLUTION

"NATURE has a time-order," comments a critic of the book, *Genetics and the Origin of Species* by Theodosius Dobzhansky. Mutational changes in various species are locked in what may be called the over-all design of evolution—the time-order, of which mutation rates are presumably a part.

"In physics," observes the book critic, "the time-order is now regarded as arising from absolute or ideal properties of a matrix. Surely, this matrix must control evolution as much as it does physical or material phenomena which are described in its terms in physics. Dr. Dobzhansky's great review is thus more than a survey of high interest and large authority."

It treating the subject of genetics and evolution today, Dobzhansky expresses the modern trend in thought which is away from disorder, crass materialism and chance, toward order, transcendentalism and meaning.

Quoting the author: "Since evolution is a change in the genetic composition of population, the mechanism of evolution constitutes problems of population genetics. Of course changes observed in population may be of very different orders of magnitude, from those induced in a herd of domestic animals by the introduction of a new sire to phylogenetic changes leading to the origin of new classes of organisms. . . . Experience seems to show . . . that there is no way toward an understanding of the mechanism of macro-evolutionary change processes observable within the span of a human lifetime and often controlled by a man's will. For this reason we are compelled at the present level of knowledge reluctantly to put a sign of equality between the mechanisms of macro- and micro-evolution, and, proceeding on the assumption to push our investi-

gations as far ahead as this working hypothesis will permit. . . ."

"The phenotype is . . . what a living being appears to be to our sense organs. The genotype is the genetic constitution, the sum total of the hereditary factors received by the organisms from its ancestors. . . . A phenotype is always the resultant of the interactions between a genotype and an environment. . . ."

"It is vastly easier to render an organism sterile or to destroy it altogether than it is to produce the slightest change in the genotype. . . . Inheritance of acquired characters—a reflection of phenotypic changes in the structure of the genotype—apparently does not take place. . . . Unfortunately, in the heat of the polemics against Lamarckism some statements have been made by geneticists which do not contribute to a clarification of the issues: to this class belongs the assertion that the genotype is not influenced by the environment. . . . The determining environment is, however, not merely the one prevailing at the moment, but rather it is the sum of the historical environments to which the organism has been exposed in its phylogeny. . . . Evolution is possible only because heredity is counteracted by another agent opposite in effect—namely, mutation. In genotypically homogeneous populations, hereditary variation sooner or later arises de novo. . . ."

"The mutation concept has had a tortuous history. Not only has the term changed repeatedly in meaning, but even now it is being used in at least two different senses. Alternatives to the term 'mutation' have been proposed, but all of them have failed of adoption. Many years ago, Waagen (1869) designated as mutations the smallest perceptible changes in the temporal series of forms in a species

Dr. Francis W. Goddard, former medical missionary to China, has been appointed medical supervisor for the Rockville Centre Public Schools, filling the vacancy left by Dr. James J. Tibone, who has joined the armed forces.

Born in Ning Po, China, of missionary parents, Dr. Goddard came to the States at an early age. He holds a B.A. degree from Colgate, an M.A. degree from Harvard, and a medical degree from Jefferson Medical College. In 1903 he returned to China as a medical missionary and remained there for thirty-five years, leaving as tangible evidence of his labors a three-story brick hospital with one hundred beds and a nurses' training school. He returned to the United States in 1938 and since that time has served on the staff of the Associated Medical Office, an interdenominational organization that cares for missionaries.*

"It is better to look bunched and stay looking than it is to look svelte, sleek, and chic—and die of pneumonia," editorialized the *Nassau Medical News* in commenting on a sharp increase in pneumonia which may be attributed to residents not dressing properly in low-temperature living quarters.*

New York County

The New York Association of Medical Record Librarians has organized a registry to put its members in touch with available positions. Miss Diana Krezmer, vice-president of the Association and record librarian at the New York Infirmary for Women and Children, will be in charge of this placement service.

A maternity mortality rate set by New York City welfare authorities as an "irreducible minimum" fifteen years ago already has been lowered, according to the latest figures from the Department of Health's bureau of statistics. For the first seven weeks of 1943, the rate per thousand births is recorded as 1.9, although the goal of health officials in recent years has been to reach 2.2.

"Present maternity mortality rates have dropped below what looked like an almost impossible goal set for us some fifteen years ago," Miss Hazel Corbin, director of the Maternity Center Association, said. "The rate of 2.2 looked so far from accomplishment then that we thought if we ever reached it, that would be ideal. As a result, it has never before been so safe to have a baby."

The present decline in the rate, which has been dropping fairly constantly during the last decade, coincides happily, she pointed out, with the rocketing figures in the birth rate.

As contributing factors to the stage now reached in the declining graph, Miss Corbin cited the widespread education among women for early and better medical care and the medical studies in obstetrics that have been developed throughout the country. Definite progress can be attributed, she added, to the practice now well established among county medical societies of studying the maternal death records, classifying those that were preventable, and working to prevent repetition of the circumstances.

"Another factor perhaps is that we are more conscious of the value of life today when we see so many

NEW YORK, N. Y.

Development of an antiseptic, healing dressing for wounds, burns and other injuries from the red blood corpuscles which have been discarded after donors gave their blood for use as plasma is reported in the January issue of *The American Journal of Surgery*.

The authors of the article, entitled "Human Red Cell Concentrate for Surgical Dressings," are Dr. John J. Moorhead, a specialist in traumatic surgery, involving the treatment of wounds, and Dr. Lester J. Unger, hematologist and associate clinical professor of surgery at the College of Physicians and Surgeons, Columbia University.

Dr. Moorhead, who was at Pearl Harbor when the Japanese attacked, and who performed many operations on wounded men, has been conducting experiments with Dr. Unger since April at New York Post-Graduate Hospital.

The doctors made their first clinical use of the corpuscles on April 28, 1942, in the case of a "knee joint arthrotomy (surgical incision) torn apart by a delirious patient." Red cells of a semiliquid consistency were placed in the joint, the article says, and after several applications the entire incision was thus closed.

In a second case of "extensive burns of both extremities" cited in the article, the favorable outcome was "outstanding, notably because many other types of treatment had been tried in vain."

Colleagues of Dr. Moorhead and Dr. Unger at Post-Graduate Hospital and elsewhere have used the treatment for infected and noninfected wounds, burns, and certain types of ulceration.

Dr. Moorhead and Dr. Unger have formed several theories to account for the beneficent effects of the once apparently useless red-cell discard. "Perhaps it acts as an occlusive and reduces oozing and reinfection," they write. "The very high protein content of the material may play a role. There may be some specific element which in this concentrated form is of value, or the process of destroying or disintegrating cells may stimulate cell reproduction."*

Oneida County

Dr. Arthur H. Cummings announces the opening of an office in Rome for the general practice of medicine. Dr. Cummings comes to Rome from a recent assignment with the U.S. Public Health Service Reserve Corps in Virginia.

For nine years he was engaged in general practice at West Winfield and Clinton, and for the past twelve years has been associated with the New York State Department of Health and the U.S. Public Health Reserve Corps.*

Orange County

Dr. J. Emerson Noll has announced that Dr. William H. Foege has become associated with him in his practice in Port Jervis.

Dr. Foege is roentgenologist in the French Hospital in New York City and also had an office in the city.

He has served as assistant professor of physiology and anatomy in Long Island College Medical School and is a former captain in the Medical Corps of the 7th Regiment, New York State Guard.*

Rensselaer County

Dr. Robert E. DeFriest, of Troy, has resigned as medical consultant for the Rensselaer County Welfare Department. The resignation was prompted by the pressure of private practice, it was said.

[Continued from page 698]

lives being lost on the battlefronts," Miss Corbin added.

The progress made has borne out the earlier contention of medical and health officials that two-thirds of the deaths of mothers in childbirth were preventable, she said.

"When our death rate was so shameful," she continued, "the three major causes were infection, toxemia, and hemorrhage. Those three causes still maintain, although they have been greatly reduced."

New York's rate of maternal mortality is far below the rate for the country as a whole, according to a comparison with figures issued by the Children's Bureau. The most recent compilation issued covers 1941, when the rate was 3.2. Anticipating the records still to be issued for last year, Miss Corbin said it was reasonable to believe that the 1942 rate would be at least 10 per cent below the previous figure.

Because of the difficulty of gathering statistics in wartime, comparable figures for other countries are not available, although Miss Corbin added that the United States need no longer look with envy, as it has for years, on the records of the more progressive countries abroad.*

The New York Physicians Association recently elected the following officers for the current year: President, I. M. Brenner; president-elect, Elihu Katz; first vice-president, Jacob Buckstein; second vice-president, Joseph L. Morse; secretary, A. J. Greenberger; recording secretary, Samuel Hochman; treasurer, Joseph Q. Jonas.

Hamilton Southworth, M.D., has joined the staff of the medical division of the Office of Civilian Defense as a member of the scientific development and research section.

"Metropolitan News Briefs," a regular feature of the county society *Journal*, carried the following personal items on February 27:

"Frank A. Calderone, M.D., has been appointed Deputy Health Commissioner, succeeding George F. Palmer, M.D., who resigned February 13.

"The New York Society for Clinical Ophthalmology will hold its March meeting in conjunction with the Section of Ophthalmology of the New York Academy of Medicine on March 15.

"Major Charles Robert Rein, M.C., chief, division of serology, Army Medical School, Army Medical Center, Washington, D.C., will give a series of seven lectures and three demonstrations on the "Present Status of the Serodiagnosis of Syphilis" to matriculants of the department of dermatology and syphilology at the New York Skin and Cancer Hospital on March 1, 2, 3, and 4.

"J. Burns Amberson, Jr., M.D., has been re-elected president of the New York Tuberculosis and Health Association.

"Howard Fox, M.D., has been appointed Consultant to the Secretary of War in Tropical Medicine.

"At a recent meeting of the Association for the Advancement of Psychotherapy the following officers were elected: President, Frederic Wertham; vice-president, Joseph Wilder; secretary, Emil Gutheil."

of ammonites; these changes have a definite direction, and their gradual accumulation with the passage of time leads to the appearance of types progressively more distinct from the progenitor. To what extent Waagen's mutations correspond to the mutational steps observed by geneticists is an open question.

"The creators of the mutation theory were Kojinsky and De Vries. The latter (De Vries, 1901) defines it as follows, 'As the theory of mutation I designate the statement that the properties of organisms are built from sharply distinct units. . . . Intergrades, which are so numerous between the external forms of plants and animals, exist between these no more than between the molecules of chemistry.' A mutation is, then, a change in one of the units which at present are known as genes. The comparison of genes with chemical molecules may prove to be a truly prophetic one."

(*Genetics and the Origin of Species*, Theodosius Dobzhansky, Columbia University Press, 379 pp., bibliography and index, \$4.25.)

AGAR-AGAR IN WARTIME

Peacetime visitors to San Diego would be surprised today if they could take a cruise over the Submarine Gardens there in one of those glass-bottom boats that formally provided such interest.

Surprising enough in ordinary times—these Submarine Gardens which line much of Southern California's coastline—a visitor now, if permitted to look below the waters, would see men as well as bright-colored fish moving in and out of the rocks.

Men in diving helmets are doing an essential war job, strange as it might seem. Their important work is picking clumps of sea fern from the lush underwater growths. This is Agar sea fern, one of the many very essential products that Uncle Sam wants these war days.

Agar-agar, the gelatin made from the fern, gives smoothness to ice cream and certain cheeses. More important, it's the one essential gelatin for which no substitute has been found in making laboratory tests of drinking water, milk and food to safeguard civil and military health.

Before Pearl Harbor, Agar-agar came from Japan. Now the United Nations' supply comes from San Diego and the output has been "frozen" by the government.

This is one case of gearing an attraction into our growing war effort.

DIAGNOSIS ACCORDING TO RIPLEY

Man is a chameleon according to Ripley—when he is angry he turns red, when scared he turns white and when cold he turns blue. His color becomes yellow when sick, purple when choked, pink when embarrassed, black and blue when bruised, and he turns green when envious.

Ripley forgot that man turns gray with age and invisible in a blackout.

[Continued from page 701]

Appointment of Dr. P. Huntley Austin, of Castleton, to fill the vacancy was announced by Welfare Commissioner John J. Ahern following the receipt of Dr. DeFriest's resignation.

The appointment is of a temporary nature, pending the return of Dr. H. Gordon Anderson, of Troy, who left the post to enter the Army Medical Corps several months ago.*

Suffolk County

The monthly communicable disease report for November of last year as published in the January "Newsletter" of the Suffolk County Medical Society discloses that Huntington had but nine cases, divided as follows: cancer, 1; chickenpox, 1; scarlet fever, 3; syphilis, 2; and tuberculosis, 2.

• • •

Dr. I. Fred Frankel, of New York City, has established an office for the practice of medicine in Riverhead.

He received his degree in medicine from Bellevue Medical College and was formerly resident physician at Danbury Hospital, Danbury, Connecticut.

Tompkins County

Miss Florence A. Curtis has been appointed executive secretary of the Otsego County Tuberculosis and Public Health Association, with headquarters at Oneonta, following service since 1941 in a similar position with the Tompkins County Tuberculosis and Public Health Association. Miss Curtis holds the degree of B.S. in physical education from Skidmore College.

Mrs. Mildred S. Crittenden, chosen by the Tompkins County Association to succeed Miss Curtis, has been employed during the past year as nutritionist by the Cayuga Health Association, Auburn. Mrs. Crittenden holds Red Cross certificates for teaching nutrition and canteen work.—S.C.A.A. News

Ulster County

The county society at its last meeting elected Dr. J. S. Taylor of the Kingston city laboratory as president, to succeed Dr. Edward F. Shea. Other officers elected were: Dr. Maurice H. Silk, vice-president; Dr. Chester B. Van Gaasbeek, treasurer, and Dr. Clarence L. Gannon, secretary.

Westchester County

The Westchester County Medical Society recently renewed its appeal to Westchester families that at least one person in each household be trained as a home nurse.

The Medical Society pointed out that in the event of serious increases in respiratory diseases a large number of chronic and convalescent patients may have to be cared for in their homes because of crowding of the hospitals.

Dr. John B. Ahouse, of Yonkers, chairman of the society's public health committee, said that a person trained by the Red Cross in home nursing can be a valuable aid to a physician at a time when his services are at a premium and registered nurses are difficult to find.

"Training in home nursing is just as essential under wartime conditions for the defense of our homes as are air raid precautions," Dr. Ahouse declared.

Acceptability

A CARDINAL FACTOR IN EFFECTIVENESS

● Physicians are in agreement on the importance of the acceptability of a contraceptive method to the patient and her husband. Any feature of a method found unfavorable by a wife or husband may result in disuse of the method, or abandonment, with consequent loss of efficiency. The problem of acceptability has received particular attention in the formulation of Ortho-Gynol.

*"...The method... must... find favor in the hands of the user

to insure adherence to the method and avoid partial use or discontinuance. Acceptability to the patient seems to be a cardinal factor in any family planning program."

YOUR FRIENDS WITH THE FIGHTING FORCES

*Send them the cigarette that Rates-First! **

IN camps at home...at the fighting fronts...the cigarette is a military institution...a comfort to all...a special solace to the wounded...and attending doctors, too.

Small wonder that service men appreciate cigarettes above all other gifts...and, by actual survey*, Camel is the favorite brand of men in our

armed forces...for mellow mildness, for clear, full flavor.

Your dealer features Camels—see or telephone him today.

* With men in the Army, Navy, Marines, and Coast Guard, the favorite cigarette is Camel. (Based on actual sales records in Post Exchanges and Canteens.)

REMEMBER, you can *still* send Camels to Army personnel in the United States, and to men in the Navy, Marines, or Coast Guard *wherever they are*. The Post Office rule against mailing packages applies only to those sent to the overseas Army.

SULFADIAZINE

Lederle

SULFADIAZINE IN ETHANOLAMINES SOLUTION (Pickrell) *Lederle*—extensively employed for the treatment of burns involving 40% or less of the body surface—contained in a solvent well adapted for diffusion into superficial tissues and ideally suited to application by means of an atomizer. It is colorless, non-staining, odorless, non-irritating, aids in forming a strong pliable eschar and tends to prevent many infections.

SULFADIAZINE SURGICAL POWDER *Lederle*. The local bacteriostatic action of this powder tends to inhibit the growth of hemolytic streptococci, staphylococci and various other organisms. The powder is packed in vials sealed against moisture and sufficiently strong to withstand pressure, a convenient form for handling. Complete sterility of the powder has been obtained by methods studied at Lederle for over a year prior to commercial production.

SULFADIAZINE OINTMENT 5% *Lederle*. This ointment inherently has a wide general application for superficial minor burns and such skin infections as impetigo. It may also be used as a dressing following the use of SULFADIAZINE IN ETHANOLAMINES SOLUTION (Pickrell) *Lederle*.

COLLOIDAL IRON VS IONIZABLE IRON

NON-IONIZING—EASILY ASSIMILABLE

FOR
THE
PALE
CHILD

IRON SALT IONS MAY IRRITATE STOMACH

IN the run down child, anemia and malnutrition are usually combined with digestive malfunction. In combating this triumvirate, colloidal iron has many therapeutic advantages over the iron salts. The salts (sulphates, citrates, etc.) are split up by the gastric juice with the release of ions likely to produce astringent and irritating effects. In the intestine, the iron ions form precipitates which are therapeutically inert, highly dehydrating, and constipating.

But the iron in OVOFERRIN is *colloidal iron protein*—not in ionic form. It is little affected by the gastric juice. It is stable and cannot irritate. Indeed it actually appears to stimulate the appetite. Most nutri-

ment must be in the colloidal state to be absorbed. OVOFERRIN arrives in the intestines as a colloidal hydrous oxide which is readily assimilable and does not dehydrate or constipate.

Particularly important in the young patient, OVOFERRIN is practically odorless and tasteless and can stain tongue or teeth no more than can an iron nail. Its palatability is the result of its colloidal state and not due to sweetening or masking.

Prescribe OVOFERRIN also in secondary anemia, convalescence and pregnancy. Supplied in 11 oz. bottles. dose one tablespoonful at meals and bedtime in milk or water.

DIURBITAL**

STRESS ON HEART EASED WITH

DIURBITAL

BLOOD PRESSURE GOES DOWN

DIURBITAL* exerts *vasodilating, relaxing* effects on the blood vessels in hypertension. It eases the fluid burden on the heart and helps check possible cerebral or peripheral edema by *active diuresis*... and serves to dilate coronary arteries for *myocardial stimulation*. Relief from headache, vertigo, fear, irritability, insomnia, etc. occurs as blood pressure gradually descends. Enteric coating of DIURBITAL avoids gastric insult. DIURBITAL TABLETS CONTAIN EACH: Theobromine Sodium Salicylate 3 grs.; Phenobarbital ½ gr.; Calcium Lactate 1½ grs. Bottles of 25 and 100 tablets at your pharmacy.

Write "DIURBITAL"
on Rx blank for samples
and literature.

NOT A WAR-BORN IDEA

Personalized Field Service on G-E Equipment Has Prevailed for Many Years

It is important that x-ray and other electromedical equipment be kept in tip-top operating condition during these busy days in hospitals, clinics, and physicians' offices. And to users of G-E equipment the need for expert technical and maintenance service in this wartime period has presented no problem. They continue to get it from the same G-E branch offices and regional service depots that have taken care of them for many years past.

In other words, this idea of G-E field service is not something set up *just for the duration*. It is considered quite as important to G-E customers in peacetime as well.

G-E Periodical Inspection and Adjustment Service, for example, is a low-cost, year-round service that keeps thousands of G-E x-ray and electromedical units at highest operating efficiency at all times. Thus investments in fine equipment are protected, to preclude costly and annoying breakdowns.

Therefore, to present and future users of G-E equipment, this competent field service will always be available—in wartime and peacetime, both.

Effectiveness plus Palatability in

GASTRIC ULCER MEDICATION

ALUMINOID supplies the time-tested therapeutic value of aluminum hydroxide and eliminates any possible objection to the taste of gels on the part of the patient. Aluminoid affords relief by hydrogen ion adsorption rather than by chemical neutralization. After-acid tides are avoided.

Aluminoid is available, in easy to swallow gelatin capsules, through the better prescription pharmacies. Literature and samples will be sent to doctors on request.

SIMILAC

SIMILAR TO BREAST MILK

A powdered, modified milk product especially prepared for infant feeding, made from tuberculin tested cow's milk (casein modified) from which part of the butterfat is removed and to which has been added lactose, olive oil, coconut oil, corn oil, and cod liver oil concentrate

Similac provides breast milk proportions of fat, protein, carbohydrate and minerals, in forms that are physically and metabolically suited to the infant's requirements. Similac dependably nourishes — *from birth until weaning.*

One level tablespoon of Similac powder added to *two* ounces of water makes *two* fluid ounces of Similac. This is the normal mixture and the caloric value is approximately 20 calories per fluid ounce.

Degalol

THE ORIGINAL DEOXYCHOLIC ACID for fat digestion and the absorption of fat-soluble vitamins

Degalol represents deoxycholic acid, the bile acid which is chiefly responsible for emulsification of food fat and the formation of the water soluble choleic acid compounds.

Degalol is valuable in biliary fistula, assuring fat digestion even with diversion of bile to the outside.

Degalol enhances absorption of the fat-soluble vita-

mins A, D, E, and K. In complete biliary obstruction with poor or absent fat digestion, Degalol makes possible utilization of food fat, and insures absorption of orally administered vitamin K.

Degalol consists solely of chemically pure deoxycholic acid. It is supplied in boxes of 100 1½ gr. tablets.

**THE OLD
VARIABLE
DOSAGE**

us.

**THE NEW
ACCURATE
DOSAGE**

In the past, Iodides in liquid form were assumed to furnish 1 grain of Potassium Iodide in a drop—but drops vary in size and even the solution might vary as much as 30 grains in an ounce. Today, you can be certain of the correct dosage with ENKIDE (Brewer) 15 grain Enteric Coated tablets of Potassium Iodide.

ENKIDE

(BREWER)

for

IODIDE

Administration

ENKIDE is an enteric coated tablet containing 1 gram of Potassium Iodide, U.S.P., that minimizes gastric distress and permits the administration of large doses of Potassium Iodide. Sold on prescription only (\$2.25 for a bottle of 100 tablets) Enkide may be prescribed in accurate doses of 1 to 5 tablets a day, in a modern convenient form easy to take.

Construction

You don't expect to restore normalcy to feet that even nature has failed to aid, but you do expect to relieve your foot-patient from conditions that create agony and handicap.

There is no "standardized" form or last in shoes to cover every case, so a wide range of shoes is essential for correction. In PEDIFORME FOOTWEAR you will find both general features and individual construction points variable enough to take care of the most difficult case. These orthopedic shoes are attractive, too.

OWNED AND OPERATED BY

THE STATE OF NEW YORK

If 70,000 physicians leave civilian practice

... the load doubles, triples for you practitioners who remain. Particularly are you entitled to aid with your chronic heart, circulatory and rheumatic cases where the responsibility of continuous direction is most taxing on your energy and time.

Saratoga Spa was planned for your use in your care of such patients, and for those suffering from obesity, general debility and stomach disorders. Nature localized here a store of naturally carbonated mineral waters of established

therapeutic value. New York State, safeguarding these waters, has organized around them, ideal facilities for your use. Here patients reorder their lives in accordance with your direction, and prepare themselves for the full benefit of your advice.

The non-practicing Medical Staff of the Spa simply oversees the treatments you prescribe. Local specialists are available for your choice, should you feel your patients need medical supervision, while they are here.

For professional publications of The Spa, physician's sample carton of the bottled waters, with their analyses, please write

BLOOD FOR THE BRAVE

Fighting men are losing blood! . . . blood which must be replaced by mothers and schoolgirls, merchants and laborers, the office boy and the business executive. Fighting men are getting blood—thousands of units collected by the Red Cross in a united effort for United Nations.

In the Lilly laboratories men and women in fleece-lined clothing work in low-temperature rooms where blood, generously donated, is reduced to plasma, frozen, and dried. Plasma is processed by Eli Lilly and Company, without profit, for exclusive use by the armed forces.

Editorial

Meeting You at Buffalo?

Of course we will meet you there, May 3-6; this year, more than ever, your presence is important; important to your State Society, important to your community, important to you. Communities can well spare some of their physicians to attend this meeting. The need for disseminating new scientific information is one of the imperative demands of the hour.

The program places special emphasis on war medicine. There will be sessions devoted to emergency defense, protection from chemical warfare, use of blood plasma, tropical diseases, industrial medicine, how to safeguard the lives and health of industrial workers under wartime conditions. Specifically, on Tuesday, May 4, at 3:00 P.M. the first general session will be held, Dr. Dexter Davis, presiding. Colonel George Baehr, Chief Medical Officer, O.C.D., Washington, D.C., will speak on "British and American Experiences in Civil Defense." Captain Reynolds Hayden, M.C., U.S.N., Commandant, Third Naval District, New York, will present a "Summary of the Modern Treatment of War Injuries."

The "Care of Soft Tissue Injuries" will be discussed by Forrest Young, M.D., assistant professor of surgery, University of Rochester School of Medicine. And "Continuous Caudal Anesthesia in Obstetrics: Demonstration of Catheter Technique for Administration" will be shown by Francis R. Irving, M.D., professor of clinical obstetrics, Syracuse University College of Medicine, and C. Albertson Lippincott,

M.D., and Frank Meyer, M.D., of Syracuse.

Then on Thursday, May 6, at 2:00 P.M., there will be a "Symposium on Plasma." You should have at least some of your questions on this subject answered. For, "The Physiologic Aspects of Shock and Its Treatment with Plasma and Other Blood Substitutes" will be discussed by H. Necheles, M.D., Ph.D., professorial lecturer, Department of Physiology, University of Chicago. "Laboratory Aspects of the Preparation and Biologic Control of Plasma" will be presented by A. Milzer, M.S., Ph.D., Associate in Research and Production Bacteriologist of Serum Center, Michael Reese Hospital, Chicago. "Principles and Methods of Desiccation of Plasma" will follow, by F. Oppenheimer, Ph.D., Physicist in Charge of Production and Research of the Serum Center, Michael Reese Hospital, Chicago; after which "The Clinical Application of Plasma" will be presented by Sidney O. Levinson, M.D., Director of The Samuel Deutsch Convalescent Serum Center, and Chairman, Blood Plasma Committee, Civilian Defense, Metropolitan Area, Chicago.

You cannot very well obtain this up-to-the-minute information by staying home, and who can say how soon or how badly you may need it?

Remember that the men who have gone with the armed forces depend upon you who remain here to hold the standards high, to carry on with the work of the Society, to protect with your knowledge and skill those

whom they have left behind in your communities, in your care.

Therefore we hope that from May 3-6

you will put aside other things and help to make the Annual Meeting in Buffalo the success it can be only if you make it so.

Social Insurance

In a recent address before the Kings County Medical Society,¹ Mr. Louis H. Pink said in part, commenting on the *Beveridge Report*:

"Sir William makes it clear that his plan for freedom from want is based upon very important prior considerations, which have not been sufficiently stressed in this country:

"That the world after the war is a world in which the nations set themselves to cooperate for production and peace, rather than to plotting for mutual destruction by war, whether open or concealed.

"That the readjustments of British economic policy and structure that will be required by changed conditions after the war should be made, so that productive employment is maintained."

"Increasing the number of persons covered and the amount of benefits, provided such broadening is based upon long-term ability to pay, need not be postponed until after the war. But, standing alone, increased insurance coverage cannot provide freedom from want. Security must be based first of all upon a different kind of world. The nations must cooperate with each other so that economic benefits will be available to all and trade may flow freely. The standard of living must be increased, not only in one or two nations, but generally throughout the world. We must, through encouragement and stimulation of private initiative and worth-while public enterprises, see to it that people are fully employed in productive effort. If these two objectives are not accomplished, it is idle to talk about any considerable extension of social security as a permanent plan.

"Why is so little thought and planning given to these basic necessities and so much to the mere passing of laws which will extend compulsory insurance benefits? Are we not getting the cart before the horse?

"Social insurance cannot create wealth; it can only distribute it more equitably. Any politician can propose a plan for extending social security, but only a statesman can erect it upon the base of full employment and international economic cooperation. We should increase our social security benefits and extend them as rapidly as we can, but there is danger that if we get this intricate machine speeding too rapidly and have not sufficient oil, we may burn out the bearings."

It is well that so qualified and experienced a man as the former State Superintendent of Insurance, now president of the Associated Hospital Service, should emphasize these points. We hope he will continue to hammer them in, and we believe that every physician will lend a hand to assist him.

Commenting on his address, the *Westchester Medical Bulletin*² said editorially:

"He cautions those who would apply the British plan to the United States, to consider the existing differences in wage scales in the two countries; to remember 'the sincere attachment of our people to the preservation of reasonable political power and authority in the state and local communities'; and to make allowance for the desire of Americans to voluntarily provide for themselves and their families....

"One cannot buy the experience of twenty years in two years; hence, Mr. Pink cautions us against listening to those who suggest that we can make up for lost time, skip over all the evolutionary steps, and improvise a mature and workable system of social insurance surpassing in excellence anything developed in Europe after decades of painstaking experiment.

"Even when Mr. Pink was our State Superintendent of Insurance, he was well known as a proponent of voluntary efforts in the field of social insurance.

"In our opinion, it is foolhardy for one to oppose the trend toward social security just as it is foolhardy, if not indeed suicidal, to oppose the principle of collective security among nations. But, as Mr. Pink so admirably states, 'social insurance cannot create wealth; it can only distribute it more equitably,' and we would do well to put first things first, by first making secure the social and economic bases for the untrammelled creation of wealth before devoting all our attention to the task of spreading it around."

Unless such common sense as that of Mr. Pink is heeded we are all likely to find ourselves in the situation of Motteux, of whom Rabelais wrote: "He left a paper sealed up, wherein were found three clauses as his last will: 'I owe much; I have nothing; I leave the rest to the poor.'"

² March, 1943.

Bad News

It is with regret that we learn from the *Journal of the American Medical Association*¹ of the failure so far of some of the large cities of the nation to meet their 1943 quotas of physicians for the armed forces, among them New York City. Says the *Journal*:

"The responsibility rests unquestionably on the failure of young available physicians in the large cities of the country, particularly those of the eastern seaboard, to volunteer. Officers of the medical societies of New York, Massachusetts, and Connecticut were present² and the situation was placed before them. The rural areas of the United States have contributed doctors not only up to such quotas as were assigned to them but in many instances well beyond these quotas; it is simply impossible to anticipate that they will make a further contribution at this time. In the meantime, New York, Brooklyn,³ Boston, and some of the larger communities in the states of Connecticut, New Jersey, Pennsylvania, and California have failed even to approximate their quotas."

This will not be cheering news to our present members in the armed forces when they read of it. Nor is it pleasant to have to print it. But facts are facts.

"The needs of the armed forces for physicians during 1943 are well defined. The number of physicians to be expected from recent graduates, interns, and those now holding residencies have been determined. Beyond this number at least six thousand more physicians must come from the civilian population. The Procurement and Assignment Service for Physicians, Dentists, and Veterinarians has devised a technic which involves, first, a determination of the availability of the physician concerned or his essentiality for any civilian position which he occupies; second, notification of the physician of his availability and a request that he appear before his local procurement board; third, a notification of the Selective Service Board of the fact that the physician concerned is considered available and that he has failed to volunteer."

This procedure is as fair and considerate as anyone could expect. An appearance in person before his local board should go far to straighten out and to clarify on a *local* basis any misunderstandings or misinterpretations which may exist in the mind of any physician. This should be sufficient in most cases. We assuredly hope so, but—

"In some instances physicians have declared flatly to representatives of the Procurement and Assignment Service and the Officer Procurement Service that they do not wish to volunteer and that they will not volunteer. When it is known to other physicians in the community that a physician under 38 years of age, declared available by the Procurement and Assignment Service, refuses to volunteer in this time of the nation's need, when many an older physician, frequently with innumerable obligations, has given up his home, his practice, and the responsibilities of years to participate in this war, the public has a right to know that the younger physician is not willing to do his part. Certainly the Procurement and Assignment Service should consider the possibility at this advanced stage of the war effort of making public through the state medical journals not only the names of those who are already participating in the war but also the names of those who have been declared available and have not themselves ever indicated a willingness to participate. Let them be called before the bar of public opinion!"

We hope sincerely that these extreme measures can be avoided, but, if not, we are heartily in accord with the suggestion of the Editor of the *J.A.M.A.*; let them be called—and quickly!

1. *J.A.M.A.* 121: 1092 (March 27) 1943.

2. At a recent meeting in Washington of the Directing Board of the Procurement and Assignment Service for Physicians, Dentists, and Veterinarians, with representatives of other governmental agencies.

3. Since publication of this editorial by the *J.A.M.A.* we are informed that there are now in service from Brooklyn about 36 per cent of all of its physicians.

Correspondence

Gasoline Rationing

*An Open Letter to the Gasoline Rationing Branch,
Office of Price Administration*

February 17, 1943

Editor, NEW YORK STATE JOURNAL OF MEDICINE:

The open letter on Gasoline and Tire Rationing printed in the October, 1942, number of the *A.M.A. Journal* and reprinted in the December 15, 1942, issue of the *NEW YORK STATE JOURNAL OF MED-*

CINE raises the question of whether gasoline rationing officials have as much understanding of the actual practice of medicine as they have sympathy for the new problems raised by the lack of gasoline, lack of rubber, new parts, mechanical service, and new vehicles.

The steady wear and tear on doctors' cars; difficulty of proper mechanical maintenance; the blank prospect of obtaining new cars; the steady withdrawals of remaining new cars by the armed forces; the problem of what to drive while the physician's professional car is laid up for repairs; are beginning to come home to the average doctor with increasing force.

The conception that reduction of motor transport of medical care is like cutting down on truck deliveries of installment furniture or other purchases is mistaken in the first place. The physician can cut down to a certain irreducible minimum, but no further. He cannot travel 80 per cent of the way towards a woman in labor. He cannot journey 50 per cent of the way towards a man having a heart attack. He must go all the way. He has already abandoned pleasure driving because his car will not stand all the professional driving still in store for it. But the driving he must do will have to be placed in a category far ahead of most transport, instead of away behind the holders of "T" books; when, as, and if, the gasoline shortage becomes any more acute.

Mr. Ickes' plan to ration gasoline to the dealers to dole out as they see fit, without specific instruction as to where the doctors' needs stand on the gasoline priority list, may turn out to be a virtual travesty if gasoline emergencies during the next few years should continue, or become more acute. Having plenty of "C" coupons will not suffice if commercial vehicles have dried up the gasoline pumps before the physician attempts to purchase gasoline for his professional use.

Hon. Prentiss M. Brown, the new Price Administrator, is now making a determined effort to simplify procedures in the OPA. There need be no gasoline shortage for doctors if he can be persuaded that gasoline for doctors' cars should take precedence over the need for gasoline to be used in the great majority of commercial vehicles. Medical care has been determined by the U.S. Supreme Court to be one of the basic necessities. Transportation thereof is entitled to a high priority. Therefore there should be no doubt in the minds of the doctors, or in the minds of their patients, that the doctor is going to receive the gasoline he needs to practice medicine with; and that, if necessary, he is going to receive it before certain commercial vehicles are supplied.

Recently it has been suggested that 66 per cent of the retail gasoline dealers be eliminated and that gasoline be dispensed by a single combine to release men for war work. If this should go into effect, the big users would get the gasoline and the medical men could take what is left, if any. The time to safeguard our interests, and the interests of the doctors' patients is while big changes are in the making—not after they have been made, and found seriously wanting. Following are suggested changes in the present arrangement:

1. Doctors should be taken out of the "C" category and placed in the "T" classification.

2. Every physician should swear to the amount of gasoline he needs for three months.

3. He should receive the necessary number of "T" books to cover his requirements.

4. In the event that he overestimates the number of coupons he needs, he should be required to use up the excess before applying for more.

5. If he underestimates his mileage, he should receive additional coupons on the basis of an amended statement.

6. The doctor's gasoline requirements should take precedence over the majority of "T" book-holders.

7. Consideration of a doctor's requirements should be taken away from the anonymous and ever-changing subcommittees of local gasoline rationing boards.

8. Provision should be made for gasoline for the vehicles doctors drive on their professional visits while their professional cars are being serviced or are under repair.

9. Physicians should not be forced to use up all their "A" coupons before using "C" or "T" coupons, as the existing rules leave no coupons for gasoline for essential use after the first few days of the validity of a new series of "A" coupons.

10. Since every specialist is apt to be called to a home or hospital, he should receive supplementary gasoline in the amount needed.

The statement that "Mileage traveled daily or periodically between home and lodging and a fixed place of work is not considered preferred. Physicians who conduct their practices in offices, as many specialists do, are not eligible for preferred mileage," and the statement in paragraph 5 of the letter from the OPA that "Should he be assigned to a hospital, clinic, or institution after a ration card for calling on his private practice has been issued, he can use public means of transportation at the price of his personal inconvenience," both indicate unfamiliarity with actual conditions in the field. Busses are slow, late, overcrowded; taxicabs are impossible to engage promptly. In the meantime it is the patient who is being inconvenienced, worried, or even endangered, while the physician waits on the street corner—if the use of overburdened public-conveyance systems and facilities is the recommended way to make professional visits.

Up to date there is a gasoline shortage and a doctor shortage. One way to insure adequate medical care in this national emergency is to avoid raising any doubt about whether the remaining physicians are going to be able to get enough gasoline. This can be done by not "tailoring" their needs; and by being certain that their needs come before the needs of commercial transportation far less important to the national health, and economy, than mobile medical care.

PATHOGENESIS OF CONGENITAL ANOMALIES OF THE INTRAHEPATIC AND EXTRAHEPATIC BILE DUCTS

Report of a Case of Polycystic Disease of the Liver and a Case of Atresia of the Bile Ducts

SYLVAN E. MOOLTEN, M.D., New York City

Role of Embryonic Organizers in Congenital Malformation

Pathologists owe a very great debt to Spemann and subsequent experimentalists in the field of embryology for having provided a key to the understanding of malformation.¹ Differentiation in the embryo was shown by them to depend normally upon two major factors—an intrinsic predisposition within the primitive cells to (“cell-competence”) and the stimulus of chemical nature elaborated by certain previously specialized cells (“organizers”). The two factors are anatomically and functionally related. To cite an example, the primitive lens is formed by the differentiation of ectodermal cells in the head region in response to the inductive stimulus of the outgrowing optic vesicle of the forebrain. Ectodermal cells from other regions, although less intrinsically predisposed to undergo this type of specialization, may nevertheless be induced to undergo lens-differentiation if transplanted to the head region overlying the optic vesicle. Conversely, transplantation of the optic vesicle will induce lens formation beneath the ectoderm of any region. The optic vesicle is said to be an “organizer” for lens formation. The chemical (hormonal) nature of this induction has been demonstrated by the fact that soluble substances extracted from the cells of the optic vesicle possess the same inductive power as the living cells themselves.

The harmonious interplay of these two factors, cell-competence and organizer-induction, insures complete integration between the component cells of each growing organ. It seems likely that this principle of “double assurance” is important throughout embryonic development. Cell-competence, however, cannot be said to remain constant. Normally, as differentiation approaches completion, cell-competence becomes attenuated, and the fully differentiated cell may be said to be relatively refractory to further organizer influence. Up to a certain stage of growth, however, a considerable measure of reversability exists. Mesodermal tissue which has become no-

tochord is capable in very early embryos of inducing the formation of a secondary neural plate in any part of the epidermis. Ectoderm may even become converted to notochordal mesoderm if transplanted into a powerful organizing “field” such as the region of the foregut. The theory of the immutability of the three germ layers is superseded, therefore, by the doctrine of differentiation by multiple organizers.

By interference with the orderly sequence of embryonic organizers or by alteration of the spatial configuration of various induction centers, numerous malformations such as ectopias and duplications (plus formations) have been produced experimentally. Transplantation of cells from the dorsal lip of the blastopore may induce the formation of an entire new embryo. In addition, embryonal defects of many sorts have been seen in which the mechanism seems to have been a partial or complete suppression of embryonic induction (minus formations). Lehmann found that chlorobutanol abolished specifically the induction of the lens by the optic vesicle, resulting in either complete suppression of the lens or in an abnormally small lens.² Lens formation was also blocked by the interception of a thin layer of mesodermal cells between the epidermis and the optic vesicle.³ Lithium salts were found to inhibit the development of the embryonic notochord.⁴ Hale described eyeless pigs born of vitamin A-deficient sows, and in similar experiments Zilva and his associates reported failure of limb formation.⁵ These and other examples prove that faulty differentiation occurs either through a diminution in cell-competence in spite of normal inductive stimulus, or through interference with the mechanism of organizer-induction in normal cells. The operation of the principle of “double assurance” makes it probable that minor degrees of insufficiency of either factor do not interfere with differentiation.

In spite of the wealth of experimental data, the application of the principles of organizer induction to the study of the pathogenesis of malformations in human beings is still based largely on speculation. The formation of various types of teratoma has been explained by Krafka⁶ on the basis of a deviation of organizers at critical stages of induction. It is theoretically possible that every type of maldevelopment not due to pri-

Read at the Annual Meeting of the Medical Society of the State of New York, New York City, April 29, 1942.

From the pathologic laboratory of St. Peter's Hospital, New Brunswick, New Jersey.

Fig. 1. Congenital polycystic disease in newborn infant (Case 1). Note enormous enlargement of kidneys and numerous minute cysts visible through capsule. The bladder (opened) is of normal size. The liver, stomach, heart, and lungs are displaced upward by the kidneys. The liver is free of gross abnormality.

mary cell injury involving cell-competence presupposes some interruption of organizer function.

For the purposes of this discussion malformations may be tentatively grouped into two principal types, those resulting from defective cell potencies (lack of cell competence to undergo differentiation) and those resulting from imperfections in the mechanism of differentiation by means of organizers. In the former the malformation is essentially an aplasia and arises from a primary defect or injury in the formative cells; in the latter the primary fault lies in the integrating mechanisms.

Malformations arising from faulty organizer mechanisms may, in turn, be grouped into two morphologic types: (a) anomalies of organ structure and (b) anomalies of tissue combination (hamartia). The former depend upon disturbances in the earliest stages of embryonal organization and include a variety of monster types as well as less serious defects involving anomalies of migration, rotation, fusion, or fission of body units and of individual organs or the establishment of a well-formed lumen in various ducts and hollow viscera. The latter begin, as a rule, somewhat later—i.e., after the principal structures have been formed, and present the aspect of an imperfect maturation of their cellular components together with anomalous architectural arrangements of the cells, resembling the

abnormalities of architecture of the former type but on a miniature scale. These microanomalies (hamartia, or "embryonal rests") are often marked by a certain degree of uncontrolled tumor-like overgrowth (hamartoma) due to the defect in differentiation, and take on the form of cell or tissue gigantisms, cyst formations, angiomas, and other "benign tumors" (see Fig. 5C).

Two cases of anomaly affecting the bile ducts are presented for discussion from these standpoints. The first is that of a newborn child with polycystic disease of the liver and kidneys, the second that of an infant dying at the age of 7 months of obstructive jaundice caused by complete atresia of the extrahepatic bile ducts.

Case Reports

CASE 1

The patient weighed approximately 5 pounds at birth and seemed to have a very large belly which felt hard. On examination eight days after birth both kidneys were palpated as markedly enlarged firm masses. Intravenous urography with skiodan failed to visualize the kidneys. The infant was totally anuric despite an abundant intake of fluid, and soon developed generalized edema. Moderate azotemia was present. Death occurred two weeks after birth.

The clinical diagnosis of polycystic disease of the kidneys was made on the basis of these findings and on the additional history that the child's mother had been subjected to removal of one kidney and part of the other kidney thirteen years previously, shortly after her first pregnancy.

Autopsy Findings.—The subject was a white female infant exhibiting pitting edema of the trunk, labia, and lower extremities. Ascites was present.

Kidneys: Both kidneys were enormously enlarged, displacing the intestines toward the midline and elevating the diaphragm and liver (Fig. 1). They were of normal shape and exhibited the usual fetal lobulations. Their outer surface, which was smooth, had a foamy appearance caused by the presence of innumerable tiny cysts. When sectioned, the kidneys presented a dripping cut surface and became very flabby. Cortex and medulla could be differentiated vaguely on cut section, but the medullary rays could barely be recognized. The papillae were rudimentary and failed to project beyond the surrounding pelvic mucosa into the cavity of the pelvis. The pelvis were enlarged in proportion to the kidneys as a whole, but were smooth and devoid of true calices as a result of the aplasia of the papillae. The pelvic mucosa was smooth and glistening, like the lining of a large vein. The ureteropelvic junction of each kidney presented an abrupt narrowing to the normal dimensions of the ureters. The bladder was also normal in size. Yellowish streaks of suppuration were visible in the medulla of the left kidney, as well as numerous pinhead-sized points of suppuration in its cortex. A solitary marble-sized round cyst was present in the substance of the right kidney.

FIG. 2. A—congenital polycystic kidney. Photomicrograph showing anomalous widening of tubules and excessive amount of supporting stroma. Note also areas of rudimentary tubular development showing primitive type of epithelium. The glomeruli appear normal. B—section showing redundancy of tubular epithelium and excess of stroma. C—dilated collecting tubules showing thick-layered primitive epithelium. D—section through pancreas showing incomplete differentiation of the interlobular collecting ducts and abnormal thickness of their lining epithelium with tendency to cystic dilatation. Note immaturity of duct epithelium and acini, also excessive thickness of stroma.

Microscopically (Fig. 2, A, B, C) the kidneys were found to be composed largely of numerous widely dilated tubules lined by low cuboidal epithelium. Many appeared to have partly collapsed, resulting in buckling and desquamation of their epithelium. Scattered among these were occasional small pinkish tubular structures resembling convoluted tubules of normal or immature development and an abundance of well-formed glomeruli. The glomeruli appeared compressed and bloodless, as a result of tamponade by fluid in the glomerular space. Loops of Henle could not be identified. The dilated tubules were of varying caliber and often followed a winding tortuous course through the stroma. The latter was excessively abundant both in the cortex and in the medulla and often formed fairly compact islands containing few parenchymal elements. The stroma in general was markedly edematous, so that its cell structure was more than normally apparent and resembled embryonal mesoderm. Here and there indefinite groups of scattered primitive cells resemb-

FIG. 3. A—congenital polycystic liver. Photomicrograph showing anomalous widening of intrahepatic ducts and excessive periportal connective tissue. Note profusion of anomalous ducts and numerous anastomoses. The hepatic trabeculae appear normal. B—anomalous portal field showing wide lumen of portal vein and thick surrounding connective tissue containing an abundance of anomalous ducts. C—higher magnification, showing primitive character of duct epithelium and of thickened stroma. Note inspissated bile in lumen of duct, indicating imperfect communication between smaller and larger ducts. D—larger intrahepatic duct showing wide lumen and markedly redundant lining epithelium (partly desquamated).

ling large lymphocytes or plasma cells were seen, especially near the surface of the kidneys. These groups contained no elements of recognizable architecture, and conformed to the description of nephrogenic mesenchyme.

Collecting tubules were also greatly dilated, but they exhibited less variability in caliber or shape of lumen than the convoluted tubules. Their epithelium was of somewhat greater thickness than that of the latter, and the supporting stroma was very much thicker than that of the cortex. The collecting tubules were found to converge for the most part toward the region of the papillae. However, apparently as a result of the excessive amount of medullary stroma and the minute size of these rudimentary papillae, only a small minority of the collecting tubules were found to end in the latter, the remainder ending blindly in the adjacent stroma.

The lining epithelium of the pelvis was lacking in all sections, probably as a result of antemortem desquamation. The submucosa of the pelvis was com-

posed of a thick layer of fibromuscular tissue, together with blood vessels, nerves, and lymphatics, and contained a few scattered aberrant tubules.

Many of the dilated tubules in the left kidney were seen to be filled with a dense exudate of polymorphonuclear leukocytes, as seen in a very recent infection, but there were no evidences of previous (prenatal) inflammation.

Liver: The liver was normal in size and external appearance. The gallbladder was flaccid and contained a slight amount of mucoid colorless secretion. The extrahepatic biliary passages appeared normal. The cut surface of the liver appeared normal on gross inspection.

Microscopically, a striking abnormality in the portal fields was apparent (Fig. 3). They were conspicuous for their sharp staining, for their marked variation in size, their marked irregularity of distribution, and their histologic composition. Many were considerably exaggerated above normal in size and many others were much smaller than normal. In their location they bore no constant relation to the collecting (central) veins; many of the smaller type of portal field were seen in rather close proximity to these veins. Accordingly, it was impossible to speak of hepatic lobules as such in the conventional sense. The histologic structure of the portal fields was marked by the presence of an abnormal profusion of anomalous small bile ducts of very striking appearance. These were most numerous in the zone of contact between the portal fields and the hepatic parenchyma, where they formed a wreath along the periphery of the portal field when it was of large size. Even when the fields were small, these ducts constituted their most conspicuous element. That portion of their wall which lay against the parenchyma presented a flatter epithelium than the opposite wall lying against the connective tissue of the portal field. Many of these ducts were completely surrounded by this connective tissue and presented a rather tall cuboidal or columnar epithelium. Many of them were considerably dilated and contained rounded plugs of inspissated dark-brown bile pigment. The epithelium stained deeply and exhibited sharp smooth cell contours with small round dense nuclei. It was often possible to trace these ducts directly into the hepatic cords. The connective tissue stroma of these portal fields was unusually bulky and often of rather primitive type. It had a tendency to form cushion-like projections into the lumen of the dilated anomalous ducts. The branches of the portal vein were somewhat wider than normal and often appeared sheathed in an abnormally thick adventitia (Fig. 3B).

The central veins varied considerably in size but were otherwise normal. Their walls contained only the usual scanty amount of connective tissue and were not surrounded with abnormal bile ducts as in the case of the portal venules. The parenchymal cords surrounding the central veins had the normal radial relation to the latter even when one or more anomalous portal fields were interspersed among them.

Collecting bile ducts of the intermediate type and larger were also histologically abnormal. In general,

they were much wider than normal and presented numerous elongated ramifications and epithelial infoldings. They contained granular material and inspissated bile pigment and formed numerous junctions with many of the anomalous small bile ducts of perilobular origin.

The parenchyma of the liver appeared to be normally developed. The cytoplasm was well formed but nearly devoid of vacuoles. Kupffer cells were numerous and the sinusoids were somewhat distended in a variable manner. Bile thrombi were often present in the regions nearest the portal fields in which the bile ducts were dilated and occupied by inspissated bile pigment (Fig. 3C).

The capsule of the liver was thicker than normal and contained numerous elongated abnormal ducts skirting the margins of the underlying hepatic parenchyma (Fig. 5A). These ducts were identical in appearance with those lying in the margins of the portal fields and were often traceable into the latter where the capsular connective tissue dipped beneath the surface to become continuous with adjacent portal fields.

Pancreas: Grossly, the pancreas was normal. Microscopically (Fig. 2D), it seemed somewhat immature in development and exhibited an excess of connective tissue stroma and an incomplete differentiation of secretory acini. Many of the latter still possessed a distinct lumen continuous with that of the collecting ducts, and their cells were of small size. The lining epithelium of some of the larger ducts appeared excessive and exhibited papillary folds projecting into the lumen. Their supporting stroma seemed excessively thick. The islets of Langerhans appeared normal in number and appearance.

Spleen: Grossly and microscopically, the spleen appeared normal except for congestion and a moderate accumulation of polymorphonuclear leukocytes in the sinusoids.

Adrenals: These appeared normal grossly and histologically. Microscopically, a small accessory adrenal was discovered in close attachment to the body of the pancreas.

Gastrointestinal tract: The esophagus and stomach appeared normal. The bowel was somewhat distended with gas.

Heart: No gross or microscopic abnormality was found in the heart.

Lungs: Both lungs were congested and nearly airless. On cut surface they appeared fleshy. There was incomplete development of the fissure between the right middle and upper lobes. Histologically, a considerable degree of atelectasis was present, as well as congestion and rather marked interstitial edema. The alveolar parenchyma appeared normally developed. The bronchi also appeared normal, but in the wall of some of the bronchioles, normally devoid of cartilage, islands of cartilage were seen which were of embryonic appearance and which projected somewhat into the lumen.

Diagnosis: Congenital Polycystic Disease

- (a) Polycystic kidneys with hypoplasia of renal papillae; acute suppurative tubular nephri-

tis of left kidney; obstructive anuria with extreme interstitial edema of kidneys and generalized anasarca.

- (b) Polycystic liver with partial atresia of perilobular ducts and incomplete intrahepatic obstructive jaundice.
- (c) Slight anomalies of development of pancreas, lung, adrenal. Anomaly of renal pelves.

CASE 2

This patient was a boy of 7 months with a negative family history. His development appeared normal at birth. Increasing jaundice was first clearly remarked by his parents after his third week of life. His growth seemed unaffected and he weighed 17½ pounds when admitted to the hospital. He had had measles and otitis media but, except for jaundice, appeared well until a short time previously, when he evinced a tendency to hemorrhage. On examination he presented ecchymotic spots in his skin, evidences of recent nasal and intestinal bleeding, and hematomas of the scalp. The liver was considerably enlarged, its lower edge being felt at the level of the umbilicus. The spleen was palpable. There was distinct icterus and pallor of the skin and visible mucosae. The blood showed the following: hemoglobin, 40 per cent; erythrocytes, 2,290,000; leukocytes, 30,500, of which 48 per cent were polymorphonuclear leukocytes, 41 per cent lymphocytes, and 8 per cent monocytes. The platelets numbered 330,000. The urine contained bile but no urobilinogen. The stool was strongly positive for occult blood. The patient died three days after admission.

Autopsy Findings.—The subject was a white male infant of 7 months, well nourished and well developed, exhibiting pronounced icterus and numerous purpuric and petechial hemorrhages of the skin and subcutanea. The blood within the various organs was almost entirely in a fluid state. The situs viscerum was normal, and there was no ascites.

Liver: The liver was considerably enlarged and appeared dark olive-green. Its surface was faintly stippled with yellow. On cut section the lobules appeared large and greenish; they were somewhat paler and more granular centrally. The perilobular connective tissue appeared to be widened.

In the gallbladder groove there was noted a delicate strand of connective tissue but no recognizable vestige of the gallbladder. The common bile duct was represented similarly by a delicate fibrous cord. The hepatic ducts could not be found outside the liver nor were any bile ducts visible grossly within the liver when it was cut. The portal vein and hepatic artery appeared normal. Their branches within the liver appeared in normal proportion to each other and to the parenchyma, but they were unaccompanied by any grossly visible vestiges of bile ducts.

Microscopically, the liver exhibited a typical appearance of "biliary cirrhosis" (Fig. 4A). The portal fields were enormously widened at the expense of the parenchyma, so that many lobules appeared

FIG. 4.—A—congenital atresia of extrahepatic bile ducts (Case 2). Photomicrograph showing biliary cirrhosis. Note numerous "bile-duct sprouts" at zone of contact of thickened periportal connective tissue and hepatic trabeculae. B—large intrahepatic bile duct showing fibrosis of wall and degeneration of lining epithelium. The lumen is filled with inspissated bile and epithelial debris. C—higher magnification, showing differentiation of perilobular ducts ("bile-duct sprouts") from hepatic trabeculae. D—differentiation in normal embryo of perilobular bile ducts from hepatic trabeculae at periphery of periportal mesenchyme (embryo of 99 mm. crown-rump length).

reduced as much as three-fourths from the normal diameter. There was much bile stasis within the lobules, which was seen in the form of brown pigment in the cytoplasm and bile thrombi in the canaliculi of the hepatic cords. The Kupffer cells were prominent, but they did not contain significant amounts of pigment.

The widening of the portal fields was caused by an excessive proliferation of connective tissue containing a great number of newly formed small perilobular ducts ("bile duct sprouts"). These ducts were particularly numerous along the margin of the lobules and could often be traced directly into the cords of the lobular parenchyma (Fig. 4C). Despite their great number they were small in size, fairly uniform in caliber, and lined by small cells of the cuboidal type with rather faintly stained cytoplasm. In all respects they resembled the "bile duct sprouts" common in other types of cirrhosis. Many of these ducts were slightly distended with rounded globules of deep brown bile pigment. The branches of the

A—photomicrograph showing anomalous perilobular bile ducts beneath Glisson's capsule in polycystic disease (Case 1). B—perilobular ducts ("bile-duct sprouts") beneath Glisson's capsule in case of biliary cirrhosis (Case 2).

C and D—other forms of hamartial cyst of kidney. C—cystic tubules in common type of solitary hamartoma found in adult kidneys ("medullary fibroma"). The abnormal tubules are lined with thick epithelium of somewhat primitive type, and lie scattered within a mass of dense connective tissue. D—cystic anomaly of renal tubules in a case of the tuberous sclerosis complex (a form of disseminated hamartiosis). Note their irregular wide lumens, thick-layered primitive epithelium, and excessive amount of stroma. Less marked imperfections are seen in many of the neighboring tubules.

portal vein and hepatic artery exhibited no significant abnormality. The centrilobular veins were surrounded by a somewhat thickened connective tissue support, most conspicuous in the larger collecting veins, but unaccompanied by bile duct proliferation as seen in the portal fields.

The connective tissue of Glisson's capsule was considerably widened and also contained numerous "bile duct sprouts" along the margins of the lobules, although these were more numerous in the regions where the subcapsular tissue became continuous with the intrahepatic connective tissue of the portal fields (Fig. 5B).

Collecting bile ducts of large and intermediate type were present in a rudimentary form, often undergoing degeneration (Fig. 4B). In some of them

bile-stained granular material was present, filling the greatly narrowed lumen, and partly or completely replacing the lining epithelium. In others, the epithelium formed a nearly solid mass of small deeply staining cells; a minute, eccentric, irregular lumen was present in which no bile or other material was seen. Delicate channels containing bile pigment were occasionally seen in which the lining was composed of flattened, thin epithelium, and here and there these could be traced as having direct continuity with "bile duct sprouts" which had grown out from the parenchyma. In many areas the only vestige of a collecting system was a lumen containing a faintly stained round or oval mass of brownish granular material surrounded by a concentric layer of loose fibrous tissue.

Spleen: Grossly, the spleen was moderately enlarged and elongated; it was firm and scraped very little. Histologically there was seen uniform marked fibrosis of the pulp cords, with narrow sinusoids lined by hyperplastic endothelium. Malpighian follicles were surrounded by a narrow zone of congestion in which erythrophagocytosis was well marked.

Pancreas: The pancreas appeared normal. The ampulla of Vater was patent and formed the opening of the duct of Wirsung, which could be probed for a short distance into the head of the pancreas. Histologically, there were no significant changes.

Adrenals: Negative.

Lungs: Petechial hemorrhages and patchy bronchopneumonia were present.

Heart: Negative except for pallor.

Kidneys: On section there were noted pallor and moderate bile-staining. Microscopically, some of the collecting tubules were found to contain bile-stained epithelial casts.

Gastrointestinal Tract: The small intestine was somewhat distended with gas. Otherwise the findings were negative. The feces were clay-colored.

Diagnosis

Congenital atresia of extrahepatic bile ducts and gallbladder. Obstructive jaundice with secondary hemorrhagic diathesis and anemia. Biliary cirrhosis with indurative splenomegaly. Terminal bronchopneumonia.

Discussion

The development of the liver, as shown by Lewis⁷ and others,⁸ takes place by differentiation of the primitive hepatic diverticulum into two portions—a cranial portion, which becomes elongated into the hepatic duct and glandular tissue of the liver, and a caudal portion, which gives rise to the gallbladder and cystic duct. At all stages of development a continuity is maintained between the future hepatic cords and the duct system. At first this continuity is that of solid cords of cells. As differentiation proceeds, a continuity of lumen is also established. In the hepatic cords this is represented by the formation of the

bile capillaries. With the ingrowth of the branches of the portal vein, subdividing the parenchyma into lobules, a further differentiation of hepatic cords is seen, in which many of these take on the form of peribiliary ducts at the zone of contact with the periportal mesenchyme (Fig. 4D). As the liver enlarges and becomes further subdivided into many lobules, the periportal mesenchyme increases in amount, and in the peribiliary zone more and more polygonal hepatic cells become converted into the cuboidal cells of the peribiliary ducts. At the same time the earlier peribiliary ducts become surrounded completely by periportal mesenchyme and undergo still further differentiation into larger ducts with taller epithelium. The process apparently extends back to the hepatic duct proper (Bloom)^{8a}.

From the above description two facts seem particularly noteworthy from the point of view of anomaly formation. One is the primary continuity of the primitive hepatic cords with the forerunners of the extrahepatic bile ducts; the other is the apparent relation of the periportal mesenchyme to the process of differentiation of the intrahepatic bile ducts from the hepatic cords.

It may be interesting to attempt to explore the possible interpretations which may apply to the two cases just described in terms of known ontogenetic mechanisms. It is apparent that two contrasted principles are concerned: in the first case—that of polycystic liver associated with polycystic kidney—the outstanding feature was the apparent superfluity of bile duct epithelium in the liver and of tubular epithelium in the kidney associated with cystic dilatation of the lumens. In the second case the anomaly consisted in a complete aplasia of the extrahepatic bile ducts associated with secondary biliary cirrhosis. As stated previously, malformation may arise from primary defectiveness in formative cells, leading to aplasia of organ parts or body units, or from faulty integration of organizer mechanisms, leading to disturbances in differentiation of body units and of individual organs as well as to disturbances in tissue combination (hamartia).

I. Congenital Atresia of the Extrahepatic Bile Ducts

The case of congenital atresia of the extrahepatic bile ducts and gallbladder appears the simpler one to explain (Case 2). It offers a fairly clearcut example of developmental failure based on a primary suppression of embryonal induction in the case of entodermal elements intended for development into a duct system. In most instances of this anomaly the suppression of induction is relatively limited, so that only segmental

atresias or strictures occur.⁹ In the case of atresias the obstruction may sometimes be relieved surgically, permitting survival.¹⁰ In the case of incomplete obstruction intermittent jaundice with enormous cystic dilatation of the common duct results (choledochus cyst) in the course of several years.¹¹ Very few cases are on record of patients in whom the defect was as complete as in the child described here.¹²

The fact that in all the reported cases this anomaly is apparently limited to the extrahepatic portions of the biliary tree suggests that its cause is to be found in a disturbance affecting the earliest stages of development, when the hepatic diverticulum becomes differentiated into pars cystica and pars hepatica, following formation of the first hepatic cords. This assumption is particularly helpful in explaining the complete atresia of the gallbladder and extrahepatic ducts which was found in this case. The rudimentary and degenerated appearance of the intrahepatic ducts, which are derivatives of the primitive hepatic cords,¹³ has been seen likewise in many of the reported cases and has been commented on by other authors,¹⁴ who explained it either as a result of the injurious action of retained bile or as an atrophy of disuse consequent upon a diminished rate of production and compensatory accelerated disposal of bile elements into the blood.

From the facts at hand, it cannot be clearly determined whether the pathogenesis of this anomaly is based on a primary defect in the entodermal cells lining the hepatic diverticulum (defective cell-competence) or on a dysfunction of organizers. The evidence strongly favors the former interpretation inasmuch as the anomaly consists in simple failure of development, with none of the anomalous overgrowths and anachronisms of maturation seen in the latter. The cause of the anomaly is therefore probably an early postconceptional injury of the primordial cells of the extrahepatic bile ducts.*

II. Congenital Polycystic Disease of the Liver and Kidneys

In the case of the infant with polycystic disease (Case 1), the greatest interest attaches to the coincidence of the anomaly in the kidneys and in the liver. By scrutinizing closely the essential elements in the anomaly of each organ, one is enabled to draw certain conclusions regarding the basic nature of the anomaly and its possible interpretation. The association of congenital cystic liver with congenital cystic kidney is well known and has been reported in more than eighty

* Complete aplasia of the hepatic diverticulum is theoretically also possible, but it is unlikely that the resulting absence of liver tissue would permit the formation of a mature fetus.

separate publications.¹³ Moschcowitz¹⁴ collected 85 cases in 1906, all but 10 of which were associated with cystic kidneys. On the other hand, persons with cystic kidneys were found to have associated cystic disease in the liver in only 19 per cent of the cases. In rare instances cysts were also found in the pancreas,¹⁵ spleen,¹⁶ ovary,¹⁷ and lung.¹⁸ In addition, the disease is not infrequently associated with other malformations of an unrelated type—e.g., polydactylism, meningocele, spina bifida, hypospadias, anomalies of the bladder, ureters, or renal pelvis, hemicephalus, acrania with anencephaly, encephalocele, dystopia cordis, omphalocele, atresia ani, and hemangioma of the skin.¹⁹ There is, moreover, a marked hereditary tendency in its occurrence.²⁰

Certain parallelisms may be traced in the morphologic appearances of the disease when it affects the liver and the kidneys in the same individual. The involvement of the organs may be total, as in the case presented here, which is an example of the so-called infantile form of the disease. In such cases, survival is impossible because of high-grade renal insufficiency. When the involvement is partial, the function of the kidneys is preserved and the patient generally reaches adult life. Death is then brought about in the fourth or fifth decade as the end result of progressive enlargement of renal cysts, resulting in pressure atrophy of the intervening (otherwise normal) parenchyma.²⁰ Cystic liver in adults, even when very extensive, rarely causes functional impairment because of the almost unlimited capacity of the liver to regenerate; portal stasis may ensue, however, causing ascites and splenomegaly.²¹

Other parallelisms are seen in their histologic structure. The lesions in the liver and in the kidneys share a certain aspect of embryony. In the earlier stages of embryonal development these organs normally possess a mesenchymal component much greater in proportion to parenchyma than when they mature. The mesenchyme has certain characteristics of immaturity which are distinctive, including lack of compactness, larger cell body, more delicate cell processes. The epithelium likewise has distinctively embryonal characteristics, including larger nuclei, more basophilic cytoplasm, and a tendency to project in numerous folds. Cell migration is also incomplete before a certain stage. In polycystic disease all these features persist as permanent traits without further change. In the kidneys, the convoluted tubules may be immature or mature, and may end blindly in an overabundant stroma or may expand into irregular twisted cystic dilatations lined by a rather low cuboidal primitive epithelium. The glomeruli may be

normal or imperfect and may be greatly reduced in number; in many cases they are found projecting into the lumen of a cyst formed out of Bowman's capsule. The collecting tubules also exhibit a primitive aspect, being either irregularly dilated and showing papillary projections of a thick lining epithelium, or twisted and contracted within a dense stroma. The migration of the collecting tubules (derivatives of the pars ureterica) to unite with and form a continuous lumen with the tubular derivatives of the nephrogenic mesenchyme (convoluted tubules) is partly or wholly repressed as part of the abnormal fixation of development at an early embryonic level. The stroma of the kidney is proportionately much more abundant, as a rule, than normal and has an unripe appearance; often, scattered groups of dark staining cells are seen in the outer layers of the cortex as vestiges of the primitive nephrogenic mesenchyme which have failed to undergo any differentiation into glomeruli or tubules. Blood vessels may be excessive, even angiomatous in appearance, and similar changes may involve lymph vessels.²² The mechanism of cyst formation is not entirely clear and is probably not the same in all cases. Two main factors appear to be involved—overgrowth and obstruction. According to more recent views,²² the former is the basic factor, while the latter is merely adjuvant. Among the evidences in favor of the dominant role of overgrowth are the observations that the dilatations are irregular in caliber, which is suggestive of gigantism rather than the effect of simple distending pressure, and also the presence of epithelial papillary projections and the occasional occurrence of dilatations limited to the distal ends of tubules. If purely mechanical factors were involved, epithelial overgrowth, as seen in these cases, would be lacking or there would be actual epithelial atrophy. The failure of migration and of fusion of the two separately derived component elements probably explains simple retention cysts originating in the glomeruli and convoluted tubules.²³ In other cases of this type, especially in those in which the collecting tubules are also dilated, an obstruction to the outflow of urine into the renal pelvis may also be a factor.²⁴ In the case reported here, for example, the renal papillae were barely visible as a result of the inhibited differentiation of the parenchyma into cortex and medulla; as a result of this and the excessive amount of medullary stroma there followed an excessive crowding of the collecting tubules converging toward the tips of these rudimentary papillae so that relatively few of these tubules achieved actual penetration into the pelvis. In addition there was a particularly marked condensation of the superfluous stroma in the same region, so

that many tubules ended blindly there or appeared disconnected from the remainder of the parenchyma in the form of aberrant ducts. The anomalous enlargement of the pelvis was probably an incidental malformation, independent of the cystic anomaly *per se*.

In the liver the immaturity of development was exhibited in several forms. The hepatic cord trabeculae themselves appeared essentially normal. The anomaly of development affected primarily the development of the perilobular ducts and their downward prolongations in the form of intrahepatic collecting ducts. It was shown by Lewis⁷ that the smallest bile ducts (perilobular ducts) normally arise from the hepatic cords aligned along the outer surface of the periportal mesenchyme. Within these cords a lumen is observed and soon afterward the ducts thus formed become surrounded with mesenchyme and develop cuboidal or columnar epithelium of distinctive type. The hepatic trabeculae are seen to connect freely with these ducts. These perilobular ducts intercommunicate, forming a plexus, but with the further growth of the liver the anastomoses normally become less numerous. The differentiation of the perilobular ducts out of the mass of hepatic trabeculae is recorded by Lewis as first occurring in the 22.8 mm. embryo.

Two elements in differentiation normally distinguish these perilobular ducts. They are seen to arise in the hepatic trabeculae,^{13a} and they arise only in relation to the mesenchyme surrounding the branches of the portal vein²⁵ or in Glisson's capsule. In the case of polycystic liver described here, these ducts exhibited a great multiplicity in number similar to that seen in early embryonic life and also numerous anastomoses with one another. They were often grotesquely large, yet the enlargement was due only in small measure to simple retention resulting from obstruction (retention cysts), being primarily the result of irregular overgrowth (gigantism), which gave them also a many-branched appearance. They could be traced directly into the hepatic cords. They were lined by low cuboidal epithelium where they lay against the parenchyma, and were lined by high cuboidal epithelium where they made contact with the periportal connective tissue. (This differential in height of epithelium was recorded also in the normal embryo by Lewis.) The abundance of mesenchyme of normal early fetal life was reproduced in this case on a somewhat magnified scale in the form of an abnormally thick connective tissue in the portal fields which in many areas formed bulbous projections into the lumen of the anomalous ducts. Branches of the portal vein were numerous and were of large caliber. The elements de-

rived from the perilobular ducts also shared in the permanent fixation of differentiation at a primitive level. This took the form of dilated and ramifying collecting bile ducts with numerous infoldings of their lining epithelium surrounded by a dense wide mantle of connective tissue. It was further noted that the anomalous portal fields not only varied greatly in size but were totally irregular in distribution. Nonetheless, these two variables bore a certain relation to each other, so that the distribution of the portal blood was roughly uniform throughout the liver. This irregular dichotomy of the portal vein pattern within the liver must therefore be counted among the elements making up the anomaly in this case.

III. The Periportal Mesenchyme as an Organizer for the Intrahepatic Bile Ducts

The aforementioned researches of Lewis,⁷ Bloom,⁸ and others on the development of the perilobular ducts in the embryo leave no doubt that their formation is bound up anatomically with the mesenchyme surrounding the portal vein and its branches. These observations, together with certain features of the two cases recorded here, suggest the interesting possibility that the connective tissue of the portal fields is the actual source of an organizer which governs the differentiation of intrahepatic bile ducts. With the periportal connective tissue should be included the subcapsular connective tissue (Glisson's capsule), which is anatomically continuous with it and with which it has a common embryonic origin in the septum transversum. In the case of polycystic disease, the profusion of abnormal perilobular ducts has already been described in some detail in relation to the periportal connective tissue. Attention has also been drawn to the numerous anomalous ducts which were found in the subcapsular connective tissue in sections taken through the surface of the liver (Fig. 5A). On the other hand, centrolobular and collecting veins, which arise independently of the periportal and subcapsular connective tissue, were never found associated with these anomalous ducts.

Since regeneration of tissue in postnatal life involves not only a proliferation of cells but also involves their maturation and architectural conformity in the pre-existing "organization field," it is a fair assumption that organizer activity is the controlling factor.²⁶ According to this viewpoint, differentiation by means of organizer induction in the embryo represents only the initial phase of a biologic mechanism governing cell integration in the whole organism throughout life.

With this in mind, it is not surprising that the regeneration of bile ducts in diseases of the liver

separate publications.¹³ Moschcowitz¹⁴ collected 85 cases in 1906, all but 10 of which were associated with cystic kidneys. On the other hand, persons with cystic kidneys were found to have associated cystic disease in the liver in only 19 per cent of the cases. In rare instances cysts were also found in the pancreas,¹⁵ spleen,¹⁶ ovary,¹⁷ and lung.¹⁸ In addition, the disease is not infrequently associated with other malformations of an unrelated type—e.g., polydactylism, meningocele, spina bifida, hypospadias, anomalies of the bladder, ureters, or renal pelves, hemicephalus, acrania with anencephaly, encephalocele, dystopia cordis, omphalocele, atresia ani, and hemangioma of the skin.¹⁹ There is, moreover, a marked heredofamilial tendency in its occurrence.²⁰

Certain parallelisms may be traced in the morphologic appearances of the disease when it affects the liver and the kidneys in the same individual. The involvement of the organs may be total, as in the case presented here, which is an example of the so-called infantile form of the disease. In such cases, survival is impossible because of high-grade renal insufficiency. When the involvement is partial, the function of the kidneys is preserved and the patient generally reaches adult life. Death is then brought about in the fourth or fifth decade as the end result of progressive enlargement of renal cysts, resulting in pressure atrophy of the intervening (otherwise normal) parenchyma.²⁰ Cystic liver in adults, even when very extensive, rarely causes functional impairment because of the almost unlimited capacity of the liver to regenerate; portal stasis may ensue, however, causing ascites and splenomegaly.²¹

Other parallelisms are seen in their histologic structure. The lesions in the liver and in the kidneys share a certain aspect of embryony. In the earlier stages of embryonal development these organs normally possess a mesenchymal component much greater in proportion to parenchyma than when they mature. The mesenchyme has certain characteristics of immaturity which are distinctive, including lack of compactness, larger cell body, more delicate cell processes. The epithelium likewise has distinctively embryonal characteristics, including larger nuclei, more basophilic cytoplasm, and a tendency to project in numerous folds. Cell migration is also incomplete before a certain stage. In polycystic disease all these features persist as permanent traits without further change. In the kidneys, the convoluted tubules may be immature or mature, and may end blindly in an overabundant stroma or may expand into irregular twisted cystic dilatations lined by a rather low cuboidal primitive epithelium. The glomeruli may be

normal or imperfect and may be greatly reduced in number; in many cases they are found projecting into the lumen of a cyst formed out of Bowman's capsule. The collecting tubules also exhibit a primitive aspect, being either irregularly dilated and showing papillary projections of a thick lining epithelium, or twisted and contracted within a dense stroma. The migration of the collecting tubules (derivatives of the *pars ureterica*) to unite with and form a continuous lumen with the tubular derivatives of the nephrogenic mesenchyme (convoluted tubules) is partly or wholly repressed as part of the abnormal fixation of development at an early embryonic level. The stroma of the kidney is proportionately much more abundant, as a rule, than normal and has an unripe appearance; often, scattered groups of dark staining cells are seen in the outer layers of the cortex as vestiges of the primitive nephrogenic mesenchyme which have failed to undergo any differentiation into glomeruli or tubules. Blood vessels may be excessive, even angiomatous in appearance, and similar changes may involve lymph vessels.²² The mechanism of cyst formation is not entirely clear and is probably not the same in all cases. Two main factors appear to be involved—overgrowth and obstruction. According to more recent views,²² the former is the basic factor, while the latter is merely adjuvant. Among the evidences in favor of the dominant role of overgrowth are the observations that the dilatations are irregular in caliber, which is suggestive of gigantism rather than the effect of simple distending pressure, and also the presence of epithelial papillary projections and the occasional occurrence of dilatations limited to the distal ends of tubules. If purely mechanical factors were involved, epithelial overgrowth, as seen in these cases, would be lacking or there would be actual epithelial atrophy. The failure of migration and of fusion of the two separately derived component elements probably explains simple retention cysts originating in the glomeruli and convoluted tubules.²³ In other cases of this type, especially in those in which the collecting tubules are also dilated, an obstruction to the outflow of urine into the renal pelvis may also be a factor.²⁴ In the case reported here, for example, the renal papillae were barely visible as a result of the inhibited differentiation of the parenchyma into cortex and medulla; as a result of this and the excessive amount of medullary stroma there followed an excessive crowding of the collecting tubules converging toward the tips of these rudimentary papillae so that relatively few of these tubules achieved actual penetration into the pelvis. In addition there was a particularly marked condensation of the superfluous stroma in the same region, so

the diffuse manner in which the disorder affects the kidney or liver, its predilection for these organs specifically, and its heredofamilial occurrence. The last point involves of necessity a genic abnormality. The determiners of the disease may therefore be said to be inherent in the germ plasm before conception takes place and to become activated in a wide manner in the course of embryonal development at a selectively predetermined stage of development which is identical in all cases. The ultimate cause of such abnormalities of the germ plasm lies within the domain of the geneticist, and is probably to be explained in terms of mutation. In this connection it is of interest that numerous mutations have been produced in laboratory animals by means of treatment with x-rays. Bagg,³⁰ for instance, has shown that hereditary abnormalities of the viscera are to be found in the third and subsequent generations of the descendants of irradiated mice. The defects involve mainly the kidneys—e.g., partial or nearly complete atrophy of one or both kidneys, congenital hydronephrosis, and polycystic kidneys. Associated abnormalities are also found, including blindness and various defects of the limbs (syndactylism, polydactylism, club feet). These defects are definitely inherited, being recessive to the normal and approaching the mendelian expectation in behavior.

A number of other diseases are known in which a heredofamilial fault exists in association with the formation of disseminated areas of hamartial and hamartomatous abnormality in several organs. One of these, the tuberous sclerosis complex, has been similarly discussed by me²⁶ with particular reference to the role of a disturbance in embryonic organizers in its causation. In this disease hamartomas are seen in the skin (adenoma sebaceum), in the brain (tuberous sclerosis), in the heart (rhabdomyoma), and in the kidney and retina. Hamartial cysts of the kidney may occur (Fig. 5D). In addition, gross malformations are frequent accompaniments, such as cleft palate, spina bifida, accessory lung, diverticulum of the heart, etc. The latter have been ascribed to the premature onset of the disorganizing factors underlying the primary disease.³¹ Therefore, this disease can be put in a new category—*disseminated hamartiosis*. Recklinghausen's neurofibromatosis belongs also in this category, as does Lindau's disease (hemangiomatous lesions of cerebellum, spinal cord, and retina; cysts of kidneys, pancreas, and liver), and possibly other syndromes.

On the basis of the diffuse hamartial nature of the anomaly in polycystic disease, its involvement of more than one organ, its heredofamilial occurrence, and the frequently associated malfor-

mations of unrelated type, it is suggested that it be classified likewise as a type of disseminated hamartiosis. Like the aforementioned diseases, its causation is probably bound up with a particular defect of embryonic organizers conditioned by an inherent abnormality within the germ plasm.

Summary

Two cases of congenital anomaly of the bile ducts are described, the first patient being a newborn child with polycystic disease of the kidneys and liver, and the second being an infant of 7 months with congenital atresia of the extrahepatic bile ducts and gallbladder. The possible embryologic mechanisms for both malformations are discussed, particularly the role of embryonic organizers. A distinction is drawn between malformations based on defective cell-competence, resulting in aplasia as in the case of atresia of the ducts, and malformations based on a disturbance in organizer action, resulting in a hamartial type of tissue anomaly. In polycystic disease the latter is manifested in the form of cyst-like gigantism of the small bile ducts and renal tubules associated with some degree of mechanical obstruction. Polycystic disease is classified as a type of disseminated hamartiosis and is based on the same dysontogenetic principles as those which underlie multiple neurofibromatosis, the tuberous sclerosis complex, and Lindau's disease.

The mesenchyme about the branches of the portal vein and beneath the capsule of the liver apparently possesses specific inductive powers as an organizer in embryonal development of the intrahepatic bile ducts and in the regeneration of the latter in postnatal life.

should follow the same pattern as that of their original evolution in the embryo. In Case 2, in which biliary cirrhosis was present in marked degree as a result of congenital atresia of the extrahepatic bile ducts, "bile duct sprouts" were found in great profusion in the zone of contact of the periportal connective tissue with the hepatic lobules. In addition, they were found in the subcapsular connective tissue, also in considerable number (Fig. 5B). They were altogether lacking, however, in the thickened connective tissue which formed the outer support of the centrilobular and collecting veins.

IV. The Hamartial Nature of Polycystic Disease

It is doubtful from our present knowledge that a single basis for the hepatic anomaly and the renal anomaly in polycystic disease can be assigned to any known factor held by both in common. Nevertheless, it may be helpful to point out that mesenchymal abnormalities are present in both and probably cannot be disregarded in causation. In view of the importance of the mesenchyme as an organizer, not only here but in general,²⁷ this interpretation is probably more justifiable than the banal view which holds that parenchyma and stroma share in the malforming process together.

One further point deserves emphasis—the appearance of cellular hyperplasia. Many of the older authors were sufficiently impressed with the appearance of this condition to express the opinion that polycystic disease is a form of benign neoplasm (cystadenofibroma).^{19c,28a} However, hyperplasia in the sense of excessive cellular proliferation is not characteristic of the lesion, either in the kidney or in the liver. The papillary projections within the greatly dilated peribiliary ducts and convoluted tubules are best regarded as aspects of an imperfectly controlled growth of tissues, which is a process more akin to gigantism than to hyperplasia. The organizer concept makes it possible to explain both the immaturity and the gigantism of these elements on a single basis. If it is assumed that at a crucial stage of ontogenesis failure or inhibition of organizer activity occurs within certain tissues (periportal and nephrogenic mesenchyme), a corresponding failure or inhibition of differentiation may be expected. As this stage is succeeded by another, in which new organizers supersede previous ones, further differentiation passes these tissues by and they remain "stranded. . . in a condition of permanent embryonicity."²⁶ The intrinsic growth energy within the cells of the affected tissues is not diminished, however, and as a result they continue to grow. Because of their loss of competence their growth is imperfectly controlled by

organizers which normally govern differentiation and as a consequence they may continue growing until they reach an enormous size.

Defective tissue combinations of the above type, as discussed previously, can be treated in a separate category of malformation comprising a wide variety of organoid structures arising in a fault of histogenesis. These were formerly considered persistent embryonal tissues ("embryonal rests") but are more suitably designated hamartia (Albrecht).²⁹ When the defective action of organizers to which they owe their origin permits them to gain a certain degree of tumor-like bulkiness they are best classified as hamartomas. This definition should also include various types of angioma, including glomangiomas and cirroid aneurysms as well as many forms of pigmented and keratotic naevi. There is a growing tendency to regard benign tumors in general not as neoplasms but as hamartomas. The cells of a hamartoma share a common embryonal origin with those of the parent organ (in contrast to those of a "choristoma," which is presumably the result of misplaced embryonal cells) and share to some extent also in the growth and retrogression of the organ. The predisposition to malignancy of persistent embryonal remnants is an established principle (Cohnheim-Ribbert theory) and may well be traced to the defective mechanism of cell-differentiation resulting from the original organizer deficiency. Malignant tumors of this type (hamartoblastomas) also represent the so-called "transition" of benign into malignant tumor. The sequence of change from hamartia to hamartoma or to hamartoblastoma of simple or mixed type is probably not restricted to embryonic cells but may arise equally well in reserve cells of normal tissues at any period of life in the event of a defective process of regeneration.²⁶ As stated previously, one may look upon normal regeneration as being governed by tissue organizers homologous if not identical with those controlling development in the embryo. It is possible, then, to regard the fibromas, naevi, angiomas, papillomas, and similar hamartomas of older persons as identical in the principle of their origin with the hamartomas of congenital origin.

The concept of polycystic disease in the liver or in the kidney as a form of hamartoma^{29b} was the natural outcome of the dissatisfaction of pathologists with its interpretation as a simple congenital arrest of development or as an actual neoplasm. Under this classification it was possible to group the many expressions of an excessive growth tendency, epithelial and mesenchymal, along with the obvious arrest of differentiation. Among the many questions which remain to be solved, however, are those which concern

CERTAIN NEUROPSYCHIATRIC ASPECTS OF MEDICINE IN THE EMERGENCY*

EARL H. ADAMS, M.D., New York City

THE present emergency will make great demands upon all specialized personnel. Medical men are realizing more and more that serious changes and unusual loads are being placed upon them and that the end cannot be foreseen. We are already wondering how to make the most of our limited numbers. Many of our colleagues are now serving with the armed forces. Their way will be arduous and not always satisfying. They are under detailed regulations that allow very little in the way of personal or professional preference. We may leave them to their problems, close our own ranks, and face the special problems of the civilian population. It is my purpose in this paper to present from the accumulated neuropsychiatric experiences here and abroad some of the problems that arise in the clinical and preventive aspects of human behavior in health and disease and with reference to public morale. Time does not permit one to present an outline of neuropsychiatry or to touch upon all the ramifications in which individual physicians may have a special interest. If remarks of a general nature often seem to predominate over specific entities, it is because of the nature of the subject under consideration.

Do not suppose that we are entirely altruistic in placing these problems before you. Frankly, we are limited in numbers, we have a desperately large job, and we need your help. For the fact that we are few you may at times have been devoutly thankful. Unfortunately, the experiences of the last war showed that psychiatric casualties assumed alarming proportions. Wars produce both physical and mental traumata; and of these the latter are likely to cause the country more lasting trouble and greater expense. War neuroses tend to increase for at least twenty-five years after cessation of hostilities. We are trying by all available means to prevent those who are especially vulnerable from being subjected to the peculiar stresses and strains of warfare.

We must also consider how we may save the civilian population from similar troubles and breakdowns. In the broadest sense these are problems of morale; and this collective state of mind assumes additional importance in "total war." Practically everyone is in the front line; the enlisted man in camp and the troubled civil-

ian at home maintain contact, and the morale of the one definitely affects that of the other. Also the efficiency of the civilian approaches in importance that of the fighting man. The efficiency of the armed forces depends directly upon effective civilian support in the form of production of arms and food and maintenance of health and morale. On the efforts of the American worker depends the success of fighting men in all parts of the world.

The behavior of the civilian must therefore be efficiently marshaled and directed to common goals. To this end it is necessary to pool the resources of social institutions and available agencies dealing with human behavior. Such institutions have been exceptionally well developed in America. In addition to homes, schools, churches, hospitals, and the press and radio, the many government and private service organizations and their scope amaze visitors from abroad. Our medical clinics, for example, impress them as being large and elaborate. Our people have become dependent upon them, and are proportionately less self-reliant. Hence, such facilities are sources of strength only when properly maintained and utilized. When the available specialized personnel—sociologic or medical—is reduced, it may become necessary to devise means to cover the needs in some group fashion, as well as the more usual individual approach. New agencies are being established to meet new requirements.

Liabilities consequent upon disturbances of human emotion and behavior ought to be properly evaluated, in order that existing facilities may be kept free for the most urgent war needs, and, too, in order that a great opportunity may be fully appreciated. The press of routine duties—office, rounds, clinics—and the familiarity of daily scenes can readily blind the physician to the highly specialized and important place that he occupies in the whole picture. The National Roster and the Procurement and Assignment Service have brought to many doctors a new and somewhat surprising vista. They are realizing that they are not merely practitioners of the healing art but also that they are parental symbols in the minds of mankind. The mother reminds her child of the doctor's orders with an air of finality, assuming that the child, too, will sense that from the doctor's verdict there is no court of appeal. This role, which we utilized much more than we

Discussion

Dr. W. S. Hammond,* *New York City*—I should like to preface my discussion of Dr. Moolten's paper with a few remarks about organizers and inducers, although the problem of organizers and inducers is such a broad and complex one that it cannot be adequately treated in the time at my disposal. In general, a great deal is known about organizers in lower vertebrates, and that knowledge is being extended to higher forms, notably the chick. The stage has been reached where the nature of the organizer substance itself is considered almost certainly lipoidal and is probably a sterol.

In controlled experiments and given circumstances, one can predict the results of organizer or inducer action with a fair degree of accuracy. That is not to say, however, that the results in lower forms can be applied dogmatically to mammals. A hypothesis may properly be formed, but its ultimate proof rests upon controlled experimental evidence.

In the case of developmental anomalies, it is interesting and instructive to apply the organizer principle as a possible explanation. Of course, some anomalies may be explained on a mechanical basis—for example, ectopic thyroid material and variations in the pattern of the great vessels arising from the arch of the aorta. Multiple congenital anomalies may result from sequential disturbances. These disturbances may be mechanical or inductive. In

some cases, however, the multiple anomalies are not necessarily related.

In development of the human liver, the intrahepatic biliary tree is derived normally from the hepatic trabeculae. These trabeculae are always in relation to the biliary duct system, and by some method, not clearly understood, these trabeculae are transformed into parts of the excretory duct system. This transformation appears to go hand in hand with the migration of the connective tissue along the portal canals.

In the two cases presented by Dr. Moolten, the outstanding features are: (1) the abnormally large number of intrahepatic ducts, some of which are cystic, containing inspissated bile, and (2) the excessive amount of embryonic areolar tissue in the portal fields and in Glisson's capsule.

By hypothesizing that the embryonic areolar tissue is an inducer which causes a transformation of hepatic trabeculae into bile ducts, an excessive growth of the areolar tissue would result in a large number of intrahepatic ducts with a reduction of hepatic parenchyma. Irregularity of this areolar overgrowth might cut some ducts off from the system, resulting in cyst formation.

This leads us naturally to the speculation that in obstructive biliary cirrhosis, peribiliary fibrosis, and atrophic cirrhosis, the primary factor is the excessive fibrosis, and the "bile duct sprouts" are formed by a transformation of the existing hepatic parenchyma. That the fibrosis is primary and not secondary to hepatic destruction seems to be supported by the fact that the appearance is the same in both cases, and yet Case 1 showed complete biliary obstruction. The adult liver certainly contains sufficient connective tissue elements of an embryonic nature to permit us to hold such a theory. This embryonic connective tissue might suddenly proliferate under the proper stimulus and give the typical picture of cirrhosis. What that stimulus may be is another question.

I would support, therefore, Dr. Moolten's conclusion that the periportal mesenchyme is the immediate causative agent in this profusion of intrahepatic ducts.

The agenesis of the gallbladder in Case 1 and complete atresia of the extrahepatic ducts is not easily explained. I would presume that the caudal portion of the hepatic diverticulum, the so-called pars cystica, failed to become differentiated, but the cause for such failure is quite obscure. It may be pointed out, however, that such agenesis is not necessarily serious—a number of mammals—e.g., elephant, camel, deer, and some rodents—normally lack a gallbladder.

In regard to the cystic kidney in Case 2, two interpretations have already been given. The "gigantism" or duplication of tubules which Dr. Moolten has reported might be due to the embryonal fibrosis. It has been shown in tissue cultures, that in the chick, embryonic mesenchyme is necessary for the formation of kidney tubules.

* By invitation

CERTAIN NEUROPSYCHIATRIC ASPECTS OF MEDICINE IN THE EMERGENCY*

EARL H. ADAMS, M.D., New York City

THE present emergency will make great demands upon all specialized personnel. Medical men are realizing more and more that serious changes and unusual loads are being placed upon them and that the end cannot be foreseen. We are already wondering how to make the most of our limited numbers. Many of our colleagues are now serving with the armed forces. Their way will be arduous and not always satisfying. They are under detailed regulations that allow very little in the way of personal or professional preference. We may leave them to their problems, close our own ranks, and face the special problems of the civilian population. It is my purpose in this paper to present from the accumulated neuropsychiatric experiences here and abroad some of the problems that arise in the clinical and preventive aspects of human behavior in health and disease and with reference to public morale. Time does not permit one to present an outline of neuropsychiatry or to touch upon all the ramifications in which individual physicians may have a special interest. If remarks of a general nature often seem to predominate over specific entities, it is because of the nature of the subject under consideration.

Do not suppose that we are entirely altruistic in placing these problems before you. Frankly, we are limited in numbers, we have a desperately large job, and we need your help. For the fact that we are few you may at times have been devoutly thankful. Unfortunately, the experiences of the last war showed that psychiatric casualties assumed alarming proportions. Wars produce both physical and mental traumata; and of these the latter are likely to cause the country more lasting trouble and greater expense. War neuroses tend to increase for at least twenty-five years after cessation of hostilities. We are trying by all available means to prevent those who are especially vulnerable from being subjected to the peculiar stresses and strains of warfare.

We must also consider how we may save the civilian population from similar troubles and breakdowns. In the broadest sense these are problems of morale; and this collective state of mind assumes additional importance in "total war." Practically everyone is in the front line; the enlisted man in camp and the troubled civil-

ian at home maintain contact, and the morale of the one definitely affects that of the other. Also the efficiency of the civilian approaches in importance that of the fighting man. The efficiency of the armed forces depends directly upon effective civilian support in the form of production of arms and food and maintenance of health and morale. On the efforts of the American worker depends the success of fighting men in all parts of the world.

The behavior of the civilian must therefore be efficiently marshaled and directed to common goals. To this end it is necessary to pool the resources of social institutions and available agencies dealing with human behavior. Such institutions have been exceptionally well developed in America. In addition to homes, schools, churches, hospitals, and the press and radio, the many government and private service organizations and their scope amaze visitors from abroad. Our medical clinics, for example, impress them as being large and elaborate. Our people have become dependent upon them, and are proportionately less self-reliant. Hence, such facilities are sources of strength only when properly maintained and utilized. When the available specialized personnel—sociologic or medical—is reduced, it may become necessary to devise means to cover the needs in some group fashion, as well as the more usual individual approach. New agencies are being established to meet new requirements.

Liabilities consequent upon disturbances of human emotion and behavior ought to be properly evaluated, in order that existing facilities may be kept free for the most urgent war needs, and, too, in order that a great opportunity may be fully appreciated. The press of routine duties—office, rounds, clinics—and the familiarity of daily scenes can readily blind the physician to the highly specialized and important place that he occupies in the whole picture. The National Roster and the Procurement and Assignment Service have brought to many doctors a new and somewhat surprising vista. They are realizing that they are not merely practitioners of the healing art but also that they are parental symbols in the minds of mankind. The mother reminds her child of the doctor's orders with an air of finality, assuming that the child, too, will sense that from the doctor's verdict there is no court of appeal. This role, which we utilized much more than we

* This paper was produced under the auspices of the Emergency Committee of the Neuropsychiatric Societies of New York City and read before general medical groups.

realize, must imply a parental type of responsibility.

This we realize when we are called upon to judge, interpret, smooth out, arbitrate, console, and generally stand by at all times. If he recognizes the parental cloak, the doctor will constantly have an opportunity to dispel vicious rumors, to nip spreading fears in the bud, and to help to keep the wheels of domestic and industrial life running more smoothly. Somewhat after the Chinese fashion, he may be expected to keep people in fighting trim.

Within his own district or community he will find numerous definite channels through which he may exert a powerful influence. Defense committees, first aid instruction, selective service duties, and blood banks are merely a few of the focal points about which people can be rallied. All these opportunities are, of course, yours primarily because it is to you, not to the neuropsychiatrists, that the vast majority of patients first come with their problems. You have always handled (and will continue to handle) the majority of them.

It must be recognized that there is also good propaganda as well as bad. Public health agencies have continually carried on propaganda against various forces that are noxious to human beings. One must be aware that the constant and increasing employment of psychological warfare by the enemy is another noxious agent. The purpose of this war of nerves is, of course, to distract individuals, particularly those in positions of importance, from real dangers by implanting notions in their minds which will produce fear or feelings of guilt or doubt, will increase conflicts between groups, or will lead to widespread apathy, war weariness, or disillusionment. The literature on this subject is quite extensive and very interesting. Suffice it to say that the chief instruments employed are disquieting rumors, efforts to destroy the value of old social institutions, the production of climatic crises and terrorization. In many persons these are sufficient to precipitate neurotic illness.

Our position in the community enables us, if we so desire, to fight these forces directly. Our efforts will naturally be reinforced if we align ourselves with another "father" symbol—namely, government. We can interpret the aims of government to the individual in terms of watchful benevolence, stressing the interest of government in nutrition, education, child welfare, and justice for all. The British government found that morale was effectively supported by the implantation of the idea that it really was guarding these things for the individual.

We are even more interested, in this matter of morale, in those destructive forces which may pre-exist in the community and in the individual or may arise therein, and also we are interested in their effects on the orderly life and special productive efforts of the nation. Even during peacetime, organized clinical and mental hygiene activities merely scratched the surface. Emotional maladjustment in one form or another in adults or in children is a great source of unhappiness, inefficiency, and wasteful illness. It must necessarily be magnified by the stresses and upheaval of war.

History has shown, in a none too flattering way, that international hostilities pass through stages of development closely resembling the quarrels of children or neighborhood gangs. There is a stage of provocation merging into one of many viewpoints and much indecision. This leads, at some point, to active warfare, which if protracted will inevitably reach a stage of weariness and lagging effort. The stage of active warfare may be subdivided into a period of waiting on the part of the general population and another of active self-defense from bombing or shelling or invasion. We are still in the waiting period, and it may well serve the enemy to keep us in it for a while. This is the time of depressive ideas, bad news, and calamity-spreaders. It is with this period in mind that I shall mention more specifically the various internal destructive forces. Many of them are operative at any time, but some are markedly modified in a time of active defense. At present we are concerned with the widespread occurrence, singly or in combination, of such factors as chronic physical disabilities, established mental illness or defect, excessive fatigue, real deprivation, isolation and insecurity, conscious conflict and confusion, fear in its various forms, including anxiety, and various nervous ailments in adults and children.

The role of serious physical illness and especially of chronic illness in lowering the courage of the individual may be self-evident. In combination, however, with deprivation, worry, or confusion more serious reactions are liable to occur. Every physician knows of cases of debilitating disease, of slowly uniting fractures, of such neurologic conditions as multiple sclerosis, combined sclerosis, Parkinsonism, hemiplegias, epilepsy, of frankly psychotic individuals, and those who are neurotic invalids. He knows cases of blindness or marked deafness. He knows parents who are a problem to their children and vice versa. He can add to this list many illnesses that I have omitted. He should realize that patients who have been paroled from mental hospitals have not necessarily recovered, or may not yet have made an extramural readjust-

ment. They will need special attention. Much good can be done by anticipating possible trouble under additional stress; and the community as well as the patient may benefit by his evacuation to a less exposed area, by placement in another environment, or even by hospitalization. It is a good rule wherever possible to put your patients under treatment of some appropriate nature, even if not specific. It will occupy their attention, give a feeling of support, and permit the maintenance of contact.

Psychoses are not greatly increased in number in wartime and the types encountered are about the same. However, there is need for their more prompt removal from the community for obvious reasons. A psychosis tends to insulate the person from harsh reality. When hospitalized, a psychotic faces fewer problems than the average person outside does, and communal hospital life no doubt combats fear and anxiety. You may help many relatives by explaining this to them. Recently, Hemphill, in the *Journal of Mental Science*, presented an interesting picture of the life of mental cases in the Bristol Mental Hospital in a very heavily bombed district of England. It was apparent that some patients take little notice of sirens or other noises, and many sleep through the din of heavy gunfire. Some playful maniac patients would mimic the sirens with alarming accuracy. It may also be well to mention that the increasing employment of persons in defense industries will make it even less safe to leave depressed patients under home care.

The problem of mental defect might also unduly alarm us at this time. While our institutional capacity has never even remotely met the numbers of these persons in the community, those at large escape many of the common mental stresses and they have probably already established such states of dependency that their basic needs will be met. Another form of defect—the so-called psychopathic personality—will be considered later.

Fatigue is a symptom which in ordinary times we are likely to treat lightly, if we do not make it a diagnostic wastebasket. In the present emergency, however, so much depends on the fitness of the individual and the results of his efforts that excessive fatigue becomes a matter of prime importance. Hence, it may not be out of place to recall the associated symptoms, and to state that it occurs in acute and chronic form. The symptoms increase and change with the degree of fatigue. In its mildest form one feels tired and weak. In some persons the condition is slowly progressive with gradual diminution of working efficiency; others rather suddenly cave in. Tremor of the hands and clumsiness

develop early. There is diminished power of concentration, especially at precision work or figures, and accidents tend to increase. There are individual characteristics such as headache, backache, distress in the eyes, including scotomata, anorexia, and insomnia, and even pains in old scars or injuries. Irritability is very common. Some persons become anxious and tense, some depressed, others resentful. Underlying dissatisfactions begin to destroy cooperation. In chronic fatigue there is likely to be apathy or boredom.

We must not think that overtaking of capacity of nerve and muscle is the sole cause. The physical health must, of course, have close scrutiny. Mental factors include monotony of occupation, concern over the attitudes of others, chronic anxiety with relation to the whole war situation or the individual's own security, and chronic personal worries, frustrations, and dissatisfactions that have gone unchanged. Some persons have serious maladjustments. Lack of recreation is important and is more likely in the case of night shifts. The conditions of work—space, lighting, temperature, posture, and the prevalence of noise—need attention. Certain personality types find the responsibility of executive positions very fatiguing, and consequent defects in judgment are obviously of serious import.

In the control of fatigue we must look for these factors. The individual is primarily emotional and not merely a machine.

Real deprivation of the necessities or the accustomed comforts of life has been found in war zones to be of great importance. The British found it more disturbing to the civilian population than the blitz. The needs of the people will, of course, differ somewhat in different parts of the world and even in different localities. Doctors can definitely assist people with problems of the family diet in relation to rationing or infant feeding and with health matters and defense housing.

To many persons a weekly movie or a properly functioning radio is a necessity. A little old lady in the East End of London was quite demoralized when her church was bombed out; but she became a functioning unit again when it was arranged for her and her group to resume meetings in another location. Loss of material things is really deprivation only in proportion to the emotional attachment to them. Insecurity, from whatever cause, can be destructive and, indeed, rather contagious. When one feels insecure, efficiency lags, initiative is lost, the strength of the foe is overestimated, and, with a feeling of defeat, a search begins in the mind for a source of protection or an avenue of escape. For that individual social integration has been lost. Consequently, through the

removal of this individual and others similarly affected, the group is undermined.

Isolation is also dangerous. Most individuals must feel that they belong to some group. The degree to which strength and comfort are derived from a feeling of identification with others of our kind will vary, of course, with the personality. Morale is definitely higher in purposeful groups. This is true in civilians as well as in soldiers. At all events, the social sense must not be lost. The problem of isolation inevitably entails the concept of discipline and the degree to which a group is homogeneous. In both these respects the British civilian has an advantage over the American, and the soldier is more fortunate than the civilian. It would therefore appear to be wise at this time to foster membership in organizations that have a clear aim, a powerful emotional appeal, a congenial, homelike atmosphere, and some disciplinary elements. The problem of subversive groups will require special attention. Old organizations are better than new and untried ones. In England the value of the community air raid shelters in this respect was found to outweigh completely the dangers from the sanitary viewpoint.

Some people will seek solitude, having by preference and by habit learned to rely on their own wits. They will need special attention, since new dangers do not come within the scope of their experience. They may do better at manual activities than in social or cooperative endeavors. Special responsibilities will assist in quelling their wishes to be somewhere else. Such persons are really still attached to the family circle of childhood.

People who harbor hostility are not few and far between. Such feelings commonly exist in gentle, outwardly docile persons. They will surprise you if you draw out their feelings of aggression; and such feelings are likely suddenly to appear as a complication during important group activities.

Conflict and confusion have already been mentioned as part of the goal of enemy propaganda. Apart from the role of unconscious conflict in the neuroses, we must appreciate the fact that conscious ideas of a conflicting or confused nature will delay decisions and action. Latent dissatisfactions will be awakened. Leadership is urgently needed, but if it is very hesitant or clearly shows incompetence, it is worse than none in poorly disciplined circles. People write angry letters about the faults of certain air raid wardens. They are critical of misplaced authority, while anxious to be told exactly what to do. Again the parental role of the physician is useful. When people lose control, they look for a scapegoat. Thus excessive hate and anger reactions

are seen directed against the President of the United States and others in authority. Such reactions may become intensely destructive. Cases of pathologic hate and paranoia should be spotted and isolated as rapidly as possible.

Fear, like heat regulation and other natural defenses of the organism, has constructive and destructive potentialities. It is the conscious emotional accompaniment of a reflex visceral and somatic protective mechanism, designed to marshal the extra wherewithal to meet danger. It enables us to fight or run away "to fight another day." The more rapidly the reflex activity is permitted to take place, the less the subjective experience of fear. Unfortunately, modern bombing attacks do not permit civilians to retaliate individually. There are clear indications that the antidote for the emotion of fear is activity. Everyone experiences fear. It is quite senseless to tell a person not to be afraid. He is already afraid that he will show fear. Do not suggest that he will be afraid, but instead mention what we all will do when we are afraid. The enemy hopes to make our fear paralyzing or destructive. He hopes it will go on to panic. In order that activity can be started as early as possible one should plan for it before the emergency. The best defense is offense.

Everyone must have a job. What kind of jobs can be done under certain conditions? Ask oneself what one would wish to have in the way of a task while under suspense, in a blackout, during the fall of demolition bombs? Some prefer manual tasks, others group discussion, still others must move about. Tasks should be appropriate and well understood. We should not have to wonder whether we are competent to do the job, when we are at the same time apprehensive of the safety of ourselves and others. Encourage adults to take some part in community defense, production, or combatant efforts. But remind mothers and guardians of the care of their children.

Panic is a profound fear reaction, in which a person loses self-control and tends to react in a primitive or disorganized manner. Like fright, it contains elements of surprise and unpreparedness. It is strangely contagious in groups.

Anxiety, or anxious apprehension, is aroused by some indefinite, not experienced or little-understood threat. It is a low-grade persistent fear, deriving its true force from conflicts within the individual, with consequent inhibition. To most persons the prospect of an air raid is indefinite and usually not understood. One cannot fully evaluate or prepare for it. Those who are prone to experience anxiety will readily call up in imagination their previous reactions, not always with satisfaction.

Anxiety is such a destroyer of efficiency and morale that its nature should be well understood. We are all inclined to be anxious about raids, about the safety of schools, about transportation, about loved ones who are away. We dread separation from those upon whom we are dependent. These things are inevitable under war conditions. Darkness and the weather may add to anxiety. It will be seen that all degrees of this condition may exist. If, however, the dread cannot be overcome by activity and tends to immobilize or incapacitate the individual, we must recognize that there is an underlying personal problem that needs solution. Anxiety combines readily with other factors.

Pathologic anxiety means unconscious conflict. This situation is basic in the so-called psychoneuroses. To conflicts already present, actual conditions of warfare or the new problems of civilian life add another—namely, a conflict between acquired social attitudes of loyalty, honor, and manliness on the one hand and the instinct of self-preservation on the other. Pathologic degrees of anxiety, anxiety neuroses, and anxiety states constitute the largest group among the psychoneuroses. Such cases will not make "good soldiers," whether enlisted or not. We should try to recognize these states and distinguish between degrees of severity and duration. They illustrate beautifully the value of a good medical history. They also point out the complex relations that exist between mind and body.

Anxiety has a tendency to show this psychosomatic relationship in numerous physical symptoms with or without psychic symptoms. Characteristic presenting signs are tremor, sweating, and tachycardia. Complaints include insomnia and bad dreams, "heart trouble," vomiting, diarrhea, polyuria. Others have difficulty in breathing. The psychic symptoms are largely fearful—fear of insanity, death, or impending disaster. In many cases protection is obtained from some of the anxiety-producing situations by phobias involving closed spaces, various forms of transportation, or crowds. Thus, by avoiding such situations, the patient may keep at work, but the total social life must be impaired, and new restrictions, rationing, etc., must bring this person more and more to incapacitating anxiety. When the patient is comfortable, between characteristic attacks, the physical signs may not be at all suggestive. For this reason the history becomes most important. The longer the patient is induced to talk about his relations with the family and others, the more evidence will accumulate of past anxiety symptoms. Vague gastrointestinal complaints or peptic ulcer in the history are reasons for suspicion.

Once recognized, how should anxiety states be handled? The question is not should you use psychotherapy, but instead it is to what extent you should use it and in what cases. Treatment really begins at the moment of first contact, and it will always be beneficial to permit the patient to state the complaints in detailed story form. Some unburdening of the mind is always helpful. Whether one should permit this process to go on extensively or not will have to be carefully considered. In very young persons, or when external circumstances may be readily altered with benefit, one may at this point decide to give appropriate medication and reassurance. The latter, however, like mental catharsis, should be timed and controlled. It is well to realize that when we tell a patient that he has no physical disease and that his symptoms are due to something else, the symptoms and the "something else" are still with him. If you are not prepared to cover this unknown in such a manner that the patient will be benefited, it is often well to introduce symptomatic treatment and the more indirect assurance to be obtained from repeated examinations, while special assistance is being arranged. It is important that the patient be receptive to your ideas of treatment. If so, almost anything you may do will have suggestive therapeutic value. Patients should not be told that crying will upset them. It may upset the ward, the office, or you, but uncontrolled weeping will usually subside in isolation.

There are numerous other forms of nervousness indicative of unadjusted personality problems. A group of rather mild cases will be found to be due to an essential instability in which heredity plays a part. Such patients under strain or disappointment or dread react excessively but most often in ways that cannot be called pathologic. In some the vegetative nervous system is easily disturbed. Some have allergies of specific type; some are rather allergic to life situations.

Hysteria, whether it be manifested by conversion of a problem into such disturbed body functions as partial paralysis, anesthesia, tremor, convulsions, or blindness, or by such dissociated phenomena as amnesia or somnambulism, presents a need for immediate handling. A cure will probably be a highly specialized job. Mild reactions respond to forceful suggestion—how forceful is left to your discretion. It is generally understood and agreed that therapy should be started at the earliest possible moment, and that if possible the patient be made to tell all the details surrounding the onset before these facts have faded from memory and in the hope of preventing a certain fixation of the symptomatic pattern. Such patients should be isolated for

purposes of therapy and to avoid deleterious effects upon others.

Other psychoneuroses and milder forms of nervousness are much less likely to constitute destructive elements in morale. Some common ones, I shall, from this point of view, not even mention. Neurasthenia is characterized by excessive fatigue without definite relation to activity, and feelings of pressure or tension, mounting to actual pain, in the head, the nape of the neck, and the spine. Mental concentration is impaired. I shall not burden you with the details of what the patient is trying to do by means of this crippling reaction. Where doctors fail to assist the patient back to activity, such a patient is likely to move out of danger zones. This is an instance where fatigue is subjectively advantageous, since it lowers the susceptibility to noise and other outside stimuli.

We should be constantly on the alert for hidden depressions of serious character. Some are masked by physical complaints.

In the treatment of nervousness, it is a general rule that somatic symptoms begin to improve as soon as new emotional outlets have been provided. Many common outlets will occur to you; other cases will demand a specialist's approach. But the importance of activity must be emphasized. The role of the onlooker does not suit these patients. "Help yourself by helping others" is a good motto.

We are often surprised at the prevalent failure of doctors to recognize psychopathic personalities, or, as they were once called, constitutional psychopathic inferiors. Doctors fail to distinguish them from psychoneurotics. The issue is important enough, because of the asocial or anti-social attitude and behavior of psychopaths, and because one can waste much valuable time trying to treat them. Usually they seek out a doctor only when physically ill or when trying to escape from the consequences of their acts. Their history contrasts strikingly with that of neurotics. They are usually quite intelligent, but have little social progress to show for it—many jobs and few promotions. Misdemeanors, truancy, divorce, desertion, drugs or alcohol are commonly found, as is the story of unusual sex experience. These things contrast with the good school, work, and moral records of the neurotic, whose background is likely to include other cases in the family, a broken home, frequent minor operations, overconscientiousness, anxiety, and a realization of shortcomings.

I have been referring, so far, chiefly to these problems as they are manifested in adults. The emotional welfare of children under war conditions has naturally received much attention everywhere. Stress has been placed on funda-

mental needs, the detection of early signs of trouble with a view to prevention, the common behavior problems and their management. Very good pamphlets, such as that produced by the Child Study Association, are available on various phases of the subject, and these are worthwhile to doctors as well as to parents or guardians. It is impossible to measure the extent and ramifications of the catastrophe that war brings to childhood. Not only is the mental state of the child of importance to its own present and future but also in relation to the anxiety aroused in parents, the extra load placed upon teachers by problems demanding attention at the worst possible time, and the tendency of serious behavior problems to overload public agencies.

We must make every effort to shield children from certain forces to which they are peculiarly susceptible. Their fundamental needs—food, shelter, clothing, medical attention, and security—must be met. Safety sometimes demands their evacuation from danger zones. In such cases children under five years of age should not be separated from their mothers. The chief need is a feeling of security, and this is much more emotional than physical. This was given further demonstration in the evacuation programs in England, where it was found that adjustment to new placement situations depended on the feeling of security. Small children adjusted well if the mother or some member of the family remained with them a few days in the new setting. They are very adaptable if given more time to adjust. Haphazard placement did not work. Individual child study was found to be extremely important. Each child has built up its own emotional needs. The welfare of a rag doll may be to the child of prime consequence in the matter of its own peace of mind.

In the preschool and school ages, security depends in large measure upon the behavior and attitude of the adults. Doctors must stress to parents the importance of a cool, matter-of-fact manner and attitude toward events in the presence of children. If one cannot be calm one must keep away from children. It also is dangerous to lie to them.

Older children need useful tasks as well as proper leadership. Britain goes so far as to explain the war news to children over the radio daily, so they will not feel that they are being kept in the dark. Adolescents must be employed to avoid asocial trends. This will be enhanced by special emphasis upon athletics.

The doctor will do well to center his whole approach to these problems of children upon the parent. He will achieve the most good by answering as definitely as he can the questions and problems of the mother.

In the period referred to as that of active service, problems will involve chiefly the basic needs of food, shelter, and clothing, disruption of services, emergency medical and casualty work. Real needs will take the center of the stage. People then find out for themselves how brave they are. Others evacuate themselves to safer areas. Remember that action for which we have been well prepared will most often remove tension and anxiety. In fact, anxiety states will diminish in prominence, while hysteria and traumatic neuroses will increase. In London under active defense conditions, fear gradually changed to annoyance, which can more readily be shared with others.

In this necessarily sketchy and obviously incomplete presentation I have tried to point out

that the opportunity is large, that the responsibility will bear down on us all. I have emphasized the types of problems which may tax you most severely. Many will be much less complex. In fact, in many cases you will already be forewarned and, indeed, forearmed by your knowledge of the patient and his life situation. I have said that these people come to you before they would even think of coming to us. The majority never need our services because the medical practitioner has so splendidly utilized the assets available to him. He will continue to do so with the same traditional indefatigability and courage.

CONSERVATION OF EYESIGHT IN INDUSTRY

Recognized methods of protecting the eyesight of workers are being overlooked by industry, in contrast with the widespread provision of general safety measures, it is disclosed in a report on "Industrial Eye Efficiency in the War Program" published in the current issue of *The Sight-Saving Review*, quarterly journal of the National Society for the Prevention of Blindness.

The report, based on a study of 50 typical plants employing approximately 167,000 workers, was made by Charles P. Tolman, consulting engineer for the Society and a past-president of the National Safety Council. In making it public, the Society called attention to an estimate that at least 25 per cent of industrial workers have defective, but correctable, vision.

"Although front rank companies provide good general safety facilities, they, for the most part, appear to be unaware of the importance of eyesight in industry as a managerial responsibility," the report states. "Obviously, industrial concerns need to give much more attention to the subject of industrial vision, not only for humane reasons, but to increase production, to reduce spoilage, and to add manpower. One thing that can be done, for instance, is to provide prescription lenses to correct subnormal vision so that workers may be usefully employed in the war effort who would not otherwise be available."

Practically all of the plants investigated are carrying out faithfully most general safety procedures—such as the maintenance of first aid facilities, employment of safety supervisors, enforcement of accident prevention rules—but inadequate provision is made for protecting eyesight and improving visual conditions in the plant, according to the National Society for the Prevention of Blindness.

More than three-fourths of the plants covered by this study indicated that they make no effort to determine what visual requirements are necessary or acceptable to qualify a worker for any particular job. "This means," the report explains, "that these plants do not know how many color-blind or one-eyed men, or men with subnormal but correctable vision can be utilized. On the other hand, they

may be employing men whose vision is a hazard on the particular job. For example, a man may be working as a crane operator who has deficient 'depth perception,' and so cannot judge the height and placement of the crane load. This would make him a menace to life and property, while if assigned to another job for which his eyesight is suited, he could carry on safely and effectively."

Only 14 per cent of the plants arrange for periodic eye examination of workers who are especially exposed to hazards, according to the report. "This is a serious oversight," it states, "because some industrial eye injuries are cumulative—for example, those due to intense radiation as in welding and furnace work."

Failure to provide or require the use of prescription lenses in goggles, when needed for either safety or efficiency, was found in 42 per cent of the plants. Prescription lenses are nonshatterable, but they are ground to compensate for the visual defect of the employee.

The study disclosed that accident reports of industrial plants often fail to note the condition of the worker's eyesight or the illumination at the scene of the accident when an injury occurs. Only 22 per cent of the plants indicated the eye condition of the individual involved in an accident, and only 12 per cent mentioned the illumination at the scene of an accident. "The lack of such data," the report comments, "suggests that a much greater percentage of general accidents may be caused by bad eyesight or poor illumination, than is generally supposed."

"Eighty per cent of the plants claim to supply goggles to workers whom they consider exposed to hazards," the report states. "This figure is doubtless in excess of the fact, because some exposures are frequently not recognized. For example, some front rank plants do not consider that a lathe operator is exposed to eye injuries. Only 70 per cent of the plants fit goggles for the comfort of the workers, although safety men agree that this is essential to gain cooperation from the workers on the wearing of protective equipment; and more than a third of the plants fail to sterilize the goggles before issuing them to be worn by other workmen."

purposes of therapy and to avoid deleterious effects upon others.

Other psychoneuroses and milder forms of nervousness are much less likely to constitute destructive elements in morale. Some common ones, I shall, from this point of view, not even mention. Neurasthenia is characterized by excessive fatigue without definite relation to activity, and feelings of pressure or tension, mounting to actual pain, in the head, the nape of the neck, and the spine. Mental concentration is impaired. I shall not burden you with the details of what the patient is trying to do by means of this crippling reaction. Where doctors fail to assist the patient back to activity, such a patient is likely to move out of danger zones. subside and also stopped the itching, burning, etc.

Acute types of infantile eczema have responded to sulfur paste, where crude coal tar has proved ineffective.

An acute eczematous eruption of the face, axillae, and pubic area occurring in a child with Hodgkin's disease disappeared with the use of sulfur paste after all other applications, including the mildest of topical remedies, had failed.

Seborrheic Dermatitis.—Sulfur concentrate paste was not utilized in the ordinary cases of seborrheic dermatitis responding to the conventional ammoniated mercury and salicylic acid ointment, sulfur ointment (10 per cent or less), or preparations containing resorcinol, betanaphthol, etc.

The sulfur paste was employed in acute seborrheids with extensive generalization of the eruption, including the genitals and intertriginous areas, where the skin was unusually irritable

and where the blandest applications could not be tolerated.

The following case reports will serve as examples:

Case Reports

Case 1.—A. A., a housewife aged 42, born in Turkey, had seborrheic dermatitis with numerous acute exacerbations for almost two years. The skin was decidedly inflamed, with fissuring of nearly all intertriginous areas. The conventional remedies produced little or no effect. Those of a soothing nature were poorly tolerated.

The 30 per cent sulfur paste was spread in the form of a thin layer on all the affected parts and rubbed into the scalp. Steady improvement followed immediately. After eight weeks of treatment the skin was of normal appearance with the exception of a small area on the back of her scalp.

An interesting experience with this patient developed during the course of treatment. Some

THE EXTERNAL USE OF 30 TO 50 PER CENT SULFUR IN PETROLATUM IN VARIOUS DERMATOSES

E. WILLIAM ABRAMOWITZ, M.D., New York City

ONE of the principles in the treatment of skin diseases is to apply soothing remedies to acute inflammatory dermatoses. Darier,¹ however, in discussing the treatment of eczema, states that "contrary to what might be expected, strong compound ointments such as those (of tar and sulfur . . .) are not only effective in the obstinate forms, but also in the case of acute and weeping eczemas." Dermatologists are aware of such paradoxical effects. MacKee² has had good results with 30 to 40 per cent ammoniated mercury ointment in seborrheic dermatitis of the scalp when 12 per cent failed. Chrysarobin and crude coal tar have each been applied to acute types of eczematous dermatitis, but sulfur in any strength, form, or vehicle in similar conditions has been avoided carefully for fear of dire consequences.

Sulfur

Sulfur has been employed in the external treatment of skin diseases from time immemorial. While crude brimstone and other commercial forms of sulfur contain various impurities that make them unfit for medicinal use, the native sulfur obtained within recent years is, according to Solis-Cohen,³ 99 to 99.6 per cent pure. The washed sulfur of the U.S. Pharmacopeia XI is sulfur treated with ammonia and water. It is deemed as unnecessary and the U.S.P. XII Committee of Revision proposed its deletion. Precipitated sulfur is to be retained. It is prepared from the washed sulfur by boiling with calcium hydroxide and then treating with hydrochloric acid. Precipitated sulfur is practically free of any impurities and is considered the most active of the sulfur preparations, except possibly colloidal sulfur. Sulfur volatilized by heat and deposited as a fine crystalline powder is called the "sublimed," or flowers of sulfur. This is apt to contain sulfurous acid, arsenic, and other volatile impurities and is not so desirable for therapeutic purposes as the precipitated form. Combes⁴ believes that sulfur owes its position as a therapeutic agent to the existence of certain impurities, especially the sulfurous acid, and that pure sulfur is probably inert.

Preparation and Directions for Use of 30 to 50 Per Cent Sulfur in Petrolatum.—Petrolatum, white or yellow, rubbed up with 30 or more per cent of precipitated sulfur forms a thick paste that

may be softened by levigation with a small amount of liquid petrolatum. A 50 per cent sulfur paste is frequently found to be too thick to apply. A 40 per cent paste may be preferable to a 30 per cent paste in warm weather.

The paste is spread on thin with a tongue blade. It is not to be rubbed in except on the hairy scalp. Applications may be changed one or more times daily, depending on the need. It is removed by any bland mineral or vegetable oil, followed by a soap or linit starch bath.

White or yellow petrolatum was chosen as a base for the sulfur in these studies because the anhydrous and hydrous wool fat (lanolin) may prove irritant.

Sulfur 30 to 40 per cent was suspended in a watery vehicle with the aid of either glycerin, tragacanth, bentonite, or methyl cellulose. The action of the concentrated sulfur suspension was about the same as that of the concentrated paste, but more frequent applications were necessary for sustained effect. It may be substituted for the sulfur paste if the patient so prefers.

Dermatoses That Responded to Concentrated Sulfur Paste

Pityriasis Rosea.—Pityriasis rosea is considered by some to be especially susceptible to irritation by sulfur. During a period of five or more years, a number of patients with this dermatosis were treated, at first with 30 per cent sulfur in petrolatum, later with even 40 to 50 per cent sulfur. The skin lesions involuted more rapidly, but irritation occasionally developed. This was of a passing nature, however, and further treatment with the same preparation was later well tolerated.

This treatment is not advocated for the ordinary case, which will subside in a few weeks under little or no treatment. It may be applied when the eruption is of a severe type or in those cases in which the skin condition has been present longer than the usual time and is lagging in involution in spite of the usual treatments. M. Oppenheim⁵ stated that 25 per cent sulfur ointment was the customary treatment for pityriasis rosea in Vienna.

Eczematous Dermatitis.—The sulfur paste was not indicated in contact dermatitis that responded to soothing remedies. However, when soothing applications failed to cause the eruption to involute, the sulfur paste caused the lesions to

FIG. 6. (Case 6) Erythroderma psoriaticum. After two months' treatment with 30 to 40 per cent sulfur in petrolatum, applied to the left side of the face, trunk, and extremities. The left side of the body shows less reddening of the skin with involution of psoriasis lesions.

titis developing. In the few instances where irritation was complained of at first, it soon disappeared, either with continuation of the treatment or after a rest from treatment for several days.

Psoriasis.—The sulfur concentrate paste did not prove effective in ordinary psoriasis, or in the pustular type.

Several cases of erythroderma psoriaticum, one following injections of gold, responded to the sulfur concentrate paste sufficiently well to warrant its trial in other types of erythroderma. The following two case reports are of interest in this connection:

Case 5.—H. R., a cabinet maker aged 55, married, was born in Austria and lived in the United States about forty years. His past history was irrelevant except that he had psoriasis for about thirty years. During this period the eruption became generalized on six or seven occasions. The last episode was severe and was accompanied by an infection of the upper respiratory tract. Biopsy confirmed the diagnosis of psoriasis. The patient presented an enlarged liver and spleen with inguinal and axillary

adenopathy. The blood count indicated chronic lymphatic leukemia.

The exfoliative dermatitis was treated with a sulfur ointment (30 per cent) in petrolatum. The use of the ointment was continued for a little over three months, resulting in a disappearance of the eruption except for a few scattered scaly papules on the body. The sulfur seemed to control the itching better than the other remedies. There was no recurrence. This patient was presented by me at a meeting of the Manhattan Dermatological Society, May 9, 1939.^{6c} The patient later died from leukemia.

Case 6.—See Fig. 5. M. S., a boy aged 19, attending school, first noticed psoriasis on his scalp about two years ago. Since then the eruption has spread to other parts of his body. In the fall of 1941, he developed an erythroderma psoriaticum. Owing to the widespread extent of the eruption, he was admitted to the New York Postgraduate Hospital, Service of Dr. I. Rosen, in October, 1941. The entire body was covered with one mass of numerous papular psoriasis lesions, but here and there normal skin could be observed. Considerable redness of the skin was present. All the nails were

FIG. 3. (Case 4) Seborrheic dermatitis. Duration five weeks. Before treatment with 40 per cent sulfur in petrolatum.

red and scaly lesions on her neck were not receding so rapidly as other affected areas of the body. A 3 per cent ammoniated mercury together with 1 per cent salicylic acid in a petrolatum base was applied to these resistant areas. It had to be discontinued because of an immediate aggravation of the eruption. However, the use of the sulfur concentrated paste, at first with 30 per cent and then with 40 and 50 per cent sulfur, caused the eruption to subside. This patient was presented by me at a meeting of the Manhattan Dermatological Society, December 13, 1938.^{6a}

Case 2.—C. G., a woman aged 28, had a scaly erythematous eruption of two months' duration on the chest, arms, face, ears, back of neck, and scalp. Oozing was present in some areas. Examination for fungi was negative. She had used "Glover's Mange Cure," which caused an extension of the dermatitis. The use of 30 per cent sulfur in petrolatum caused immediate improvement and final cure.

Case 3.—See Figs. 1 and 2. H. S., a woman aged 51, presented extensive erythematous scaly patches, of a year's duration, on the face, chest, upper extremities, and in the groins. The patches on the trunk appeared more recently. Treatment with

various ointments had been of little avail. She was told to apply sulfur 40 per cent in petrolatum twice daily to the affected areas. As indicated in Fig. 2, the eruption disappeared after two months' treatment. Some residual pigmentation remained.

Case 4.—See Figs. 3 and 4. V. C., a man aged 40, presented a stubborn erythematous and crusted dermatitis of the entire face. There was seborrheic scaling of the scalp, with erythematous scaly papules on the chest. The eruption was of five weeks' duration before the institution of treatment with 40 per cent sulfur in petrolatum. About six weeks later most of the dermatitis had subsided and was barely visible.

These 3 patients (Cases 2, 3, and 4) were presented by me at a meeting of the New York Academy of Medicine Section of Dermatology and Syphilology, March 7, 1939.^{6b}

My first report on the use of 30 to 40 per cent sulfur paste in cases of a similar nature was made in 1939.⁷ Several dermatologists in this and other cities have employed it since then with satisfactory results. Even the delicate skin over the eyelids and genitals can tolerate the sulfur paste. There need be no fear of a severe derma-

vehicle, etc. These effects are aside from those due to the primary irritant action on the skin or those due to cutaneous hypersensitivity.

Doubling or tripling the dose of a drug for internal use produces an increased pharmacologic effect entirely out of proportion to the increase in dose.¹⁰ For instance, if the inactive threshold dose of digitoxin is 0.9 mg., and the active therapeutic dose is 1 mg., then the effect from 2 mg. of this drug is as follows:

$$1.0 - 0.9 = 0.1$$

$$2.0 - 0.9 = 1.1$$

In other words, the difference in action between 1 mg. and 2 mg. of digitoxin is not twice as much but eleven times (0.1 : 1.1) as much.

In the case of external remedies, it may be stated that the purely local therapeutic effect of a drug (active ingredient) in a vehicle increases with an increase in the concentration of the drug, the vehicle being the same. But this continues only up to a certain point in the concentration of the drug, beyond which no further added local effect is noted. For instance, a 10 per cent chrysarobin ointment is less than ten times as active as a 1 per cent chrysarobin ointment, other things being equal. In fact, it has been observed that a 1 per cent chrysarobin ointment may be just as effective (in psoriasis) as the higher concentrations. The action of local remedies, therefore, is dependent on many different factors, some of which need further clarification.

A number of our own treated patients have been patch-tested with 5, 10, 20, and 30 per cent sulfur in petrolatum. An erythematous papular reaction of the skin occasionally developed after contact for two days, over the area of the weaker sulfur pastes, but not from the 30 per cent paste. Several patients who presented a dermatitis from some sulfur ointment obtained elsewhere were able to use a 30 or more per cent sulfur in petrolatum.

It may be argued that in using a concentrated sulfur paste, an effect resembling that of a bland powder is obtained, owing to the compact physical state of the preparation. That some sulfur action takes place is indicated clinically by the antiscabetic effect of the sulfur paste. The activity of sulfur in the sulfur paste has been further verified in the following way:

Five silver coins (dimes) with markings almost gone, were placed separately face down in contact with 3 per cent, 5 per cent, 10 per cent, 20 per cent, and 30 per cent sulfur in petrolatum in separate covered ointment tins. Each coin was left in the paste for about twelve hours. When removed the surface of the coin in contact with the 30 per cent sulfur showed a deep black color, the others were less black, varying with the

strength of the sulfur precipitate present in the petrolatum (Fig. 7). The surface of the coins not in contact with the sulfur paste remained unchanged, showing that no sulfur reached this surface of the silver coin, even though it was exposed in the covered ointment tin. As judged by this rough chemical test,* the sulfur paste is not inert material. The 30 per cent sulfur paste shows a much larger presence of sulfur than the weaker sulfur petrolatum preparations.

The following quotation is taken from Smith's *Inorganic Chemistry*: "We do not think ordinarily of sulfur as a very active chemical substance, but this is largely due to the fact that its solid condition interferes with the attainment of close contact with the body upon which it acts. It is really very active."¹¹ The large amount of sulfur present in the concentrated sulfur paste renders it more compact. There is less close contact with the skin upon which the sulfur acts. This may account for the less irritating properties of strong sulfur preparations with little or no interference in the beneficial local therapeutic

* Suggested by Dr. H. Sharlit.

crumbly, pitted, and discolored. His general condition was good. Physical examinations revealed nothing abnormal. There was no glandular enlargement. A blood Wassermann reaction was negative. Urine analysis was normal.

The patient could not tolerate bland oils and ointments, as he complained of irritation and the skin appeared redder after such applications. Ultra-violet ray treatments were also of no avail.

A 30 per cent precipitated sulfur in petrolatum was applied first to the left arm and forearm, while a Burow emulsion was applied to other parts of the body. The patient preferred the sulfur preparation and its use was extended to the entire left side of the scalp, face, neck, trunk, and extremities. While this was done, the right side of the body was given applications of zinc oxide ointment, then zinc paste, and finally mineral oil.

The left side of the body, treated with sulfur, showed some paling of the reddened skin and beginning involution of the psoriasis lesions. There was no change on the right side of the body, which was treated with zinc oxide and zinc paste. Mineral oil made the patient uncomfortable. See Fig. 6.

Sulfur 30 per cent was then applied to both sides of the body for the remainder of the patient's stay in the hospital. A test for sulfhemoglobin in the blood was made but none was detected. The patient was discharged in December, 1941, considerably improved.

He had an aggravation of the eruption after he left the hospital, however, in spite of the use of sulfur in petrolatum.

Rosacea.—This skin affection responded nicely to the use of sulfur 30 to 40 per cent in petrolatum. It was applied in the usual manner at night and removed by washing the following morning. The general systemic measures used in rosacea were also prescribed. No irritation was observed in any of the patients treated.

Scabies.—Several cases of scabies were cured with the concentrated sulfur paste. Irritation did not develop even when the paste was applied to the skin of a 5-year-old child. There was no definite advantage, however, over the more easily applied acaricides.

Dermatoses with Partial Response to the Concentrated Paste

The sulfur paste was tried in lichen planus. The pruritus was relieved in some instances, but there was little effect on the dermatosis itself.

Impetigo and tinea circinata appeared to be benefited, but there was no special advantage in using this remedy over others.

Infectious eczematoid dermatitis and intertriginous dermatitis of fungous origin subsided to a certain point but required further etiologic treatment for final cure.

Several recalcitrant cases of sycosis vulgaris of long standing seemed to improve under treat-

ment with the sulfur paste. In other instances the results were questionable. Nevertheless, it appears worthy of further trial in this obstinate skin affection.

Dermatoses with No Response to the Concentrated Sulfur Paste

Acne Vulgaris.—A few cases of ordinary acne were subjected to the sulfur paste treatment, but it was soon abandoned. It did not control the seborrhea, the comedones, or the other lesions seen in acne vulgaris as well as sulfur and other preparations in a nonfatty vehicle.

Other Dermatoses.—The sulfur paste was tried in neurodermatitis, localized and general types, and also in the discoid type of lupus erythematosus. No particular beneficial effect was noted. Vesicular and bullous dermatoses, like herpes simplex, zoster, erythema multiforme, and pemphigus, showed in general no relief from subjective symptoms and no hastening of involution of the eruption. The sulfur paste is being tried further in these and in still different dermatoses.

Tentative Explanation of the Action of Concentrated Sulfur Paste

Most of the official preparations of sulfur ointments contain about 10 to 20 per cent of sulfur (precipitated or sublimed). Sulfur containing lotions, lotio alba N.F., magma sulfurata,³ etc., may contain anywhere from 4 to 30 per cent of various compounds of sulfur. Dermatitis has appeared from the weaker preparations in dermatoses of a chronic nature (acne, rosacea) as well as from stronger preparations. Several cases of fatal poisoning have been reported in nurslings with scabies, presumably from the external application of 10 per cent sulfur in petrolatum.⁴

The local antiparasitic effect of sulfur—that is, the precipitated sulfur—is attributed to the development of hydrogen sulfide, alkali sulfides, and sulfites when brought in contact with organic matter. Its reducing, keratoplastic, astringent, and antiphlogistic actions are accounted for also in this way.

It appears to the author that the 30 to 40 per cent sulfur in petrolatum is not only effective therapeutically in certain acute dermatoses but, paradoxically enough, is less apt to cause irritation and dermatitis than the weaker sulfur ointments. The explanation of this paradox is not an easy matter.

The local therapeutic effect of an active ingredient, even more so than in the case of drugs for internal use, is only one of several other actions possessed by the particular agent. One or the other of these pharmacologic properties may assume an ascendancy, depending on the concentration, duration and place of application,

peutically active is that in direct contact with the epidermis. Because of the density of the paste and the close proximity of each sulfur particle with the other, movement of sulfur to the surface is slower in a paste than in an ointment, thus lessening the intensity of the action.

The question will be asked, why is a paste frequently beneficial when the weaker ointment is not?

This can be answered by assuming that the keratoplastic action of sulfur is dependent upon its ability to absorb oxygen with the formation of polythionic acids, while its irritating and keratolytic effect is dependent on the basic polysulfides which are present to a greater degree under a thin ointment than under a thick paste. The keratoplastic action is therefore intensified while the irritating effect is lessened.

PHYSIOLOGY OF DELAYED PARACHUTE JUMPS

Certain hiatuses have become apparent in the available knowledge concerning the physiologic effects of free fall through the air. Additional information on this subject is now supplied by the report of an important investigation of the subject by Carlson, Ivy, and their colleagues [Quart. Bull. Northwestern Univ. M. School 16: 254 (1942)]. Their observations were made on Mr. Arthur H. Starnes, an experienced parachute jumper . . . in six free falls. These occurred through distances which ranged from 8,400 to 29,300 feet. The rate of free fall varied from an average of 112 to 158 miles an hour in the case of the lower altitudes to 171 miles an hour in the free fall from 31,400 feet above sea level . . . The maximum average rate calculated for 4.6-second intervals was about 229 miles an hour.

The heart rate during the free fall from 31,400 feet was within the normal range; this was determined by broadcast to the ground by special apparatus which picked up cardiac potentials from chest leads. The blood pressure is not significantly influenced, according to the evidence based on Mr. Starnes's reactions during fall and on studies carried out during rapid recompression in an altitude

chamber. A transient "blackout," or loss of consciousness, may occur when the rate of fall is suddenly checked by the opening of the parachute. Respiration is irregular, varying from three to fourteen respirations during the various free falls. Auditory acuity is definitely diminished during free falls; visual acuity, however, is not impaired when goggles are worn. The position of the body during a free fall is not fixed, and the body tends to wobble, twist, and spin. However, the human body can be kept nearly vertical . . . by use of an accessory "antispin" parachute. This position has certain physiologic advantages and reduces one of the hazards of parachute jumping, namely, twisting and fouling of the shroud lines of a parachute. Convincing evidence was obtained that, at least in the experienced person, mental reactions are clear and rapid during an extended free fall through the air. . . .

The principal conclusion agrees with that previously expressed by Lieut. Col. H. G. Armstrong—namely, that delayed parachute jumps are an entirely practical means of avoiding certain highly hazardous aerial situations, such as the danger of the parachutist being shot down by an unscrupulous enemy in a plane.—*J.A.M.A.*

PSYCHIATRY IN AVIATION

Generally speaking, the career of a pilot may be separated into about three periods. During the first period, extending over about four years from the time of graduation, he is carefree and flies with considerable abandon. He is less conservative and has few inhibitions. He then merges into the next period, which extends for about ten years, ranging from, say, 27 to 37. During this period he becomes more conservative. He has frequently experienced or witnessed crashes, and he has developed a more practical appraisal of his profession. He usually has acquired a family and he may be regarded as being at the peak of his profession. The next period is associated with more mature years. As the pilot grows older he incurs certain physical limitations. His domestic and social responsibilities increase and he inclines more toward administrative duties and tends to lose contact with the ever increasing advancements of the improved types of aircraft. Under these circumstances he may give up flying, or restrict his flying to a narrower field of activity. If he maintains his adjustment, he may continue for an indefinite period. Maladjustments often result in the assignment of a pilot to a type of flying duty for

which he has lost contact. He becomes conscious of his limitations and may develop an anxiety as to his ability to cope with the situation.

The keenly intelligent and analytical type of pilot is not always the best risk for the long pull. These individuals are more capable of sensing danger. . . . Undoubtedly they are subject to greater emotional response. They respond more sensitively to noise and other stimuli encountered in flying. Therefore, they require a more profound adjustment because of these facts. Age is another factor. Young men under 25 qualify more readily under flight training than do older personnel.

In conclusion, the early indications of fatigue, staleness, effort syndrome, and even aeroneurosis are often characterized by increased irritability and changes in the pilot's attitude to his work and his associates. Only trained medical personnel and flight surgeons, who know the pilots and know their habits and reactions, can detect a change at this stage. It is this early diagnosis that we must depend on for salvage of flying personnel if they are to be saved for useful flying.—*Capt. J. C. Adams, M.C., U. S. N., in U.S. Naval Medical Bulletin*

action of sulfur on the skin when the sulfur concentrate paste is used.

Summary and Conclusions

The basic principle of the rational therapy of skin diseases is to apply soothing remedies to those of an acute inflammatory nature. Strong and stimulating agents are used in obstinate and chronic dermatoses.

Precipitated sulfur, 30 to 40 per cent in petrolatum, acts effectively in acute inflammatory dermatoses that fail to respond to the conventional mild and soothing applications.

Pityriasis rosea, acute eczematous dermatitis, generalized acute seborrheids, and psoriasis of the erythrodermatous type, also rosacea, and scabies, responded favorably to the sulfur concentrated paste. Infectious eczematoid dermatitis and other eczematous parasitic dermatoses, impetigo, and sycosis vulgaris also may do well.

Other dermatoses, like acne vulgaris, neurodermatitis, lichen planus, discoid lupus erythematosus, vesicular and bullous dermatoses (herpes simplex, zoster, pemphigus), show questionable or no response to the sulfur paste.

The sulfur paste acts as an antiphlogistic, reducing, antipruritic, and antiparasitic agent.

Dermatitis, not uncommon with milder sulfur ointments, has not been observed following the use of 30 to 40 per cent sulfur in petrolatum. Irritation may appear. It is of a temporary nature and subsides with the further use of the sulfur paste.

There is less close contact of the sulfur with the skin by the use of 30 to 40 per cent sulfur in petrolatum than with weaker sulfur ointments, allowing the therapeutic action of sulfur to assume the ascendancy over the less desirable irritating effects.

As shown by actual tests, the concentrated sulfur paste is not an inert compound.

Discussion

Dr. Frank C. Combes, *New York City*—I am sure we have all enjoyed listening to Dr. Abramowitz's interesting paper. 'Sulfur is a most remarkable element. It exists in several allotropic forms, possesses three valences, diadic, tetradic, and hexadic, occurs as electropositive and as electronegative ions, and is dispensed as flowers of sulfur, precipitated sulfur, and sublimed sulfur.'

The failure of 30 to 50 per cent sulfur pastes to irritate the skin which has previously rebelled against weaker concentrations has always intrigued me. We may not know why, but we can always theorize.

Sulfur, under favorable conditions, has the ability of combining with oxygen to form various oxides which combine with water to form polythionic acids. It also has the ability to combine with hydrogen to form hydrogen sulfide, which in turn forms hydroxides and basic sulfides. The actions of sulfur on the skin are dependent on these two series of compounds. The keratoplastic action is dependent on the ability of sulfur to absorb oxygen from the skin. Its antiscabetic action probably depends upon its ability to combine with hydrogen, since this action may be elicited by the application of the dry powder in the presence of warmth and perspiration.

Now, why will a 10 per cent sulfur ointment irritate the skin, whereas a 40 per cent ointment will not? There is no doubt that 40 per cent is potent (as Dr. Abramowitz has stated) and does not act as a bland paste. However, I do not think the result of his demonstration with the dimes is due primarily to the sulfur but rather to sulfuric acid, which is formed from oxygen taken up from the air and is present in all sublimed and precipitated sulfur as an impurity. It is doubtful whether elemental sulfur exhibits any activity until it comes in contact with the proteins of the skin, sebum, and sweat, and is changed to thionic acids.

Only two theories appeal to me as explanations of this paradox. Both probably act simultaneously. The first is dependent upon the secretion of sweat over the area on which the paste is applied. Sulfur applied to the skin causes an active dilatation of the cutaneous capillaries, edema of the rete, and activity of the sudoriparous glands. This sweat has a pH which is more alkaline than normal because of dilution of the fatty acids. Sulfur is more active in an alkaline medium. Sulfur in a paste is more absorptive, acting, by capillarity, to some degree like Lassar's paste, as a sponge, and removing this sweat from the surface. An oleagenous ointment repels it, leaving it on the surface, saturating the normally acid epidermis, enhancing the formation of alkaline sulfides which are in turn keratolytic and irritating. Elemental sulfur is also soluble in these sulfides, thus setting up a vicious cycle.

The second theory is based upon the viscosity of a paste. The only part of the sulfur which is thera-

vided that the humble institution required. Some students of medicine volunteered to perform in rotation the duty of apothecary, and the landlord from whom the rooms were rented acted as superintendent. . . . It was made publicly known that all poor persons applying at No. 45 Chatham Street on certain days and hours of each week with diseases of the eye would be gratuitously treated, and the necessary medicines and appliances furnished them.

"A single week proved that our infirmary would succeed, for immediately many poor persons, thus suffering, applied for relief, and in a short time our small apartments were crowded with them, and the labor of caring for so many proved far greater than was anticipated.

"The undertaking was commenced in the month of August, 1820, and in a period somewhat less than seven months, 436 patients had applied and received the care and treatment of the surgeons of the infirmary."⁵

The successful outcome of the experiment undertaken by the New York physicians did not fail to impress their contemporaries, as evidenced by the testimony of Dr. Edward Reynolds, co-founder with Dr. John Jeffries of the Massachusetts Eye and Ear Infirmary of Boston. In an address delivered on July 3, 1850, at the dedication of the new building of the Infirmary, Reynolds declared: "As the London Eye Infirmary owes its origin to the Institution at Vienna, so the Massachusetts Infirmary, where we are this day assembled, must claim its parentage from that.

"The valuable work of Saunders, published in 1816, and the occasional reports of the infirmary of which it was the first fruits, began to excite a spirit of inquiry among several eminent individuals in our country. But no general movement was made in its favor until 1821, when the first eye infirmary in America was established by Dr. John Kearny Rodgers and Dr. Edward Delafield, two of the most distinguished physicians and surgeons in New York, who may be called the fathers of American ophthalmology. Filled with the spirit first received at the London institution, and finding on their return from Europe a great number of poor people afflicted with diseases of the eyes, they were desirous of extending a similar blessing to their native city. Accordingly, at the request of several of the senior members of the profession, they founded the New York Eye Infirmary, where they have since labored with praiseworthy diligence, devoting to its interests a great amount of time, that was with difficulty spared from other professional pursuits, uncheered by any adequate patronage of the public, though 36,000 fellow beings have received the blessing of sight and

hearing at their hands; and reaping no other reward than the happiness of doing well.

"Two years after, in the latter part of 1824, the example was followed in Boston and the first effort was made, whose noble result we are this day assembled to celebrate."⁶

The New York Infirmary continued to be a significant factor in the development of American ophthalmology and, as will be shown later, was intimately connected with the organization of the American Ophthalmological Society. During the twenties and thirties ophthalmic hospitals and dispensaries were also founded in Philadelphia, Boston, and Baltimore, but as yet I am not prepared to state definitely whether their establishment was in any way influenced by the organization of the New York Infirmary. In 1852 another institution for diseases of the eye, the New York Ophthalmic Hospital, was opened for the indigent poor of New York City. Besides these special hospitals, ophthalmic services were also organized at various times in connection with general hospitals and general dispensaries in both New York and Brooklyn.

Although physicians devoting themselves exclusively to diseases of the eye did not appear in New York until after 1850, otology and ophthalmology were practiced together for a long time, and since both are specialties I am disregarding this combination in the discussion. There were nevertheless a number of surgeons and general practitioners during the first half of the century who paid particular attention to ophthalmic conditions and acquired considerable skill in their treatment.* Many of these men were connected with the special eye hospitals, or with general hospitals having eye services. Among them may be mentioned Valentine Mott, Gurdon Buck, Willard Parker, Alfred C. Post, Frank H. Hamilton, George C. Blackman, George Wilkes, and William C. Wallace. Important contributions to the growing body of knowledge on the eye and its diseases were made by various New York physicians and surgeons. Of these, Wallace's studies on the mechanism of visual accommodation, Post's successful blepharoplasty, and Blackman's operation for blepharospasm are perhaps among the more significant.

* An exception to this general statement is apparently to be found in the case of William Clay Wallace, of New York City, who was active during the first half of the 19th century and who styled himself "oculist."⁷ The first clear-cut case of ophthalmic specialization that I have found is that of Dr. John H. Dix of Boston. In 1843 the *Boston Medical and Surgical Journal*⁸ noted: "Dr. Dix, of Boston, advertises that in future he shall devote himself to the diseases of the eye and ear"; and in Volume 29 of the same journal, facing page 28, is to be found the following announcement: "Diseases of the Eye and Ear. Dr. J. H. Dix will, from this date, relinquish general practice, and attend exclusively to the medical and surgical treatment of Diseases of the Eye and Ear. February 14, 1843, No. 2 Bowdoin Square."

History of Medicine

NEW YORK CITY IN THE HISTORY OF AMERICAN OPHTHALMOLOGY

GEORGE ROSEN, M.D., Brooklyn

THE extensive subdivision of labor and segmentation of function, so characteristic of modern medicine, manifests itself in the existence of certain limited fields of practice known as specialties. Underlying their development is the general social process of specialization. Social scientists have subjected the principle of specialization to analysis in order to ascertain the factors involved in its operation. It was recognized that specialization is generally an aspect of social and economic systems of a certain degree of complexity and that it is intimately related to urban concentration. The appearance of the city is of the utmost importance for the development of specialized skills and activities. Adam Smith pointed out that the operation of the principle of specialization was limited by "the extent of the market."¹ Emile Durkheim formulated a principle indicating the relation between segmentation of function and population size. "The division of labor," he says, "varies in direct proportion to the volume and density of societies, and, if it progresses steadily in the course of social development, it is because societies become regularly more dense and very generally more voluminous."² The significance of these generalizations is that they provide an approach which makes it possible to investigate the development of the medical specialties not as isolated accumulations of technical knowledge, but rather as integral elements in a texture of interwoven social and scientific processes. The present study attempts to investigate the role of the city in the process of specialization by an analysis of a particular case—namely, the part played by New York City in the development of ophthalmology as a specialty in the United States.

While ophthalmology as a full-blown specialty did not make its appearance until after 1860, the factors and conditions that made possible its development may be traced back to the second decade of the century. Among the preconditions contributing to the rise of ophthalmic specialization, the existence of a number of hospitals for patients afflicted with eye diseases must be considered of prime importance. Indeed, it is an interesting and noteworthy fact that both in the United States and Great Britain

the organization of special ophthalmic institutions preceded the appearance of the ophthalmologist. These hospitals provided centers where the care and teaching of eye diseases could be cultivated and where the value of this special field of practice could be demonstrated to the medical profession.

The first ophthalmologic institution in this country was the New London Eye Infirmary established by Elisha North in 1817 at New London, Connecticut.³ This establishment ceased to exist some time around 1830 and apparently exerted no influence on the development of American ophthalmology.⁴

In 1820, however, the first permanent hospital for diseases of the eye, the present New York Eye and Ear Infirmary, was founded in New York City. The organization of this institution was the work of two young physicians, Drs. Edward Delafield and John Kearny Rodgers. The story of the founding of this hospital, which was intended to serve the poor who suffered with eye diseases, was related by Delafield in an address delivered on April 25, 1856, at the dedication of the new building of the New York Eye Infirmary. "Some time in the year 1816," he said, "two young men recent graduates in medicine of the College of Physicians and Surgeons of this city, who had spent together the previous year in the New York Hospital, one as house physician and the other as house surgeon, sailed for Europe. Their object was to improve themselves in the knowledge of the profession of their choice."

On their arrival in London they availed themselves of the instruction in the nature and treatment of eye diseases given at the London Eye Infirmary, which had recently been founded by John Saunders. The two young Americans were greatly impressed with the Infirmary and its teaching. "On their return to their country in the year 1818," relates Delafield, "the subject of diseases of the eye engaged their earnest attention, and they soon came to the resolution that they would establish in our city for the first time in America an infirmary for curing diseases of the eye. . . .

"Accordingly, two rooms were hired in the second story of a building in Chatham Street, then in a central situation, and the few articles pro-

Read at the Annual Meeting of the Medical Society of the State of New York, New York City, April 29, 1942.

the flourishing metropolis astride the mouth of the Hudson, often brought with it immigrant doctors, especially from Germany and Central Europe after the defeat of 1848. It is not implausible to suggest that these men may have helped to familiarize American physicians with the concept of the medical specialty, since segmentation of medical practice had already progressed much farther in Europe. In this connection it is worth noting that the *American Journal of Ophthalmology*, the first ophthalmologic journal to appear in America, was published in New York in 1862 by Dr. Julius Homburger, an immigrant physician from Germany who had studied with von Graefe and Sichel and who had settled in New York in 1861 to practice ophthalmology.¹⁷ Similarly, the *Archives of Ophthalmology*, which began to appear in 1869, were established by Dr. Herman Knapp, who had taught at Heidelberg and had come to New York in 1868.

Second, the growth of the port of New York and the development of transatlantic shipping lines created conditions which profoundly influenced American medicine and stimulated the growth of specialization. The facilitation of cultural change generally and the development in medical knowledge and practice specifically are contingent upon the existence of a high degree of social interaction involving a number of processes. Among these processes the direct interaction arising from face-to-face contacts and the mediate interaction produced by the transmission and circulation of theoretic and factual information are of great significance in stimulating cultural change. Improved means of travel and communication render possible or accelerate the operation of these processes. The development of the transatlantic transportation facilities brought New York and European medical centers into closer contact, and numerous physicians took advantage of this circumstance. Many of the founders of the American Ophthalmological Society went abroad to study with the leaders of ophthalmology in Europe, with Donders in Holland, with Bowman in London, Sichel and Desmarres in Paris, von Graefe in Berlin, and Arlt and Jaeger in Vienna.

In June, 1864, the American Ophthalmological Society was organized in New York.¹⁸ The formation of this society marks a decisive turning point in the development of the specialty of ophthalmology. Specialized knowledge and techniques may exist and be utilized by physicians, and yet there may be no specialty. A number of men operating within a limited field of medical practice do not constitute a specialty, which can only be said to exist when there are bonds between the practitioners, bonds which take shape

within an association based upon like interests and common problems. It is in this sense that the organization of the American Ophthalmological Society may be regarded as marking the first appearance in America of ophthalmology as a formal specialty.

The prominent role of New York City in the development of ophthalmology as a specialty is strikingly evident in the organization of this society and in its subsequent history. In his "Account of the Origin . . . of the American Ophthalmological Society," Dr. Henry D. Noyes relates: "The beginning of the American Ophthalmological Society was suggested by correspondence held by Dr. Derby, of Boston, and Drs. Noyes and Bumstead, of New York, who verbally communicated with friends likely to be interested in the subject and residing in these cities, respectively. It was resolved to bring together those who felt the need of such an organization, and the first consultation on the matter was held at the office of Dr. Henry D. Noyes at 278 Fourth Avenue in New York. . . ."¹⁹

At this meeting eight men were present. Seven of them were New Yorkers—Drs. Henry B. Sands, Herman Althof, John H. Hinton, F. J. Bumstead, D. B. St. John Roosa, W. F. Holcomb, and Henry D. Noyes. The eighth member of this group was Dr. Hasket Derby, of Boston. This meeting, which was held on January 9, 1864, was convoked in order "to consult upon the best mode of promoting the interests of ophthalmology in this country. . . . The subject of founding a journal of ophthalmology was discussed and a resolution passed unfavorable to the project. Dr. Bumstead offered a resolution that a committee be appointed to invite ophthalmic surgeons from the whole country to assemble in New York at the time of the meeting of the American Medical Association to form themselves into the American Ophthalmological Association."¹⁹ This motion was carried and a committee consisting of Drs. Bumstead, Noyes, and Derby was appointed.

The meeting of ophthalmologists called by the committee took place on June 7, 1864, at 2:30 p.m. at the New York Eye and Ear Infirmary, Second Avenue and Thirteenth Street. Among those attending were the eight who had been present at the original meeting, as well as Drs. Edward Delafield, Cornelius Rea Agnew, Francis Simrock, William F. Carmalt, and William Stimpson, of New York City; Dr. C. A. Robertson, of Poughkeepsie; Drs. John H. Dix, Joy Jeffries, and Francis B. Sprague, of Boston; and Dr. Ezra Dyer, of Philadelphia. Eighteen men interested in ophthalmology and its problems assembled at this meeting, twelve of them being New Yorkers. At this meeting also, eight new

The accomplishments of these New Yorkers and of their confreres in other large cities attracted the attention of the medical profession to the possibilities of the growing field of ophthalmology and inspired other physicians and surgeons to engage in ophthalmic work. This development was particularly marked in New York because of the influence of various economic and social conditions resulting from the growth of the city.

By 1850 New York had become the colossus of the North, having disposed of her rivals during the preceding fifty years. New York, through her location at the mouth of the Hudson, stood at the entrance to a great avenue of communication with the interior of the country, for the Mohawk Valley with the Mohawk River formed a connecting link between the Hudson and the Great Lakes. This natural advantage had been utilized in the building of the Erie Canal, which was completed in 1825. The agricultural Middle West was thus brought into contact with the highly developed industrial and urban section, to which New York was the gateway, and also with Europe. As a result, the thriving city at the mouth of the Hudson became a great distributing center, its spacious harbor accommodating ships from many lands. In 1850 New York's import trade was somewhat less than 60 per cent of that of the entire country; Philadelphia, Baltimore, Boston, and New Orleans had all been compelled to acknowledge her commercial supremacy.⁹ This was the New York which Herman Melville saw as the "insular city of the Manhattos, belted round by wharves as Indian isles by coral reefs—commerce surrounds it with her surf."¹⁰

Hand in hand with this economic development had gone a growth of population. In 1790, New York, the second largest city in the country, had a population of 33,131.¹¹ By 1840, it had increased to about 313,000, and twenty years later, it had already reached a total of more than 800,000.¹² This rapid growth was in a large measure a product of immigration, that mass movement of peoples during the nineteenth century which Hansen has called the "Atlantic Migration."¹³ During the forty years between 1820 and 1860 about 5,000,000 immigrants entered this country. The decade of the fifties witnessed the arrival of 2,700,000 "passengers of foreign birth," more than half of the previously mentioned total.¹⁴

As a result of this rapid increase of its population, New York City, like many other urban communities of this period, was soon faced with problems of housing, of overcrowding, unsanitary conditions, cellar dwellings, and high rents—in short, by the problem of the slum.

John H. Griscom in his study on the "Sanitary Condition of the Laboring Population of New York," which appeared in 1845, has left us a vivid portrayal of these conditions. Nor do the "First and Second Reports of the Metropolitan Board of Health," published some twenty years later, reveal very much improvement.¹⁵

The morbidity and mortality of a given social or occupational group are to a large extent functions of its living conditions, so that one is not surprised to find a high incidence of disease and death associated with the unsanitary and unhealthy living conditions of the poorer classes in New York. Among the diseases commonly found in this group those affecting the eye occupied a prominent position. On this point, we have the testimony of Dr. Reynolds who, in his aforementioned address, affirmed "that the poor and laboring classes are peculiarly liable to these diseases—a fact now familiar to everyone acquainted with the results of these institutions.

Whoever would study the diseases of the eyes must pass by the houses of the affluent, and enter those of the poor. The great majority of all these cases belong to the humbler ranks of society, and have their prolific parentage in the various privations and sorrows unavoidably consequent upon poverty. . . . It is the toil-worn laborer, whose fatiguing occupations must be continued in the summer's heat and the winter's cold—it is the poor foreigner who builds your railroads and repairs your docks that seek the aid of this friendly charity. A large proportion of all the accidents to which the eye is liable is to be found not in the office of the professional man or the counting house of the merchant but in the workshop of the poor but industrious mechanic."¹⁶

Although Dr. Reynolds was referring to Boston, his statements are perhaps even more applicable to New York City at the same period.

Thus, by the decade of the sixties there were already present in New York important preliminary conditions favoring the appearance of ophthalmic specialization—namely, (1) the existence of special ophthalmic institutions, (2) the presence of a group of medical men interested in diseases of the eye and trained to deal in them therapeutically, and (3) a rapidly growing urban population with a high incidence of morbidity and mortality. In addition to these factors, brief mention must be made of two circumstances which, in a sense, have been implied in the preceding discussion of the economic development of New York.

First, the ever-growing stream of immigration, which, spanning the Atlantic, emptied into

Diagnosis

CLINICOPATHOLOGIC CONFERENCES FOURTH MEDICAL DIVISION OF BELLEVUE HOSPITAL

Date: January 28, 1941

Conducted by: Dr. Harry A. Solomon

DR. CHARLOTTE T. PEIRCE: This was the third Bellevue admission of a 57-year-old Italian stonecutter who had been in excellent health except for an abdominal operation for shrapnel wound sustained in the last war. In July, 1941, he first noted a chronic nonproductive cough, exertional dyspnea, edema of feet and ankles, and swelling of the abdomen. The patient was treated at another hospital with paracentesis and diuretics and was then discharged, although he was still dyspneic. His symptoms recurred, and he was admitted to the Third Medical Division of Bellevue Hospital on October 11, 1941.* Physical examination revealed rales at the bases of both lungs; the blood pressure was 145/105; the heart was enlarged to the left; the point of maximum impulse was not felt; the heart sounds were fair, with normal sinus rhythm; A2 was greater than P2. The liver was felt down to the umbilicus, with flatness and shifting dullness in the flanks. There was 4-plus pitting edema of the extremities. A roentgenogram of the chest showed fluid at the base of the right lung and an enlarged heart, with disseminated nodular infiltration involving the major portion of both lung fields consistent with silicosis. Kymography showed abnormally diminished pulsations of the lower portion of the left ventricle, suggesting myocardial damage or enormous hypertrophy. The electrocardiogram showed normal sinus rhythm, low T waves, PR interval of 0.2 second, and no axis deviations. The blood Wassermann was negative. The erythrocyte count was 5,300,000, with 14-Gm. hemoglobin; the leukocyte count was 9,850, with 63 per cent polymorphonuclears, 18 per cent lymphocytes, and 19 per cent transitional cells. The blood non-protein nitrogen was 34 mg. per cent and the albumin-globulin ratio, 4.4/2.0 Gm. per cent. The patient was digitalized to toxicity and was given diuretics, with gradual improvement except for an episode of thrombophlebitis of the right leg. This, however, gradually subsided. Before discharge, a swelling of the left palm and palmar aspect of the left wrist were noted. A

* Permission to use this case was granted by Dr. William S. Tillet, Director, Third Medical Division, Bellevue Hospital, on which service this man had previously been a patient

week after discharge, because of a recurrence of the edema, the patient was admitted to another hospital, where findings were essentially the same. Two thoracenteses of the right side of the chest were performed, and, following redigitalization and further diuretics, he was transferred to an institution for care of the chronically ill, where he remained until ten days before his readmission to Bellevue Hospital, Third Medical Division, on March 19, 1942, for recurrence of symptoms of dyspnea, orthopnea, and edema of the extremities. Physical examination at this time showed a blood pressure of 185/80; there was no venous distention of the neck; the lungs were hyper-resonant, with diminished breath sounds. There were no rales, but there were signs of fluid at the base of the right lung. The heart was enlarged, with the point of maximum impulse 12 cm. to the left of the midsternal line, in the fifth intercostal space. The heart sounds were distant, and there were no murmurs. The liver edge was 8 cm. below the costal margin; there was no fluid wave or shifting dullness. Thickening of the left epididymis was noted. Swelling of the left wrist, chiefly of the volar aspect, with slight nodular induration under the skin, and a fusiform swelling of the fifth finger were noted. There was no fever at any time.

Laboratory Data.—Repeated sputum examinations were negative for acid-fast organisms. The erythrocyte sedimentation rate was 36 mm. per hour, and the blood count was normal. The blood nonprotein nitrogen was 30 mg. per cent; the albumin-globulin ratio was 3.9/3.0 Gm. per cent, and the icteric index, 8. The right side of the chest was tapped on March 25, 1942, with removal of 1,050 cc. of clear yellow fluid; the specific gravity was 1.014; there were 160 cells per cu. mm. Guinea-pig inoculation was negative for tuberculosis. Thoracentesis was repeated on April 8, 1942, with removal of 2,100 cc. of fluid with a specific gravity of 1.020, 480 cells per cu. mm., with 84 per cent lymphocytes and 16 per cent monocytes. No acid-fast organisms were found, and gram-stain showed gram-negative cocci in chains and clumps; a few gram-negative rods were also found. The venous pressure on admission was 260 mm., and, following diuretics and redigitalization, venous pressure dropped to 179 mm., the ether circula-

members were elected, of whom one was a New Yorker. Thus, of the twenty-six physicians who organized the American Ophthalmological Society and who were elected as members at this first meeting, thirteen, or one-half of the total number, were from New York. Furthermore, it is significant that of the thirteen New Yorkers, six were on the attending staff of the New York Eye and Ear Infirmary—Althof, Carmalt, Delafield, Du Bois, Noyes, Simrock. Four other members of the Infirmary staff became members of the Society between 1865 and 1869, but three of them resigned shortly thereafter when the aural surgeons organized the American Otological Society—Allin, Francis Delafield, Watts.²⁰

The relative preponderance of New York members persisted well into the present century. Friedenwald has analyzed the geographic distribution of the membership of the society at three different dates.²¹ In 1871 there were 52 members, half of them living in New York. In 1903 the membership totaled 164; of these 53, or 32.5 per cent, were New Yorkers. In 1938 the Society had a membership of 183; 36, or 20 per cent, resided in New York. It should be noted that Friedenwald makes no distinction between residents of New York City and of other parts of the state. However, on the basis of a much more detailed analysis of the membership lists of the American Ophthalmological Society, which was carried out some time prior to the appearance of Friedenwald's article and which it would take too long to present here, I am able to confirm his analysis and to state that his statistics are on the whole indicative of the relative size of the membership from New York City at different times.

It may be noted that the connection between New York and specialization has not been limited to ophthalmology. In 1873 an editorial writer in the *Virginia Clinical Record* remarked that "there are very few 'specialists,' simon-pure,

this side of New York. . . ."²² The development of other specialties, as, for instance, urology and dermatology, also exhibits significant connections with New York City.

As a result of the preceding analysis it is clear that New York has played a prominent and important part in the rise of ophthalmic specialization in America. This does not imply that other factors and conditions were not involved in this process, or that developments in other parts of the United States did not have any significant repercussions on ophthalmology in this country. There can be no doubt, however, that the appearance of ophthalmology as a *specialty* was intimately linked with New York City.

TUBERCULOSIS DEATHS

A decrease of only 0.3 per cent in the tuberculosis death rate in forty-two of the largest American cities as a group occurred in 1941 compared with 1940, it was announced in December by the National Tuberculosis Association. In 1941 the rate for the entire country was 3.3 per cent lower than in 1940 and the rate for New York City rose 2 per cent to 55 per 100,000. The local rise was the first since 1936.

The study was made of cities of more than 200,000 population.

Twenty-two of the cities studied have large Negro populations. In these cities, as a group, the rate for whites was 42 and for Negroes 203.

TYPHUS SHOWS GAINS IN EUROPE

Since the outbreak of the war in North Africa and Russia, a noticeable increase has been seen in the number of victims of spotted typhus. Further indications of its rising proportions are clear from the fact that sporadic epidemics of the disease are appearing frequently in Central Europe, which has never before been infected.

Germany particularly has been touched by the disease, with cases being reported in 44 of its 74 administrative divisions. The threat of epidemics naturally becomes greater as standards of cleanliness are lowered and as troop movements carry the disease to previously uninfected zones.

TUBERCULOSIS DEATHS

A decrease of only 0.3 per cent in the tuberculosis death rate in forty-two of the largest American cities as a group occurred in 1941 compared with 1940, it was announced in December by the National Tuberculosis Association. In 1941 the rate for the entire country was 3.3 per cent lower than in 1940 and the rate for New York City rose 2 per cent to 55 per 100,000. The local rise was the first since 1936.

The study was made of cities of more than 200,000 population.

Twenty-two of the cities studied have large Negro populations. In these cities, as a group, the rate for whites was 42 and for Negroes 203.

TYPHUS SHOWS GAINS IN EUROPE

Since the outbreak of the war in North Africa and Russia, a noticeable increase has been seen in the number of victims of spotted typhus. Further indications of its rising proportions are clear from the fact that sporadic epidemics of the disease are appearing frequently in Central Europe, which has never before been infected.

Germany particularly has been touched by the disease, with cases being reported in 44 of its 74 administrative divisions. The threat of epidemics naturally becomes greater as standards of cleanliness are lowered and as troop movements carry the disease to previously uninfected zones.

On the second admission to Bellevue, after having been bedfast for one year and with a number of admissions to different hospitals, the patient showed symptoms of adhesive pericarditis. Favoring this diagnosis were the kymographic findings of diminished cardiac pulsation, the electrocardiogram showing low voltage in all leads and fixed QRS complex with change of posture, normal ether time in the face of elevated venous pressure and prolonged circulation time, hypertrophy of the right auricle and ventricle without cor pulmonale (diodrast studies of the heart), enlarged liver and spleen, polyserositis, and active tuberculous infectivity. On the other hand, the chest film did not show any irregularity of the cardiac border or pericardial calcification, and certainly the high blood pressure and pulse pressure would speak against the presence of constrictive pericarditis.

No information was available concerning the patient's history for the six months preceding his final admission, at which time he was in a state of deep coma and terminal bronchopneumonia. The blood pressure remained high, and there was evidence of a hemiplegia, so that it was reasonable to assume that a cerebral vascular episode terminated his life. Curiously enough, no congestive signs were noted at this time, but this may have been owing to prolonged dehydration.

In summary, then, the clinical aspects of this case were presented as follows:

- (a) Uncontrollable congestive heart failure, early attributed to hypertensive and arteriosclerotic heart disease.
- (b) Silicosis and tuberculosis of the lungs of long standing.
- (c) Dissemination of tuberculous infectivity by hematogenous and pleural spread.
- (d) Evaluation of changes suggestive of adhesive pericarditis.
- (e) Termination with cerebral vascular phase of hypertensive disease.

DR. EMANUEL APPELBAUM: It is possible that the patient had an advanced form of failure of the right side of the heart, except that the ether circulation time, determined during the preceding admission, was quite normal. There is insufficient evidence to support a diagnosis of chronic cor pulmonale. The presence of pulmonary tuberculosis has not been ruled out despite the absence of clear-cut radiographic evidence. In many respects, the clinical features resembled those found in Pick's disease. Taking all the facts into consideration, it seems to me that the most logical diagnosis is tuberculous pericarditis with cardiac compression.

The nature of the terminal episode is difficult

to determine. It is very likely that the patient sustained a cerebrovascular accident, probably thrombosis. The spinal fluid findings, showing a slight increase in protein and no pleocytosis, are consistent with this condition.

DR. MAX TRUBEK: This patient had a long, afebrile course of illness. The response to diuretics was also unusual for tuberculosis. I should say that he had long-standing hypertension, silicosis, and hypertrophy of the right side of the heart and possible damage to the left ventricle. Congestive heart failure is the cause of the fluid accumulations, and I would consider cortical infarction due to thrombotic softening as the cause of the cerebral insult.

Discussion of Pathology

DR. IRVING GRAEF: At necropsy, it was notable that there was no cyanosis, even of the postmortem type. There was no clubbing of the fingers or toes and no external edema. There was a healed longitudinal scar, 12 cm. in length, in the left upper quadrant overlying the left rectus muscle. On opening the abdomen, many fibrous adhesions binding the greater omentum to the anterior abdominal wall were found. Similar adhesions bound the liver to the diaphragm, spleen, and the splenic flexure of the transverse colon.

The right pleural sac contained 2 liters of slightly turbid brown fluid, which compressed the right lung. The left pleura was obliterated by fairly dense fibrous adhesions. The pericardial sac could not be opened because of dense adhesions uniting its walls. The myocardium and the chambers did not appear abnormal except that almost the entire anterior aspect of the heart was represented by the right ventricle. Sharp dissection of the pericardial adhesions revealed occasional zones of caseous necrosis squeezed between layers of dense connective tissue. The inferior cava was not constricted at the point of entrance into the right heart; the right auricle and auricular appendage were unaltered; the tricuspid valve and leaflets and its chordae tendineae were unchanged. The pulmonary conus was not abnormally wide. The wall of the right ventricle measured 3 to 5 mm. in thickness from the thinnest to the thickest portions. The left auricle and ventricle were unchanged; mitral and aortic leaflets were not remarkable.

Dissection of the pulmonary artery revealed moderate widening so that its branches could be traced almost to the periphery of the lungs. Here and there, small thin atheromatous plaques could be demonstrated.

Both lungs were increased in density and were less crepitant than normal. The pleural sur-

tion time was 5.7 seconds, the cyanide time, 20.8 seconds, and the edcholin time, 20.5 seconds. Electrocardiograms showed low voltage with no change accompanying change in position. Diodrast films taken of the heart showed the right auricle to be normal except for apparent thickening of the wall to 1.1 cm.; the right ventricle was moderately enlarged; the pulmonary artery and branches were normal; the left ventricular cavity was faintly outlined and approximately normal, the wall measuring 1.9 cm. Six hours after injection of diodrast, the patient had a generalized convulsion followed by left-sided paresis which was transient in character. Spinal tap at this time showed clear fluid with initial pressure of 240 mm.; the Pandy test was negative; there were no cells, and the Wassermann reaction was not reported. On a maintenance dose of phenobarbital, there were no further convulsions. The lesion of the left hand was diagnosed as tuberculous tenosynovitis, and the patient was transferred to the Orthopedics Service, where incision and biopsy were performed and diagnosis was substantiated by microscopic studies. The patient was discharged on June 8, 1942, and he was not seen again until November 21, 1942, when he was admitted to the Fourth Medical Division. No history was obtainable at this time.

On admission his temperature was 100.0 F., pulse, 84, respirations, 48, and blood pressure, 185/120. Physical examination revealed an obese white man in deep coma, with stertorous breathing. There was slight cyanosis of the lips and nailbeds. The head, eyes, ears, nose, and throat were essentially negative except for a slight weakness of the left side of the face. The neck was flaccid. There were numerous medium moist rales throughout both lung fields, with dullness and diminished breath sounds at the right base. The heart was enlarged to the left. The rhythm was slow and the sounds were of good quality. A2 was greater than P2. No murmurs could be heard. Examination of the abdomen revealed the liver to be four finger-breadths below the costal margin, and the spleen was one finger-breadth below the costal margin. There was no edema of the extremities. The legs were held rigidly, and there was voluntary resistance of the left arm. Abdominal reflexes and cremasterics were absent bilaterally. Biceps jerk and triceps jerk on the right were absent. Both knee jerks were present and were equal. A positive Babinski reaction was present on the right side.

Laboratory Data.—The blood Wassermann was negative. Urinalysis showed a specific gravity of 1.020, 3 plus albumin, and no glucose. The microscopic examination revealed occasional

granular casts. The white blood count was 8,700, with a normal differential. The erythrocyte count was 3,600,000, with 90 per cent hemoglobin.

Course.—A spinal tap was made and yielded clear fluid, with an initial pressure of 180 mm. There were no cells. The Wassermann was negative, and the total protein was 60. The temperature gradually rose to 104.8 F., and the patient died fifty-four hours after admission.

Discussion

DR. HARRY A. SOLOMON: In going over this case it seems to me that an understanding of the findings lends itself to a discussion of the developing clinical features.

In the first place, the patient, a 57-year-old stonecutter, was treated for intractable heart disease with severe and uncontrollable congestive failure. Because of his age, cardiac enlargement (particularly of the left ventricle), and elevated blood pressure, the cardiac status was no doubt placed in the hypertensive and arteriosclerotic group. Because of the advent of rapid and persistent congestive failure it was likely that there developed extensive myocardial damage either from coronary insufficiency, occlusive or otherwise, or, because of the absence of coronary pain, physiologic dilatation of a hypertensive heart. The x-ray of the chest showed left ventricular enlargement; the kymogram showed diminished pulsations of the apical portion of the left ventricle; the electrocardiogram, low voltage—all pointing to extensive myomalacia or dilatation. Likewise, in the electrocardiogram, the prolonged PR interval could be ascribed to digitalis toxicity, and the absence of left axis deviation to the neutralizing effect of hypertension of the lesser circulation produced by the constricting fibrosis of the pulmonary changes. The x-ray showing extensive changes of silicosis permits, therefore, the inference of pulmonary tuberculosis, too; but the clinical effect of these changes was limited—early, at least—to that of diminished vital capacity, pulmonary hypertension, accentuation of right heart insufficiency, and neutralization of left axis preponderance of hypertensive heart disease.

Dissemination of tuberculous infectivity in the aged is not an unusual finding at Bellevue, so it was reasonable to explain the appearance of the tuberculous tenosynovitis to hematogenous spread and the lymphocytic fluid in the chest to tuberculous effusion even though the guinea-pig inoculation proved negative.

Now, as frequently happens on any medical service, patients admitted in congestive heart failure, when followed up, show conditions not suspected at first.

THE SIGNIFICANCE OF RECTAL BLEEDING

STUART T. ROSS, M.D., Hempstead, New York

IN THE past, it has been the careless custom of many physicians to ascribe any rectal bleeding to the presence of hemorrhoids, often without even a cursory examination. Many articles have been written upon the subject, emphasizing primarily the danger of this nonchalance, especially as a potent means of overlooking a malignant neoplasm. Attention has been repeatedly called to the advisability of a digital examination in all cases. There are, however, a great number of conditions besides hemorrhoids and cancer which produce rectal bleeding. It is my intention here to attempt to enumerate these and, to a certain extent, codify them. Obviously, it is impossible to do this completely and in detail, since such an undertaking would cover nearly the entire field of proctology.

Most Frequent Causes

The most frequent causes of localized bleeding are hemorrhoids, carcinoma, various forms of polyps, anal fissure, and ulcerative diseases of the mucous membrane.

The subject of hemorrhoids is so well known that I shall limit myself here to calling attention to the necessity for a visual examination. Internal hemorrhoids cannot be accurately diagnosed with the unaided finger—an anoscopic view is necessary and easily accomplished.

Rectal carcinoma can often be reached with the finger and sometimes a rectosigmoidal lesion can be felt by examining the patient while he is straining down in a squatting position. However, lesions in the sigmoid proper—and these are numerous—cannot be felt, and, in any case, a far better concept of the condition of the tumor will be gained by adding a proctoscopic examination to a digital examination. It should be remembered that bleeding is not the only sign of colonic carcinoma. Change in bowel habit, early morning diarrhea, discharge of mucus or pus, and, in more advanced cases, signs of partial obstruction, are all to be looked for.

Under the term *polyp*, we include all the colonic adenomata, whether pedunculated or sessile. There are several varieties, all of which are potentially malignant, and should be destroyed if possible. A single polyp may occur anywhere along the course of the large bowel, but it is found most frequently in the rectum or sigmoid. Those in the rectal ampulla can nearly always be detected with the palpating finger and should in

any case be found by the use of the sigmoidoscope. Polyps located higher than can be visualized may usually be detected by means of a barium enema, using the double-contrast air-injection technic.

It is advisable to take biopsy specimens not only from the summit but also from the base or pedicle of the growth, including a portion of the adjoining mucous membrane, if possible. These specimens should be carefully studied in order to detect any early malignant changes.

Multiple polyps will fall into one of two categories: (1) a so-called idiopathic polyposis or (2) one secondary to chronic ulcerative colitis. These can be differentiated in that the former is likely to be familial and will have an apparently normal mucous membrane between the individual growths. Polyps secondary to chronic ulcerative colitis, however, will be separated by areas of the diseased mucous membrane characteristic of the primary condition. Even during remissions, a swab applied to the mucosa will usually produce some bleeding.

Anal fissure is comparatively easy to diagnose. The small amount of blood (often simply a streak on the cleansing paper), the excruciating pain associated with or following the bowel movement, and the visualization of the lesion itself with its sentinel pile present a picture difficult to mistake.

The remaining major causes of bleeding from local lesions consist of the ulcerative diseases and various forms of proctosigmoiditis, exclusive of cancer. The most important of these are chronic ulcerative colitis, lymphogranuloma venereum, amebic and bacillary dysentery, and tuberculosis.

Tuberculosis may occur in the form of localized ulcers, diffuse colitis (usually terminal), and tuberculous hyperplasia. It is most often found in the cecum or ascending colon. Although gross or microscopic blood may be observed in cases of tuberculosis in this site, it is a rare phenomenon outside of tuberculosis sanatoriums.

Preoperative diagnosis of tuberculous hyperplasia of the ileocecal region will be made, if at all, by barium enema. The picture is one of a filling defect, sometimes indistinguishable from cancer on the one hand, and frequently from non-specific ileotyphlitis on the other.

Diffuse tuberculous colitis exists, as a rule, only in the terminal stages of a pulmonary or generalized tuberculosis. History, x-ray, proctoscopic findings, and bacteriologic examinations will reveal the diagnosis.

Localized ulceration in the rectum and colon

faces contained small, fairly evenly spaced blackish nodules, about 2 mm. in diameter. On section, the centers of the nodules were grayish and the periphery was black. Section of the lung disclosed an almost universal distribution of similar nodules at all depths. Areas of collapse alternated with areas of emphysema were present, but in the right lower lobe there was notable collapse and absence of crepitus. The bronchi and bronchioles were bilaterally and cylindrically dilated.

The peribronchial and paratracheal lymph nodes were enlarged and were blackish gray in color; on section, these nodes were dense and apparently scarred. Some nodes were the seat of caseo-calcific deposits.

The liver and spleen exhibited marked thickening of the capsules because of the deposit of connective tissue. The rest of the viscera were not remarkable except that the left testicle was smaller than the right. On section, the organ appeared fibrotic and the tubules could not be teased out. The epididymis on this side contained a small, grayish nodule, 3 mm. in diameter, embedded in one pole. A large area of caseous necrosis was found in the medulla of the right adrenal gland. Permission to examine the head could not be obtained.

Microscopic Findings.—In general, the sections confirmed the gross impression that the lungs were the seat of extensive anthracosilicosis of the nodular type. The characteristic nodule was composed of concentric whirls of connective tissue with central clefts, some of which contained highly refractile, unstained material suggestive of silicotic particles. At the periphery, aggregations of macrophages filled with carbon particles formed the margin of the nodules. However, three sample sections failed to disclose the presence of tubercles in the lungs. The small arteries and pulmonary arterioles were only slightly thickened by medial fibrous changes.

The pericardium was the seat of a chronic inflammatory process. Sections including both layers contained central areas of caseous necrosis bounded by tuberculous inflammatory tissue. The adrenal gland was the seat of an active caseous inflammation. The left epididymis was partly replaced by fibrous tissue in which no evidence of tuberculous infiltration could be demonstrated.

Review of the surgical specimen removed from the left little finger indicated that the tuberculous synovitis reported earlier was of duration com-

parable to the other tuberculous lesions. In it there were numerous old fibrotic tuberculous lesions as well as the more active exudative synovial inflammation.

Comment.—This case may be analyzed from many aspects. It is apparent that although anthracosilicosis was fairly advanced, it led only to moderate pulmonary hypertension as shown by the state of the pulmonary arteries and the size of the right side of the heart at necropsy. This statement must be qualified because of the probable constricting effect of chronic tuberculous pericarditis. It may be held responsible for some degree of interference in the right heart filling. Pleural effusion and peritoneal ascites may also be related to this lesion.

It is notable that random sections of the lungs revealed no tuberculous lesions although evidence of spread of tubercle bacilli via the blood stream was strongly suggested by the adrenal, synovial, the pericardial, and the old epididymal lesions. Because of the obsolete hilar lymphatic focus, we can only infer now that the original portal of entry was in the lung and probably healed, while the distant foci of tuberculosis continued to smolder. The peritoneal adhesions, the pleural adhesions, and the effusions of fluid into these scars are evidence to support the possible diagnosis of Pick's syndrome in the patient, especially because of the presence of tuberculous pericarditis. The multiplicity of lesions present and the possibility of unrelated inflammation of these serous membranes make it difficult to invoke this diagnosis with certainty.

Anatomic Diagnoses

CHRONIC TUBERCULOUS PERICARDITIS.

Diffuse nodular silicotic pneumoconiosis.

Obsolete caseo-calcific hilar lymphadenitis.

Caseous tuberculosis of right adrenal.

Pleural effusion, right.

Healed pleuritis, left.

Chronic passive congestion of liver and spleen.

Chronic perihepatitis.

Chronic perisplenitis.

Healed focal epididymitis.

Atrophy of left testis.

Pulmonary emphysema and cylindrical bronchiectasis.

Intra-abdominal peritoneal adhesions at operative site.

Healed surgical incision, left upper quadrant.

Tuberculous tenosynovitis, left hand, healed.

JUST A MINUTE—

"Are you John A. Van Dorky?" asked the young man beside the coat rack.

"No," was the surprised reply.

"Well, I am," came the frosty rejoinder, "and that is his coat you are putting on."

—*Milwaukee Medical Times*

THE SIGNIFICANCE OF RECTAL BLEEDING

STUART T. ROSS, M.D., Hempstead, New York

IN THE past, it has been the careless custom of many physicians to ascribe any rectal bleeding to the presence of hemorrhoids, often without even a cursory examination. Many articles have been written upon the subject, emphasizing primarily the danger of this nonchalance, especially as a potent means of overlooking a malignant neoplasm. Attention has been repeatedly called to the advisability of a digital examination in all cases. There are, however, a great number of conditions besides hemorrhoids and cancer which produce rectal bleeding. It is my intention here to attempt to enumerate these and, to a certain extent, codify them. Obviously, it is impossible to do this completely and in detail, since such an undertaking would cover nearly the entire field of proctology.

Most Frequent Causes

The most frequent causes of localized bleeding are hemorrhoids, carcinoma, various forms of polyps, anal fissure, and ulcerative diseases of the mucous membrane.

The subject of hemorrhoids is so well known that I shall limit myself here to calling attention to the necessity for a visual examination. Internal hemorrhoids cannot be accurately diagnosed with the unaided finger—an anoscopic view is necessary and easily accomplished.

Rectal carcinoma can often be reached with the finger and sometimes a rectosigmoidal lesion can be felt by examining the patient while he is straining down in a squatting position. However, lesions in the sigmoid proper—and these are numerous—cannot be felt, and, in any case, a far better concept of the condition of the tumor will be gained by adding a proctoscopic examination to a digital examination. It should be remembered that bleeding is not the only sign of colonic carcinoma. Change in bowel habit, early morning diarrhea, discharge of mucus or pus, and, in more advanced cases, signs of partial obstruction, are all to be looked for.

Under the term *polyp*, we include all the colonic adenomata, whether pedunculated or sessile. There are several varieties, all of which are potentially malignant, and should be destroyed if possible. A single polyp may occur anywhere along the course of the large bowel, but it is found most frequently in the rectum or sigmoid. Those in the rectal ampulla can nearly always be detected with the palpating finger and should in

any case be found by the use of the sigmoidoscope. Polyps located higher than can be visualized may usually be detected by means of a barium enema, using the double-contrast air-injection technic.

It is advisable to take biopsy specimens not only from the summit but also from the base or pedicle of the growth, including a portion of the adjoining mucous membrane, if possible. These specimens should be carefully studied in order to detect any early malignant changes.

Multiple polyps will fall into one of two categories: (1) a so-called idiopathic polyposis or (2) one secondary to chronic ulcerative colitis. These can be differentiated in that the former is likely to be familial and will have an apparently normal mucous membrane between the individual growths. Polyps secondary to chronic ulcerative colitis, however, will be separated by areas of the diseased mucous membrane characteristic of the primary condition. Even during remissions, a swab applied to the mucosa will usually produce some bleeding.

Anal fissure is comparatively easy to diagnose. The small amount of blood (often simply a streak on the cleansing paper), the excruciating pain associated with or following the bowel movement, and the visualization of the lesion itself with its sentinel pile present a picture difficult to mistake.

The remaining major causes of bleeding from local lesions consist of the ulcerative diseases and various forms of proctosigmoiditis, exclusive of cancer. The most important of these are chronic ulcerative colitis, lymphogranuloma venereum, amebic and bacillary dysentery, and tuberculosis.

Tuberculosis may occur in the form of localized ulcers, diffuse colitis (usually terminal), and tuberculous hyperplasia. It is most often found in the cecum or ascending colon. Although gross or microscopic blood may be observed in cases of tuberculosis in this site, it is a rare phenomenon outside of tuberculosis sanatoriums.

Preoperative diagnosis of tuberculous hyperplasia of the ileocecal region will be made, if at all, by barium enema. The picture is one of a filling defect, sometimes indistinguishable from cancer on the one hand, and frequently from non-specific ileotyphlitis on the other.

Diffuse tuberculous colitis exists, as a rule, only in the terminal stages of a pulmonary or generalized tuberculosis. History, x-ray, proctoscopic findings, and bacteriologic examinations will reveal the diagnosis.

Localized ulceration in the rectum and colon

Read before the Proctologic Society of the Graduate Hospital, University of Pennsylvania, March 18, 1942.

is revealed by proctosigmoidoscopy in the form of shallow, ovoid ulcers with undermined edges and dirty gray bases. Scrapings from the ulcer bases may reveal the *Mycobacterium tuberculosis*.

Tuberculous ulcers about the anus will be found to be shallow, with sharply defined undermined edges, a nodular floor, and a scant, foul discharge. They are usually painless, unless within the grasp of the sphincters.

All of these varieties are much more frequently found in patients with an associated pulmonary tuberculosis. Moreover, any bleeding is apt to be slight in amount.

The presence of *amebiasis* will be difficult to determine, and the absolute diagnosis will rest upon the finding of the *Endamoeba histolytica* in the stool or on the bowel wall. The stool will probably be loose and mixed with mucopurulent material as well as with blood. Proctosigmoidoscopy reveals rather typical isolated ulcers, deep rather than shallow, and with a predilection for prominent folds of the bowel. If the diagnosis is suspected but cannot be confirmed, a therapeutic test with emetine may clear up the matter.

Bacillary dysentery also presents a picture of diarrheic stools mixed with mucus, pus, and blood. The ulcers tend to be more shallow than they are in the amebic variety and are less definite in character. Bacillary dysentery may be easily confused with chronic ulcerative colitis even on direct visual examination. Final diagnosis is made by finding the specific organism in the stool culture in the first week or two of the disease, or later by the specific agglutination reaction of the patient's serum.

There remains the subject of chronic idiopathic ulcerative colitis, which is the most serious cause of rectal bleeding, except for carcinoma itself. The cause of this disease is not definitely known; it has a guarded prognosis, and a difficult and prolonged treatment. It should be one of the first possibilities to enter the mind of the diagnostician when he is confronted with the presence of blood in the stools, especially when accompanied by loose or very frequent movements.

The cause, while not proved, is probably streptococcal; the incidence is greater in men and occurs most frequently in patients between the ages of 20 and 40. Although the majority of cases begin in the rectum and progress cephalad, there exists a variety which may be localized to a small segment anywhere in the colon. Fansler has described a condition which appears identical with the ordinary ulcerative colitis except that it is limited sharply to the lower segment of the rectal mucous membrane. It is his present opinion that this particular entity may be the

same as regional ileitis, localized to the final 2 inches of the bowel.

Ulcerative colitis is usually not difficult to diagnose on proctoscopy. In the preulcerative stage, the mucous membrane is the site of a diffuse inflammation and appears to be studded with small granules from 1 to 2 mm. in size. These really are minute abscesses. Later, they break down to form large irregular ulcers, presenting a picture which once seen is not easily mistaken. Still later, the bowel becomes thickened, haustrations are less marked, and the involved colon is transformed into a more or less rigid tube. Common complications are perirectal abscesses, polyposis, and strictures. The proctoscopic appearance is so characteristic that when the physician is confronted with an ulcerative condition that resembles chronic ulcerative colitis but which he has not confirmed as that, he will do well to rule out the other causes of large bowel ulcerations, especially bacillary dysentery.

Less Frequent Causes of Rectal Bleeding

These may be listed as follows: diverticulitis, intussusception, fistula, the presence of a foreign body, lymphogranuloma venereum, actinomycosis of the cecum, thrombosis of the mesenteric vein, trauma, drugs, acute gastro-enteritis, pinworms, peptic ulcer, prolapse and procidentia, impaction, chancre and chancroids, condylomata, Meckel's diverticulum, hemangioma, vicarious menstruation, nephritis and hypertension, radiation proctitis, endometriosis, and nonspecific granuloma.

To these may be added, for the sake of completeness: cholera, yellow fever, typhoid, sprue, malaria, scurvy, septicemia, the blood dyscrasias (including Henoch's purpura), icterus, and swallowed blood from epistaxis, esophageal varices, hemoptysis, and ruptured aneurysm.

Lymphogranuloma venereum may likewise exhibit blood per anum, but the diagnosis in this case is likely to be easy. Obviously, bowel hemorrhage from lymphogranuloma venereum will be confined to those suffering from the rectal manifestations of the disease, and the patients will be found almost exclusively to be adult negroes between the ages of 20 and 40. This stipulation is, of course, not absolute, but will be observed in the overwhelming majority of cases.

The proctitis of lymphogranuloma venereum occurring in the presence of stricture, produces a discharge which is a dirty, rather thin, often bloody material. However, there is a period following the primary inoculation with the virus, and before the appearance of the stricture, during which the proctitis appears alone, and a bloody purulent discharge exudes from the granulating

surface which replaces the normal mucous membrane. As Evans has recently brought out,¹ approximately six weeks elapse between infection of the rectal mucosa and the development of symptoms. In the majority of cases, stricture formation will begin within three months after the onset of proctitis. Since with the use of the sulfonamide drugs a cure may be expected in many cases which are exhibited before the onset of stricture, the importance of early recognition of this form of proctitis is evident. Either the Frei test, using mouse-brain or chick-embryo antigen, or the complement-fixation test may be used to differentiate lymphogranuloma from other forms of proctitis.³ (Lygranum antigen has been employed for complement-fixation. In well over 90 per cent of the serums, there was complete agreement with the cutaneous tests. The new test is especially valuable with a doubtful skin test and permits some gradation quantitatively of the progress of the disease.)

Prolapse and procidentia are terms that cannot be used interchangeably. The former designates an abnormal descent of the mucous membrane of the rectum, whereas the latter denotes an abnormal descent of all the coats of the rectum. Either condition may be internal or external, depending upon whether the protrusion appears outside the anal orifice. In the external variety of either prolapse or procidentia, the diagnosis becomes obvious when the patient is asked to strain.

Bleeding occurs when the mucous surfaces become irritated by friction, but it is usually slight in amount. In the internal varieties the diagnosis is often quite obscure. Blood-tinged mucus may be observed without apparent cause, and in cases of procidentia of the sigmoid, the condition is sometimes not determined except by digital examination with the patient in a squatting posture. Thus, sigmoid intussusception is to be thought of when blood-tinged mucus is not accounted for on ordinary examination or x-ray.

Diverticulitis may produce small amounts of blood mixed with feces in about 10 per cent of cases. (Hayden cites blood in 28 out of 140 cases—20 = 3.38 per cent.) However, this leaves about 80 to 90 per cent which do not bleed. In any case, when bleeding is found in the presence of a known diverticulitis, it is essential to use every means, including x-ray, to rule out carcinoma, as the two may coexist. Diverticulosis without inflammation does not produce bleeding.

Bleeding peptic ulcer and other forms of hemorrhage from the upper intestinal tract will usually be demonstrated by dark, tarry material in the stool. Otherwise, the blood may be undetectable except by chemical tests. It should be

noted here that if the hemorrhage produces a very large quantity of blood, some of it may not be acted upon by the time it has reached the anus, and may still be red instead of black. However, in this case the constitutional symptoms and history will probably be sufficient to establish the diagnosis.

Intussusception, excepting procidentia of the sigmoid, occurs principally in infancy, most often about the eighth or ninth month of age. The blood is accompanied by mucus and by an abdominal tumor in an acutely ill child with symptoms of obstruction.

Trauma and foreign bodies, while important causes of bleeding, are usually readily diagnosed by the history and ordinary methods of anorectal examination. *Fecal impaction* is also easily found by means of a simple digital exploration, although a complete proctologic examination should always be done after the impaction has been removed and the patient is in condition to undergo the procedure.

Summer diarrhea of children, and *irritant drugs*, especially arsenic, calomel, and excess purgation in any form, may give rise to transient bleeding which stops when the causative factor is removed.

Chancre, chancroids, and less often *condylomata* may produce a sanguineous discharge, but the source is obvious upon inspection.

Meckel's diverticulum is found mostly in children. In some cases there have been found small areas of gastric mucosa, which is susceptible to ulcer formation. The character of the bleeding from a Meckel's diverticulum is quite indefinite—it may be bright or dark, mixed or unmixed with the feces. Hudson has reported a series of 32 cases from the Children's Hospital in Boston, with rectal bleeding in 17 (53 = 8.8 per cent).²

Fistula-in-ano or *cryptitis* may be accompanied by a small amount of blood on the outside of the stool.

Pinworms (*Oxyuris vermicularis*) may be the source of small amounts of blood, especially in children. They are to be suspected particularly when there is itching about the anus, increasing at night, and can be diagnosed by finding either the ova or the worms themselves in the stool.

Actinomyces of the cecum is fortunately a rare entity, and when present will usually offer enough other signs that the rectal bleeding will be simply an associated symptom.

Hemangioma is a blood vessel tumor, ordinarily benign. It is fortunately quite rare, but may produce alarming, massive hemorrhages when present. The majority of these tumors appear in the small intestine, although several have been

reported in the rectum and colon. When the tumor cannot be visualized with a sigmoidoscope, diagnosis is made only on exploratory laparotomy.⁴

Radiation proctitis represents an inflammatory process of the rectum resulting from the use of radium, usually for the treatment of carcinoma of the cervix. Bleeding is almost always present, slight in amount and usually in the form of clots which are passed with the stool. Proctoscopy, together with a careful history, will readily disclose the diagnosis. The lesion is usually situated on the anterior rectal wall and appears as an oval, pearl-gray plaque surrounded by telangiectases.

Endometrial implants are rarely found in various parts of the bowel and the rectovaginal septum. Although bleeding is uncommon with this condition, it may occasionally be noted. Endometriosis occurs only in women of the child-bearing age and is diagnosed by the presence of firm, tender nodules and rectal pain which is accentuated with each menstrual period.

Classification

Classification of the more common causes of bloody emanations from the rectum according to type and age of the patients is as follows:

Infants

Hemorrhagic disease of the newborn
Intussusception

Older Children

Prolapse
Rectal polyp (usually single)
Summer diarrhea (acute gastro-enteritis)
Pinworms

Adults (20 to 40)

Hemorrhoids
Fissure and fistula
Polyposis or single polyps
Ulcerative colitis
Amebic or bacillary dysentery
Diverticulitis

Older Adults

Carcinoma
Hemorrhoids
Prolapse and procidentia
Impaction
Polyps
Dysentery, amebic or bacillary

Adult negroes are especially prone to lympho-granulomatous strictures.

The following diagnostic points may be mentioned:

1. A chronic or subacute bloody diarrhea is likely to signify, in the following order:

- (a) Chronic ulcerative colitis
- (b) Carcinoma, or
- (c) Amebic dysentery

2. With hemorrhoids, fissure, and fistula, the blood is not usually mixed with the stool, and since the site of these lesions is low, very little, if any, mucus is associated.

3. When mucus as well as blood is present, it is probable that something more than hemorrhoids is involved.

Summary

When confronted with a complaint of blood per anum, the physician must make a differential diagnosis between the numerous conditions capable of producing this symptom. There has been made an attempt to list and comment briefly upon the more common and the less common of these conditions, and to mention the rarities. Some practical points in differential diagnosis have been emphasized.

\$150,000 GIFT FOR TROPICAL MEDICINE

Dr. Willard C. Rappleye, dean of the College of Physicians and Surgeons of Columbia University, has announced that Columbia-Presbyterian Medical Center will shortly launch a five-year program of research and teaching in tropical medicine. This program has been made possible by a \$150,000 gift from the Josiah Macy, Jr., Foundation. It has been formulated, according to Dean Rappleye, to meet the country's "great responsibility" to train physicians and medical students in tropical medicine.

A regular department of tropical medicine will be set up in the De Lamar Institute of Public Health, which is a division of the College of Physicians and Surgeons. Existing laboratories and clinical facilities will be used and cooperation will be established with the city's Health Department. Columbia's School of Tropical Medicine at the University of Puerto Rico will be utilized as a field station and its work coordinated with the teaching program in New York.—*J. Med. Soc. Co. N.Y.*

THE DEMONSTRATION OF MALIGNANT CELLS IN VAGINAL SMEARS AND ITS RELATION TO THE DIAGNOSIS OF CARCINOMA OF THE UTERUS

GEORGE N. PAPANICOLAOU, M.D., and HERBERT F. TRAUT, M.D., New York City

THE exfoliation of normal epithelial cells which line the uterine cavity, the cervix, and the vagina is a phenomenon which is generally known and accepted. It is not widely known, however, that abnormal epithelial cells resulting from pathologic processes, including cancer, are shed and that they may be collected and studied by a simple technic. It is our purpose to point out some of the things that may be learned from the study of vaginal smears, particularly in relation to the diagnosis of cancer of the fundus and cervix of the uterus.

The methods used in making the smears¹ and in staining² them have been previously reported. Before one can hope to recognize and analyze the meaning of abnormal cell forms as they appear in vaginal smear preparations, it is necessary to gain experience with the variations in the normal cell pattern as a background. The process is in many respects analogous to that pertaining to the use of stained blood smears, essential to the recognition of many blood diseases. The pathologist will find but little help from the vaginal smear until he has approached the task with a well-founded knowledge of the normal variations as well as of those which result from benign pathologic conditions, such as trichomonas vaginitis, cervical and endometrial polyps, hyperplasia of the endometrium, and inflammations of the cervix and endometrium. Having done this, however, he is in a position to give valuable diagnostic aid to the clinician in the form of advice concerning patients who should be kept under careful observation, as well as those with early evidences of the disease or with well-established lesions.

For the past two years, vaginal smears have been made routinely upon every woman admitted to the gynecologic service of the New York Hospital. By use of the vaginal smear, a considerable number of asymptomatic and therefore unsuspected cases of uterine malignancy have been discovered, some of them in such an early stage of development that they were invisible to the unaided eye or undemonstrable by the biopsy method. Two cases, one an adeno-

carcinoma of the fundus and the other a squamous carcinoma of the cervix, will serve to illustrate.

Case Report

Case 1.—Miss J., aged 61, had never had any symptoms which could be correlated to a malignancy of the fundus of the uterus, having come to us because of chronic bladder difficulties. We took weekly vaginal smears for a period of four months, and all were indicative of adenocarcinoma. Two curettage biopsies failed to corroborate the vaginal smear diagnosis. Accordingly, a third biopsy was done, from which a small, suspicious fragment of tissue was obtained. Hysterectomy showed a small polypoid area of carcinoma situated in the corner of the left side of the uterus—in fact, such a small lesion that three attempts with the curette were required before the growth could be demonstrated.

Case 2.—Mrs. Q., aged 47, came to the Out-Patient Clinic of the New York Hospital complaining of symptoms referable to a relaxed pelvic floor and some descensus of the uterus, with cystocele and rectocele. Routine vaginal smear revealed cells that were thought to be characteristic of squamous cell carcinoma of the cervix. However, the most minute examination of the cervix and vagina failed to reveal any visible lesion. Repeated biopsies were made without discovering anything malignant, although some hyperkeratotic zones of epithelium were found.

The patient was kept under observation for four months, with careful inspection of the cervix and vagina at monthly intervals. Finally, a small area of leukoplakic epithelium was observed and a biopsy made, showing an unquestionable early squamous cell carcinoma of the cervix. During the four months of observation, weekly vaginal smears were made, in each of which could be seen the cellular picture of squamous cell carcinoma of the cervix.

This is interpreted as an instance of early carcinoma of the cervix in which the vaginal smear made the diagnosis possible at a much earlier date than would have been possible by means of biopsy technic. Furthermore, this diagnosis could not have been made had we not been making routine vaginal smears of all patients.

That the early lesions of squamous carcinoma and adenocarcinoma of the uterus can be detected is a finding of great importance; heretofore there has been no method available for the accomplishment of this end. As is well known, the early lesion can usually be cured, and not only

¹ Read at the Annual Meeting of the Medical Society of the State of New York, New York City, April 30, 1942.

² From the Departments of Anatomy and Obstetrics and Gynecology of the Cornell University Medical College, New York City.

² Papanicolaou, George N.: *Science* 95: 438 (1942).

that—it can be cured by simple and relatively inexpensive means. If a vaginal smear study could be made once or twice a year on each woman in the cancer-bearing period of life, it would be possible to change the whole aspect of present experience with this disease of the uterus. The importance of such a project may be grasped when one realizes that only rarely in the use of other methods does one encounter the early lesion. Therefore, our present treatment is largely of advanced lesions, with but little over 30 per cent cure. Furthermore, about 15,000 women succumb annually to the ravages of the disease.

Although it is possible to learn how to make the diagnosis of carcinoma of the uterus only through actual experience, we may nevertheless attempt to outline the criteria upon which the diagnosis is based.

Squamous Carcinoma of the Cervix

The cells show great variations in form and size. Generally speaking, the more undifferentiated forms exhibit the smallest cells. The reduction in size is due chiefly to smaller amounts of cytoplasm. Mitoses are rarely observed, but enlarged, malformed, and hyperchromatic nuclei with granular chromatin and prominent nucleoli are typical. Most of the cells are discrete, but many are seen in groups or sheets. The cytoplasm is often dense and stains dark. In well-differentiated carcinomas one may see spindle-like triangular or ameboid shapes. Some of the cells reach unusually large sizes. Cytoplasm may be cornified or may show pronounced vacuolation.

Adenocarcinoma of the Cervix

In general, the nuclear changes are similar to those outlined for the squamous variety. The cells are much smaller, however, and may be seen more frequently in clusters. The more embryonic types may have little demonstrable cytoplasm, and these growths nearly always shed cells in clusters consisting of from few to many cells. It requires much experience to differentiate this type of adenocarcinoma of the cervix from that which is characteristic of the fundus.

Adenoacanthoma of the Fundus

This type of carcinoma yields cells in the vaginal smear which have relatively abundant cytoplasm, often acidophilic to some degree and frequently vacuolated. The cells are comparatively large. The nuclei are also enlarged and

show characteristic inequalities in shape and form.

Adenoma Malignum of the Fundus

This is the most difficult carcinoma of the uterus to discover by means of the vaginal smear, the reason being that many relatively normal forms are intermixed with cells bearing malignant characteristics. The cells are shed in clumps. Therefore, one must go to some pains to find small groups and to observe several of these before arriving at negative conclusions.

Adenocarcinoma of the Fundus

Groups of cells, many of which contain nuclei with an atypical arrangement of the chromatin, deep basophilia, and irregularities of shape, and size, are found in this type of carcinoma. The cells contain very scanty cytoplasm and usually are small, the smallest approximating the size of a polymorphonuclear leukocyte.

In addition to the specific cellular changes, there are accessory factors which, though they do not have diagnostic importance in themselves, are contributory, and often serve to arouse one's suspicions when present. Among these are the presence of erythrocytes, clumped leukocytes, histiocytes, and the small basal cells which evidently come from the malpighian layer.

As has been said, there are numerous benign pathologic conditions, such as chronic cervicitis, endometritis, and prolonged hyperestrogenic conditions, which may, and often do, result in the appearance of somewhat modified cervical and endometrial cells in the smears. Such cells form atypical groups, and the individual cells may acquire atypical forms such as enlarged nuclei and vacuolation of the cytoplasm; however, these always retain normal nuclear content and arrangement. One must therefore be familiar not only with the normal cells of the vaginal smear but also with these atypical forms.

A positive diagnosis of malignancy should not be given until numerous characteristic and pathognomonic cells and cell groups have been seen. Negative findings should not be considered as final, particularly when atypical cells or some of the suspicious signs such as the presence of erythrocytes, polymorphonuclear leukocytes, and groups of histiocytes are seen. Under these circumstances, or when there is bleeding or a profuse watery discharge, further smears should be examined.

A well-illustrated monograph is in the process of preparation and should be of great assistance to those who desire to learn the exact details of this method of diagnosis.

Case Report

HEMATURIA WITH PROGRESSIVE OLIGURIA DUE TO BILATERAL URETERAL OBSTRUCTION FOLLOWING SULFATHIAZOLE ADMINISTRATION; SIGNIFICANCE OF EARLY CYSTOSCOPIC AND URETERAL LAVAGE

SAMUEL LUBASH, M.D., F.A.C.S., and JACOB H. TURKELL, M.D., New York City

A NUMBER of investigators^{1,5-9} have shown that extrarenal* as well as intrarenal obstruction to urinary flow can occur following the administration of the sulfonamide group of drugs. Clinical reports^{12,14,16} in which obstruction to urinary flow was primarily due to extrarenal deposits of sulfapyridine have confirmed the experimental findings. To date there has not appeared a clinical report in which inefficiency of urinary flow following sulfathiazole administration was primarily due to extrarenal obstruction. Thus, Pepper and Horack² reported a case of anuria due to sulfathiazole concretions deposited in the collecting tubules. Knoll and Cooper⁴ describe a case of gross hematuria associated with a rise in nonprotein nitrogen and blood pressure. Arnett¹² reported a case of severe hematuria and lumbar pain following sulfathiazole therapy. The only case,¹⁷ to date, in which sulfathiazole concretions were found in the extrarenal passages did not give any clinical signs of urinary complications or renal suppression. The findings were incidentally disclosed at autopsy. Flippin *et al.*,¹⁸ in a comparative study of sulfapyridine and sulfathiazole therapy for pneumonia, mention the finding of crystals of acetyl sulfathiazole in the pelvis as well as the tubules of both kidneys in a fatal case of endocarditis. They, too, do not mention whether or not any signs of renal suppression occurred. To our knowledge, the following case is the first to be reported in which urinary suppression with anuria following sulfathiazole administration was caused primarily by extrarenal obstruction—namely, deposition of crystalline sediment in both ureters.

Case Report

M. S., a 76-year-old woman, was first seen for a cold by her private physician, Dr. Louis Greenwald, of New York City, on January 15, 1941. The following data were obtained from his records:

Examination at the time the patient was first seen revealed dyspnea, cyanosis, fibrillation with marked pulse deficit, and bilateral basal pulmonary rales with an area of crepitant rales below the right scapula. The blood pressure was 160/100. The blood count was: hemoglobin, 95 per cent; red blood count, 4.8; white blood count, 8,400, with 84 per cent polymorphonuclears. The urine showed a trace of albumin and an occasional white blood cell. Past history revealed that the patient was a known hypertension arteriosclerotic cardiac of two or three

years' standing, suffering from episodes of dyspnea, edema of the legs, and paroxysms of fibrillation for which she was given digitalis. She had also been a chronic bronchial asthmatic for many years. There was no history of any renal disease. On January 16 the patient was started on sulfathiazole, 1 Gm. q4h. Digalen, grain twice a day, 1½ was prescribed. Owing to the drop in temperature to 100 F. with symptomatic improvement, the drug was discontinued the next day, January 17, after a total of 7 Gm. had been given. NaHCO₃, 1 teaspoonful three times a day, was then prescribed. During the twenty-four-hour course of therapy, the fluid intake was 2,040 cc. and the urinary output 1,440 cc., with an additional 600 cc. of clear urine voided in a period of four hours following the last dose of sulfathiazole. Twelve and one-half hours after the last dose the patient began to complain of a desire to void and, with difficulty, passed 120 cc. of urine. Three hours later she again complained of discomfort and inability to void. Catheterization was resorted to and 45 cc. of dark-reddish urine were obtained. This was sent to a neighboring laboratory for analysis, which reported a + plus albumin, many red blood cells, positive benzidine, and many crystals described as resembling leucine and tyrosine. One hour following catheterization she voided 120 cc. of dark-red urine. During the next two and one-half hours she still complained of discomfort and urgency but was unable to pass more than 15 cc. on three separate occasions. The presence of urinary obstruction due to sulfathiazole was considered probable, and because of the possibility of impending anuria, the patient was hospitalized on January 18.

On admission to the Beth Israel Hospital she appeared slightly cyanotic and moderately dyspneic. She complained of pain over the right kidney. There was no icterus; the liver was not felt, but the overlying area was tender. There was questionable dullness at the right pulmonary base, with generalized coarse rales throughout and fine crackling rales in the bases and axillae. The heart was not enlarged and no murmurs were present, but there was a regular sinus rhythm with no pulse deficit. The blood pressure was 190/98. A + plus pretibial edema was present. The temperature was 99.6 F.; respiration 42; pulse 90. Blood count showed hemoglobin 101 per cent; red blood count, 4.9; white blood count, 7,300, of which 5 per cent were stab cells. Sulfathiazole concentration in the blood was 1 mg. per cent. N.P.N., which was done at first by the intern on call and reported as 44, was later found to be 78.

Cystoscopy with ureteral catheterization was done. The bladder was slightly congested and held 1 cc. of very bloody urine. No concretions were noted in the bladder. There were numerous crystals protruding from and surrounding the right ureteral orifice. The left ureter showed one crystal protruding from its orifice. Punctate lacerations about the right ureteral orifice were noted. The ureters

*Associate attending urologist, Beth Israel Hospital, New York City.

Research intern, Urological Department, Beth Israel Hospital, New York City.

*The term "extrarenal" indicates the urinary passages outside the kidney proper—viz., pelvis, ureters, and bladder. The term "intrarenal" designates the collecting tubules of the kidney.

were catheterized, and immediately a shower of crystals simulating a snowstorm descended from both ureteral orifices down along the sides of the catheters into the bladder. Twenty cc. of blood-tinged urine was obtained from the right kidney and 10 cc. from the left. Both catheters were allowed to remain *in situ*, and lavages of warm sterile water were started. Microscopic examination of the sediment secured from the ureters showed innumerable sulfathiazole crystals with many red cells. For chemical examination the total sediment was extracted with acetone. This yielded 480 mg., of which 258 mg. were conjugated drug, 210 mg. were in the free form, and 12 mg. were extraneous material.

The catheters were allowed to remain indwelling in both ureters for sixteen hours and during this time 700 cc. of urine was obtained. Lavage was repeated every fifteen minutes in order to prevent blocking of the catheters. Because of the patient's cardiac status, fluid therapy had to be carefully outlined in order to secure rapid urine alkalization and diuresis without overtaxing the myocardium. A hypodermoclysis of 600 cc. of Hartman's solution was given. A slow intravenous of Ringer's solution at 40 drops per minute was started, with repeated portions of 50 cc. of 50 per cent sucrose. Potassium citrate and Ringer's solution were given orally. The patient was placed on a maintenance dose of digitalis. After removal of the catheters, the patient voided 1 ounce of dark-reddish urine, pH 6. This revealed many red blood cells, a few hyaline casts, and a moderate number of sulfathiazole crystals. During the next 17½ hours she began to void more freely, her urinary output totaling 1,470 cc. She had had during this time a fluid intake of 2,790 cc. Examination of the urine passed now gave an alkaline reaction, pH 7.5. No crystalline sediment was present. The N.P.N. of the patient returned to 26 mg. per cent. Because of the elevated CO₂ (79.9) and increased dyspnea, alkalization was discontinued, the patient was placed on a cardiac regimen, with salt free diet, restricted fluids, and nasal oxygen. Digitalis was continued. In spite of this regimen, dyspnea became more severe. The temperature fluctuated between 100 and 102 F. X-ray revealed senile emphysema with unresolved patches of consolidation in the left upper and both lower lobes. The patient continued to go downhill and died on January 24, 1941, the seventh day of hospitalization.

An N.P.N. taken one hour before death was 27. At no time did the patient become anuric or show other signs indicative of the recurrence of renal obstruction. A routine urine taken had a specific gravity of 1.030. This showed that renal function was adequate.

Although the death of the patient was probably due to cardiac failure with a superimposed bronchopneumonia, there is little doubt that the oliguria and transitory uremia played a contributory part. We believe the latter complications were secondary to renal insufficiency resulting from tubular but primarily ureteral obstruction of the kidney passages by crystalline deposits of sulfathiazole.

Discussion

Gross *et al.*¹ pointed out that sulfapyridine uroliths tend to be precipitated in the pelvis and ureters, whereas sulfathiazole deposits were found more commonly in the renal tubules. Since then, the tendency has been to differentiate the mechanism responsible for the urinary obstruction caused by the two drugs—that is, if sulfapyridine causes the

obstruction, it is of extrarenal origin, whereas if sulfathiazole causes the obstruction, it is of intrarenal origin. Such a concept leads to the danger of disregarding the significant role that extrarenal obstruction might play in cases receiving sulfathiazole therapy. That no such sharp line can be drawn between the two drugs is indicated by the case reported. In any case of obstruction, whether by sulfathiazole or sulfapyridine, one should not forget to guide the therapy by the recognition of the fact that extrarenal as well as intrarenal concretions may be present.

The importance of treating the intrarenal obstruction by discontinuance of the drug, forcing fluids, and immediate alkalization of the urine is now a well-established principle.^{3,10,12,16} Gross⁷ and Antopol⁸ have shown experimentally that the crystalline deposits dissolve on discontinuance of the medication. It is to the treatment of the extrarenal type of obstruction that we wish to call particular attention. The presence of hydronephrosis, hydro-ureters, or a distended, obstructed bladder have been only too commonly demonstrated in the experimental animal.^{1,5,6} Cases of extrarenal urinary obstruction are being reported more and more frequently.^{13,14,15,16} Cognizance of the cystoscopic manipulation and its importance is shown in the cases reported by Tsao,¹³ Carroll,¹⁴ and Dourmashkin and Warton.¹⁶ The latter^{14,16} were able to re-establish kidney drainage by ureteral catheterization in cases of bilateral ureteral obstruction following sulfapyridine administration.

In our own case, we feel that relief of the urinary obstruction was in great part due to removal of the extrarenal deposits by ureteral catheterization and lavage. Were it not that the patient finally succumbed to the bronchopneumonia and cardiac decompensation, she probably would have fully recovered from her urinary complications.

There is one other point worthy of emphasis, previously pointed out by Sadusk *et al.*,¹¹ viz., the use of caution in the administration of even small doses of these drugs in elderly patients with chronic cardiovascular disease. In the case reported here, only 7 Gm. had been given with, apparently, an adequate fluid intake, yet this was enough to cause dangerous urinary obstruction.

Summary

1. A case is reported in which hematuria and oliguria, with elevation of the N.P.N., resulted from bilateral obstruction of the ureters following the administration of only 7 Gm. of sulfathiazole for pneumonia in an elderly patient with chronic cardiovascular disease. Bilateral ureteral catheterization helped to bring about re-establishment of kidney drainage.

2. Animal experiments now substantiated by clinical reports show that sulfathiazole, like sulfapyridine, can crystallize within the extrarenal passages of the urinary tract.

3. Those cases in which hematuria and oliguria are not relieved promptly by forcing fluids and alkali should lead to the recognition that the obstruction may be in the extrarenal urinary passages.

In these cases, the necessity of early cystoscopy and urethral intervention and drainage as a life-saving theurpeusis is emphasized.

4. The importance of exercising caution in administering even small doses of the drug to elderly individuals with chronic cardiovascular disease is stressed.

IMMUNITY AND PROTEIN RESERVES

According to a recent presidential address before the American Association of Immunologists by Dr. Paul R. Cannon, the last two decades have seen the general acceptance of a new theory of specific antibody production with numerous practical applications to nutritional physiology in wartime.

Toward the close of the nineteenth century the accepted theory of specific immunity was based on Ehrlich's specific receptor hypothesis. This assumes that specific antibodies pre-exist as hereditary "receptors" or "side chains" in fixed tissue cells, from which they are given off as a result of contact with corresponding specific antigens. Accumulated clinical and experimental evidence eventually led to an almost unanimous discarding of this theory in favor of the concept that protective antibodies are newly formed chemical complexes, synthesized as a result of the action of normal intracellular enzymes. Antibodies were conceived to be acquired chemical characters, whose method of synthesis became a feasible problem in biochemical research.

Numerous biochemists became interested in this basic problem. Breinl and Haurowitz, of Czechoslovakia, proved through experimentation that the precipitating antibody is chemically identical with normal rabbit serum globulin except for the spatial arrangement of its constituent amino acids. From this it seemed evident that specific precipitins are normal serum globulins whose intracellular synthesis is modified by the "templating" action of the absorbed antigen. The locally synthesized "antigenic template" thus replaced the hereditary "cell receptor" of the earlier theory.

In his address Dr. Cannon reviewed the accumulated experimental evidence in support of the "template" theory, with additional evidence sug-

gesting that the "antigenic template" is synthesized from the intracellular protein reserves. Luck and others showed that a high protein diet leads to an increase in fixed tissue protein reserves with parallel increases in circulating serum globulin. A diminution in cytoplasm protein associated with decreased serum globulin as a result of low protein diets was demonstrated by Elman and Heifetz. These facts suggest the probable importance of a luxury protein diet for the maintenance of adequate "antibody matrix" (protein reserves) to serve as basic materials for specific antibody templation. If so, the immunologic potential of the reticulo-endothelial system, for example, would vary quantitatively with the amount of locally available protein reserve.

This suggested relationship is in line with statistical evidence covering the increased susceptibility to infectious diseases observed as a result of dietary insufficiency during the first World War. Dr. Cannon was able to confirm this relationship on experimental animals. Rabbits whose protein reserves had been reduced by low protein diets showed a distinctly subnormal capacity to produce specific antibodies.

The accumulated evidence in support of the relationship between protein reserves and specific immunity is of particular interest at present in view of the popular overemphasis of the role of vitamins in promoting antimicrobial resistance. There is a resulting popular underestimate of the basic importance of a luxury protein intake. Without more than enough protein to maintain nitrogenous equilibrium, antimicrobial vitamins are immunologically ineffective. In the words of Madden and Whipple, "The reserve store (of protein) is the bulwark against infection."—*J.A.M.A.*

GIRL MEDICAL STUDENTS ADVOCATED IN BRITAIN

The *New York Times* carried the following special cable from London on December 20:

"The British Medical Students Association adopted a resolution today advocating the admission on equal terms of women and men to all British medical schools.

"The resolution was adopted after strong opposition was expressed on the ground of the lack of accommodations for women. It was also contended that 35 per cent of the women admitted to practice ceased practicing after they have reached the age of thirty."

Postgraduate Medical Education

Programs arranged by the Council Committee on Public Health and Education of the Medical Society of the State of New York are published in this section of the JOURNAL. The members of the committee are Oliver W. H. Mitchell, M.D., chairman (428 Greenwood Place, Syracuse); George Baehr, M.D.; and Charles D. Post, M.D.

Cancer Teaching Day

A **CANCER Teaching Day** will take place on Thursday, April 15, at the Academy of Medicine, 1441 East Avenue, Rochester, New York. The conference is presented under the combined auspices of the Medical Society of the County of Monroe, the Seventh District Branch of the Medical Society of the State of New York, the Rochester Academy of Medicine, the University of Rochester School of Medicine and Dentistry, the Tumor Clinic Association of the State of New York, the Medical Society of the State of New York, and the New York State Department of Health, Division of Cancer Control.

The meeting will be opened by G. Kirby Collier, M.D., president of the Monroe County Medical Society. J. Craig Potter, M.D., is chairman.

The program is as follows:

4:15 P.M.—“Care of the Advanced Cancer Patient,” by Norman Treves, M.D., instructor in surgery, Cornell University Medical College, and associate surgeon, Memorial Hospital, New York City.

“What May be Logically Expected from Pre- and Postoperative Radiation in Mammary Cancer,” by Fred W. Stewart, M.D., associate professor of surgical pathology, Cornell University

Medical College, and pathologist, Memorial Hospital, New York City.

6:30 P.M.—Dinner at the Academy of Medicine.

The evening meeting will be opened by John Aikman, M.D., president of the Rochester Academy of Medicine. Chairman of the meeting is Leo F. Simpson, M.D. The evening program will include:

8:00 P.M.—“Role of the Endocrine in Neoplastic Disease,” by Cornelius P. Rhoads, M.D., professor of pathology, Cornell University Medical College, and director, Memorial Hospital, New York City. “Diagnosis and Treatment of Prostatic Cancer,” by Charles B. Huggins, M.D., professor of surgical urology, University of Chicago, Chicago.

Members of the cancer committee of the Medical Society of the County of Monroe are: G. Kirby Collier, M.D., president of the Society, ex officio; J. Craig Potter, M.D., chairman; Leo F. Simpson, M.D., vice-chairman; and Lyman C. Boynton, M.D., Walter A. Calihan, M.D., William I. Dean, M.D., Andrew H. Dowdy, M.D., James M. Flynn, M.D., Donald C. Houghton, M.D., and John M. Swan, M.D.

Reservations for the dinner must be made in advance.

Sulfonamide Therapy

A **SERIES** of postgraduate courses in sulfonamide therapy are being held for the Tioga County Medical Society under the sponsorship of the Council on Public Health and Education of the State Medical Society, and the State Department of Health. The first lecture took place at 6:30 P.M. March 31, at Jenkins Inn, Waverly, New York. The subject was “Treatment of Pneumonia,” and the speaker was Walsh McDermott, M.D., instructor in medicine, Cornell University Medical College, New York City.

Other lectures, which were held at 6:30 P.M. in the Green Lantern Inn at Owego, New York, included:

April 7—“Gynecology in General Practice”

Nathan P. Sears, M.D., professor of gynecology, Syracuse University College of Medicine

April 14—“The Treatment of Genitourinary Infection”

Thomas F. Laurie, M.D., associate professor of clinical surgery (urology), Syracuse University College of Medicine

“The Treatment of Meningitis”
A. Clement Silverman, M.D., professor of clinical pediatrics, Syracuse University College of Medicine

War Medicine and Surgery

A **TEACHING Afternoon** on War Medicine and Surgery was presented March 25 for the St. Lawrence County Medical Society by the Council Committee on Public Health and Education of the Medical Society of the State of New York, and the State Department of Health, in cooperation with the Office of Civilian Defense and the Health Preparedness Commission of the State War Council. The meeting was held in the Hepburn Hospital Nurses’

Auditorium at Ogdensburg, New York, at 2:00 P.M.

The program included lectures on “The Care of Soft Tissue Injuries” by Frederick S. Wetherell, M.D., professor of clinical surgery, Syracuse University College of Medicine, and on “Plasma Therapy and Whole Blood Transfusion,” by Frederick N. Marty, M.D., instructor in clinical medicine, Syracuse University College of Medicine.

Teaching Day on Virus Diseases

MEMBERS of the Otsego County Medical Society were given postgraduate instruction in virus diseases at a Teaching Day held on Wednesday, March 24, at the Homer Folks Tuberculosis Hospital in Oneonta, New York. Speakers and subjects included:

4:00 P.M. "The Nature of Viruses"

Jerome T. Syvertson, M.D., associate professor of bacteriology, University of Rochester School of Medicine and Dentistry.

6:00 P.M. Dinner

8:00 P.M. "The Clinical and

tures of Primary . . .
Lawrence E. Young, M.D., instructor in medicine, University of Rochester School of Medicine and Dentistry, and Paul A. Lembcke, M.D., district state health officer and instructor in epidemiology and preventive medicine, University of Rochester School of Medicine and Dentistry.

Medical Aspects of Chemical Warfare

A TEACHING Day for physicians and nurses on "Medical Aspects of Chemical Warfare" was held at Syracuse University College of Medicine on Friday, April 9, 1943 from 2:00 p.m. to 5:00 p.m. in Room 116. This was a three-hour review session with discussion of new developments. This instruction was

presented by Syracuse University College of Medicine, in cooperation with the Health Preparedness Commission of the New York State War Council, the Medical Division of the Office of Civilian Defense, and the New York State Department of Health.

Plasma Therapy and Whole Blood Transfusion

AT A joint meeting of the Onondaga County Medical Society and the Syracuse Academy of Medicine, held on April 6, a lecture on "Plasma Therapy and Whole Blood Transfusion" was arranged by the New York State Department of Health and the State Medical Society.

The lecture was given by Earle B. Mahoney, M.D., assistant professor of surgery, University of Rochester School of Medicine and Dentistry. The meeting took place at 8:30 p.m. at the University Club in Syracuse.

On Wednesday, April 7, a postgraduate lecture on "Plasma Therapy and Whole Blood Transfusion" was given before the Saranac Lake Medical Society. The instruction, which took place in the John Black Room of the Saranac Laboratory in Saranac, was given by Frederick N. Marty, M.D., instructor in clinical medicine, Syracuse University College of Medicine, Syracuse. The program was presented through the cooperation of the Medical Society of the State of New York and the New York State Department of Health.

Sulfonamide Therapy

THROUGH the cooperation of the New York State Department of Health and the Medical Society of the State of New York, a postgraduate lecture on "Sulfonamide Therapy" was presented on April 7 for the Putnam County Medical Society.

Norman Plummer, M.D., assistant professor of clinical medicine, Cornell University Medical College, was the speaker. The meeting was held at 7:00 p.m. at the Gipsy Trail Club in Carmel, New York.

General Medicine

A POSTGRADUATE lecture on May 13 has been arranged for the Seneca County Medical Society by the Medical Society of the State of New York and the New York State Department of Health. The lecture, entitled "What We Do Know

About Vitamins," will be delivered by David K. Miller, M.D., professor of medicine, University of Buffalo School of Medicine. The meeting will take place at 2:00 p.m. at the Armitage Tea Room in Seneca Falls.

THE JOURNAL OF THE NATIONAL MALARIA SOCIETY

The first volume of a new journal devoted to malaria has just appeared. It is the official organ of the National Malaria Society, formerly the National Malaria Committee. It is to be made a quarterly of fifty pages as soon as financial support and sufficient material justify such action. The

first issue, which is the entire volume for 1942, contains some sixteen original contributions on various phases of the malaria problem. In view of the world-wide importance which is attached to control of malaria, this new journal will doubtless serve as a highly useful medium for disseminating information.

Postgraduate Medical Education

Programs arranged by the Council Committee on Public Health and Education of the Medical Society of the State of New York are published in this section of the JOURNAL. The members of the committee are Oliver W. H. Mitchell, M.D., chairman (428 Greenwood Place, Syracuse); George Baehr, M.D.; and Charles D. Post, M.D.

Cancer Teaching Day

A CANCER Teaching Day will take place on Thursday, April 15, at the Academy of Medicine, 1441 East Avenue, Rochester, New York. The conference is presented under the combined auspices of the Medical Society of the County of Monroe, the Seventh District Branch of the Medical Society of the State of New York, the Rochester Academy of Medicine, the University of Rochester School of Medicine and Dentistry, the Tumor Clinic Association of the State of New York, the Medical Society of the State of New York, and the New York State Department of Health, Division of Cancer Control.

The meeting will be opened by G. Kirby Collier, M.D., president of the Monroe County Medical Society. J. Craig Potter, M.D., is chairman.

The program is as follows:

4:15 P.M.—“Care of the Advanced Cancer Patient,” by Norman Treves, M.D., instructor in surgery, Cornell University Medical College, and associate surgeon, Memorial Hospital, New York City.

“What May be Logically Expected from Pre- and Postoperative Radiation in Mammary Cancer,” by Fred W. Stewart, M.D., associate professor of surgical pathology, Cornell University

Medical College, and pathologist, Memorial Hospital, New York City.

6:30 P.M.—Dinner at the Academy of Medicine.

The evening meeting will be opened by John Aikman, M.D., president of the Rochester Academy of Medicine. Chairman of the meeting is Leo F. Simpson, M.D. The evening program will include:

8:00 P.M.—“Role of the Endocrine in Neoplastic Disease,” by Cornelius P. Rhoads, M.D., professor of pathology, Cornell University Medical College, and director, Memorial Hospital, New York City. “Diagnosis and Treatment of Prostatic Cancer,” by Charles B. Huggins, M.D., professor of surgical urology, University of Chicago, Chicago.

Members of the cancer committee of the Medical Society of the County of Monroe are: G. Kirby Collier, M.D., president of the Society, ex officio; J. Craig Potter, M.D., chairman; Leo F. Simpson, M.D., vice-chairman; and Lyman C. Boynton, M.D., Walter A. Calihan, M.D., William I. Dean, M.D., Andrew H. Dowdy, M.D., James M. Flynn, M.D., Donald C. Houghton, M.D., and John M. Swan, M.D.

Reservations for the dinner must be made in advance.

Sulfonamide Therapy

War Medicine and Surgery

A TEACHING Afternoon on War Medicine and Surgery was presented March 25 for the St. Lawrence County Medical Society by the Council Committee on Public Health and Education of the Medical Society of the State of New York, and the State Department of Health, in cooperation with the Office of Civilian Defense and the Health Preparedness Commission of the State War Council. The meeting was held in the Hepburn Hospital Nurses’

Auditorium at Ogdensburg, New York, at 2:00 P.M.

The program included lectures on “The Care of Soft Tissue Injuries” by Frederick S. Wetherell, M.D., professor of clinical surgery, Syracuse University College of Medicine, and on “Plasma Therapy and Whole Blood Transfusion,” by Frederick N. Marty, M.D., instructor in clinical medicine, Syracuse University College of Medicine.

Woman's Auxiliary

To the Medical Society of the State of New York

Annual Convention

Buffalo—May 2-5

Officers

President, Mrs. J. Emerson Noll, Port Jervis
President-Elect, Mrs. F. Leslie Sullivan, Scotia
First Vice-President, Mrs. William Lavelle, Long Island City
Second Vice-President, Mrs. Stanley P. Jones, Mattituck

Treasurer, Mrs. Louis A. Van Kleeck, Manhasset
Recording Secretary, Mrs. Carlton E. Wertz, Buffalo
Corresponding Secretary, Mrs. Travalin Omstead, Pearl River

The Annual Convention of the Woman's Auxiliary to the Medical Society of the State of New York will be held on May 2, 3, 4, 5, 1943, at the Hotel Statler, Buffalo. The headquarters will be in the Terrace Room.

All doctors' wives, whether members of a Woman's Auxiliary to a county medical society or not, are urged to register at the Registration Desk in the Foyer of the Terrace Room, and are cordially invited to participate in all parts of the program.

Program

Sunday, May 2

2:00 P.M.- Registration—Main Foyer of Hotel
5:00 P.M.

Monday, May 3

9:00 A.M.- Registration of delegates—Foyer of
12 Noon Terrace Room
9:00 A.M.- Registration of all doctors' wives—
5:00 P.M. Foyer of Terrace Room
9:00 A.M.- Registration for dinner (7:00 P.M.),
4:00 P.M. luncheon Tuesday (1:00 P.M.), and
tea Wednesday (3:30 P.M.)—Foyer
of Terrace Room
10:00 A.M.- Preconvention meeting—Terrace
12 Noon Room
1:00 P.M.- House of Delegates meeting—Terrace
4:00 P.M. Room
7:00 P.M. Annual Auxiliary Dinner

Tuesday, May 4

9:00 A.M. Registration, members and guests—
Foyer of Terrace Room
9:00 A.M.- Registration for luncheon (1:00 P.M.)
10:00 A.M. and tea Wednesday (3:30 P.M.)—
Foyer of Terrace Room
9:30 A.M.- House of Delegates meeting—Terrace
12 Noon Room
1:00 P.M. Luncheon (place to be announced)

Wednesday, May 5

9:00 A.M. Registration continued—Foyer of
Terrace Room
9:00 A.M.- Registration for tea (3:30 P.M.)—
12 Noon Foyer of Terrace Room
9:30 A.M.- Postconvention meeting of Executive
11:00 A.M. Board—Terrace Room
11:00 A.M.- Conference of County Presidents—
12 Noon Terrace Room
3:30 P.M. Tea (place to be announced)

New York State Nursing Council for War Service*

Bulletin No. 5 (March 19, 1943)

Progress in New York State's War Nursing Activities

1. Since December 10, 61 local councils have been formed in New York State. Make your local council a strong force for service to your community, your state, and your country at war. Your achievement will stimulate others.
2. The Office of Civilian Mobilization of the New York State War Council has planned for state-wide cooperation with our nursing councils through its block leader service, thanks to Mrs. Winthrop Pennock, director of the Office of Civilian Mobilization, and her assistant, Miss Katherine Olmsted, who is a member of the State Nursing Council for War Service.

Supply and Distribution Committees

Forty-eight Supply and Distribution Committees of local nursing councils are beginning a survey of hospital needs and resources. In most cases these surveys will be made by personal interviews. Although results are to be reported to the State Nursing Council, the real purpose of the survey is to provide information for the local councils and to aid them in seeing that community nursing needs are met. When sending in the survey forms, *please be sure that the name of the hospital is written at the top.*

Hand in hand with the survey goes the equally important work of bringing local inventory files up to date. The campaign now being carried out by local War Councils through their Block Leader service in house-to-house canvasses will, it is hoped, prove one more way of finding additional nurses. Since the real task is to make the greatest and wisest use of all available nursing power in every community, inactive nurses who now offer full- or part-time service should be referred to your local hospitals or agencies that need nurses. Nurses who are physically unable to do floor duty may often be used in the central supply room or in a clerical capacity. In some instances they are caring for the children of other nurses, releasing these mothers for a few hours of daily work in a hospital. Please let us know the ways in which formerly inactive nurses are being used in your community.

Your local survey may reveal causes of nurse shortage which can be corrected. The influence of your local nursing council should prove an effective means of bringing about desirable changes. Recent studies made by the State Nurses Association on salaries and personnel practices and their continued efforts to bring about changes where needed will strengthen your own efforts.

Attention is called to two recent articles in the *American Journal of Nursing* which will be of interest to all nurses and especially to Supply and Distribution Committees. One is Dr. Joseph Mountin's article, "Nursing—A Critical Analysis," in the January, 1943, issue, page 29; the other, "Salaries of General Staff Nurses," March, 1943, page 270.

Student Recruitment Committee

Reports now coming in indicate a good response to Open House Week held in many hospitals during February. The week of May 12 will again be designed

as Open House Week. The same kind of publicity recommended for use in February will be appropriate, with a few adjustments, for use in the May 12 program. Cooperation between Student Recruitment Chairmen and Publicity Chairmen will make possible timely publicity on current projects of the Student Recruitment Committee.

The planning for rallies or mass meetings is suggested as a means of stimulating public interest. Two such meetings have been conducted by the New York City Nursing Council for War Service with great success. The District 7 Nursing Council for War Service is participating in a mass meeting to be held on March 31 in Utica, at which the need for community cooperation in the nursing program will be stressed with particular emphasis on the need for scholarships. The Federation of Women's Clubs is sponsoring that program with the cooperation of the Nursing Council and the Red Cross.

Publicity Committees

Publicity Chairmen are asked to keep in close contact with other committee chairmen of their councils, seeking their suggestions for desirable publicity to aid their programs.

The use of a scrapbook of clippings and effective publicity projects will prove its value to Publicity Chairmen, not only as a means of showing what has been done but as a guide to future planning.

Have you planned any nursing exhibits for your community? There have been good exhibits in store windows, showing nurses in all manner of service uniforms; an exhibit of dolls in the uniforms of local hospitals; excellent exhibits of actual photographs of nurses in action; exhibits of publicity material, posters, pamphlets, magazine covers and articles; exhibits of nursing books and literature in libraries and high schools. Exhibits may be helpful in creating lay interest, stimulating recruitment for the war forces, and encouraging young women to enter schools of nursing. Do plan one or more nursing exhibits and let Miss Arnstein, the publicity chairman for the New York State Nursing Council for War Service, know about them.

Participation of Red Cross in Council Programs

While primarily carrying on a program aimed at recruiting nurses for the armed forces, volunteers for Nurses Aides, and the organization of Home Nursing Courses, the American Red Cross has also asked its representatives to cooperate with local nursing councils in all phases of their war nursing program. Although the responsibility for the student recruitment and supply and distribution program rests upon the nursing councils, the offer of Red Cross assistance has been effectively used by many councils, most of which have Red Cross representatives on their membership.

Progress Reports from Local to State Nursing Council

The long-felt need for a report from every local nursing council on its activities, plans, and suggestions for increased help from the State Nursing Council will be met through the use of the progress report forms which have now been supplied to chairmen of local nursing councils. The first report was requested for April 1; others at intervals of every two months thereafter.

* IMPORTANT NOTE: The monthly bulletin is prepared as a means of keeping you informed of the War Nursing Program. Back copies of Bulletins 3 and 4, which describe the general program, will be sent to chairmen upon request.

This change was necessary in order to have the bylaws comply with those of the State Society.

Cortland County

To relieve the shortage of doctors and trained nurses, the Cortland County Chapter of the American Red Cross has instituted a class for the training of individuals in caring for themselves.

Dutchess County

Drs. J. Wilson Poucher and Charles E. Lane, of Poughkeepsie, were honored at a testimonial dinner at the Nelson House on April 7 to celebrate their "sixty years in medicine."

Dr. Robert W. Andrews, headed the county society committee on arrangements, and the guest speaker was Dr. George W. Cottis, of Jamestown, president of the State Society. Others on the committee were Dr. Joseph L. Cummings, secretary; Dr. William A. Krieger, Dr. Clifford A. Crispell, and Dr. Archibald W. Thomson. Dr. Andrews acted as the toastmaster.*

Dr. Emil A. Stoller presided at the March meeting of the county society, which was held at the golf-house of the Hudson River State hospital. The scientific program featured a discussion of the progress of pediatrics, led by Dr. Bela Schick, of New York City. Dr. Schick was the originator of the Schick method of treatment of persons susceptible to diphtheria.

Dr. Scott Lord Smith led a talk on the postwar economic outlook.*

Dr. Frank Hacker, native of Vienna, Austria, but more recently of New York City, has opened an office in Beacon.

Dr. Hacker has come to Beacon on the recommendation of the Procurement and Assignment Service.*

Erie County

The county society met at the Hotel Statler in Buffalo on March 23. Dr. Frederick W. Filsinger was the speaker.

Genesee County

Dr. T. Murray Steele, of Batavia, formerly of Le Roy, has been elected to the American College of Surgeons.

A graduate of the University of Toronto in 1925, Dr. Steele served his internship at the Clifton Springs Sanitarium, Ontario County, and spent two and a half years doing accident surgery in the gold mining district of Timmins, Ontario. He then went to Le Roy, New York, and began the practice of medicine, remaining for eight years. He then returned to Toronto as an instructor in anatomy and surgery at the Toronto Medical School. While serving in this capacity he received the degree of Master of Surgery and a fellowship in the Royal College of Surgeons. Dr. Steele was also resident surgeon at the Toronto General Hospital and the Toronto Hospital for Sick Children.*

Jefferson County

The March meeting of the county society was held Thursday evening, March 11, at the Black River Valley Club.

Dinner was served at 6:30 p.m. Five-minute talks were given by members, including Drs. J. D. Olin, D. G. Gregor, L. E. Henderson, C. A. Prudhon, and H. L. Gokey. A colored film on sulfonamide therapy was shown.*

Kings County

The county society held a stated meeting on March 16, at which time Dr. George W. Cottis, president of the State Society, was the speaker. "Forecast of Postwar Medicine" was the title of his address.

On Saturday evening, March 6, about 30 neighborhood physicians gathered at Gregory's Restaurant in Brooklyn to honor Dr. Earl H. Mayne, of Bay Ridge Parkway, who is entering his fiftieth year of medical practice.

Dr. Mayne has spent all of these years in the Brooklyn section. In 1912, together with Drs. John McQuillin and Henry Bruning, he organized the Bay Ridge Sanitarium, later named the Bay Ridge Hospital, and has been its president since its organization.

Speeches of congratulation were made by Drs. Clifton Dance, Robert Ives, Herbert T. Wickle, Russell Fowler, John Masterson, Ross, McQuillin, and Bruning.*

Monroe County

Plea for proper placement of stutterers in military service was sounded by Dr. James Sonnett Greene, of New York City, in an address before the county society at the Academy of Medicine on March 16.

Stuttering, Dr. Greene declared, is merely a symptom of an underlying nervous condition that makes a man unfit for active combat duty, though he can be useful to the armed forces in limited service. Failure of draft boards to screen out those with impediments of speech, he said, has led to the breakdown of many of these inductees.

Dr. Greene is director of the National Hospital for Speech Disorders in New York City. He became interested in the treatment of stutterers when his first patient, to whom he was unable to offer encouragement, took his own life.*

New York County

"Medicine's Continuing Part in the War" was discussed by Dr. Frank H. Lahey at the March meeting of the county society.

Dr. Lahey is chairman of the Procurement and Assignment Service of Physicians, Dentists, and Veterinarians of the War Manpower Commission and director of the Lahey Clinic in Boston.

The New York Times of March 26 carried the following news item:

"The University of Pennsylvania Club of New York City will award the William Guggenheim Honor Cup to Dr. Josiah C. McCracken, who heads the Pennsylvania Medical School of St. John's University, Shanghai, China, at 7:00 p.m. today. Speakers will include Dr. Hu Shih, former Chinese Ambassador to the United States, and former Senator George Wharton Pepper."*

Dr. David D. Rutstein, of Albany, young cardiac specialist who has devoted himself to defense against

Medical News

International College of Surgeons Meets in June

THE Fourth International Assembly of the International College of Surgeons will be held on June 14, 15, and 16 at the Waldorf-Astoria Hotel in New York City, it is announced by Dr. Fred H. Albee, International President. The program will be devoted to war surgery and rehabilitation.

Delegations made up of prominent surgeons from the United Nations, in addition to those from other countries, are expected to attend. The United Nations representatives will give outstanding examples of the progress being made in war surgery and rehabilitation under battle conditions by their respective countries.

Dr. Manuel A. Manzanilla, of Mexico, and Professor Herman de las Casas, dean of the University of Caracas, Venezuela, who was appointed chairman of the Inter-American Exchange training activities, have been designated as chairmen of the program coordination for Central and South America. Dr. Rudolph Nissen, at present in New York City, will act for Europe.

The Rehabilitation Committee is composed of Drs. Fred H. Albee, of New York; William D. Ryan, of Detroit; and Custus Lee Hall, of Washington, D.C. Dr. William S. Bainbridge, of New York City, is chairman of the Military Affairs Committee. The Program Committee has as its chairman Dr. A. A. Berg, of New York City. Dr. Gustave Aufrecht is secretary of the Program Committee, and members of the College in Philadelphia, Plainfield, New Jersey, Columbus, Ohio, Denver, Washington, D.C., and Rochester, Minnesota, are also represented.

Dr. Charles Phillips, of New York City, is chairman of the arrangements Committee; Dr. Chester A. Peake, of Brooklyn, is chairman of the Exhibit Committee; and Dr. Milton Bodenheimer, of New York City, is chairman of the Publicity Committee.

Serving on the Publicity Committee with Dr. Bodenheimer are Drs. Max Thorek, of Chicago, and Dr. Edwin A. Griffin, of Brooklyn. Dr. Thorek is the International Executive Secretary.

Clinic to Serve Dutch Seamen

DR. FRANS E. VAN DER GUGTEN, chief medical officer of the Netherland Shipping Committee, who was named recently to take charge of a new merchant marine polyclinic at 61 Broadway in New York City, reports that work on the institution is progressing rapidly and that it will be opened to serve Netherland seamen soon.

The clinic will be responsible for the health problems of nearly 20,000 men serving under the Dutch flag, most of whom will eventually pass through the Port of New York. The institution is to have complete and modern facilities for diagnosis and outpatient treatment, and will have an arrangement with New York specialists and hospitals for additional treatment when required.

"The service," Dr. van der Gugten said, "is con-

sidered a very essential one for the proper maintenance of full health standards for the men on our ships. Before the war each individual steamship company had its own medical department at its home port, but since Holland was occupied by the Germans these have, of course, been unavailable. This handicap has been further complicated by the greater incidence of psychological problems brought on by the war, both through the men's lack of home contacts and the removal of customary means of obtaining consultation and treatment for minor ailments, causing bewilderment and mental distress."

The doctor graduated from the University of Leyden, and spent twenty-one years in Batavia, Java, and Sumatra as an instructor and a military surgeon.

County News

Albany County

Dr. Robert A. Hingson and Dr. Waldo B. Edwards, of the United States Marine Hospital, Staten Island, discussed the new "painless childbirth" method in obstetrics before a meeting of the county society in the Albany College of Pharmacy on March 24.

Dr. Hingson and Dr. Edwards, both past assistants of the U.S. Public Health service, described the results of a series of 600 cases which they studied and the continuous improvements made in methods of administration. In the 600 cases there were no maternal deaths or complications.*

Bronx County

An address on "Certain Practical Considerations in the Treatment of Traumatic Shock," by Comdr. L. R. Newhouser, M.C., U.S.N., with discussion by Drs. Samuel Gitlow and Thomas J. O'Kane, was

the feature of the scientific program at the regular meeting of the county society on March 17.

Broome County

At the March meeting of the county society the speaker was Dr. Eugene Pavlov, nephew of Ivan Pavlov.

At the February meeting the following motion was passed:

"That Section 2, Article XIII, of the Bylaws of the Broome County Medical Society be changed to read: 'All active members who have not paid their annual dues and State Assessment on or before the thirty-first day of May of each year shall be placed on the list of members in arrears for dues and assessments, and be so reported to the Society at the next regular meeting. Such members shall not receive publications, notices of meetings, malpractice defense, or any of the other privileges of membership until all dues and assessments are paid.'"

* Asterisk indicates that item is from local newspaper

The device these men chose for their seal was a lancet within the words St. Lawrence Medical Society. This was adopted in July, 1811. The society suspended its workings sometime in 1856, and the records were lost, and if it were not for the invaluable Dr. Hough's history, we should know little about the important organization previous to 1856. In 1864 some members of the old Society met and reorganized with Dr. Martin Parker, of Parishville, president."

Saratoga County

Consumption of raw milk is believed to have been the cause of an outbreak of at least 56 cases of severe sore throat which recently occurred in Ballston, according to an announcement by the State Department of Health. It was estimated that on the basis of the number of consumers of the suspected milk, 130 or more persons were affected.

Inquiry revealed that the milk supply of the patients was from a common source. Pasteurization of the supply was instituted immediately, and no additional cases have been reported with onsets occurring more than forty-eight hours after the pasteurization was begun.

The udder of one of the cows in the implicated herd was shown to be infected with hemolytic streptococci of the group causing infection in human beings, and a throat culture from the milker was found to contain hemolytic streptococci of the same group.

. . .

Dr. William H. Ordway has resigned as chief of the Emergency Medical service for Saratoga County and will be succeeded by Dr. Walter S. McClellan. Dr. McClellan is medical director at the Saratoga Spa and has been associated with Dr. Ordway in emergency work.*

Schenectady County

Dr. Louis P. Tischler, of Schenectady, has been appointed to the resident staff in gynecologic and obstetric service at Boston City Hospital. He will assume his new duties this month.

Dr. Tischler served his internship at Ellis Hospital and later was appointed resident assistant in surgery at that institution. He opened an office for private practice in Schenectady in 1935.*

Schoharie County

Jacob H. Enders, chairman of the County Board of Supervisors of Health Preparedness Commission, has announced the following complete committee, which will function and work with the New York State Health Preparedness Commission:

Dr. Joseph F. Duell, physician member of the county medical society; Dr. R. D. Champlin, district state health officer; Jacob H. Enders; Dr. M. M. Lee, health officer; Eugene F. Gorse, county commissioner of public welfare; George D. Ryder, member of the American Red Cross; Mrs. Anna L. Pick, member of the State Nurses' Association; Albert G. Munro, member of the Pharmaceutical Society; Dr. S. A. Scranton, member of the State Dental Society; Mrs. Frances B. Spencer, of the New York State Nutrition Committee; Dr. Ward L. Oliver, chairman of the County Infantile Paralysis Committee; Mrs. Olivia W. Van Aller, school nurse; Rev. C. Walter Kessler, chairman of the County Tuberculosis Association.

The state chairman of the commission is Assemblyman Lee B. Mailer, of New York City.

The objectives of the commission are to maintain adequate medical, nursing, and health facilities; to determine the availability of existing hospital facilities for civilian and military use in an emergency; to provide for the adequate supply of drugs, surgical supplies, and equipment; to safeguard municipal water supplies and sewage disposal systems; and to take care of other matters that concern the preservation of health.

All health preparedness committees are urged to make an immediate study of the objectives in their respective communities. Their findings are to be reported, with recommendations to the County War Council.*

Tioga County

The March meeting of the Medical Society of the County of Tioga was held at the Wagner Hotel, Waverly, at 7:00 p.m. on March 2. There were twelve members and guests present.

Dr. Johnson reported for the Committee on Medical Education that arrangements for a post-graduate course of three lectures were being completed. After discussion, it was agreed that two of these meetings be held in Owego and one in Waverly.

On regular motion it was voted that the name of the Medical Preparedness Committee be changed to the War Participation Committee, as recommended by the Council of the State Society.

A discussion of increased costs of compensation work was held, and the secretary was ordered to express to the State Society Compensation Committee the facts concerning increased expenses and an increased load of 25 per cent of such cases.

Discussion as to an increase in general fees was initiated by Dr. Brown. The president named Drs. Brown, Johnson, and Shaw as a committee to investigate the present fees and make recommendations.

Dr. Zoltowski introduced Dr. Earl Smith, of Elmira, who spoke to the society on "X-Ray Diagnosis of G-I Pathology."—Ivan N. Peterson, M.D., Secretary

Tompkins County

Nervous conditions associated with warfare was the subject of a lecture at a meeting of the county society in the College of Veterinary Medicine at Cornell University on March 16.

Dr. Foster Kennedy, professor of clinical medicine at the Cornell University Medical College in New York, was the speaker.

Warren County

Dr. J. W. Stevens, of Glens Falls, has been called to a defense plant in the Metropolitan area of New York to attend the firm's workmen in the event of accident or illness. He assumed the duties of his new post early in April.*

Westchester County

"Our First Ten Years" is the title of the following editorial in the March issue of the *Westchester Medical Bulletin*:

"Publication of the current issue of the *Westchester Medical Bulletin* marks the tenth year of continuous publication by the Society, and is our 120th consecutive monthly issue.

"Ten years ago the Medical Society of the County of Westchester was completely reorganized during

poison gas since the United States entered the war, has been appointed medical deputy commissioner of health, Health Commissioner Ernest L. Stebbins has announced. Dr. Rutstein will be in charge of the city's gas defense preparations, as well as the nutrition and industrial hygiene programs of the Department.*

Ontario County

"Penicillin," was the title of a paper by Dr. A. W. Armstrong at the March meeting of the Canandaigua Medical Society.

Now in experimental stages for medicinal purposes, penicillin is a substance made from the mold which grows in Roquefort and Camembert cheeses.

Dr. Margaret T. Ross, of Brigham Hall, president, was hostess to the society at this meeting. Dinner was served to fourteen guests.

Dr. John H. Pratt of Manchester, was host at the April meeting, at which Dr. Leon A. Stetson was the speaker.*

Otsego County

Dr. Charles Oberling, pathologist of the Mary Imogene Bassett Hospital in Cooperstown and director of the Otsego County laboratory, has accepted an invitation of the Iranian (Persian) government to be dean of the medical faculty of the University of Teheran and to act as adviser of the Iranian government in public health and hygiene. In accepting this appointment, Dr. Oberling will represent the national committee of the Fighting French.

Since Dr. Oberling has already spent two years in Iran, helping the Iranian government to reorganize its medical services, he is familiar with the medical needs and the public health problems of that country. The Iranian government has now made available adequate resources to put into effect plans which Dr. Oberling had formulated for the much-needed improvements in public health and medical education.

During the past winter Dr. Oberling lectured at the Bassett Hospital and in Albany on the health conditions in Iran. He described the appalling incidence of disease, the extreme ignorance and superstition of the population in public health matters, and the control of communicable disease.*

Queens County

The following program was presented at the stated meeting of the county society on March 30: "Symposium on Health Insurance," by Louis H. Pink, president of Associated Hospital Service and former Superintendent of Insurance for the State of New York; Frederic E. Elliott, M.D., secretary-treasurer of Medical Expense Fund of New York, Inc.; Kingsley Roberts, M.D., director of Group Health Cooperative, Inc.; Joseph Wrana, M.D.; and "Epidemic Keratoconjunctivitis," by W. Guernsey Frey, Jr., M.D., ophthalmologic surgeon, Manhattan Eye, Ear, and Throat, St. Luke's and St. John's (Long Island City) hospitals, and director of ophthalmology at Queens General Hospital.

* * *

The Friday Afternoon Talk on April 16 will be given by Dr. Girsch Astrachan, dermatologist and syphilologist at New York Post-Graduate Hospital, and associate dermatologist at Metropolitan Hospital in New York City. His subject will be "General Principles of the Treatment of Syphilis."

Rockland County

Dr. George Stone, Suffern physician, was recently elected a fellow of the American College of Surgeons for distinguished work in the field of general surgery. He was also recently made a fellow of the New York Academy of Medicine.*

St. Lawrence County

A luncheon meeting of the Medical Society of the County of St. Lawrence was held on March 18 at the St. Lawrence Social Club, Ogdensburg, at 12:15 p.m.

Two lectures, presented as a cooperative endeavor between the State Medical Society and the State Department of Health, were given in the nurses' auditorium of Hepburn Hospital at 2:00 p.m. The care of soft tissue injuries was discussed by Dr. Frederick S. Wetherall, professor of clinical surgery at Syracuse University. Dr. Frederick N. Marty, instructor in clinical medicine at Syracuse University, discussed plasma therapy and whole blood transfusion.*

* * *

On January 22 the *Potsdam Herald Recorder* published an article of local historical interest. It concerned Dr. Joseph Smith, the first physician in the county. Harriet Parker Rowland is the author. We reprint the article in part:

"Joseph Smith was born in Cheshire, Massachusetts, on February 22, 1781. Soon after his birth, his father removed to Addison, Vermont, where the child grew up. Joseph decided that he wished to be a physician and accordingly studied with one Dr. Ebenezer, in Vergennes, Vermont, and later went to Middlebury, where he completed his medical education with Dr. William Rose. In the following year, 1803, Dr. Smith came to Lisbon, New York. He was the first physician to settle in St. Lawrence County. He had not been there long when his practice began to spread, and soon included Madrid, Canton, and Oswegatchie.

"It is difficult now to realize the hardship of the doctor's life in those bygone days. Often he had to travel great distances, always through the forest. At best he might go on horseback, all of the materials of healing . . . packed in saddle bags. At worst he must travel, as Dr. Joseph sometimes did, on foot through the forest . . .

"Dr. Smith never spared himself when called to the sick and suffering . . . History tells us of one call he answered at night. He must go to Canton, eighteen miles away, and there was no path where a horse could pass . . . So he started on foot with a torchlight to help him find the way. After terrible exertion and with great fatigue he arrived safely in Canton and went quietly about the business for which he had come.

"Sometimes a patient was found to be too ill to be left and was carried to the doctor's home, put to bed in the old spool bed, and cared for by the doctor and his wife, as long as the need existed. . . .

"Since 'History is the memory of nations' may this tribute to Dr. Joseph Smith bear a small part in the memory of the pioneer heroes of St. Lawrence county.

"When the St. Lawrence County Medical Society was organized on October 14, 1807, Dr. Joseph Smith, who had by that time moved to Canton, was made president; I. W. Pier, vice-president; John W. Noble, secretary; B. Holmes, treasurer; John Seeley, Powell Davis, and B. Holmes, censors.

Hospital News

Symposium on Civilian Hospitals in Wartime

A SYMPOSIUM on civilian hospitals in wartime was conducted by the United Hospital Fund of New York in cooperation with the Greater New York Hospital Association and the New York Academy of Medicine in the Hotel Waldorf-Astoria on March 29 and 30.

At the first session Dr. Harvey B. Stone, professor of clinical surgery at Johns Hopkins Medical School, discussed "Methods of Providing Medical Personnel for the Armed Forces, Civilian Hospitals, and the Community." Dr. David P. Barr, professor of medicine at Cornell University Medical College, and Dr. J. R. Clemmons, director of the Roosevelt Hospital, spoke on the same subject.

"Wartime Difficulties of Providing Adequate Hospital Service" was the title of an address by John H. Hayes, superintendent of the Lenox Hill Hospital and Dispensary, and John F. McCormack, superintendent of the Presbyterian Hospital.

At the second session Margaret E. Conrad, director of nursing at the Presbyterian Hospital, and Sister Loretto Bernard, superintendent of St. Vincent's Hospital, spoke on "The Loss of Nursing Personnel and the Problem of Replacement." Mrs. Edith G. Seltzer, consultant on medical social service of the Fund, and Dr. Thomas D. Dublin, associate professor of preventive medicine and community health, Long Island College of Medicine, discussed "Medical Social Service in Wartime." "Social Services in England" were described by Ruth Taylor, Westchester County Commissioner of Public Welfare.

At the final session Dr. Nathaniel W. Faxon, director of the Massachusetts General Hospital, and Dr. Edward M. Bernecker, Commissioner of Hospitals, gave addresses, both entitled "Catastrophe on the Home Front." Thomas W. Lamont opened the session with an address on postwar medicine.

Hospital Trains

IN AN article published in *The Modern Hospital*, Lt. Col. Thomas N. Page, of the U.S. Army Medical Corps, has given a graphic description of the newly set-up Army hospital trains, designed and equipped at the order of the Surgeon General of the Army. Through the collaboration of Army medical corps officers and officials of the Pullman Company, a fifteen-car train was designed, including the following facilities:

1. Two ward cars to provide space for 64 bed patients.
2. A unit car with kitchen capable of messing 500.
3. A unit car with dressing room completely equipped.
4. Train detachment to be quartered in standard Pullmans.
5. Seats and berths for approximately 260 walking sick and wounded patients to be furnished in standard Pullmans.
6. One baggage car for supplies and equipment.
7. A unit car with berth and office space for the train surgeon.
8. Large double doors in both sides of every car for ease in loading litters.

The total train capacity (minimum) is 4 officers, 6 nurses, 33 enlisted men, and 324 patients.

A second order from the Surgeon General called for a reduction of equipment because of the lack of certain necessary materials, and as a result plans were altered, with standard diners substituted for the unit car. At the same time arrangements were made to increase the space for bed patients so that a minimum of 90 could be accommodated.

"The train that was designed comprised fifteen cars, including one ward car modified to provide 30 berths . . . and a dressing room with complete equipment; two ward cars providing berths for 32 bed patients each; a standard dining car to provide messing for approximately 300 patients; a standard Pullman car to quarter the train detachment; a standard Pullman car to provide berths and seats for approximately 225 walking sick and wounded patients; a baggage car for equipment and supplies, and office space for the train surgeon."

Both trains are completely equipped for emergency measures and have in a compact space the facilities of a modern hospital.

Improvements

Dr. A. J. Rongy, gynecologist, has been appointed chairman of the Joint Campaign Committee of Physicians of Lebanon and Women of Lebanon, which is the first section of the \$275,000 Lebanon Hospital Building Fund Campaign to start functioning. Dr. Rongy has been connected with the hospital since 1900.

The fund will be used to furnish and equip the new \$2,000,000 hospital building at Grand Concourse and Mount Eden Parkway, the Bronx.*

It is equipped with an ultraviolet and bacteria light, and is large enough to accommodate twins.

A short time ago, the auxiliary furnished a new admission room with desk, lamp, and chairs.*

. . .

The Rochester Hospital Service Corporation, which enrolls as members of the plan many citizens of the community, has moved to its new home at 41 Chestnut Street, Rochester.*

. . .

The woman's auxiliary of the North Country Community Hospital in Glen Cove has presented that institution with an incubator, 1944 model.

The Herkimer Memorial Hospital in Herkimer has received twelve pieces of property with an assessed valuation of \$21,500 as a bequest from the estate of the late C. B. Root to the institution's endowment fund.

* Asterisk indicates that item is from local newspaper.

the presidency of Dr. Andrew A. Eggston. During that year a permanent executive secretary was engaged in the person of Mr. James E. Bryan, and the publication of the *Bulletin* in approximately its present form was commenced, with Mr. Bryan as its managing editor and with the late Dr. Henry T. Kelly as its editor. The work begun by Dr. Eggston was carried on successfully in 1934 by Dr. Mortimer W. Raynor; in 1935 by Dr. Harrison Betts; 1936, Dr. Theodore West; 1937, Dr. Morley T. Smith; 1938, Dr. Erich H. Restin; 1939, Dr. Ralph T. B. Todd; 1940, Dr. Henry J. Vier; 1941, Dr. Reginald A. Higgins; and 1942 and 1943, Dr. George C. Adie.

"During these years and under the leadership of such men the Society has continued to flourish, has grown slowly but steadily in size, and has exerted its influence continuously to uphold in the County of Westchester the highest standards of medical practice.

"Those years have seen the expansion of the social welfare work commenced in the county under the leadership of V. Everit Macy and the

integration of public medical practice with the expanding department of public welfare. Those years have seen pioneer experimental work conducted by continuous conference between the department and the Society under the well-balanced and sympathetic leadership of Miss Ruth Taylor, and it is safe to say that at least some of this work has influenced the trend of public medical care throughout the state.

"Under the guidance of its editorial board and its managing editor, the *Bulletin* of the Medical Society of the County of Westchester has been received favorably not only in the county and the state, but throughout the United States. It has perhaps been a factor in welding the opinion of the Society and in achieving for the Society a certain strength which derives from unity of thought and opinion.

"Ten years is not a long time but it is a good beginning.

"Through a liberal and foresighted editorial policy it has sought to assure for organized medicine a place of leadership in the social complex of the past decade."

In the lists of "Deaths of New York State Physicians" in the April 1 issue of the *JOURNAL* the name of Dr. Edward Herzog, of Long Island City, was included by mistake.—Editor

Two hundred and fifty hospital corpsmen—the first “pharmacist’s mates” of the United States Merchant Marine—completed a three-month course at the United States Maritime Service Training Station at Sheepshead Bay, Brooklyn, in March.

For the first time organized medical care will be provided merchant seamen on cargo ships by the hospital corpsmen, whose training, according to the War Shipping Administration in Washington, is comparable to that of pharmacist’s mates in the United States Navy.

Student corpsmen must be apprentice seamen, 25 years old or under, with four years of high-school education and five weeks of preliminary seaman training.

The course of study, which began in December, includes lectures, films, and field trips to Bellevue Hospital operating rooms and surgical wards, the New York Morgue, the Ward’s Island sewage disposal plant, the Willard Parker Hospital Serological Laboratories, the New York City pathologic laboratories, New York Medical College, and the Flower-Fifth Avenue Hospital.

The corpsmen are assigned to United States Marine and United States Public Health Service hospitals for practical experience before they are made medical petty officers on merchant ships.*

James King & Sons, Inc., Manhattan contractors, builders of the Halloran General Hospital at Willow Brook, Staten Island, the largest Army hospital in the United States, have received the Army-Navy E.*

The City Hospital Alumni Society has established the James R. Lisa Award for outstanding research done in the laboratories of the hospital under Dr. Lisa’s direction. Drs. Douglas Symmers, Oswald T. Avery, and James R. Lisa have been named a permanent self-perpetuating committee in charge of this award.

The Wyoming County Board of Supervisors has approved a contract whereby the Genesee County Laboratory will do the pathology for the Wyoming Community Hospital at Warsaw.

Donald M. Gray, chairman of the Genesee County Laboratory Commission, described the agreement as a nonprofit contract under which Wyoming County will pay its proportionate share of the pathologist’s salary, and since the pathologist is employed by Genesee County, it will result in a reduction of costs to the latter.

The plan will become operative on the approval of the New York State Department of Health at Albany.

“Calling all doctors”—or anyone else who is wanted immediately—is the latest innovation at Wyckoff Heights Hospital in Ridgewood, with the installation of an audible paging system. Anyone connected with the hospital can now be called from the switchboard and the name will be repeated by the “speaker” in each corridor of the main building and in every building on the grounds.

As a further measure to deal with an emergency, a transmitter has been installed in the private office

of Superintendent Louis Schenkweiler, which, in an emergency, can become headquarters for the quick calling together of a large number of the hospital staff. There is also an outside telephone and a radio in the superintendent’s office for keeping in touch with developments in the event of an emergency and for directing the hospital’s personnel to cope with it.*

Ward secretaries of the Wilson Memorial Hospital in Johnson City have relieved staff nurses of 1,080 hours of work in the last two months. These volunteers have taken over the record and book-keeping work that is ordinarily performed by nurses in laboratories, kitchens, drug rooms, storerooms, and record departments. The ward secretaries work in three-hour shifts five days a week.

Three Paris hospitals, Beaujon, Lariboisiere, and La Pitie, comprising 3,280 beds, have been requisitioned by the German authorities, according to a recent release, “Public Health Under Hitler’s Rule,” from the British press service. Owing to the creation of temporary hospitals, the release states, Paris patients still dispose of 36,800 hospital beds....

Few Parisians go to hospitals these days except in the last extremity because food cards must be deposited upon entering the hospital and interminable formalities are required to get them back on leaving. British patients remaining in Paris are cared for at Val-de-Grace Hospital, and Jewish patients at the Rothschild Foundation.

Among the other difficulties suffered by Paris hospitals is the lack of ambulances. Patients are brought in with the help of the police first aid and for the return journey they are grouped in the same ambulance, which makes a round trip, like a motor bus.

Although no general mortality rates have been released, it has been revealed that the annual rate of deaths at Cochin Hospital has increased from 1,200 to 1,400. Tuberculosis is said to have doubled among 6- to 8-year-old children and in the 18- to 25-year age group.—*The Modern Hospital*.

A service flag for 900 physicians, nurses, and other employees of Bellevue Hospital now in the armed forces was dedicated on March 12.

The New York Women’s Division of the National Jewish Hospital at Denver, Colorado, has opened its annual bundle campaign for the benefit of its Bargain Shop, 1281 Third Avenue, Manhattan. All kinds of merchandise are solicited. The campaign will continue through May 15.

The fiftieth anniversary of the Bushwick Hospital in Brooklyn was celebrated on March 6 with a dinner-dance in the Towers Hotel. More than 400 people participated in the festivities.

Appreciation for the gift, to be known as the "C. B. and Ada H. Root Endowment Fund," was expressed in a resolution of acceptance adopted by the directors, with instructions that a copy be sent to Mrs. Root, who is vice-president of the hospital.*

. . .

Work on an addition to the Brooks Memorial Hospital in Dunkirk, to cost \$144,000, has been commenced.

. . .

A federal grant of \$290,700 has been approved for the adding of facilities to Mercy Hospital in Rockville Centre, to care for needs of war workers.

Provisions call for emergency construction of a wing to be reached by a tunnel. The new facilities will accommodate 60 adult patients and will include 60 bassinets.*

. . .

The new addition to Mercy Hospital in Watertown was dedicated and opened on March 19.

At the Helm

Three new directors have been added to the Herkimer Memorial Hospital Board. They are Mrs. George R. Gallinger, D. Bennett Rasbach, and Palmer W. Gloo, each to serve for a term of five years. In addition, C. Harry Snell and Ross E. Sluyter, whose terms have expired, have been re-named.

A memorial to James H. Walrad, one of the original directors, who died in March, was incorporated in the minutes of the annual meeting of the board and a copy was sent to the Walrad family.*

. . .

Mrs. Elinore M. Herrick, director of personnel and labor relations of the Todd Shipyard Corporation, and Dr. Ralph T. B. Todd, of Tarrytown, have been appointed members of the board of the Associated Hospital Service of New York.

. . .

The Hospital for Joint Diseases in New York City has announced the following promotions in staff positions: George J. Ginandes, attending pediatrician; Theodore T. Fox, associate physician; Sidney A. Fox, associate ophthalmologist; Selian Hebbald, associate physician in allergy; Emanuel B. Kaplan, associate orthopaedic surgeon.

. . .

Lewis Webb, superintendent of St. Luke's Hospital for the past twenty-one years, tendered his resignation to the hospital's board of managers at their annual meeting and retired on April 1.

The board of managers appointed Carl Willmsen, proprietor of the Palatine Hotel, to serve as superintendent.*

. . .

Dr. Luvia Willard has been elected president of the medical board of Jamaica Hospital, the first woman to hold this post at the institution.

Dr. Willard has been associated with the hospital since 1912 and has filled several offices on the board, having served as its vice-president last year.*

. . .

W. W. Smith, president of the board of directors of the Alice Hyde Hospital in Malone, has been appointed superintendent and business manager of the hospital.

Miss Isabel M. Reardon, of Stroudsburg, Pennsylvania, has been named assistant superintendent and directress of nurses.*

. . .

Arthur Lathrop Zerbey was elected president of Mount Vernon Hospital, in Mount Vernon, at an annual meeting of the Board of Managers, to succeed Norman D. Ellison, who has completed four years as head of the institution.

Other officers elected were Richard M. Winfield, Harold B. Storms, and Charles A. Bird, vice-presidents; Mrs. Walter H. McNeill, Jr., secretary, and Vernon F. McClellan, treasurer.*

Newsy Notes

To meet the minimum civilian and military needs, 65,000 women must be enrolled in nursing schools between June 30, 1943, and July 1, 1944. This figure exceeds the 1942-1943 quota by 10,000.

In addition to student nurses, auxiliary hospital workers must also be trained, and, in accordance with an agreement made by Washington committees on hospitals and nurses, institutions must train their own employees.

Job instructor training for hospitals can be arranged through government agencies.

. . .

In an article in *The Modern Hospital* entitled "Do Normal Maternity Cases Require Ten Days in the Hospital?" Dr. Benjamin W. Black describes the system used in the Highland-Alameda County Hospital in Oakland, California.

According to Dr. Black, an increased load of maternity cases in the past few years has made it necessary for authorities to shorten the hospital stay whenever possible. "It was determined," he says, "that patients would be received in the hospital for delivery service primarily and that they would be discharged when the condition of mother and child permitted; the earliest day of discharge was on the fourth."

After a three-year trial, a study was made of 3,400 patients who had been hospitalized but a short time, and in no case were complications found to be due to the brevity of the hospital stay. Continued studies support these original findings.

As Dr. Black points out, present-day overtaxing of hospital facilities may make the widespread adoption of this plan necessary.

. . .

Health News

The following "Special Warning Bulletin" has been prepared jointly by the United States Public Health Service and the Committee on Ophthalmology of the American Medical Association.—Editor

SUBJECT: Epidemic Keratoconjunctivitis

Incubation period: Five to ten days.

Clinical Manifestations.—The onset may be preceded by a low fever and mild generalized malaise. The local ocular symptoms are merely those of a foreign body or conjunctival irritation. One eye is usually affected first, and in a large percentage of cases the second eye becomes infected within five to eight days. Preauricular and submaxillary glandular involvement with tenderness is common in a high percentage of cases.

Edema of the lids and the conjunctiva, especially the transitional fold, is very frequent. The conjunctiva presents the appearance of a simple purulent conjunctivitis but with little or no formation of pus. Small areas of pseudomembrane are not infrequent and when removed leave either small, white, dotted points or some bleeding points. The bulbar conjunctiva becomes edematous early. At this stage, there is some lacrimation and photophobia, but real pain and blepharospasm do not appear until the cornea becomes involved.

The percentage of cases in which corneal involvement occurs varies from 50 to 90 per cent. In six to twelve days after the conjunctivitis appears, the cornea becomes involved by the appearance of discrete gray infiltrates that lie in and immediately under the epithelial layer of the cornea. They may be confined to the periphery of the cornea but in a large percentage of cases they involve the pupillary area of the cornea directly. These infiltrates are discrete and seldom become complicated by an erosion of the corneal epithelium with resultant staining with fluorescein. The extent of visual impairment depends upon the number of infiltrates and their location.

Clinical Course.—The disease is self-limited. In the majority of instances, the conjunctivitis disappears spontaneously in fourteen to eighteen days. The corneal complications may disappear in seven days or may last for many months. The longer they persist, the greater is the danger of permanent visual impairment.

Laboratory Findings.—Scrapings of the conjunctiva show a preponderance of monocytes. Cultures and smears are either negative or show the usual contaminations.

Treatment.—There is no specific treatment that has shown a definite influence upon the course of the disease. During the acute stage the eyes should be kept clean with irrigations of boric acid, normal saline, or 1,000 to 5,000 oxycyanid of mercury. If there is much photophobia, 1 per cent holocaine may be instilled at frequent intervals. Five per cent sulfathiazole ointment has been used, as has 5 per cent solution of sodium sulfathiazole sesquihydrate. For persistent corneal infiltrates, x-ray has seemingly yielded some results.

Period of Infectivity.—It is not yet known how long the danger of transmission to others exists. At present for practical purposes a sufferer from epidemic keratoconjunctivitis may be allowed to return to work when the active conjunctivitis has disappeared.

Preventive Measures.—At present the only preventive measure known is complete isolation of infected persons. Inasmuch as the disease has been transmitted through medical personnel, the most meticulous asepsis must be insisted upon. Not only must physicians and nurses wash their hands thoroughly with soap and water after attending each patient, but also eye droppers, solutions, instruments, etc., must be sterilized to prevent infection of noncontaminated persons. The infected individual must be told of the danger of transmission of this disease to others, not only in the plant, but even in the home surroundings. It is suggested that in industrial plants where epidemic keratoconjunctivitis has made its appearance the following methods of procedure be adopted:

1. In smaller plants with a limited personnel, every individual with a red eye should be stopped at the entrance of the plant and sent at once to the plant physician to determine whether or not epidemic keratoconjunctivitis is present. In larger plants where such a procedure is not possible, supervisors and foremen should be instructed in detail to make the rounds immediately when a fresh shift starts, and send any individual with a red eye to the medical office.
2. If the cases are to be treated at the medical department of the plant, a separate room should be set aside for such cases and in that room there must be exercised the most scrupulous asepsis, even to washing off the arms of the chairs in which the patients sit. Aside from the aseptic and separate care of the recognized cases of the disease, special cleanliness of the hands of the physician in the general clinic should be maintained, with the use of an effective disinfectant between cases, lest the infection be spread by means of undiagnosed cases, especially those suspected of having foreign bodies in the eye.
3. Every worker with epidemic keratoconjunctivitis should be excluded from the communal facilities of the plant until the inflammation has subsided to the point where the plant physician considers it no longer transmissible.
4. Explicit instructions should be given to every individual regarding the danger of transmission, and emphasizing the decrease in the war effort as a result of the time lost from epidemic keratoconjunctivitis.
5. The local health authorities should be notified immediately of the existence of individual cases.

The four-year medical technology program offered by the Washington Square College of Arts and Science of New York University, in collaboration with three local hospitals, has been approved by the Council on Medical Education and Hospitals of the American Medical Association, Professor William

McTavish, director of the program, reported recently.

The hospitals with which the university is co-operating on this program are St. Luke's and Beth Israel in New York City, and Grasslands in Westchester County.*

POSTGRADUATE COURSES AT MOUNT SINAI HOSPITAL

The Mount Sinai Hospital is offering two comprehensive twelve-week postgraduate courses, one in cardiovascular diseases and the other in gastroenterology, from April 5 to June 23, 1943. These courses will be given in affiliation with Columbia University.

CARDIOVASCULAR DISEASES

Mondays, 9:00 A.M. to 12:00 M;
Wednesdays, 2:00 P.M. to 5:00 P.M.

This course has been designed to deal with the broader diagnostic and therapeutic aspects of the more common clinical patterns of rheumatic, arteriosclerotic, syphilitic, and congenital heart disease. Electrocardiography, x-ray, fluoroscopy, pathology, and physical diagnosis will be treated as major subjects.

The facilities of the medical and pediatric wards, cardiac clinics, x-ray, cardiographic, and pathologic laboratories will be made available for the purposes of teaching.

GASTROENTEROLOGY

Mondays, 2:00 P.M. to 5:00 P.M.;
Wednesdays, 9:00 A.M. to 12:00 M.

This comprehensive course in gastroenterology will attempt to cover the fundamentals of diagnosis, clinical medicine, and therapy. Medical symptomatology will be stressed. The indications for operation and the actual surgery of the disease will be followed throughout the progress of the course. The surgical amphitheater and surgical rounds are an essential part of the course. The underlying gross pathology of gastric and intestinal diseases will be presented by appropriate authorities, and laboratory, particularly functional tests, will be taught in detail.

Gastroenterology as it is affected by the war, especially with respect to peptic ulcer and the parasitology of tropical diseases, will receive particular attention.

For further information, address the Secretary for Medical Instruction, The Mount Sinai Hospital, Fifth Avenue and 100th Street, New York, New York.

GUIDES TO THERAPY FOR MEDICAL OFFICERS

An excellent pocket-sized technical manual, entitled *Guides to Therapy for Medical Officers*, has recently been issued by the War Department. As stated in the opening paragraph, the purpose of this manual is to provide the medical officer with a handy text containing guides to therapy under emergency conditions or in diseases with which he is relatively unfamiliar. . . . It is intended to serve as a guide to the "general practitioners" of the Army and not as a text for specialists, who are likely to be stationed with evacuation units or in general hospitals. . . .

The manual is well conceived and carefully executed. The Surgeons General of the Army and Navy, early in 1940, requested the Division of Medical Sciences of the National Research Council to establish committees that should act in an advisory capacity to the two medical corps. Much of the text of this manual is based on material compiled by these committees. Final revision was conducted by pertinent divisions of the Office of the Surgeon General, U.S. Army. . . .

The reports of the many experts are presented in an easily readable, compact, and orderly fashion. The major subjects covered are as follows: surgical emergencies; medical emergencies; diagnosis and treatment of venereal diseases; chemotherapy and

serotherapy in certain infectious diseases; treatment and control of certain tropical diseases; and rickettsial diseases. The contributors to each of these sections include many of the leading names in American medicine and surgery.

Under surgical emergencies are included the commonest types of wounds in various parts of the body, the management of shock, and the early treatment of burns. Most of the essential details are given, but the specialized forms of treatment that can be undertaken only by experts are almost entirely omitted. The section on medical emergencies covers the majority of situations that might arise under the great variety of conditions to which troops are likely to be subjected, including such diverse items as acute poisoning from various foods, chemicals, plants, and animal sources, seasickness, altitude sickness, the effects of exposure to heat and cold, starvation, and the acute psychoses. The sections on tropical and rickettsial disease are meant to acquaint medical officers with conditions that are rarely encountered in civilian practice but that are very likely to be met with in the far-flung regions where troops may be operating. . . . The manual can be obtained for twenty-five cents from the Superintendent of Documents, Washington, D.C.—*New England J. Med.*

Negotiable Blood

Two years ago the Medical Society of the County of New York appointed a committee to develop a plan to reduce the cost of blood transfusions and to make blood more generally available to the needy in these parts. Out of the committee's work came the remarkable Blood and Plasma Exchange Bank, which applies horse-trading principles with extraordinary efficiency, but of which few have heard.

The big hospitals have their own banks. The smaller hospitals have none, for the reason that they cannot afford them because of the fewness of their patients. Yet the small hospitals need blood or plasma in emergencies. To obtain it either friends or relatives of a patient offer their blood or a paid donor is supplied by an agency at a price of about \$50, which does not include hospital extras. Sometimes it happens that the blood of voluntary donors must be rejected because it is incompatible, though otherwise sound. Why not trade it for blood that is acceptable? So we find the small hospitals sending donors to the big hospitals and receiving in exchange half the amount of donated blood or an allowance in

money. About thirty-four hospitals are now members of the Blood and Plasma Exchange Bank. In a preliminary six months' test in which only three hospitals were involved, \$1,900 was saved in 100 cases. The cost of a transfusion has been greatly reduced for those in moderate circumstances, and the needy receive blood free of charge.

So admirable a system of trading incompatible for compatible blood clearly deserves the attention of medical societies and hospitals throughout the country.

The County Medical Society of New York has already laid plans for the extension of the exchange system to include neighboring counties. But the whole country should be dotted with blood exchanges, with the result that transfusions, which are now almost historic events in small towns, will become more frequent, and that thousands of lives will be saved annually. Moreover, there is the prospect that blood will be given to these widely scattered exchanges not only in war but in peace.—*Reprinted with permission of the New York Times*

Nurse Prevents Rabies Threat

Alertness of a nurse and the administering of emergency treatment probably saved the lives of two cement workers in Rockland County after they had been recently bitten by a rabid squirrel, according to the State Department of Health.

The two men were working in the construction of a camp. At noon, one of the workers reached inside a large tool chest for his lunch box. Without warning, he was suddenly bitten and clawed on the fingers by an unknown animal. The second man attempted to come to his aid and in extricating the hand of his fellow worker, was himself bitten. It was then that the men discovered that the animal in

the tool box was a common gray squirrel and they immediately killed it with a tool.

The two injured men sought first aid treatment at the construction company's infirmary where the nurse asked them to obtain the body of the squirrel which was then submitted by the company physician to a laboratory for examination for evidence of rabies. The results showed that the animal was rabid, and the two workers were given injections of antirabic vaccine. The report said that had the nurse been less alert, the body of the squirrel might have been discarded without examination and as a result the men might have developed rabies.

New Typhoid Record Set

A new record of no reported cases of typhoid fever in New York State outside of New York City was established in February, making the first time that an entire month has elapsed without a single reported case of this disease in the upstate area, according to the State Department of Health. The previous all-time monthly low (2 cases) was reached in March, 1933, and December, 1942.

Commenting on the report, officials of the Department said that another new low record was established last year when only 131 cases of typhoid fever were reported, 17 fewer than the previous minimum of 148 cases in 1940. The highest annual incidence was recorded in 1910 when there were 4,801 cases with the monthly maximum of 843 cases occurring during September that year.

Other Eye Diseases May Resemble Nearsightedness

"The best interests of the public will be served if those who have disease of the eyes with apparent nearsightedness will have their disease discovered and treated and not simply get a pair of glasses," Daniel B. Kirby, M.D., New York, suggests in *Hygeia, The Health Magazine*, for February.

Dr. Kirby points out that other disease conditions of the eye that are caused by such factors as dietary deficiency or undernourishment may resemble simple myopia, and that the eye physician can readily tell the difference between cases....

"Certain children are born with faultily developed eyes—such as congenital, cataract, glaucoma, scars of inflammations which existed before birth, failure of development of normal pigmented or colored cells, as in albinos, and defects caused by

hemorrhage or pressure which occurred during birth. These children are apparently nearsighted, as are those also who develop scars from syphilis, gonorrhea, tuberculosis, or other diseases in infancy or early childhood....

"In adult life, various diseases and poisons may so diminish vision by their effect on the sensitive retina and the nervous tissue of the eye that in the effort to see the patient may appear to be nearsighted. Nicotine, alcohol, diabetes, nephritis, and various infections may bring this about. Diabetes especially, with its changes of sugar and salt concentrations in the blood and changes in the fluids of the eye, may cause such 'transient' nearsightedness...."

Heredity may be a factor in the development of myopia, Dr. Kirby declares, but farsighted children

Radio Programs on Tuberculosis

In observance of the 1943 Early Diagnosis Campaign of the New York Tuberculosis and Health Association, a number of radio programs have been planned. Speakers and their subjects will include:

- April 17—9:15 A.M.—WOR
 "Present-Day Facts About Tuberculosis," Dr. Edgar Mayer, assistant professor of clinical medicine, Cornell University Medical College
- April 17—1:15 P.M.—WMCA
 "Industry Helps Tuberculosis Campaign," Mr. Bernard S. Coleman, Secretary, Tuberculosis and Health Association
- April 19—4:45 P.M.—WBNX
 "The Prevention and Early Recognition of Tuberculosis in Childhood," Dr. Charles Kastenbaum, Bronx County Medical Society and Bronx Tuberculosis and Health Association
- April 22—1:15 P.M.—WNYC
 "Control of Tuberculosis in Industry," Dr. H. H. Fellows, assistant medical director, Metropolitan Life Insurance Co.
- April 23—11:45 A.M.—WNYC
 "Too Little and Too Late," Mr. Edward J. Walton, Industrial Secretary, Brooklyn Tuberculosis and Health Association
- April 24—9:15 A.M.—WOR
 "Will I Be Able to Work Again?" Mr. Frederic G. Elton, District Supervisor, Bureau of Vocational Rehabilitation, State Department of Education

- April 24—1:15 P.M.—WMCA
 "Help for Your Health Problem," Miss Gladys M. Park, R.N., Secretary, Information Service, Bronx Tuberculosis and Health Association
- April 26—4:45 P.M.—WBNX
 "Tuberculosis and Heart Disease," Dr. Harry Jacobstein, Bronx County Medical Society and Bronx Tuberculosis and Health Association
- April 29—1:15 P.M.—WNYC
 "The Role of the Nurse," Miss Mary Ellen Manley, R.N., Director, Division of Nursing, New York City Department of Hospitals
- April 30—11:45 A.M.—WNYC
 "Putting the Tuberculous Back on the Payroll," Mr. Edward Hochhauser, President, Altro Workshops
- May 1—1:45 P.M.—WABC
 "The Working Adolescent," Dr. Thomas Parran, Surgeon General, United States Public Health Service

In addition to these speakers, radio time will be given to the campaign by the following women commentators: Nancy Booth Craig on her program, "Women of Tomorrow" over the Blue Network (WJZ) from 8:30 to 9:00 A.M. daily; Adelaide Hawley, on her program, "Woman's Page of the Air" over Station WABC from 8:45 to 9:00 A.M. daily; and Kathryn Cravens, on her program, "News Through a Woman's Eyes" over Station WNEW from 4:45 to 5:00 P.M. daily.

Invalid Diets and Rationing

In a bulletin issued on February 9, 1943, the Office of Price Administration has given special directions for ration-point distribution in invalid diets. The order, No. 13, covers all canned, frozen, and dried fruits and vegetables. Article II, Section 2.5 reads as follows:

"Consumers who need more processed foods because of illness may apply for more points. (A) Any consumer whose health requires that he have more processed foods than he can get with War Ration Book 2, may apply for additional points. The application must be made on OPA Form R-315, by the consumer himself or by someone acting for him, and may be made in person or by mail. The application can be made only to the board for the place where the consumer lives. He must submit with his application a written state-

ment of a licensed or registered physician or surgeon, showing why he must have more processed foods, the amounts and types he needs during the next two months, and why he cannot use unrationed foods instead.

(B) If the board finds that his health depends upon his getting more processed foods, and that he cannot use or cannot get unrationed foods, it shall issue to him one or more certificates for the number of points necessary to get the additional processed foods he needs during the next two months."

The application, OPA Form R-315, is the one originally designed for home canning needs and is entitled "Sugar Special Purpose Application." It is being used only temporarily until a more adequate form is ready.

No Correction for Color Blindness

Despite unsubstantiated claims to the contrary, methods of correcting color blindness are unknown, *The J.A.M.A.* warns. *The Journal* says:

"Newspaper publicity given recently to an alleged cure for color blindness seems to emanate from one J. H. Lepper, optometrist, of Mason City, Iowa. In reply to inquiries concerning his procedure for correcting color blindness, a form letter is sent in which it is stated 'YES, YOUR CASE OF COLOR BLINDNESS CAN BE CORRECTED. IF WE DO NOT, IT WILL BE THE FIRST CASE.' The statement also suggests that cases take from two to three weeks for correction. If the patient comes to Mason City, \$5 a day is charged. If the prospect finds it impossible to come to Mason City, Lepper says he can send the

same equipment, involving two pairs of special colored glasses and one color vision test book, for a total of \$25. A lamp with a reflector and a 60 watt bulb and a flasher if obtainable are also required for home treatment. The form letter is accompanied by a list of testimonials, none of them signed by the writer's full name. Color blindness is a congenital defect. Despite unsubstantiated claims to the contrary, methods of correcting this condition are unknown. Many letters sent to the headquarters of the American Medical Association indicate that men who have had difficulty in gaining entrance to the Navy or the Air Force have been given false hopes by this wholly unwarranted publicity for an unestablished procedure."

to be used
or on prescription

samples sent on request.

WER & COMPANY, Inc.
Pharmaceutical Chemists Since 1852 WORCESTER, MASS.

Say you saw it in the NEW YORK STATE JOURNAL OF MEDICINE

are often born of myopic parents and vice versa. Faulty glandular secretion may be a causative factor. Proper foods and the use of vitamins and minerals are necessary for the eyes of growing children.

Regarding the use of glasses by myopic persons, Dr. Kirby says that "it is wise to use glasses for clear vision, if only for its own sake and for the pleasure and joy of seeing, but it cannot be said that the use of proper glasses will protect the eyes and prevent the further progress of myopia, nor on the other hand may we argue that glasses ruin the eyes and regret

that glasses have been used, thinking that the eyes would have 'grown out' of the condition.....

"The slogan, 'Throw away your glasses!' is a laudible one only if applied to those who can see as well for all purposes without glasses but who have been told to wear them and are afraid not to do so.

... Taking glasses away from those who are myopic is a tragedy. These people really need glasses to see well and should have them for this purpose."

Dr. McEwen to Speak on Rheumatic Fever

Dr. Currier McEwen, Dean, New York University College of Medicine, will address the seventh session of the Refresher Lecture Course on Cardiovascular Diseases, which will be held on Wednesday, April 28, at 4:30 P.M., New York Academy of Medicine.

Dr. McEwen's subject will be "The Management of Rheumatic Fever." The course, which is open

to all practicing physicians and medical students, is given under the joint auspices of the New York Heart Association of the New York Tuberculosis and Health Association and the New York Academy of Medicine. Dr. Herbert Chasis, assistant professor of medicine, New York University, is the presiding officer of the lecture course.

Rehabilitation for Tuberculosis Patients

Practicing physicians treating patients with pulmonary tuberculosis will be interested in the facilities offered by the Committee for the Care of the Jewish Tuberculous through its Altro Work Shop for the industrial rehabilitation of patients now capable of only part-time work. Patients are engaged in making washable garments, but no previous experience in this work is necessary. They are paid at piece rates equal to the prevailing trade union scale and remain at the workshop until full work capacity is achieved—generally in six months

to two years. The patient may continue under the care of his private physician throughout the period.

A report of the results achieved at the Altro Work Shop in the past twenty-five years appeared in the November, 1942, issue of the *American Review of Tuberculosis*. Physicians and other professionals are invited to visit the Altro Work Shop at 1021 Jennings Street, the Bronx. Patients may be referred for admission to the workshop through the C. C. J. T., 71 West 47th Street, New York City.—*J. Med. Soc. County of N.Y.*

HEPVISC IN HYPERTENSION

LOWERS HIGH BLOOD PRESSURE

Relieves Hypertensive Symptoms • Prolongs Hypotensive Action

Each tablet contains a synergistic combination of 20 mg. Viscum album, 60 mg. desiccated hepatic substance and 60 mg. desiccated insulin-free pancreatic substance.

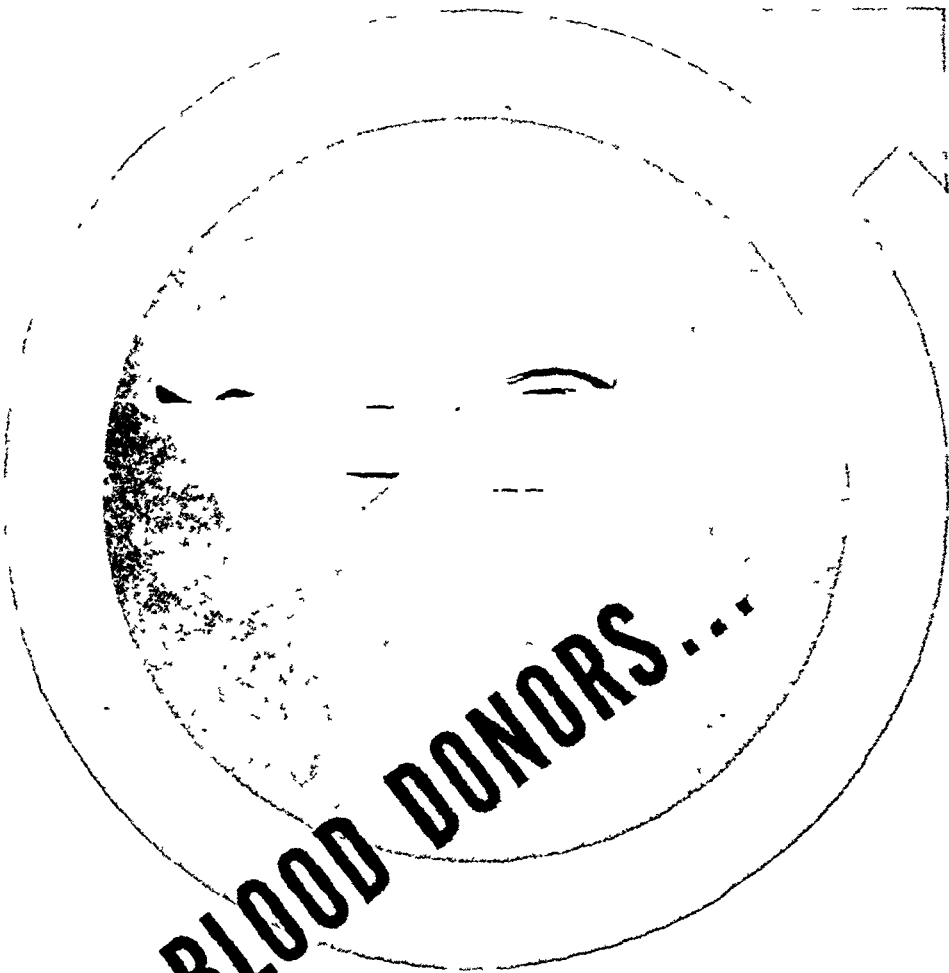

Dosage 1-2 tablets t.i.d.

Sample on request

Available in bottles of 50, 500 and 1,000 tablets.

REVIEWED

Atlas of Ovarian Tumors. By Gemma Barzilai, M.D. Quarto of 261 pages, illustrated by 58 plates, 45 in color. New York, Grune & Stratton, 1943. Cloth, \$10.

Gemma Barzilai, of New York, has done a wonderful job in her *Atlas of Ovarian Tumors*, recently published by Grune and Stratton.

The terminology is that most often accepted and the division of tumors is the one that gynecologists and pathologists have adopted.

The wealth of material required to develop such an atlas could not be found in any one clinic, and it is little wonder that the author combed the laboratories of Milan, Istanbul, Vienna, New York, and other places. The work is complete.

The micrographs, both the colored and the black-and-white ones, are excellent and are the next best thing to seeing the specimens themselves.

Following the introduction there is a classification of ovarian tumors which greatly tends to simplify the subject. If pathologists in general would stick to this classification in describing such tumors it would be much easier for the clinician.

Granulosa and theca cell tumors are more commonly seen by many of us, but the virilizing lipoid cell tumor of the ovary and some of the other rarer tumors are a real treat.

The discussion of the symptomatology and treatment of these tumors is brief, but an atlas is not a book in which one expects to find this part of the subject *in toto*. It is sufficient to point the way for ready reference.

The format of the book and the typography are a delight to the bibliophile.

ALFRED M. HELLMAN

A Short History of Cardiology. By James B. Herrick. Octavo of 258 pages, illustrated. Springfield, Charles C. Thomas, 1942. Cloth, \$3.50.

It is a pleasure to be able to report in this review that the grand old man of American cardiology, James B. Herrick, has written a delightful and, within self-imposed limits, a definitive history of cardiology.

Dr. Herrick is careful to indicate that his history is not intended to be encyclopedic. The centuries which are emphasized are the seventeenth, eighteenth, and nineteenth. There is a brief sketch of cardiology before Harvey and a few notes on twentieth-century cardiology. The arrangement of the book is extremely satisfactory. Each of the epochs is treated in a different chapter: Harvey to Laennec, Laennec to Virchow, Virchow to Koch. Other

[Continued on page 794]

The Hemorrhagic Diseases and the Physiology of Hemostasis. By Armand J. Quick, M.D. Octavo of 340 pages. Springfield, Charles C. Thomas, 1942. Cloth, \$5.00.

The purpose of this monograph may be best summarized in the words of the author: "to present and to correlate the experimental and theoretical aspects of hemostasis and to summarize the present knowledge concerning the important hemorrhagic diseases." To this task, truly a monumental one, Dr. Quick brings his armamentarium of factual knowledge and his spirit of the pioneer, the investigator, the teacher.

All this is mingled with a judicious sure-footedness, which comes of the many experiences and adventures in the field. Only such a man can have the fortitude to appraise old theories and masters for what they were, and to view new speculations in the light of authoritative inquisitiveness.

To take a subject so replete with confusion and to simplify it to its fundamental elements has been the task accomplished in this monograph.

The reviewer can recommend this book very highly to clinician or surgeon, and, in fact, dares him to get along without it.

MAURICE MORRISON

Abdominal and Genito-Urinary Injuries. Prepared under the Auspices of the Committee on Surgery of the Division of Medical Sciences of the National Research Council. Octavo of 243 pages, illustrated. Philadelphia, W. B. Saunders Company, 1942. Cloth, \$3.00.

This book provides a valuable military manual for medical officers. It should prove of great assistance to surgeons in the field and on shipboard who do not have access to highly trained specialists in abdominal and urologic surgery.

The work is authoritative, with contributions by outstanding leaders. It is well illustrated and includes references at the end of each chapter. It is one of a series of six volumes covering all surgical specialties.

Medical officers with good basic training, equipped with these manuals as ready references, should be able to meet more efficiently the problems of emergency and major surgery.

The reviewer is especially impressed with the last chapter on "Do's and Don't's," by Frank Hinman and associates.

AUGUSTUS HARRIS

Endocrinology: Clinical Application and Treatment. By August A. Werner, M.D. Second edition. Octavo of 924 pages, illustrated. Philadelphia, Lea & Febiger, 1942. Cloth, \$10.

This is a well-written book on general endocrinology. The author is a well-known internist who has made numerous scientific contributions to current endocrinologic literature. Almost every section of the book has been revised, and 323 illustrations are included. It is rich in accurate and extensive quotations from leading authorities in the field. The author's original work on involutional melancholia is reviewed. Various types of syndromes are presented in an orthodox fashion, with extensive notes on exemplary cases. Some of the early patients suffering from pituitary and gonadal deficiencies were treated with preparations which were practically inert. Nevertheless, the clinical interpretations and therapy are the last word up to the time the book was written. It is highly recommended as a treatise for the general practitioner and the endocrinologist.

Poison Ivy

The effective cleansing action of CREAM OF SOAP is demonstrated by its success in removing the irritant oleoresins of Poison Ivy from the skin. Those susceptible can profitably use it as a prophylactic after exposure. CREAM OF SOAP is a neutral, colloidal dispersion of soap. When rubbed on the dry skin it deflocculates and adsorbs the grease and dirt. Then it is rinsed off with water. It combines high detergent action with low alkalinity (pH 7.5) and is virtually non-irritating. Accepted for advertising by AMA publications and advertised to physicians only. Retail \$1. per jar. Samples to physicians on request.

ROUTINE URINE ANALYSIS SIMPLIFIED!

**GALATEST MAKES URINARY SUGAR
TESTING A MATTER OF SECONDS**

WHETHER it's the occasional specimen in your office — or thousands in hospitals, war plants and induction centers—you can cut corners on *time* and *bother* with Galatest.

**Here's how to make a
complete urine Sugar Test in 30 Seconds . . .
A LITTLE GALATEST POWDER—ONE DROP OF URINE
And that's all there is to it!**

Diabetics are taught the use of this dry reagent in no time. They will welcome its convenience—no heating, no test tubes, no liquid measuring. At home, or away from home, Galatest makes it easier for your patients to carry out their routine tests for urine sugar. The handy, portable Galatest kit contains everything the patient requires for a complete sugar test.

[Continued from page 792]

chapters are devoted to inflammation of the heart, affections of the myocardium, syphilis of the heart and aorta, and an important chapter on the coronary artery and its diseases, a subject on which the author is one of the world's most famous authorities.

The highest praise one can give this volume is to state very simply that it is exactly what one would expect from Dr. Herrick. Internists, cardiologists, and medical historians may hope that the author has a larger history of cardiology in mind. We should be given the advantage of Dr. Herrick's mature judgment for periods not covered in this short history. Nevertheless, it is surprising how much Dr. Herrick has been able to compress within the two hundred odd pages of this volume. All of the important contributions to cardiology are mentioned and there are numerous excellent illustrations. In short, this is a work which can be highly and widely recommended. It should command the admiration of a large audience.

MILTON PLOTZ

Occupational Tumors and Allied Diseases. By W. C. Hueper, M.D. Quarto of 896 pages. Springfield, Charles C. Thomas, 1942. Cloth, \$8.00.

Dr. Hueper has achieved in a compilation of volumes of pertinent literature a comprehensive well-planned work that presents the relationship of neoplastic diseases to occupational exposure.

From the earliest evidence, historically, of the development of schistosomiasis cancer of the bladder among the Egyptians, to the danger lurking in the exposure to gases, chemicals, pressure chambers, etc., of the new industries created by the expanding industrial program, the author presents, in an easily readable text, a complete description and discussion of the hazards involved and the resulting affections. The reader's attention is held from chapter to chapter by a wealth of clinical material, authentic facts, and helpful classifications. Tables, charts, and statistics are conspicuous by their absence. A comprehensive bibliography is appended to each chapter.

HARRY MANDELBAUM

Blood Substitutes and Blood Transfusion. Edited by Stuart Mudd, M.D., and William Thalheimer, M.D. Octavo of 407 pages, illustrated. Springfield, Charles C. Thomas, 1942. Cloth, \$5.00.

This excellent book is a symposium-monograph containing a collection of 38 papers by 70 collaborating investigators, and dealing with various aspects of plasma and blood transfusion. These papers were read at the annual meeting of the American Serum Association in June, 1941, and have been brought up to date by the authors, who introduced the results of more recent work when they revised the proofs. Therefore, this volume constitutes a comprehensive, authoritative, and modern review of the subject. The papers have been arranged in logical order and are collected under six main headings: (1) etiology and mechanism of shock, (2) preservation of plasma by freezing and desiccation, (3) hemoglobin, serum albumin, and casein digest as blood substitutes, (4) blood substitutes in the world emergency, (5) Rh factor: group-specific substances and universal donors, and (6) therapeutic experiences with serum and plasma. The medical profession owes a debt of gratitude to the publisher of this volume for making the papers available in convenient form. The book will prove invaluable as a constant source of reference for all physicians in military or civilian life who have any occasion to give transfusions of blood or plasma.

A. S. WIENER

[Continued from page 795]

A Textbook of the Practice of Medicine. By Various Authors. Edited by Frederick W. Price, M.D. Sixth edition. Octavo of 2,032 pages. New York, Oxford University Press, 1941. Cloth.

There is a demand for a new edition of this book every four or five years. The first edition appeared in 1922 and now we are reviewing the sixth. This speaks well for a work which apparently is the standard text in many schools abroad.

The preface to this edition contains a list of the new articles that have been added on many diseases; other sections have been completely rewritten, and so much new matter added that this edition is completely modern.

One notices a tendency to long paragraphing, reaching in one instance 70 lines (pages 421, 422, 423). The student does not like this at all. This gives one the opportunity to express a certain degree of long-repressed indignation as follows:

"There are a number of textbooks excellent in content containing authoritative material, written by men of high repute, and issued primarily for the use of students, and yet which show an utter disregard of the psychology of the student *in re* his text. The ideal textbook must have the proper type, it must not crowd too much nor oftentimes have unrelated material in one paragraph, and it must be illustrated, and it must not weigh 7 or 8 pounds. You can not present 105 pages of closely written text on diseases of the skin without a single illustration. If it is a question of cost, then the subject should be left to the specialty textbook.

"Why the pathology of influenza is merely alluded to is difficult to explain. As to its value in the elucidation of many of the clinical phenomena, we refer to 'Influenzal Pneumonia' in Boyd's, *The Pathology of Internal Diseases*.

"One would select the section on single 'Diseases of the Circulatory System' as being of special merit. Covering 225 pages and containing 51 electrocardiographic tracings, it is almost a textbook on the heart by itself.

"To begin the introduction of the chemotherapy of acute pneumococcus lobar pneumonia with the statement that 'Sulphapyridine has proved of great value' is lacking in enthusiasm; and when in the same paragraph there is a discussion of other drugs, such as diuretics and expectorants, then surely the student is left unimpressed with the specific action of the sulfa compounds.

"One awaits the day when a textbook of the practice of medicine will appear in two volumes so that there will be adequate room for illustrations, bibliography, etc. The present volumes have reached the saturation point, as has this one with over 2,000 pages; every edition must have room for additional material. It will be a red-letter day for the student when that time arrives."

S. R. BLATTEIS

Physical Chemistry for Students of Biochemistry and Medicine. By Edward S. West, Ph.D. Octavo of 368 pages, illustrated. New York, The Macmillan Company, 1942. Cloth, \$5.75.

The material for this book is an elaboration of a course in biochemistry given by the author to medical students. It was justifiably recognized by him that only selected phases of physical chemistry necessary to an understanding of biologic phenomena should be presented. This book is thus an elementary introduction to physical chemistry. It deals with such important subjects as the physical properties of protoplasm, atomic structure, the physical

TRAVEL MEDICINE

Distance is shorter on railroads in winter. So the traveler actually pays more per mile in January when he takes a train than in June. At least this is true in Canada.

During the recent cold weather, rail distance across Canada was reduced approximately two and one-quarter miles. This fact has been pointed out by engineering officials of the Canadian Pacific Railway, who have reduced to the smallest fraction, the coefficients of steel rail expansion and contraction caused by temperature changes.

Travelers between St. John, N. B., and Vancouver were not put off short of their objective, for the missing mileage was not all lost from the ends of the right of way. It was deducted in tiny contracted lengths across the railway's 3,363-mile trans-Canada route in the little gaps between the ends of adjoining rails. Measuring one-eighth of an inch under moderate temperatures, the gaps will broaden to five-sixteenths of an inch at very low temperatures.

Rails such as used on Canadian Railways will expand or contract .0026 inch for each change of one degree Fahrenheit. One rail length measures thirty-five feet. There are 160 single rails to a mile.

So—you figure it out for yourself.

* * *

"HEALTH FIRST" enters the picture of travel again.

Fitness and Efficiency was the slogan adopted at a recent meeting of the Southeastern Michigan Tourist and Publicity Association as its theme for war workers, who are in many instances, working eight hours a day, seven days a week.

A resolution passed, stated, "Periods of recreation are essential to the health and well being of these 650,000 plant workers in this area, and there is no more logical organization prepared to assist them in planning these rest and play periods than this association. We are in the process of affording information to plant management and employees who are putting their all in the victory effort.

"Labor organizations, plant management and Secretary or Labor Perkins are all agreed that fatigue results in inefficiency and men and women working these long hours, month after month, must have periods of fitting rest and relaxation."

* * *

FOOD RATIONING coupons may be needed by the hotel guest according to reports from Washington.

Restaurants and hotels operating on the European plan will not require patrons to give up their rationing points or coupons, but one thing seems absolutely sure, and that is the portions will be substantially reduced and the variety limited. Hotels operating on the American plan intend to ask guests for points and coupons.

Summer resort hotels are expected to ask their guests to bring along their No. 1 and 2 ration books, so the management can buy the necessary amount of food.

Many hotels, having enough land, plan to raise their own live stock and vegetables. As a matter of fact, this may become absolutely necessary if the hotels want to be able to feed their guests.

chemistry of gases and solutions, electrolytic dissociation, osmotic pressure, colloids, and oxidation-reduction. It is written in an interesting manner and wherever possible the application of physical chemistry to cell metabolism is stressed. Each chapter closes with a list of exercises obviously of value to the medical student.

WILLIAM S. COLLENS

The Management of Fractures, Dislocations, and Sprains. By John A. Key, M.D., and H. Earle Conwell, M.D. Third edition. Quarto of 1,303 pages, illustrated. St. Louis, C. V. Mosby Company, 1942.

The third edition of this book brings up to date a textbook which has become outstanding in its field. Because of the introduction of sulfonamides, the chapter on compound fractures has been rewritten. The new section on war injuries, which has been added, is very timely and well done. Other chapters have been completely revised and brought up to date.

This new edition will be of great value to the student and to the practitioner alike.

EDWARD P. DUNN

Diseases of the Gastro-Intestinal Tract. By Asher Winkelstein, M.D. (Oxford Medical Outline Series.) Octavo of 195 pages. New York, Oxford University Press, 1942. Cloth, \$2.00.

The author is to be congratulated on having compressed the modern concept of gastro-enterology in such a brief yet comprehensive manner. By the novel arrangement used, it is possible for one to review the facts known about any particular subject quickly and more or less thoroughly. This book should find a place on the shelf of almost any practicing physician, regardless of his special inclination.

There are several typographical errors which should be corrected in future editions, viz: (p. 35) in subhead 10 the word "therapy" should be "theory"; (p. 36) in subheading E the word "reproduction" should be "production."

BENJAMIN M. BERNSTEIN

War and the Doctor. Essays on the Immediate Treatment of War Wounds. Edited by J. M. Mackintosh, M.D. Octavo of 135 pages. Baltimore, William Wood and Company, 1941. Cloth, \$2.00.

This is the second edition of a collection of essays based on a series of lectures delivered at the request of the Edinburgh Branch of the British Medical Association. No claim is made of textbook unity, of design, or of completeness.

The first essay, "Fear Neuroses," is, at times, rather heavy but has a good account of "shell shock," a name which is now considered a misnomer and a menace. The essay on "Shock and Hemorrhage" emphasizes the dangers of the unwashed tourniquet. In this edition the use of plasma has been omitted. The chapter on "First-Aid Instruction in War-Time" has an excellent synopsis for first aid lectures. The final chapter, "Emergency Surgery in the Field," written by a veteran of the Boer War and the first World War, gives a vivid account.

JOSEPH RAPHAEL

WHEN MORPHINE PROVES A BOOMERANG

MORPHINE frequently boomerangs—producing undesirable by-effects that often becloud the clinical picture. Pantopon, the Roche sedative-analgesic, is less likely to cause unwelcome side reactions. It contains *all* the alkaloids of opium in a highly purified form, free from irritant gums and resins, affording a smooth pharmacologically balanced action. Try Pantopon in place of morphine— $\frac{1}{3}$ gr. where $\frac{1}{4}$ gr. of morphine is indicated . . .

LEDERLE LABORATORIES, Inc., NEW YORK, N. Y. — A UNIT OF AMERICAN CYANAMID COMPANY

Previous to the development of the sublingual technique of hormone administration, certain hormones such as desoxycorticosterone acetate were inert when given by mouth. By the new sublingual method, however, CORTATE, "the survival hormone", is absorbed from the sublingual space directly into the blood stream and achieves all the therapeutic results attained by intramuscular injection. Complete and potent therapy is thus available for syndromes due to insufficient cortical hormone, characterized by easy fatigability, asthenia, hypotension and hypometabolism.

Sublingual CORTATE consists of desoxycorticosterone acetate in a solution of propylene glycol containing 20 per cent absolute alcohol U.S.P., and is standardized so that 1 mg. is equivalent to 0.1 cc. of solution.

The technique of administration consists of dropping the prescribed dose directly on the visible sublingual veins. Sublingual CORTATE is supplied in 10 cc. bottles with a specially standardized dropper.

Decholin

REG. U. S. PAT. OFF.
COUNCIL ACCEPTED FOR TWELVE YEARS

DECHOLIN

Boxes of 25, 100, 500
sanitaped tablets.

. . . IN CHRONIC CHOLECYSTITIS

Conservative treatment aims to establish improved drainage of the bile ducts and the gallbladder. This removes inspissated, viscid accumulations of bile and reduces absorption of possible toxic metabolites.

Decholin and appropriate dietary control attain these objectives. Decholin exerts a marked hydrocholeretic influence, flushing the intra- and extra-hepatic biliary passages. A diet high in cream and egg proves a powerful stimulus to gallbladder evacuation. This combined cholagogue and hydrocholeretic influence produces relief of pain in stone-free chronic cholecystitis, and improves gallbladder function.

The average dose of Decholin is one or two $3\frac{3}{4}$ gr. tablets three times daily after meals. The only contraindication to Decholin is complete blocking of the common or hepatic bile duct.

Riedel - de Haen, Inc. NEW YORK, N. Y.

BUTISOL SODIUM
THE 8 HOUR SEDATIVE

The simulation of natural sleep, occurring about $1\frac{1}{2}$ hour after administration and terminating in about 8 hours, followed by complete awakening, is produced by

BUTISOL SODIUM

(Sodium salt of 5-ethyl-5-secondary butyl barbituric acid "McNeil")

Although powerful in its sedative and hypnotic action,

Butisol Sodium is approximately 30% less toxic than phenobarbital. The small dosage required and the high degree of safety are particularly important where administration must be continued over long periods.

●
CAPSULES BUTISOL SODIUM $1\frac{1}{2}$ gr. Available in bottles of 100, 500 and 1000. Descriptive literature and a trial supply will be sent to physicians on request.

nascent OXYGEN for LEUKORRHEA

CLINICALLY TESTED*: (a) eliminates unpleasant odor of discharge; (b) cuts down or eliminates irritations inside and without the vagina; (c) reduces quantity and density of the discharge, including that following cauterization... Non-irritating and non-toxic in contradiction to the arsenic and picrate preparations, is equally effective and actually soothing, especially in the (a) infantile vagina, (b) senile vagina, (c) trichomonas vaginalis vaginitis of pregnancy.

*Barrows: N. Y. St. Jr. Med. Vol. 41, 1/15/41

nascent OXYGEN for DRESSINGS

CLINICALLY TESTED*: As a surgical dressing: gauze, saturated with STA-O-GEN (a) does not adhere to wounds, (b) reduces discharge, (c) eliminates unpleasant odor, (d) wounds heal faster and appear healthier, (e) dressings are easily applied, continue effective longer and cause no burning or pain when changed, (f) there is no irritation of the skin about the wound edge, (g) particularly effective around perianal region in post-operative work (h) stainless.

*Cowell: Meet. N. Y. Proc. Soc. 4/15/42

STA-O-GEN is a bland ozonide of olive oil. On application, it releases nascent oxygen continuously for hours—deodorizing, germicidal, fungicidal, healing. Available in Liquid or Ointment; also Vag-I-Caps for leukorrhea prescription. For your convenience, druggists may obtain from any jobber.

SAFE • SIMPLE • SOUND

ERTRONIZE THE ARTHRITIC

To *Ertronize*, the dose is gradually increased to the limit of tolerance, or until a daily dosage of six capsules is reached. This maintenance level is continued, without interruption, until definite signs of improvement are noted. A complete outline of dosage and administration will be sent to interested physicians on request.

RESEARCH ON ERTRON CONTINUES

In a number of leading universities and hospitals throughout the country, investigations of various phases of ERTRON therapy are in continuous progress. The studies thus far conducted over an eight-year period prove beyond doubt the value of *Ertronization* in arthritis management.

ERTRON*

ERTRON, the only high potency, activated, vaporized ergosterol (Whittier Process) is made only in the distinctive two-color gelatin capsule.

ERTRON is promoted only through the medical profession

FIRST FOOD AFTER TONSILLECTOMY

In addition to its attractive taste-appeal and ease of ingestion, the high nutritive quality and ready assimilation of Horlick's render it ideal for use in post-tonsillectomy and other postoperative care.

HORLICK'S PLAIN OR HORLICK'S FORTIFIED (A, B₁, D and G)

is partially pre-digested and homogenized. Mixed with water or milk, it tends to produce a soft curd, which encourages ease and speed of digestion.

Horlick's provides rich protein, carbohydrate and fat in balanced proportions, calcium and other essential minerals. The Fortified is enhanced by the addition of maintenance doses of A, B₁, D and more than 50% of G.

The Popularity of
THESODATE (*Brewer*)

(the original enteric-coated tablet of Theobromine Sodium Acetate)*

is due to three factors:

1. IT IS CLINICALLY PROVED.
2. IT IS EFFECTIVELY ENTERIC COATED.
3. IT IS DECIDEDLY LESS EXPENSIVE.

Indicated in treatment of coronary artery disease, edema and hypertension.

Dosage: One 7½-grain tablet four times a day, before meals and upon retiring.

Available on prescription in 7½-grain tablets, with or without Phenobarbital (½ grain), or 3¾-grain tablets with or without Phenobarbital (¼ grain), and Theobromine Sodium Acetate 5 grs. with Potassium Iodide 2 grs. and Phenobarbital ¼ gr., 100 per bottle.

*Capsules are now available for those few patients who need extra medication.

CLINICAL VALUE OF MUSCLE EXTRACT

Carnacton *in*

ANGINA PECTORIS ARTERIOSCLEROSIS OBSTRUCTIVE ARTERIAL DISEASES

Carnacton is a biologically tested extract of *diaphragm muscle* — a powerful, markedly vascularized muscle with a high metabolic rate — most effective for its purpose. Carnacton is not only a vasodilator but also promotes cardiovascular tone and vigor.

In 1 cc. and 2 cc. ampuls — boxes of 12 and 50, vials of 30 cc. for oral use. Send for professional brochure.

CAVENDISH PHARMACEUTICAL CORP., 25 West Broadway, New York

TO REDUCE ABSENTEEISM due to urinary infections

The increasingly urgent need for manpower makes it essential that time lost through illness be reduced to the minimum. This applies to every type of worker—administrative and professional, as well as agricultural and industrial. America needs her total manpower for total victory.

When a patient suffers with one of the common urinary infections, Pyridium is of decided service. This is especially evident in the milder, ambulant cases of urinary infections. The prompt and effective symptomatic relief provided by Pyridium contributes to a more rapid recovery, with the result that the worker can be returned to his job sooner than would otherwise be possible.

Clinical experience extending over more than a decade, as reported in the published literature on Pyridium, testifies to its prompt and effective action, and its freedom from narcotic or irritant effects.

More than a decade of
service in urogenital infections

PYRIDIUM

(Phenylazo-alpha-alpha-diamino-
pyridine mono-hydrochloride)

Pyridium is the United States
Registered Trade-Mark of the
Product Manufactured by
the Pyridium Corporation

Pyridium is convenient to administer. The average oral dose is 2 tablets t.i.d. At this dosage level, it possesses the combined advantages of relative non-toxicity, effectiveness in the presence of either acid or alkaline urine, and local analgesic effect on the urogenital mucosa. Literature on request.

TO REDUCE ABSENTEEISM due to urinary infections

The increasingly urgent need for manpower makes it essential that time lost through illness be reduced to the minimum. This applies to every type of worker—administrative and professional, as well as agricultural and industrial. America needs her total manpower for total victory.

When a patient suffers with one of the common urinary infections, Pyridium is of decided service. This is especially evident in the milder, ambulant cases of urinary infections. The prompt and effective symptomatic relief provided by Pyridium contributes to a more rapid recovery, with the result that the worker can be returned to his job sooner than would otherwise be possible.

Clinical experience extending over more than a decade, as reported in the published literature on Pyridium, testifies to its prompt and effective action, and its freedom from narcotic or irritant effects.

More than a decade of
service in urogenital infections

PYRIDIUM

(Phenylazo-alpha-alpha-diamino-
pyridine mono-hydrochloride)

Pyridium is the United States
Registered Trade-Mark of the
Product Manufactured by
the Pyridium Corporation

Pyridium is convenient to administer. The average oral dose is 2 tablets t.i.d. At this dosage level, it possesses the combined advantages of relative non-toxicity, effectiveness in the presence of either acid or alkaline urine, and local analgesic effect on the urogenital mucosa. Facts

YOU'LL WANT TO KNOW ABOUT THE NEW
SQUIBB PRODUCT FOR INTRANASAL USE...

SULMEFRIN

(Squibb Stabilized Aqueous Solution Sulfathiazole Sodium with Desoxyephedrine Hydrochloride)

Sulmefrin* is an effective decongestant for intranasal use in chronic sinusitis and other upper respiratory infections associated with the common cold. It contains sulfathiazole sodium, which is effective against staphylococcus and pneumococcus organisms; and, *dl*-desoxyephedrine hydrochloride—an effective vasoconstrictor. In combination these drugs exert an effect which permits the reduction of the sodium sulfathiazole content from 5 per cent to 2.5 per cent; while the action of *dl*-desoxyephedrine hydrochloride occurs with as little as $\frac{1}{8}$ of one per cent, thus lessening the tendency toward the nervousness and sleeplessness sometimes experienced when 1 per cent solutions of ephedrine are used.

Sulmefrin may be administered by spray or drops, 5 to 10 minims into each nostril, 2 to 4 times daily; or by tamponage, 20 minims on each pack, applied for 15 to 30 minutes once a day.

* Sulmefrin is a trade-mark of E. R. Squibb & Sons.

These Advantages with SULMEFRIN

Affords quick relief—By promoting aeration and drainage.

Does not impede ciliary motility—As shown by biological test.

Its mild alkalinity (pH 8.9 ± 0.3) helps to dissolve mucous and mucopurulent secretions.

Practically non-irritating—Effective shrinkage of swollen tissues with drainage and ventilation, are generally produced without congestion of the membrane, sneezing, tachycardia and nervousness.

Remarkably stable—As demonstrated by exposure to direct sunlight; to air exposure; to pure oxygen; and to boiling.

Caution should be observed in administering this preparation to patients who have previously exhibited sensitivity to sulfonamides.

Sulmefrin is available in 1-ounce and 1-pint bottles.

WORDS CAN'T TELL THE WHOLE STORY...

Let experience show you the advantages
of 'Delvinal' Sodium!

● Hearsay, no matter how well documented, is never as convincing as first-hand knowledge. That is why we would like to send you a quantity of 'Delvinal' Sodium vinbarbital sodium for clinical trial. We know that your own experience with this distinguished new barbituric acid compound will demonstrate its advantages more effectively than could any verbal description.

'Delvinal' Sodium is an efficient sedative and hypnotic with a safe therapeutic index, moderate

duration of action, and exceptional freedom from side-effects. Drugged sensations during induction, or "hangover" afterwards, are rarely experienced.*

'Delvinal' Sodium is indicated for relief of functional insomnia and various psychiatric conditions, as well as for preoperative sedation, pre-anesthetic hypnosis and obstetric sedation and amnesia. Supplied in distinctively colored capsules of three strengths: $\frac{1}{2}$, $1\frac{1}{2}$ and 3 grains.

Write today for a trial quantity of 'Delvinal' Sodium. Sharp & Dohme, Philadelphia, Pa.

VINBARBITAL SODIUM

ARGYROL

CONTROLLED

IN MUCOUS MEMBRANE THERAPY

Decongestion without Vasoconstriction

The mildness and effectiveness of a silver protein depends very much on the correlation of two factors:—the hydrogen ion (pH) and the silver ion (pAg) concentrations. In ARGYROL, both these factors are so controlled, that regardless of the concentration of solution employed, the pH remains constant, while pAg is always properly correlated. This is *not true* of all silver proteins. It explains in part why ARGYROL remains equally bland and non-irritating in *all* concentrations from 1% to 50%. It, no doubt, also supplies one explanation why irritation is so frequently noted when allegedly equivalent preparations are substituted for genuine ARGYROL. But there are many other

reasons also why ARGYROL has come to be regarded as the "mucous membrane antiseptic of choice." ARGYROL works *in harmony* with the tissue defenses. It causes no ciliary injury. It effects a decongestion without resort to powerful vasoconstriction:—in fact, it actually appears to produce a circulatory stimulation. ARGYROL'S colloidal dispersion is finer—it has remarkable pus-dislodging, local sedative, and inflammation-dispelling qualities. In over 40 years of world-wide use, ARGYROL has achieved an unparalleled record for clinical effectiveness and safety. To insure your results—specify the "Original ARGYROL Package" whenever ordering or prescribing.

IMPORTANT ANNOUNCEMENT TO THE MEDICAL PROFESSION:

SEARLE RESEARCH PRESENTS

PAVATRINE

**... THE POTENT, SAFE, NON-NARCOTIC
ANTISPASMODIC FOR DYSMENORRHEA,
GASTROINTESTINAL SPASTICITIES**

OFFERS THESE CLINICAL ADVANTAGES:

1. Dual antispasmodic action—both neurotropic and musculotropic effects;
2. High spasmolytic potency—many times that of atropine by animal tests without untoward side effects;
3. Ability to abolish uterine contractions;
4. Increased safety—demonstrated clinically and experimentally.

Literature showing relaxing action of Pavatrine on spasm, together with dosage and administration, available on request.

Pavatrine is supplied in bottles of 20, 100 and 1000 tablets of 2 grs. each.

RESEARCH IN THE SERVICE OF MEDICINE

NEW YORK STATE JOURNAL OF MEDICINE

Copyright 1943 by the Medical Society of the State of New York

VOLUME 43

MAY 1, 1943

NUMBER 9

Editorial

April 15, 1943

To Members of the Society in the Armed Forces:

I have read some of your letters of appreciation for receiving the *New York State Journal of Medicine* and they have impressed me deeply. It is difficult for us at home to realize how much you miss your regular medical periodicals. Just as our civilians are unable to sense the sights, sounds, and smells of a combat area or to comprehend the hardships and privations of active service, we stay-at-home physicians are likely to forget the handicaps under which you must carry on. Your letters serve as needed reminders.

The Society intends to maintain and raise the standard of the *Journal*. I am sure that the Publication Committee and the editorial staff will make your wishes and your needs their first consideration. The special article by Captain H. H. Michael in the March 1 number of the *Journal* is an example of medical literature written by a medical officer for medical officers. The Annual Meeting of the Society for 1943 is concerned largely with War Medicine. The important papers and addresses will reach you in the *Journal*.

We are not forgetful of conditions which will confront you after the war. A special committee is studying the problem of alien physicians. Dr. J. R. Clemmons, Chairman of the State P. & A., is placing physicians in depleted communities on a *locum tenens* instead of a permanent basis.

This is *your* Society. For the duration your interests are paramount.

G. W. COTTIS, M.D., *President*

Medical Society of the State of New York

Petrogalar[®]

Promotes "Habit-Time" of Bowel Movement

be better served by care of the individual by groups of specialists.

"It is exactly upon this basis that all of the famous clinics in the United States have been founded and upon which they operate. We have a feeling that ultimately this is the way in which medical service will be rendered. There will still be a 'family doctor,' but this term will not be synonymous with 'general practitioner.' He will be a specialist of another kind—one specially trained in psychiatry, social science, and preventive medicine.

"We recently read the address of a president of a medical association in which he said, 'The day of the specialist is over for the duration. Before the war broke out, a man could be an eye, ear, nose, or throat specialist, for example, but now with so many doctors answering their country's call, he must be ready to deliver babies, deal with fractures of the spine, and attend to flat feet.'

"Goodness gracious!"

To which restrained comment we might add the words of Juvenal,³ "Grammarians, orators, geometricians; painters, gymnastic teachers, physicians; fortune tellers, ropedancers, conjurers—he knew everything." And what of the specialist who was, in better times, supposed to know more and more about less and less?

. . .

The *New England Journal of Medicine*⁴ is gently monitory to the paunchy and bald as follows:

"Just as the ancients believed that the heavens sped past them while they on earth stood still, so each of us, as an individual, is prone to think of himself as immutable, unchanging, while all about him goes on its course, ripening and aging and disappearing. Then, like a panic, comes a sudden appreciation of the fact that he has not been watching a procession but has been himself a part of it; that he may have little, after all, on which to congratulate himself when he notices a friend, paunchy and bald; that his own step has become more sedate, his knees stiffer; that he finds fewer fences of a proper height to vault.

"This change is something to view with equanimity if we have kept any of the talents of our earlier years from under the bushel. The lessons to be remembered are that adolescence prolonged into middle age is sometimes silly; that the scars which time inflicts are apt to slow down the machine and necessitate its direction into less swift streams of traffic; that we must use our heads to save our heels; and so on. It might be accepted as something close to an axiom that everyone who lives long enough grows old in time.

"Plenty of attempts have been made to rationalize the whole business of, shall we say, maturing,

despite or on account of its perfectly obvious inevitability.

'Grow old along with me,
The best is yet to be. . .'

is a typical, if somewhat dubious, example. Pitkin's *Life Begins at Forty* is a serious attempt to reconcile to that roaring decade the young man about to enter it.

"The mistake that we see too often is that of making no provision for a change in tempo, of assuming that we are going on engaging in the same occupation in the same manner until we drop in the traces or arrive at that questionable state of existence known as retirement. What is happening now to our retired colleagues, no doubt to the delight of most of them, is that they are being taken from the shelf, dusted off and shaken clear of moth crystals, and put gently back to work.

"It is the spirit that must be kept young while the activities are tempered to the accumulating decades, and the expanding resources of the individual's experience are made available. Samuel Johnson referred to the necessity of keeping his friendships in repair. Cato studied and, we are told, learned Greek at eighty. In that memorable story, 'The Miracle of Purun Bhagat,' Kipling depicts the unfolding, the development, and the fulfilment of a fruitful life—twenty years a youth, twenty years a fighter, twenty years a statesman, and then the begging bowl and the evening of life devoted to contemplation and the eventual service of mankind in the high Himalayas."

The begging bowl at sixty may appeal to the senescent New Englander; but, with apologies, we will trail along with Sir William Beveridge. And what have the high Himalayas got, except a little more height, that we lack in the Empire State? We will do our contemplating and service to mankind right here. Our begging bowls were contributed to the scrap drive long ago, and the records of our District Branch meetings showed⁵ that attendance in 1942 in the age group 64 to 72 was 15.66 per cent of the total; in the 75 to 84 group, 2.53 per cent; and in the 85 to 94 group, 0.17 per cent. We were "dusted off and shaken clear of moth crystals" way back in 1942. Contemplation, say you? Retirement? Out for the duration! Come on, Bunker Hill, we have a job to do!

Medicine in the News

From the *Detroit Medical News*¹ we reprint excerpts from "Be Careful with That Monkey Wrench," with our sincere compliments to the authors, Mr. S. Wells Utley and Mr. B. B. Geyer. From "The American System":

"Having reached a position where her economic and industrial life is pre-eminent in the world's history; where her standard of living incites both the wonder and admiration of every other industrial people, as evidenced both by their desire to imitate it and by the desire of their individuals to come to her shores; having reached a point of affluence where her people, both rich and poor, have more of the necessities of life, share more generously in its luxuries—eat better food, have better homes, wear better clothes—than do any other people; where they are better educated, possessed of greater opportunities for travel and enjoyment, are better taken care of when sick or incapacitated than any people have ever been; where the individual has more personal liberty and economic security, more opportunity for culture and for leisure than has ever fallen to the lot of man before; notwithstanding this pre-eminent position, many of her people present the strange paradox of seeking, with an intensity of effort which is almost fanatic, to discredit and discard the principles which have produced this success, and to substitute for them principles imported from foreign shores, which principles have failed miserably to achieve a like success in the nations where they have been tried."

From "Until I Come Back":

"We're over 20,000 feet now (the coffee's frozen in the thermos) and that's the Zuider Zee below. We must be halfway across Holland.

"Funny thing what happens to a fellow. . . .

"Those are the same old stars and the same old moon that the girl and I were looking at last Christmas.

"And here I am—flying 300 miles an hour in a bubble of glass, with ten tons of TNT.

"Somehow—this isn't the way I imagined it at all, the day I enlisted. Don't get me wrong—sure I was sore at the Japs and the Nazis—but mostly, it was the thrill of the Great Adventure.

"Well, I know now—the real reasons—why I'm up here paying my first call on Hitler.

"It's only when you get away from the U.S.A. that you find out what the shootin's really about and what you're fighting for.

"I learned from the Czech chap in London, the refugee, the nice old fellow who reminded me of Dad except for the maimed hands. I was dumb enough to ask about it. 'I got that,' he said, 'for writing a book the Nazis didn't like. . . .'

"Then there was the captured German pilot who screamed and spit when Izzy Jacobs offered him a cigarette. . . . How do fellows get that way?

"And that crazy Polish pilot—the fellow who rammed the Messerschmitt. After the funeral I learned what was eating him. Seems as how he has a sister in Warsaw who had been sent to a German Officers' Club. . . .

"I hope to hell Hitler's home tonight . . . light and wind are perfect.

"Yes, sir, I've met 'em by the dozens over here—guys warped by hate—guys who have had the ambition beaten out of them—guys who look at you as if you were crazy when you tell 'em what America is like.

"They say America will be a lot different after this war.

"Well, maybe so.

"But as for me, I know the score. . . . you learn fast over here. I know now there's only one decent way to live in this world—the way my folks lived and the way I want to live.

"When you find a thing that works as good as that—brother, be careful with that monkey wrench.

"And there's one little spot—well, if they do as much as change the smell of the corner drug store—I will murder the guy.

"I want my girl back, just as she is, and that bungalow on Maple Avenue. . . .

"I want that old roll-top desk of mine at the electric company, with a chance to move upstairs, or quit if I want to.

"I want to see that old school of mine, and our church, just as they are—because I want my kids to go there.

"That's my home town. . . .

"Keep it for me the way I remember it, just the way I see it now—until I come back."

. . . .

The *Rocky Mountain Medical Journal*² comments editorially on the question: Has the specialist a place in the wartime effort, either in the military service or in civilian practice?

"In the field of civilian practice, it is difficult to see how specialists who already are working twenty-four hours a day, doing most efficiently the things they are best qualified to do, could better serve the home front and the war by attempting to do the many other medical jobs with which they are not familiar, and which they are not qualified to do.

"Without wishing to detract in any way from the many virtues which have been attributed, and justly so, to the traditional 'old family doctor,' and at the risk of a charge of heresy, we feel that the medical interests of the population as a whole could

THE MANAGEMENT OF THE CERVIX IN THE TREATMENT OF FIBROMYOMA OF THE UTERUS

JAMES A. CORSCADEN, M.D., New York City

THE importance of the cervix in the management of fibromyoma of the uterus is being established by the discovery of a significant number of benign and malignant lesions which have occurred in cervical stumps following supravaginal hysterectomy. This and the wider spread of familiarity with the anatomy of the pelvis and the technic of complete hysterectomy have brought about an increasing practice of performing this operation for benign uterine conditions. There is, however, some disagreement as to whether the lesions found in the cervical stump are of sufficient importance to justify the routine employment of complete hysterectomy. From the evidence at hand and from our own experience we have come to the conclusion that the cervix should receive careful attention when treatment of any kind for a fibromyoma of the uterus is contemplated, and that the incidence of important conditions in the cervical stump makes complete hysterectomy the procedure of choice when removal of the uterus is deemed necessary.

The incidence of diseases of the cervix associated with fibromyoma has been fairly accurately determined. Acute inflammations, chronic cervicitis, polyps, and other benign conditions occur with about the same frequency as in the non-myxomatous uterus, with the exception of childbirth injuries, which are found less frequently, possibly because of the relative sterility of myxomatous uteri. Although rare, fibromyoma of the cervix nevertheless presents important problems in therapy whenever it is encountered.

Carcinoma of the cervix is present in about 2 per cent of the myxomatous uteri treated at a gynecologic clinic.^{1,2,3,4} This may not indicate the actual statistical coincidence between fibromyoma of the uterus and carcinoma of the cervix because most of these specimens were removed from patients applying for treatment of symptoms of which uterine bleeding is the most frequent, and because often the carcinoma so dominates the picture that a small- or even moderate-sized fibroid may not be mentioned in a report. For practical purposes, however, this figure should be accepted because it is with such cases that the therapist has to deal.

Diseases of the cervical stump are in general no different from those present in the intact uterus. Of peculiar interest is bleeding of a

functional nature from endometrium left *in situ* when the body of the uterus was removed. When this is done deliberately on the theory that continued menstruation insures a healthier and more prolonged ovarian activity, the bleeding may present no greater diagnostic difficulty than that from any menstruating uterus. When it is unexpected or when the bleeding is irregular it is a matter of considerable worry to both the patient and the diagnostician and usually requires some treatment. A persistent, more or less disabling leukorrhea, so often a sequel of supravaginal hysterectomy, may be a continuation of a pre-existing condition or may appear anew because of the trauma and infection of the endocervix incident to the operation.

Fibromyoma of the cervical stump is rare but important because it is apparently less amenable to the effect of the artificial menopause than tumors of the myometrium and because of the technical difficulties encountered during its removal.^{5,6,7,8} (See Case 3.)

Carcinoma of the cervical stump is a condition encountered regularly in any gynecologic tumor clinic. The actual incidence is uncertain. Most of the reports of conditions in the cervix following large series of supravaginal hysterectomies will not stand statistical analysis. Merely to mention that, following 5,000 hysterectomies, carcinoma of the cervix has appeared in a certain number of cases is not sufficient. At least some minimum follow-up interval (ten years) must be taken, and other statistical requirements must be met before these figures will have any validity.

With these reservations in mind, we note that Scheffey⁹ found carcinoma in 0.9 per cent of 554 cases; Henriksen,¹⁰ in 6,550 cases of supravaginal hysterectomy, without mention of the total number of cases followed, found 26 cases, (0.45 per cent); Behney¹¹ in the discussion of his paper, quotes Lincoln, 6.5 per cent, Lahey, 2 per cent, Sejourner,¹² 1.9 per cent, White, 1.8 per cent, Richardson, 1.0 per cent, Von Graef,¹³ 0.62 per cent, and Hennington (18,712 cases),¹⁴ 0.57 per cent. One concludes from these incomplete studies that the incidence of carcinoma in a cervical stump following supravaginal hysterectomy is somewhere between 1 and 2 per cent.

A second method of determining the frequency of carcinoma of the cervical stump is to compare it with the frequency of carcinoma of the cervix in general. Table 1 gives such a relationship

Read at the Annual Meeting of the Medical Society of the State of New York, New York City, April 30, 1942.

The Adolescent in Industry

In time of war, shortage of manpower for essential industries is a major problem. A normal solution is the employment of those of both sexes who are too young for purposes of war. Such a procedure carries with it not only occupational risks but also hazards due to the subjection of the actively growing adolescent to labor conditions. Great progress has been achieved in controlling industrial exposures to toxic substances by means of medical and engineering feats, but the enforced entrance of the adolescent into industry may render previously appropriate standards insufficient.

Owing to inherently greater metabolic requirements, immature persons breathe a greater volume of air per unit of time, per unit of body weight. Consequently, a given atmospheric concentration of a toxic substance will have a more injurious effect on the adolescent than upon the adult. Not only pulmonary ventilation but the rate of circulation is greater in the young than it is in the mature adult.¹ This factor enhances and adversely influences the rate of adsorption of certain toxic substances.¹ In addition, evidence has been gathered that the mechanism of detoxification is less effective in a growing individual.² It has been demonstrated for certain aromatic compounds that detoxification involves the withdrawal from body tissues of sulfur containing amino acids

essential to growth. Continuous breakdown of such amino acids by toxic chemicals may stunt the growth of a young organism.³ Involvement of other nutrition essentials, notably vitamin C, during exposure to noxious compounds, may further deprive the adolescent of important growth factors.²

We can conclude that growing boys and girls, because of physiologic factors, are more susceptible to injury from industrial poisons. It is fundamental that positions in industry should be allocated to the young adolescent with great care and circumspection. Fully cognizant of these facts, the Children's Bureau has initiated appropriate measures to safeguard the welfare of our young.⁴ The physician in industry shares the responsibility of guaranteeing the proper maturation of the adolescent in industry. He should be thoroughly familiar with the above vital facts. It ultimately rests with him not only to supervise but also to guide the adolescent into his proper industrial niche so that the nation can safely produce its maximum during war.

Editor

NEW YORK STATE JOURNAL OF MEDICINE

Dear Sir:

In your editorial, "Status of Physicians, 1942" (*NEW YORK STATE JOURNAL OF MEDICINE*, February 15, 1943) you deplore the many deaths due to cardiovascular disease among trained and experienced physicians. You stated that "the present time of national necessity seems to us appropriate for a study of these questions." You then ask, "Is anybody interested?"

I have been much interested and have published a dietary form of treatment that has proved extremely effective in cardiovascular disease. The treatment and its rationale were published in an

article titled, "The Control of the Anginal Syndrome with a Low Carbohydrate Diet," in the *Medical Annals of the District of Columbia*, October, 1941.

I have been able to follow up patients for as long as four years and can report that they are still free of anginal attacks which, before treatment, were severe and frequent. The diet afforded not only relief from anginal seizures but also lowered the blood pressure in patients with hypertension.

It is to be deplored that a new and effective treatment for such a serious disease has not been utilized by physicians. And if physicians have not seen fit to use it for themselves how can valuable men in other professions and hard-pressed executives in business and government expect to be protected from untimely death?

I trust that failure to use this new treatment is to be attributed to a healthy skepticism and not to indifference.

Yours very respectfully,
LT. BENJAMIN P. SANDLER, M.C., U.S.N.R.

Fig. 1. Photomicrograph of normal endocervix to show that there is a single layer of columnar epithelium resting on solid fibrous tissue.

Fig. 2. Photomicrograph of a portion of the cervix of a uterus removed by complete hysterectomy showing increase in number of cells, slight alteration in size, hyperchromatization, and beginning invasion.

Carcinoma of the cervix is usually obvious but in many cases presents a difficult diagnostic problem. Meigs¹⁹ reports 8 cases of carcinoma of the cervical stump following supravaginal hysterectomy for postmenopausal bleeding. Fricke²⁰ reports 9 of 57 cases of carcinoma of the stump following supravaginal hysterectomy for "suspected malignancy." In 30 to 40 per cent of the "stump" cases, the carcinoma was present at the original operation.

The possibility, then, of a carcinoma of the cervix complicating a large myomatous uterus requires a continued alertness for cancer. In the preliminary examination it occasionally may be wise to take a biopsy of a suspicious area. Usually, and especially if bleeding is a symptom, the biopsy of the cervix should be taken when the curettage is performed. The small bit otherwise obtained may give a false sense of security.

Before the incision is made for the hysterectomy, carcinoma of the cervix must have been definitely ruled out. A complete or even supravaginal hysterectomy could probably remove a small carcinoma of the corpus but would usually be futile if cervical carcinoma were present. Accordingly, a "fractional curettage" is performed. First the cervix is curetted to avoid losing a small bit of tissue from the cervical canal in a large volume of endometrium. Not until the condition of the cervix is established is the remainder of the curettage carried out. Fig. 1 is a photomicrograph of a normal cervix. The firm, fibrous bulk of the cervix is covered by a single layer of cuboidal epithelium which would yield nothing to the curette. Therefore, ob-

taining any tissue at all must be regarded as suspicious. Whether to rely on the gross appearance of this piece or to defer the hysterectomy for the microscopic report is the responsibility of the surgeon, but the hysterectomy must not be started until the possibility of cancer of the cervix has been ruled out. Since about 2 per cent of fibromyomata in uteri seen in the operating room will also contain a carcinoma of the cervix, this precaution must always be taken. In the obvious case there will be no difficulty, but with the small cancer or even a well-established endocervical cancer, the routine just described becomes vital. Of the nine cancers occurring in the stump following hysterectomy performed in this hospital, five were present at the time and discovered in the pathologic examination. Some of these were so tiny that they might have been overlooked by any procedure, but the others would have been discovered by preliminary, punctilious examination of the cervix and endocervix.

Once the diagnosis of carcinoma is established, further procedure depends upon the clinical importance of the fibromyoma. Usually this can be ignored. Even if it is large, it will not interfere with the radium or x-ray therapy. The radium will care for the tissues near the midline and the x-ray those of the parametrium. The mass of the myoma will protect, to a certain extent, the rectum so that larger doses of radiation may be applied to the parametrium.

Rarely, degeneration or the suspicion of a sarcoma in the fibroid or the location of the myoma in the cervix might demand radical treat-

TABLE 1.—INCIDENCE OF CARCINOMA OF CERVICAL STUMP

Authors	All Cases	Stumps	Percentage
Behney (1940)	910	43	4.7

and shows an average incidence ranging between 4 and 5 per cent.

Whatever the precise incidence of carcinoma associated with fibromyoma of the uterus or occurring in the cervical stump is, it looms as an important figure. The argument that, even if it does occur, the results of radiation are good (40 per cent five-year survival) is small comfort.

Management of Diseases of the Cervix Complicating a Myomatous Uterus

Acute inflammations spreading to the adnexa, occasionally seen with fibromyoma, are treated independently of the fibroid, and when they become chronic and require surgery, they are usually best managed by removal of all the pelvic organs.

The treatment of chronic cervicitis, old lacerations, and erosions depends upon the clinical importance of the fibromyoma and the treatment planned for it. When, especially in women in their forties, the myoma is clinically insignificant, small, and symptomless, the cervix is treated, regardless of the fibroid, by cautery, high frequency excision, amputation, or a plastic operation, the indications for the treatment depending upon the condition of the cervix, the possibility of future pregnancy, etc.

Second, a fibroid may be of slight clinical importance (moderate size with moderate menorrhagia) and at the moment in need of no radical treatment. Associated with it, however, is a lacerated, eroded, and inflamed cervix in need of active therapy. While this might be treated by cauterization or excision by high frequency, the best treatment is often a complete hysterectomy which disposes of both conditions. (See Case 4.)

A third group of cases includes those myomata which would be satisfactorily treated by a radiotherapeutic menopause (in women to whom the artificial menopause is acceptable, with the uterus small and bleeding as the principal symptom). Under an anesthetic, after a diagnostic curettage, the cervix is appropriately treated and the patient subsequently is given a sterilizing dose of x-ray. Radium is not often employed because of the possibility of infection

due to the opening up of infected tissues of the cervix and the possibility of interference with wound healing, although we have seen no case in which this has occurred.

The fourth group includes those cases in which operation is indicated, tumors of large size, signs of degeneration, bleeding from submucous tumors, pain, urinary disturbances, or evidence of adnexal inflammation or neoplasm. One has the choice of four procedures: (1) a preliminary cleaning up of the cervix by cauterization or high frequency, with the idea that such treatment is adequate prophylaxis against subsequent carcinoma; (2) at the operation a preliminary amputation or cauterization of the cervix followed by a supravaginal hysterectomy; (3) a supravaginal hysterectomy with immediate or postoperative cauterization of the cervix; or (4) a complete hysterectomy, abdominal or vaginal. Selection of any of these procedures would depend on its purpose. For the treatment of symptoms caused by the diseased cervix, such as discharge or even pain, any of the methods may suffice, provided that they are thorough. For prophylaxis against subsequent carcinoma, cauterization is unsatisfactory.^{15,16,17} Amputation of the cervix may protect from carcinoma in the stump but when it is combined with supravaginal hysterectomy, it requires more time than complete hysterectomy. If all the endocervix is removed, the two operative fields will overlap, and the sutures in the cervix may be cut. It is simpler to control the cervical branches of the uterine vessels and remove the organ. Another point in favor of complete hysterectomy is the more effective plastic repair of the pubocervical, sacrouterine, and cardinal ligaments in cases where there is a tendency to prolapse.¹⁸

Fibromyoma of the cervix is almost universally treated by complete hysterectomy and needs little comment. Radiotherapy seems not to reduce adequately a fibroid in this region. I have had experience with only 2 such cases. (See Cases 1 and 3.)

Polyps are easily removed, whatever the treatment planned for the fibroid. If hysterectomy is to be performed, it is advisable either to remove the uterus immediately or to allow several weeks to intervene. In a study of the mortality of supravaginal hysterectomy, there was a high percentage among the peritonitis cases in which preliminary minor operations on the cervix had been performed a week or so previous to the hysterectomy. It seemed possible that in the inflammatory process following the minor operation on the cervix, the virulence of organisms may have been raised and that, when the uterus was removed, these organisms invaded the peritoneum.

has not been a cause of complaint. Libido and orgasm have apparently not been affected.

Analysis of the studies on the mortality of complete and supravaginal hysterectomy reveals a fairly consistent picture. In many reports the mortality for complete hysterectomy is lower than that for supravaginal hysterectomy. Newell and Scrivner,²⁴ reviewing these figures, found that five authors reported a lower mortality for complete hysterectomy than that for supravaginal hysterectomy, two reported the same mortality rate for either operation, and three reported a lower rate for the incomplete operation. In nearly all reports the mortality is in inverse proportion to the number of operations of each type. McDonald²⁵ reports a mortality of 2.75 per cent for 145 cases of supravaginal hysterectomy, and 0.67 per cent for 2,355 cases of complete hysterectomy for benign conditions. Siddall and Mack²⁶ report a mortality of 6.4 per cent for 235 cases of complete hysterectomy and 2.6 per cent for 1,141 cases of supravaginal hysterectomy. These figures are probably typical of most institutions where the complete operation is performed only for exceptional conditions. At the Presbyterian and Sloane Hospitals the rate for 1,279 cases of supravaginal hysterectomy for all benign conditions of the uterus and all conditions of the adnexa was 2.7 per cent, and for uncomplicated fibroids 2.3 per cent; the rate for 58 complete abdominal hysterectomies for benign conditions was 8.6 per cent. Since the change of policy to the routine performance of complete hysterectomy, there have been no deaths but the number of cases is too small to be significant.

At first glance one would infer that the higher mortality for complete hysterectomy is due to lack of experience and that only by performing many operations could it be lowered. On closer study, it will be seen that a group reporting 1,000 or more hysterectomies is not inexperienced. Moreover, Newell and Scrivner²⁴ point out in their report that the mortality in cases operated upon by the two most experienced surgeons of the staff was 3.4 per cent, while that of the other twenty-five members was 1.5 per cent. Siddall and Mack²⁶ make a similar observation. In our experience, since being converted to the policy of performing complete hysterectomy for fibromyomata, and after taking the trouble to study the few essential points in anatomy and technic, we have been able to instruct the residents so that they now perform the operation with confidence and precision.

We conclude, then, that the generally higher mortality following complete hysterectomy is due not so much to lack of surgical experience as to lack of attention to a few basic details, particularly the blood supply of the cervix, and the

fascial structures about the cervix, the bladder, and the ureter.

The teaching—even by some who habitually perform the complete operation—that supravaginal hysterectomy is the ideal operation is unsound. This recommendation is based on the idea that most myomata will be operated upon by surgeons of limited gynecologic experience and that in their hands the complete operation would do more harm than good—in other words, that the standard should be based on expediency rather than on the ideal procedure. This is no compliment to those having the responsibility of treating fibromyomata. If, as seems to be the case, the cervical stump is something of a menace, and if, in capable hands, complete hysterectomy is the best operation for fibromyoma, this should be set as the standard. Having such a standard, the individual surgeon can conduct himself accordingly. Gynecologists and general surgeons who practice gynecology will have little difficulty in acquiring adequate technic. The “casual” or “occasional” operator will be guided by his own self-appraisal. Certainly no resident should be graduated from a gynecologic organization without being familiar with the details of the operation of complete hysterectomy.

Conclusions

1. Diseases of the cervix so frequently associated with fibromyoma of the uterus must be accurately diagnosed and properly treated.

2. The operation of complete hysterectomy can be learned by any surgeon qualified to perform a supravaginal hysterectomy.

3. The frequency with which important diseases occur in the cervical stump following supravaginal hysterectomy, regardless of the original condition of the cervix, warrants the practice of routine complete hysterectomy for fibromyoma of the uterus.

Case Reports

Case 1.—A woman of 45 with a multilobular uterine mass the size of a six-month pregnant uterus was treated by a sterilizing dose of x-ray for obesity and hypertensive cardiovascular disease. The upper portion of the mass disappeared but there remained in the lower uterine section a mass 10 cm. in diameter, which remained unchanged for two years. Because of a gradual descent of the mass into the vagina and because of the accompanying pressure symptoms, a complete abdominal hysterectomy was performed. Perched on top of the cervical myoma was a uterus below average in size, containing no gross myomata. The masses in the upper portions of the uterus had evidently disappeared. The cervical mass was not noticeably reduced.

Case 2.—A woman of 42 had a supravaginal hysterectomy for fibromyoma of the uterus. Con-

ment. If so, a Wertheim hysterectomy is to be considered.²¹

Still more rarely a carcinoma of the cervix will be treated by radiation and the fibromyoma of the uterus later operated upon. (See Case 5.) This is bound to be rare because the amount of radiation necessary for the treatment of the carcinoma will automatically produce an artificial menopause and a satisfactory reduction of the fibromyoma.

Management of Lesions of the Cervical Stump

Persistent bleeding from the cervical stump from residual endometrium presents a difficult diagnostic problem. Polyps and carcinomas must be ruled out, usually by an examination under an anesthetic. Treatment is either destruction of the endometrial tissue by excision, cautery, high frequency, chemical caustics (zinc chloride), or by a radiotherapeutic menopause. If the latter is acceptable, it is by all odds the best method. (See Case 2.) Cauterization or excision of tissue in the very summit of the cervical canal is a ticklish procedure because of the proximity of hollow viscera. Chronic cervicitis, with its disagreeable mucous leukorrhea, is a frequent complication following supravaginal hysterectomy. It can be cured only by destruction of the cervical glands, usually by high frequency, with the risks above mentioned.

The treatment of fibromyoma of the cervical stump is attended by many technical difficulties.^{5,6,7,8} If large, the tumor must be removed abdominally; if small, it may be enucleated but with considerable risk of hemorrhage. In our case (see Case 3), the artificial menopause was unsuccessful.

Carcinoma of the cervical stump is treated by radiation. The radium dosage is calculated with especial attention to the application of the law of inverse squares if radium is inserted into the cervical canal. Even with cautious treatment, the incidence of fistula is high. The end results by and large are excellent (40 per cent five-year survival).

Prophylactic Complete Hysterectomy

It can be demonstrated by no greater distortion of statistics than is frequently seen in medical literature that the removal of the uterus of every woman finished with childbearing would protect her from subsequent disability or loss of life with proportionately little danger to herself.

Such a radical proposal at this moment would not be accepted by any lay or medical group. However, once the removal of a uterus has begun, the element of prophylaxis enters the picture.

One must decide (1) whether the diseases found in cervical stumps are of sufficient number and importance to require a routine complete hysterectomy, (2) whether only certain of the lesions presumably the site of chronic irritation (chronic cervicitis, lacerations, erosions, and eversion) should be removed, or (3) whether the cervix should be ignored. Of these three policies the majority of doctors favor the middle course, believing that the diseased cervix predisposes to a subsequent cancer and that the normal-appearing cervix is innocuous. The evidence seems to be against this policy. Fig. 2 shows the condition of the cervical epithelium in a woman operated upon by complete hysterectomy for fibromyoma. A careful curettage of the apparently normal cervix preceding the hysterectomy had yielded nothing. While few would call this a definite epidermoid carcinoma, they would observe some cytologic evidence of malignancy and an apparent beginning invasion. Such lesions as these may be the precursors of true cancer.

The parity of the women is of no help. Twenty-five per cent of the carcinomas in the cervical stump are in nulliparous women.^{13,15,22} Of our 38 cases, 10 were in nulliparous women. Among cases treated by us with radiation for myoma and uterine bleeding, carcinoma of the cervix was discovered later in 5. In every case there had been a diagnostic curettage and examination under anesthesia. Of the 5, 2 were nulliparous, and in 4 the cervix was grossly normal at the time of the original treatment.

A ratio of one nulliparous to three parous would indicate that the nulliparous or normal-appearing cervix is by no means immune to carcinoma. Moreover, the conventional and casual statement—which has never been backed by careful statistical analysis—that birth injuries predispose to carcinoma is being challenged more and more²³ since groups organized for the treatment of cancer have undertaken more careful study of the disease. I am forced to conclude, therefore, that the decision to perform complete hysterectomy for fibromyoma of the uterus should be based on a general policy of prophylaxis and not upon the presence of visible so-called precancerous lesions.

Granting that the incidence of from 1 to 2 per cent of carcinoma and the occurrence of less serious but disabling conditions in the cervical stump would make such a general policy desirable, how much greater is the risk involved in undertaking the larger operation? All agree that the morbidity following complete hysterectomy is greater than after supravaginal hysterectomy. The sequelae are not important. In our experience, dyspareunia because of a short or a dry vagina

MODERN HYDERABAD HOSPITAL USES MOSLEM SPECIFICS OF POWDERED GEMS

Hyderabad, India.—Like Cleopatra, this writer has just swallowed some pearls. A correspondent's coverage of India would not be complete without a brief study and description of the ancient systems of medicine still used by perhaps nine of ten natives of this country. It is further evidence that India must not be judged in terms of Western thought, which many Indians disagree with and do not want.

Here in Hyderabad is a unique hospital founded by the Nizam to practice the Moslem Unani system of medicine. This system has been handed down through many centuries from the Greeks and Arabs. The Nizam, like most Moslems, is a firm believer in it.

The Hindus use a somewhat similar system called Ayurveda. Where Ayurvedic pharmacopeia uses mercury and sulfur as its bases, however, Unani uses sugar and honey. Moreover, the Hindu system also relies on prayers, spells, and witchcraft, whereas Unani is a purely empirical system, based on uncounted experiments on human beings over a millennium.

The chief peculiarity of the Unani system is that it uses oxidized jewels, mixed with an extraordinary variety of Indian herbs, dried fruits, and the inevitable honey and sugar. Pearl ashes are prescribed as the best form of calcium and a sovereign tonic. The mixture tastes delicious.

Unani practitioners claim that jewels provide chemicals in their purest form and have some virtue beyond their chemical composition. When

oxidized they all turn into a white or slightly brownish powder. Needless to say, they are costly.

Emeralds are esteemed as the best medicine for the liver and kidneys. Rubies are recommended for the heart, coral for asthma and the brain, and diamonds for external use. Gold oxide is prescribed for tuberculosis and the potency of silver oxide for heart ailments is highly regarded.

It all sounds weird to a Westerner, but Indian doctors point out that the allopathic system, as they call it, has borrowed much from Indian medicine.

The Hyderabad Hospital would stand comparison with any in the Western World. It is modern and spotless, and elaborate records of patients are kept. There is an operating room, but whenever possible cures are effected without surgery.

Malaria patients appear to be recovering without quinine. In the dietary regime, the latest discoveries in calories and vitamins are being used. So it goes all along the line.

One must guard against thinking that Indian medical practices are the fruits of ignorance. When such a scientist as Sir Chandrasekhara Venkata Raman, just to mention one, speaks as highly of the Ayurvedic and Unani systems as he did to this correspondent in Bangalore, it is not for the uninitiated foreigner to be contemptuous. As so often happens in India, one may come to scoff, but one goes away, at most, dubious.—*Herbert L. Matthews. Reprinted with permission from The New York Times.*

1943 OPHTHALMOLOGY EXAMINATIONS

Examinations will be given by the American Board of Ophthalmology on June 4 and 5 in New York City and on October 8 and 9 in Chicago. Candidates will be required to appear on two successive days. Formal application blanks may be obtained from Dr. John Green, secretary, 6530 Waterman Avenue, St. Louis, Missouri.

CANCEL MEDICAL WOMEN'S MEETING

The annual meeting of the American Medical Women's Association, which was to have been held in San Francisco in June, 1943, has been canceled because of the war. Instead, the board of directors will hold an extra meeting in Chicago on June 5 and 6, preceding the meeting of the House of Delegates of the American Medical Association.

FIG. 3. Photomicrograph of an edematous fibroid of the cervix.

FIG. 4. Photograph of an edematous fibroid of the corpus persisting and increasing in size six years after intensive radiation for carcinoma of the cervix. Microscopic examination showed massive edema.

valescence was uneventful. Six months following the operation there was an onset of bleeding from the cervical stump. This occurred irregularly at intervals of from four weeks to two or three months, lasted usually from one to two days, and was scant in amount. She was referred to the neoplasm clinic, where she was found to have a normal-appearing cervix. Probing of the canal caused slight bleeding. A curettage under anesthesia yielded a few bits of tissue containing a few glands which suggested the structure of a postmenstrual endometrium. She was given 600 r of x-ray anteriorly, 600 r posteriorly, 200 K.V., 50 cm. anode skin distance, 0.5 cu. mm. filtration. The bleeding ceased and has not reappeared in three years.

Case 3.—A woman of 41 was operated upon for uterine tumor by supravaginal hysterectomy. Eight years later she suffered slight heavy sensations in the pelvis. On examination there was a mass between 4 and 5 cm. in diameter in the posterior lip of the cervix, spreading out laterally into the paracervical tissues. Because of fixation and vagueness of outline of this mass, a biopsy was performed (Fig. 3). The tissue was soft, friable, white, and translucent. Because of anticipated surgical difficulties she was given a sterilizing dose of x-ray. The mass increased in size to a diameter of 7 or 8 cm., evidently because of edema. To relieve pressure symptoms, the bulk of the mass was partially enucleated but, because of bleeding, it was not completely removed. After two weeks of draining the wound in the cervix closed. The mass remained about 5 or 6 cm. in diameter. Gradually it was extruded from the cervix and appeared as a pedunculated mass in the vagina. With some difficulty the tumor and the cervical stump were removed.

Case 4.—A woman of 44 with a uterine tumor the size of an eight-week pregnant uterus, who was suffering from moderate menorrhagia and pain in the right groin and upper thigh, had a deep laceration of the cervix with extensive erosion and scars running

into the right paracervical tissue, together with a myomatous uterus which required no immediate treatment. Proper treatment of the cervix would have been high amputation. This would have kept the patient in the hospital for two weeks because of the possibility of secondary hemorrhage. It was deemed wiser, therefore, to treat both the tumor and the cervix by a complete abdominal hysterectomy. Had the uterus been more mobile, this would have been an ideal case for a vaginal hysterectomy.

Case 5.—A woman of 42 with a League of Nations Grade II Epidermoid Carcinoma of the cervix and a uterine mass the size of a three-month pregnant uterus received 70 mg. of radium in the uterus and vagina for 100 hours, followed by 2,000 roentgens of x-ray to each of four fields, given in forty treatments. The carcinoma disappeared. The uterine mass remained the same size. One year after the radiation, a dilatation of the cervix was performed because a pyometra was feared. The uterine cavity was empty. A punch biopsy near the center of the mass, taken from within the uterus, showed fibromuscular tissue. The mass remained unchanged in size until six years after the first treatment, when it became to the size of a four- to five-month pregnant uterus and seemed to fluctuate. By supravaginal hysterectomy, the specimen illustrated in Fig. 4 was removed, a myoma completely altered by cystic degeneration. Convalescence was uneventful.

FIG. 1

Case 1. *Postradiation Recurrence*.—Basal cell carcinoma recurrent three times during seven years. Excised and skin graft applied at once. Left photograph shows condition present after third postradiation recurrence. Right photograph shows appearance one year after surgical excision and repair. No recurrence to date ($4\frac{1}{2}$ years).

surgery In certain cases, on the lip, for instance, a combination of radiation of the primary growth and surgical removal of the involved lymph drainage is best.

In any event, whether surgery or radiation is used in the initial treatment of skin cancer, it cannot be overemphasized that the destruction of the growth must be adequate. However, during the later history of cancer of the skin, there are situations that occur where we believe the only chance of arrest of the growth is by radical surgery.

Postradiation Recurrences

One of the most common indications for radical surgery in carcinoma of the skin is a growth which has recurred and persisted in spite of radiation therapy. As I have indicated, initial radiation of these tumors may at times be inade-

quate, and in these instances recurrence is rather prompt. One often finds that one or more recurrences has been treated by further inadequate radiation. Again, in spite of what is usually considered adequate radiation, there are some tumors which recur. We believe that skin cancer which has recurred following repeated inadequate radiation or initial adequate radiation should be radically excised. Such an example is illustrated in the following brief case report.

Case 1

M. C., a white married woman of 42, was first seen on October 26, 1937. Seven years before, a small scaly lesion of the left temporal region had been treated by surgical diathermy and an unknown amount of x-ray. Two years later following a recurrence she received 100 milligram hours of radium. Two and a half years later the growth recurred and she was treated with radium, 100 milligram hours. After this she was free from trouble for eleven

RADICAL SURGERY FOR CARCINOMA OF THE SKIN

FORREST YOUNG, M.D., Rochester, New York

IT IS our purpose to call attention to the fact that there are certain groups of cancer of the skin that are best treated by radical surgery. This mode of treatment presupposes the ability and inclination of the surgeon to repair the damage that destruction of the growth entails.

One of the objections to radical surgical extirpation of skin cancer is the disfigurement and the long waiting period before repair is presumed safe. This is particularly so since many of these growths occur about the face.

We believe that it is much safer than is commonly thought to radically excise these tumors and repair immediately. It is our experience that extensive skin cancer can be satisfactorily eradicated by generously estimating in advance the amount of tissue which must be removed; if necessary, preparing the tissue for reconstruction beforehand, then radically removing the lesion surgically, and at the same time repairing the loss occasioned.

This plan, in certain situations, is the only method of treatment that offers any hope of a fairly high percentage of long arrests of the tumor. In other instances, although the chance of cure is as great by other means, still when all factors are weighed, radical surgery may be the method of choice.

Diagnosis

Before any treatment can be rationally outlined, a positive diagnosis must be made. Often a diagnosis can be made by inspection alone, but it should always be confirmed by microscopic study. It is important to distinguish carcinoma of the skin from benign lesions and to decide whether the growth is of basal or squamous cell type.

Senile keratoses are precancerous lesions. They occur on the face and hands of elderly people. They are plaque-like thickenings of the epidermis, slightly elevated, scaly, and a light yellow-brown color. In early change to cancer they may weep slightly and crust. Basal cell carcinoma occurs predominantly after forty. It is more frequent in the lightly pigmented races and occurs about three times more often in men than in women. It occurs particularly often in those exposed to weather—for example, in farmers. It is often preceded by a precancerous lesion. The majority of basal cell cancers occur

above the level of the upper lip. They are flat, indurated growths, ulcerated in the center, often with a hard, rolled edge. It is chronic, painless, and grows very slowly.

Squamous cell carcinoma of the skin is much less frequent than basal cell. It tends to occur at the junction of skin and mucous membrane. It grows more rapidly, is more indurated, and shows more infiltration. It often involves the extremities, the genitals, the lips, and regional lymph nodes. It occurs in chronically irritated areas, as, for example, in chronic burn scar ulcerations and on the lips of pipe smokers.

Although in the majority of cases, a diagnosis can be made from appearance alone, in early lesions recourse to microscopic examination is the only sure method.

Treatment

Once the diagnosis is made, certain facts must be kept in mind regarding therapy. At present we have but two methods of handling cancer, radiation and surgery. Basal cell carcinoma is quite radiosensitive, squamous cell cancer fairly resistant. Moreover, the lymph node metastases of squamous cell carcinoma, because of their deeper position, are not easily controlled by radiation.

Precancerous keratoses and early basal cell lesions can be satisfactorily handled by radiation with a minimum of effort, expense, and with little disfigurement. However, this initial radiation must be adequate. Too often the first treatment of a relatively insignificant basal cell cancer is given without biopsy, by one who has neither efficient equipment nor sufficient appreciation and knowledge of radiation dosage.

These cancers can also be arrested by surgical extirpation, but again this must be adequate. Superficial electrodesiccation, curetting, or the application of escharotics is not adequate. They must be excised with a sufficient margin of healthy tissue or widely and deeply destroyed by surgical diathermy or cautery. Surgical extirpation is usually more objectionable to the patient than radiation and causes more noticeable scarring.

Squamous cell carcinoma can also be arrested by radiation but with by no means the same assurance. For this reason when the growth is so located—as, for example, on an extremity—that it can be surgically removed without sacrificing a part that will produce disfigurement or derangement of function, surgery may be preferable. Involved lymph nodes are best handled by

From the Department of Surgery, the University of Rochester School of Medicine and Dentistry, Rochester, New York.

FIG. 3

ready destroyed tissue of such magnitude that disfigurement is present. Arrest of the cancer by whatever means is chosen causes still further loss of tissue. These patients must have the destroyed tissue replaced if they are to become acceptable, self-supporting members of society. It is our belief that the course of treatment is shorter and repair simpler if radical surgery is resorted to than if the tumor is arrested by radiation and the defect then repaired surgically.

To a certain extent, radiation damages normal tissue near a tumor so that when repair is necessary, the defect must be surgically increased in order to secure edges which have normal healing properties. Moreover, after radiation, months must elapse before the surrounding tissues return to a state in which they will tolerate surgical intervention. If one waits until there is some certainty that tumor is still not present, the time interval before repair can be begun is usually about eighteen months. Repair takes from four to six months more so that it is often two or two and a half years before the patient is again useful.

This treatment period can be greatly lessened in cases of extensive ulceration by excising the growth widely and repairing the defect at once.

Case 3

We first saw E. G., a 79-year-old white woman, in September, 1933. She had a large ulcerated growth involving most of the midportion of the forehead. A small growth had been present for about two years, but during the previous two months it had spread rapidly. A biopsy showed squamous cell carcinoma. Because of the extent of the ulceration surgical excision was carried out. The growth did not extend into the skull. The bone was drilled in order to obtain a granulating bed. Six weeks later the granulating wound was covered with Thiersch grafts. The wound healed nicely. She was followed for five years and had no recurrence.

The long-continued course and the difficulties encountered in primary radiation followed by repair are well illustrated by the following case report.

Case 4

W. B., a 45-year-old, white, married, gasoline salesman came for advice in September, 1933, concerning an ulceration of the right corner of the mouth. This had been present for only six weeks and had grown very rapidly, extending back to the second molar. A biopsy showed squamous cell carcinoma. The growth and neck were treated by x-ray. The patient was given 5,500 r in air in fractional doses and 1,080 mg. hours of contact radium

FIG. 2

Case 2. *Persistent, Recurrent Basal Cell Cancer.*—Left photograph, appearance after 30 years of numerous x-ray and electrodesiccation treatments; disfigurement marked, and cancer still present. Middle photograph shows condition after first operative step; forehead flap ready for transfer, tumor destroyed by cautery. Right photograph shows completed repair. Working every day, no recurrence to date (2½ years).

months, and when the growth recurred for the third time she consulted me. She had a typical recurrent basal cell carcinoma with a fairly wide zone of subcutaneous infiltration. This was proved by microscopic examination. The growth was excised with a wide margin of normal tissue about and beneath it and a free skin graft applied. She has had no recurrence for four and a half years.

Persistent, Recurrent Basal Cell Cancers

This group, we believe, should be subjected to radical surgery. It overlaps the group of post-radiation recurrences to a certain extent, but we consider it separately because a number of patients present themselves with a story of repeated recurrences after varied therapeutic agents have been used. These cancers are predominantly about the face, and we presume that the reason for the repeated, obviously inadequate therapeutic attempts, is fear of producing disfigurement. Our answer to this is that uncontrolled rodent ulcer in time causes more destruction and disfigurement than adequate initial treatment. No cancer can be cured by half-hearted methods. A growth on the ala of the nose or one on the lip should be destroyed as thoroughly and widely as anywhere else, but from patients that we see, we have come to the conclusion that there is a tendency to temporize in the initial treatment of skin cancers about the face.

The following case report illustrates long-continued temporizing and the steps finally taken to arrest the growth.

Case 2

H. B., a 59-year-old, single, white expressman, was referred to us for treatment of a long-standing ulceration of the nose. This began about twenty years before. In the intervening time he had received many x-ray treatments, and the growth had been treated with the "electric needle" on numerous occasions. The tip of the nose had gradually been lost until the left ala was completely destroyed and most of the right ala. A crusted ulcer was present over the remaining edges of the nasal tip. A section showed basal cell carcinoma infiltrating the alar cartilage. On January 25, 1940, a forehead flap was elevated and the lower half of the nose and septum burned away with the cautery. Reconstruction of the nose was completed on April 25, 1940, three months later. Four operative steps were used. He has been followed frequently since. To date, almost two and a half years later, there has been no recurrence.

Extensive Ulcerations

Fortunately the number of patients in this group is small, but there are still some patients who, for one reason or another, allow cancer to progress to extensive ulceration before seeking treatment. In this group, the cancer has al-

Case 6. *Skin Cancer Invading Bone.*—Left photograph shows many times recurrent basal cell cancer which by x-ray had extended into bones of orbit. Right photograph, result after radical surgery and immediate repair by doubled forehead flap. No recurrence on last follow-up (3 years).

FIG 4

Case 4. Extensive Ulceration—Left photograph shows defect present 1½ years after arrest of squamous cell cancer by radiation. Right photograph, appearance on completion of repair. Time from initial treatment to completion of repair, three years. This time could have been no more than three or four months if lesion had been treated by radical surgery initially. No recurrence, six years.

over the growth. The growth healed. Six months later recurrence was evident, and radium seeds were implanted in the growth. Following this the angle of the mouth sloughed. The edge of the defect healed slowly. In March, 1935, about eighteen months after the first treatment, there had been no recurrence, and surgical repair of the defect was started. This was attended by numerous difficulties. A tube graft was first formed on the neck. This proved to be a mistake, for the tissues had received enough radiation to partially devitalize them. Infection developed, part of the graft was lost, and eventually was entirely discarded. A new flap was developed on the chest and successfully transferred to the face. After fifteen major and minor surgical steps, repair was finally completed in October, 1936. The entire period of treatment was just about three years. Fortunately the growth was permanently arrested—at least he was last seen in October, 1940,

six years after onset, and there was no recurrence at that time.

Cancer Occurring in Scars

There is, I believe, practically complete agreement that cancer arising in old burned areas and in skin which has been damaged by heavy irradiation, responds poorly to radiation therapy. But since we from time to time see such lesions after unsuccessful x-ray treatment, it seems best to call attention again to the fact that this small group of skin cancers should be treated surgically.

Case 5

A white farmer, 63 years of age, was first seen in December, 1939, because of a growth on the side of his neck. He had been burned about the face, neck, and trunk as a child. For many years an

area in the scar just below the ear had been rough and scaly and ten years before an epithelial horn had appeared. This began to increase in size some two months before and had grown rapidly. The tumor was an elevated, firm mass with some ulcerated area; it was about 8 by 8 cm. in size. A biopsy showed squamous cell carcinoma. The growth was widely and deeply excised and the large defect immediately covered with a split thickness skin graft. The area healed promptly. He has been examined at regular intervals and to date, about two and one-half years, there has been no recurrence.

Skin Cancer Invading Bone

There comes a time in the history of cancer occurring in the skin or mucous membrane over bony prominences, when the neoplasm extends into bone. This occurs particularly in squamous cell carcinoma of the alveolar ridge and basal cell carcinoma about the rims of the orbits and over the bony nasal bridge. When bone is invaded by cancer cells they are so protected that they can be killed only by destruction of the bone in which they are lodged. This can be done by irradiation but only by extremely heavy dosage to the point of radiation necrosis. Such a dose affects deep soft tissues and makes the patient miserable for months. Repair following such treatment is difficult because of wide-spread tissue devitalization. We believe the chances of arrest of the growth are greater, the patient less miserable, the course shorter, and the final repair better if carcinoma extending into bone is handled surgically.

Case 6

F. N., a white farmer, age 63, was seen in August, 1937, because of a long-continued growth near the internal canthus of the right eye. Seven years before a few small pearly nodules in this region were treated by x-ray. Three years later an ulceration in the same area was treated with 100 mg. hours of

radium. The lesion recurred promptly and was treated six months later by electrocoagulation. Within six months the growth was again present, and radium was again applied. Two and one-half years after this I saw him. He had a firm, puckered, ulcerated tumor adherent to the inferior orbital rim. X-rays showed bone destruction. In September, 1937, a radical removal of the growth and exenteration of the orbit was done. The defect was closed by a doubled forehead flap. The entire course of treatment entailed five operative steps and was completed in three months. He was followed for three years and then failed to return for follow-up. When last seen there was no recurrence.

Summary

1. Skin cancers occurring in burn and post-radiation scars are best treated initially by radical surgery.

2. Extensively ulcerated skin cancers are more satisfactorily and quickly arrested by surgery than by radiation followed by surgical repair.

3. Postradiation recurrences of skin cancer should be treated surgically rather than by further radiation.

4. Persistent-recurrent skin cancer should be surgically excised.

5. Skin cancers that have invaded bone can be arrested by surgery only.

These groups of skin cancer can be arrested in a high percentage of cases by wide, deep surgical removal and immediate repair. The accepted teaching that cancer defects should be left open for inspection for at least eighteen months causes a long period of disability that is not always necessary. Deep invasive growths whose complete eradication is doubtful, should not be repaired until one is certain that recurrence is not probable. However, large surface areas of growth should not be a deterrent to immediate repair.

COLOR-BLIND FAMILY

A father and two sons who among them exhibit all the three known types of color-blindness were described by Dr. Dean Farnsworth of New York University at a recent meeting of the Optical Society of America in New York.

The father is violet-blind. He confuses violet with yellow, blue with green, and orange with red-purple. One son is red-blind; the other green-blind.

Violet-blindness by itself is extremely rare. Dr. Farnsworth mentioned only two conspicuous previous cases investigated in this country. One was of quite a different type, he said, and the other

was not adequately investigated. However, he believes that violet-blindness is not so rare as generally supposed, that a number of cases have escaped detection because of inadequacy of the color-blindness tests.

Another rare feature of the present case is that the father is completely blind to the violet edge of the rainbow. He does not see violet light at all. He sees yellow light but it appears colorless to him. The red-blindness and the green-blindness of the two sons are not uncommon among males.—*Science News Letter*

DISCREPANCIES IN SEROLOGIC FINDINGS AS SHOWN BY THE RESULTS OF THE WASHINGTON SEROLOGY CONFERENCE

J. F. MAHONEY, M.D., Staten Island, New York

THE recently enacted items of social legislation requiring premarital and prenatal blood testing are serving to bring to the fore the shortcomings of the laboratory methods used in the serum diagnosis of syphilis. It is now rather generally agreed that none of the procedures in use at the present time completely covers the field of clinical syphilis. It is also conceded that any method may yield false positive results in the presence of intercurrent illness and that leprosy and malaria are prone to produce positive reactions. Less well recognized is the fact that a certain amount of disagreement in the findings of any two tests is to be anticipated and that these discrepancies may be looked upon as a shortcoming of the science of serology rather than as a limitation of an individual technic.

A study of the problem presents some practical difficulties. Two approaches are open. The first, and the one usually adopted, consists of the detailed study of groups of patients who display discrepant serologic findings, or for whom the laboratory findings are at variance with the clinical picture. The second method requires the carrying-out of multiple procedures in a large group of serum specimens and the analysis of the results as to the frequency with which conflicting findings are produced and as to the type of patient from whom discrepant findings tend to appear. The latter study requires that the specimen material be identical for the various tests and that the technical methods be carried out in an unimpeachable manner. The data supplied by the Washington Serology Conference fulfill these requirements and will be used, in part, in an effort to illuminate the problem of conflicting test findings.

On three previous occasions—at Copenhagen in 1923 and 1928, and at Montevideo in 1932—groups of serologists, each credited with having contributed a new test or major modification, have been assembled. The purpose of these assemblies was the rapid gathering of precise information in regard to the reliability of each method in the detection of syphilis. The Washington Conference was a further step in this direction and represented an effort to evaluate the

earlier American technics and some of the more recently developed methods. Nineteen serologists participated and reported upon the findings obtained with 28 procedures. A total of 1,002 serum and 234 spinal fluid specimens, (1) from donors with the established diagnosis of syphilis, (2) from presumably nonsyphilitic patients suffering from intercurrent illnesses and/or pathologic conditions, and (3) from normal individuals, were distributed. Upon a scrutiny of the findings of this group are based some of the considerations to be stated in regard to discrepant findings.

All of the distinctive test procedures available at this time are technical adaptations of one of two principles, complement fixation and precipitation or flocculation. All of the tests are considered to be capable of detecting the presence of the same component of blood serum. This component has been designated as reagin, or Wassermann substance, and is supposedly the product of spirochetal action. It has been convenient to look upon reagin as an entity and to consider that the strength of a positive reaction is roughly indicative of the concentration of the reacting substance. If this were entirely true the cause of conflicting findings could be traced to the ability of one test to measure concentrations which escape detection by another. The degree to which a difference in sensitivity may account for conflicting findings may be estimated from the following.

In Chart 1 are arrayed the percentage ratings attained by a group of more widely known American methods in the testing of 376 serums from syphilis patients. The blood specimen withdrawn from each patient was sufficiently large to provide an adequate and entirely comparable sample for each participant. Only patients with a clearly established diagnosis of syphilis were used as donors. Although the actual conduct of each of the methods was in the hands of the originator, or an accredited representative, an appreciable difference is apparent in the ability of the tests to detect reacting substance.

In the complement fixation group of tests there is a difference between 77.4 per cent of positive findings recorded by the most sensitive and 54.2 per cent recorded by the least sensitive procedure. The doubtful range in some of the tests serves partially to close the gap and indicates that some reacting substance was detected but that the degree of the reaction did not warrant a positive report. In the flocculation group the

Read by invitation at the Annual Meeting of the Medical Society of the State of New York, New York City, April 30, 1942.

Percentage Findings of Tests with 376 Serums from Patients with Syphilis

CHART 1

spread appears to be almost equally pronounced. The procedure at the left of the array attained 76.9 per cent positive findings as compared with 58.3 per cent for the method at the right.

The difference in the totals of positive findings displayed by any two procedures serves as an indication of the mathematical possibility of conflicting results being produced. The point may be further emphasized by the statement that 87 per cent of the specimens from syphilis patients were found to be positive or doubtful by at least one diagnostic procedure, whereas the highest percentage attained by any one test was 83.2. The average for fifteen of the tests which were acceptable from the specificity point of view was 71 per cent. Thus it would seem that in a group of specimens from known syphilis patients a discrepancy rate of from 4 to 20 per cent may be expected.

Individual serum reactivity patterns further complicate the picture. When the findings of any two methods are analyzed on the basis of results in comparable specimens, the range of complete disagreement between tests in the complement fixation group varies from 6 to 20 per cent. This means that the same serum may be recorded as positive by one method and negative by another. As an example, the New York State complement fixation and the Kolmer tests recorded approximately the same total number of positive and doubtful findings. However, the New York State method recorded reactions

in 12 serums which were negative to the Kolmer. The reverse was true in 18 serums. The Boerner-Lukens test was positive or doubtful in 12 instances which were negative to the Connecticut State test, while the reverse was true in 28 serums. In comparing two methods which have a distinct difference in sensitivity levels, the disagreement becomes more pronounced and is toward the most sensitive method, but not entirely so. Thus, the Mazzini test records as positive or doubtful 70 serums which were negative to the Kahn, but the Kahn was positive in 4 serums which were negative to the Mazzini.

A still further complicating feature may be illustrated by the following information. As a result of considerable experimentation, it has been found that serum specimens which have been Seitz-filtered and to which an adequate concentration of merthiolate substance has been added, may be maintained in a testable condition for prolonged periods without appreciable loss of reactivity. This knowledge was utilized in the Washington Conference in the following way:

For the purpose of testing the ability of a procedure to reproduce its findings in identical specimen material tested upon different days, a group of specimens was prepared. Pooled positive serum was diluted with negative serum in a series of 9 dilutions ranging from 3 of positive and one of negative to one of positive and 43 of negative. The bulk specimens of each dilution were passed through a Seitz filter and preserved with merthiolate substance. A sample of each dilution was tested by every participant on each of the ten days of the Conference. When the results are tabulated the ability of each procedure to follow the dilution schedule is displayed, as is also the day-to-day variation to be expected in testing samples of identical material.

Chart 2 represents the findings of a group of the more widely used technics. Attention is invited to the performance of the Michigan State Modified Kahn Presumptive procedure, which contributed a completely satisfactory performance in this group by detecting reagin in all specimens in which reacting substance was present. The New York State complement fixation test gave an almost perfect picture in that the transition from positive to negative findings was precise, although at a higher level of reagin concentration than the first-mentioned procedure.

The majority of tests, however, appear to pass through a critical zone which covers two and sometimes three of the present dilutions. In this zone the findings of "positive," "doubtful," or "negative" are indiscriminately recorded for identical specimens tested upon different days. The critical zone may occur at different levels in the dilution schedule for different tests and

It would thus seem that discrepant serology findings are to be expected at the present state of our knowledge. It should be recalled that the findings here presented were produced by workers skilled in each technic and that the results may be looked upon as a fair maximum of that attainable by the methods. In less skilled hands the degree of discrepancy would probably be of a greater order. It is surely regrettable that there has not been developed a method by which the medical man who is called upon to interpret the findings could be guided in determining the type of conflicting picture with which he is dealing. There are, however, several principles which may be found helpful.

The conflicting findings that are directly attributable to faulty technical work present a perplexing dilemma for the medical man. As has been previously intimated, there is no way of compensating for the vagaries and inconsistencies which may result from the improper conduct of tests due to indifference, or lack of knowledge or training. It is, moreover, difficult for the profession to judge the laboratory which is doing good serology. The safe attitude is the patronizing of a laboratory in which recognized procedures are being carried out under careful check at all times. The state health departments, which maintain an approval system for laboratories, contribute a valuable service through the insistence upon high technical and educational standards.

Another general thought to be borne in mind is that a serologic upstroke almost invariably accompanies the invasion of syphilis and that, once the invasion is completed, practically all well-conducted procedures give positive findings. Under effective treatment the test findings are unevenly reduced or reversed. The bulk of discrepant results are found in this category of patient. When a history of previous infection and therapy are obtainable, the import of conflicting serology is minimal, as the continuation of therapy, or the approval for marriage, will be predicated upon conditions and circumstances other than the serologic findings. Discrepant findings may be considered as the rule, rather than the exception, in patients who are responding to treatment or who are in the initial stage of serorec.

The trouble occurs in patients with instances of conflicting serology of previous infection and do not give a history of possibility of a false positive. In those the always be given consideration. In those the is usually that of low-reading positive or negative reactions with some methods and negative should ings with others. As a basic premise it may be stated that this is not the expected picture of an untreated syphilis of any appreciable duration. It is the picture frequently encountered in syphilis which is responding to therapy. Hence, in the absence of history and clinical evidence of syphilis, consideration should always be given to the possibility of the atypical finding being an expression of the influence of a condition other than syphilis. It is only rarely that an arbitrary diagnosis of syphilis and the beginning of treatment are warranted upon the basis of this type of serologic finding.

Discussion

Discussion
Augustus B. Wadsworth, M.D., Albany—I wish to preface my remarks by stating that I agree heart-

ily with the main points that Dr. Mahoney has stressed. There is possibly one exception and with that I agree from one point of view while from another I disagree. In our first evaluations by comparative series the standard that was selected and that proved most satisfactory wherever there was a discrepancy was the consensus of reports on a given specimen. On the other hand, it does not help to multiply tests that are defective in order to reach a satisfactory confirmation.

It is reassuring to have such a broad evaluation of the comparative results obtained with the different serologic tests—that is, an interpretation within the limitations of our knowledge of serology. Still I must reiterate that the laboratory should not make a diagnosis of syphilis, that the reports of the serologic tests should not be submitted as "positive," "negative," or "doubtful," and that evaluations based on such reports fail to give a true comparison of the methods either from the theoretic or the practical point of view. The statistical comparison of results based on reports of "positive," "negative," and "doubtful," although it has contributed to the general knowledge, has been worn threadbare, and speak, especially since it does not give the data necessary for comparison within the group of so-called discrepant results. "Positive" reactions of a marked reaction, whereas in sensitive tests they really represent a relatively slight amount of disease. In such instances even those reactions that are of specific origin represent such a small degree of activity that their significance is doubtful. The variation in reports of "positive," "doubtful," and "negative" in this borderline group is particularly objectionable. Specific information, in the light of our experience, has only been obtained by the detailed analytic comparison of the degree of reaction obtained in the different tests and in the light of clinical observation in the individual case. The significance of low grades of reaction obviously depends upon whether or not the case is syphilitic, the stage of development of the disease, whether or not the patient is under treatment, and the importance of detailed analytic comparison. The degree of reaction is strikingly emphasized in the modern intensive method of treatment. Under the modern intensive method of treatment we have made of the final titer in cross-reactions. This applies also to the evaluation of the Yaws test. Cross-reactions reported in other diseases—syphilis, yaws, leprosy, and true infections—have been reported in the literature. In the comparative study of sera acted in para/Mrs. Mallan's study of sera from patients with leprosy and tul. degree in the tuberculin test there are true tuberculous reactions, a greater percentage of discor., a greater degree of activity of the disease than in the tuberculin test.

*Am. J. Trop. Med.

as with paraffin
ations and the
may be up to
not concerned

The percentages recorded with precipitation as compared with complement fixation, in Dr. Mahoney's report, are so remarkable that a question is raised as to the significance of a certain proportion of these reactions—that is, in the light of our experience. In comparative studies of the reactivity of the same serum it is not possible to secure as sensitive results with precipitation as with complement fixation.

The difficulty of interpreting the significance of the relatively small percentage of atypical reactions that occur in serologic tests is illustrated when the results of a long series of repeated tests are studied. The deviation in the great majority of specimens is only 8 to 10 per cent, which might indicate the technical error, but in a small number the deviation ranges as high as 25 or 50 per cent or higher, a variation in reactivity that is not clearly manifest in the ordinary test but only on quantitative titration. This has been our experience in a series of repeated tests and in tests at short intervals on sera of patients

under treatment. The varying results which Dr. Mahoney has reported with dilutions of reacting serum in pooled nonreacting serums suggest that the treatment of the serum under these conditions has definitely altered its reactivity.

As data in regard to these variations in reactivity of the serum under different conditions accumulate, it appears to be the changes in the serum that give rise to the atypical variations in the degree of reactivity rather than the antigen. Now that we have an antigen prepared from balanced quantities of practically pure substances—cardiolipin, lecithin, and cholesterol—it will be possible to obtain final proof of this conclusion.

Just before the meeting, Dr. Mahoney told me that an institute of serology in the United States Public Health Service has now been established and is delayed in its development only by the demands of the war. This assures the future of the work and will inspire confidence in the evaluation of tests by competent serologists.

STATE INDUSTRIAL HEALTH PROGRAMS

The movement toward more and better preventive industrial medicine has received force and direction from committees on industrial health in the state medical societies. Following the recommendations of the Council on Industrial Health, these agencies were to contain representation from private practice, industrial practice, and the state bureau of industrial hygiene, all to assist in focusing the interest of every element in medicine on the physical welfare of workers. Already significant advances have been made. When the full implications unfold, no other committee in the structure of medical organization in each state is likely to exert more influence on the nature and standards of medical practice.

One of the principal obstacles to widespread industrial medical activity is lack of public interest, particularly among the managers of small plants. The fault is not that of medicine alone; it is equally a responsibility of management and labor. State medical society committees on industrial health have established excellent working relations with state manufacturing associations and are bringing directly to them dependable information on the benefits of competent industrial medical supervision.

The representatives of organized labor need to be approached to secure cooperation in the development of medical and hygienic programs in large and small plants and also in the province of general health education. Workers spend far more time off the job than on it. Ordinary illness plus

the combined effects of poor housing, wrong nutrition, and injudicious use of leisure time are the most prolific causes of absenteeism due to sickness.

Two other phases of activity by state committees contain the secret of successful advancement of industrial health. If any considerable degree of public acceptance is to be developed, physicians, hygienists, and nurses must be capable of meeting these new demands. Much effort is now being exerted to supply the medical profession with an awareness of modern industrial health methods. Much remains to be done, however, largely under the immediate stimulus of state medical organizations.

Already some of the state committees have organized cooperating units in the medical societies of industrial counties. Efforts in the counties should be undertaken in accordance with accepted community medical practice and public health administration. The type of committee representation described for the states is equally important in counties. . . . These committees must exercise medical initiative and leadership in any community industrial health department. Opportunities are numerous for local investigation of causes of absenteeism, for correlation of interested community health facilities, for education of the public to the advantages of preventive industrial medical service, and for continuous instruction of the profession and ancillary groups about advances in industrial medicine, surgery, and hygiene.—J.A.M.A.

X-RAY IN TREATMENT OF DIPHTHERIA CARRIERS

The use of x-ray therapy in the treatment of diphtheria carriers has been promoted with marked success by two clinicians from the University of California, Drs. Arthur J. Williams and Thomas Fullenlove.

According to these workers, all classes of carriers

should be given x-ray treatments in order to avoid the risk of developing a chronic illness. It has also been suggested that, since the natural process of resistance to infection is accelerated by x-rays, immunization may possibly be combined with x-ray therapy.

The conflicting findings that are directly attributable to faulty technical work present a perplexing dilemma for the medical man. As has been previously intimated, there is no way of compensating for the vagaries and inconsistencies which may result from the improper conduct of tests due to indifference, or lack of knowledge or training. It is, moreover, difficult for the profession to judge the laboratory which is doing good serology. The safe attitude is the patronizing of a laboratory in which recognized procedures are being carried out under careful check at all times. The state health departments, which maintain an approval system for laboratories, contribute a valuable service through the insistence upon high technical and educational standards.

Another general thought to be borne in mind is that a serologic upstroke almost invariably accompanies the invasion of syphilis and that, once the invasion is completed, practically all well-conducted procedures give positive findings. Under effective treatment the test findings are unevenly reduced or reversed. The bulk of discrepant results are found in this category of patient. When a history of previous infection and therapy are obtainable, the import of conflicting serology is minimal, as the continuation of therapy, or the approval for marriage, will be predicated upon conditions and circumstances other than the serologic findings. Discrepant findings may be considered as the rule, rather than the exception, in patients who are responding to treatment or who are in the initial stage of serorecurrence.

The troublesome instances of conflicting serology occur in patients who do not give a history of previous infection and therapy. In those the possibility of a false positive finding should always be given consideration. The serology is usually that of low-reading positive or doubtful reactions with some methods and negative findings with others. As a basic premise it may be stated that this is not the expected picture of an untreated syphilis of any appreciable duration. It is the picture frequently encountered in syphilis which is responding to therapy. Hence, in the absence of history and clinical evidence of syphilis, consideration should always be given to the possibility of the atypical finding being an expression of the influence of a condition other than syphilis. It is only rarely that an arbitrary diagnosis of syphilis and the beginning of treatment are warranted upon the basis of this type of serologic finding.

Discussion

Augustus B. Wadsworth, M.D., Albany—I wish to preface my remarks by stating that I agree heart-

ily with the main points that Dr. Mahoney has stressed. There is possibly one exception and with that I agree from one point of view while from another I disagree. In our first evaluations by comparative series the standard that was selected and that proved most satisfactory wherever there was a discrepancy was the consensus of reports on a given specimen. On the other hand, it does not help to multiply tests that are defective in order to reach a satisfactory confirmation.

It is reassuring to have such a broad evaluation of the comparative results obtained with the different serologic tests—that is, an interpretation within the limitations of our knowledge of serology. Still, I must reiterate that the laboratory should not make a diagnosis of syphilis, that the reports of the serologic tests should not be submitted as "positive," "negative," or "doubtful," and that evaluations based on such reports fail to give a true comparison of the methods either from the theoretic or the practical point of view. The statistical comparison of results based on reports of "positive," "negative," and "doubtful," although it has contributed to our general knowledge, has been worn threadbare, so to speak, especially since it does not give the detail necessary for comparison within the group of so-called discrepant results. "Positive" connotes a marked reaction, whereas in sensitive tests it may really represent a relatively slight amount of reagin. In such instances even those reactions that have a specific origin represent such a small degree of activity that their significance is doubtful. Thus the variation in reports of "positive," "doubtful," and "negative" in this borderline group is particularly objectionable. Specific information, in the light of our experience, has only been obtained by the detailed analytic comparison of the degree of reaction obtained in the different tests and in the light of clinical observation in the individual cases. The significance of low grades of reaction obviously depends upon whether or not the case is syphilis, upon the stage of development of the disease, and upon whether or not the patient is under treatment. The importance of detailed analytic comparison of the degree of reaction is strikingly emphasized by studies we have made of the final titers in cases of syphilis under the modern intensive methods of treatment. This applies also to the evaluation of the so-called cross-reactions reported in other diseases. Cross-reactions have been reported in the test as it is used in syphilis, yaws, leprosy, and tuberculosis. Yaws gives a true cross-reaction that approximates the reaction obtained in syphilis, whereas this is not true in leprosy. In the comparative studies of these diseases made by Mrs. Maltaner* only a relatively small proportion of serums from cases of leprosy reacted to a marked degree in the test as it is used in syphilis. The tubercle antigen they reacted to with a greater degree, than did syphilis. Thus, with yaws and syphilis, the small percentage of atypical reactions clinically.

serum
leprosy
the
ce
of
*

The percentages recorded with precipitation as compared with complement fixation, in Dr. Mahoney's report, are so remarkable that a question is raised as to the significance of a certain proportion of these reactions—that is, in the light of our experience. In comparative studies of the reactivity of the same serum it is not possible to secure as sensitive results with precipitation as with complement fixation.

The difficulty of interpreting the significance of the relatively small percentage of atypical reactions that occur in serologic tests is illustrated when the results of a long series of repeated tests are studied. The deviation in the great majority of specimens is only 8 to 10 per cent, which might indicate the technical error, but in a small number the deviation ranges as high as 25 or 50 per cent or higher, a variation in reactivity that is not clearly manifest in the ordinary test but only on quantitative titration. This has been our experience in a series of repeated tests and in tests at short intervals on sera of patients

under treatment. The varying results which Dr. Mahoney has reported with dilutions of reacting serum in pooled nonreacting serums suggest that the treatment of the serum under these conditions has definitely altered its reactivity.

As data in regard to these variations in reactivity of the serum under different conditions accumulate, it appears to be the changes in the serum that give rise to the atypical variations in the degree of reactivity rather than the antigen. Now that we have an antigen prepared from balanced quantities of practically pure substances—cardiolipin, lecithin, and cholesterol—it will be possible to obtain final proof of this conclusion.

Just before the meeting, Dr. Mahoney told me that an institute of serology in the United States Public Health Service has now been established and is delayed in its development only by the demands of the war. This assures the future of the work and will inspire confidence in the evaluation of tests by competent serologists.

STATE INDUSTRIAL HEALTH PROGRAMS

The movement toward more and better preventive industrial medicine has received force and direction from committees on industrial health in the state medical societies. Following the recommendations of the Council on Industrial Health, these agencies were to contain representation from private practice, industrial practice, and the state bureau of industrial hygiene, all to assist in focusing the interest of every element in medicine on the physical welfare of workers. Already significant advances have been made. When the full implications unfold, no other committee in the structure of medical organization in each state is likely to exert more influence on the nature and standards of medical practice.

One of the principal obstacles to widespread industrial medical activity is lack of public interest, particularly among the managers of small plants. The fault is not that of medicine alone; it is equally a responsibility of management and labor. State medical society committees on industrial health have established excellent working relations with state manufacturing associations and are bringing directly to them dependable information on the benefits of competent industrial medical supervision.

The representatives of organized labor need to be approached to secure cooperation in the development of medical and hygienic programs in large and small plants and also in the province of general health education. Workers spend far more time off the job than on it. Ordinary illness plus

the combined effects of poor housing, wrong nutrition, and injudicious use of leisure time are the most prolific causes of absenteeism due to sickness.

Two other phases of activity by state committees contain the secret of successful advancement of industrial health. If any considerable degree of public acceptance is to be developed, physicians, hygienists, and nurses must be capable of meeting these new demands. Much effort is now being exerted to supply the medical profession with an awareness of modern industrial health methods. Much remains to be done, however, largely under the immediate stimulus of state medical organizations.

Already some of the state committees have organized cooperating units in the medical societies of industrial counties. Efforts in the counties should be undertaken in accordance with accepted community medical practice and public health administration. The type of committee representation described for the states is equally important in counties. . . . These committees must exercise medical initiative and leadership in any community industrial health department. Opportunities are numerous for local investigation of causes of absenteeism, for correlation of interested community health facilities, for education of the public to the advantages of preventive industrial medical service, and for continuous instruction of the profession and ancillary groups about advances in industrial medicine, surgery, and hygiene.—J.A.M.A.

X-RAY IN TREATMENT OF DIPHTHERIA CARRIERS

The use of x-ray therapy in the treatment of diphtheria carriers has been promoted with marked success by two clinicians from the University of California, Drs. Arthur J. Williams and Thomas Fullenlove.

According to these workers, all classes of carriers

should be given x-ray treatments in order to avoid the risk of developing a chronic illness. It has also been suggested that, since the natural process of resistance to infection is accelerated by x-rays, immunization may possibly be combined with x-ray therapy.

INFECTIOUS MONONUCLEOSIS

From the Point of View of the General Practitioner

HENRY B. SOKAL, M.D., Brooklyn

IN THE days of Emil Pfeiffer, it was a simple matter to make a diagnosis of infectious mononucleosis. It was enough to keep in mind the clinical picture of the disease as described by Pfeiffer,¹ with its special emphasis on the enlargement of the cervical lymph nodes, the fever, and the benign character of the disease.

This conception of glandular fever changed when Burns,² and later Sprunt and Evans,³ published their reports stressing the hematologic findings in this disease. The normal response to an acute infection is usually a pronounced leukocytosis, but in Pfeiffer's disease this tendency was reversed. Burns noticed that a high mononucleosis was invariably present in all cases.

Later reports coming from many quarters confirmed these observations. It was generally agreed that the blood picture was a more constant and a more pathognomonic feature for this malady than the varying degree of lymphatic glandular enlargements. Consequently, a new name was suggested for glandular fever—the present term, "infectious mononucleosis."

This term is somewhat confusing; it must therefore be emphasized that the changes occurring in the blood affect chiefly the lymphocytes, and not, as the name might suggest, the large mononuclears, also known as the transitional, or Ehrlich's, cells. This complicated the diagnostic problem. Infectious mononucleosis had to be differentiated from a group of diseases in which a lymphocytic reaction was a frequent occurrence, as in pertussis, rubeola, measles, mumps, and typhoid fever, not to mention lymphatic leukemia and other less frequently occurring diseases, especially since glandular enlargement was no longer regarded as indispensable for the diagnosis.

The observations of Paul and Bunnell⁴ on the reaction of the serum of patients with infectious mononucleosis toward sheep erythrocytes marked the third advance in our knowledge of the disease.

These investigators found that the serum of these patients will agglutinate sheep erythrocytes in a high dilution. Thus, a new postulate was added to the diagnosis of this malady: a positive heterophile antibody reaction to sheep corpuscles. The diagnosis of infectious mononucleosis is based today on three essential factors: (1) the blood findings, (2) the serologic reaction, and (3) the clinical picture.

The Blood Picture

This is the most constant and therefore a most useful diagnostic sign for infectious mononucleosis. It is characterized by a high mononucleosis. These cells may total 95 per cent of the white cell count. In the first day or two of the disease this increase may not be so striking; it may even be preceded by a transient polymorphonuclear leukocytosis. However, within a few days the blood picture is usually well established.

The average practitioner, after reading the descriptions of the delicate tinctural nuances and the minute cytologic details in the structure of the nuclei and the cytoplasm of the lymphocytic cells in infectious mononucleosis, might harbor the impression that only a top-ranking hematologist can diagnose this condition. However, if one keeps in mind the typical small, round-shaped lymphocyte with its very narrow rim of cytoplasm, as seen in the average blood smear, the "atypical" lymphocyte of infectious mononucleosis will instantly attract attention by contrast. A number of cells will appear somewhat larger and in a higher percentage than usual; the ring of cytoplasm around the nucleus is much wider, and the shape of the nucleus more irregular. The tinctural qualities may also show some nuances in that the cell stains a much deeper blue (more basophilic). The nucleus may show great variations in size and shape. Instead of the usual round-shaped form, it may become bean-shaped, lobulated, or indented. It may lie eccentrically, with the mass of cytoplasm at one end of the cell. The latter may show the presence of small empty spaces (vacuoles) or may contain a larger number of azurophilic granula. These cells are spoken of as "atypical," leukocytoid, or Downey's⁵ cells.

The Heterophile Antibody Reaction

The serum of patients with infectious mononucleosis will agglutinate sheep red cells in a high dilution. A titer 1:64 is the minimum measure for a positive test. Some authors⁶ report positive reactions in over 90 per cent, while others⁷ place the percentage at a much lower level.

The reaction appears at the end of the first week. In evaluating the results of the Paul-Bunnell test it would be safer for the present, in view of the conflicting statements, to regard only positive reactions as being of diagnostic value. A negative heterophile antibody reac-

tion would not necessarily exclude the possibility of infectious mononucleosis.

Clinical Picture

The classical type of the disease as described by Pfeiffer, with the great enlargement of the cervical lymph nodes, the fever, the high mononucleosis and a positive heterophile antibody reaction, does not need further elaboration.

There are, however, cases of infectious mononucleosis which clinically have little in common with the type originally described. Infectious mononucleosis is looked upon today as a generalized infectious disease, although the causative agent has not yet been isolated with certainty.

As is the case with many infectious diseases, several types of infectious mononucleosis have been described, depending on the predominant clinical symptoms appearing during the illness. The glandular enlargement may be of such small degree that it is barely distinguishable from the normal, especially in children. Contrary to the statement by Pfeiffer, skin exanthemata are not rare. The rash may resemble that of German measles^{8,9} or any of the acute exanthematic infectious diseases.

Reports have been made of an abdominal type of the disease simulating acute appendicitis¹⁰ and of a cerebral type^{11,12} with a predominance of meningeal symptoms.

Last summer I had an opportunity to observe in a children's camp a mild epidemic of what to all appearances could be regarded as a respiratory type of infectious mononucleosis. The outstanding clinical symptoms were a hacking cough, a subfebrile temperature, a sore throat, and a moderate enlargement of the cervical lymph nodes. The blood counts revealed a lymphocytosis between 55 per cent and 64 per cent, with some atypical cells present. Because of lack of facilities, serologic examinations were not made, except in 2 patients about two months later. In these 2 cases the results were negative. Pertussis could safely be ruled out, for most of the children and the few adults had had whooping cough sometime in the past. The disease lasted about three or four weeks.

Recently an asymptomatic¹³ type of the disease has been reported, in which, except for a high mononucleated cell count, no abnormalities could be found. The heterophile antibody agglutinative reactions were negative in every instance.

From the above remarks one can clearly see how rich and variable the symptomatology of infectious mononucleosis can be. Indeed, sometimes the disease may develop rapidly, with sudden chills, high fever, severe headaches, vomiting, skin rashes, jaundice, and all the common

signs of an acute and severe infection. At other times the symptoms may be so mild that the patient feels only a little "indisposed," and continues with his work. These cases may easily be overlooked if no blood examination is made. The term "abortive" infectious mononucleosis would be appropriate in cases of this kind.

Like the symptoms, the duration of the disease also varies greatly. It may last from a few days to three or four weeks. The prognosis is said to be always favorable. The following case reports illustrate some of the types of infectious mononucleosis which I have seen in my practice during the last two years.

Case Reports

Case 1.—C. R., a 24-year-old woman, was taken suddenly ill with high fever, headaches, a dry cough, and pain in the back and lower extremities. On the third day the patient noticed large, hard masses along both sides of the neck. The temperature was 103 F. and the pulse 120 and regular. The throat was red and the cervical lymph nodes were greatly enlarged along both sides of the neck, some of them the size of small plums. The lungs and heart were normal. The liver was not enlarged, nor the spleen palpable.

A blood count made on the third day showed a hemoglobin of 94 per cent (Sahli), with 11,200 white cells and the following differential count: polynuclears, 27 per cent, including 10 per cent staff cells; small lymphocytes, 27 per cent; large lymphocytes, 29 per cent; "atypical," 12 per cent; mononuclears, 4 per cent; eosinophils, 1 per cent; total lymphocyte count, 68 per cent. The heterophile antibody reaction was positive in a dilution 1:1,024.

The fever continued for over three weeks and came down by lysis.

Case 2.—M. Z., a 44-year-old woman, was a day nursery supervisor, whose chief complaint was of a gain in weight and menopausal symptoms. Physical examination revealed no abnormalities, except for obesity. A routine blood count showed a hemoglobin of 16 Gm., with 4,900,000 red cells and 8,000 white cells, of which 55 per cent were lymphocytes, 43 per cent polynuclears, and 2 per cent eosinophils. The basal metabolism rate was minus 2, the sedimentation rate 19 mm. at the end of one hour, and the Wassermann and heterophile antibody tests were negative.

On further inquiry the patient recalled that about two years previously she had waked up one morning with a slightly sore throat, and on the same day she had noticed the presence of large masses along the right side of the neck. Since she had no fever and had felt well, she did not consult a physician. The swelling gradually disappeared within a week.

Case 3.—J. S. was a 3-year-old girl whose mother is apparently healthy but whose father suffered from asthma up to about four years ago. At the age of 3 months the patient was supposed to have

had an erysipelas infection. Two months later she developed an eczema. About a year ago she suffered her first asthmatic attack. In March, 1942, the child was taken suddenly ill, with high temperature, sore throat, and a croupy cough resembling diphtheria. The next day the family physician was called and told the mother that the child had bronchopneumonia. Following the administration of sulfathiazole her temperature dropped to normal within two days. No blood examination was made at that time, nor was the sputum or throat exudate cultured.

I saw the child in June of that year on account of a severe asthmatic attack. On examination her temperature was 98.8 F. by rectum, the cervical lymph nodes were barely palpable, and nose and throat examinations were entirely negative. Diffuse dry rales could be heard over both lungs. The abdomen was negative, the liver not enlarged, and the spleen was not palpable.

A routine blood count made on that day showed 87 per cent lymphocytes (see Table of Blood Studies). The sedimentation rate was 8 mm. at the end of one hour. The heterophile antibody reaction was negative. The mother of the child, a woman of 22, seemed to be in good health. At the time when the child was sick, she, too, had a slightly sore throat. This, however, did not prevent her from doing her housework.

The blood count now showed a hemoglobin of 14 Gm., with 5,600 white cells, of which 61 per cent were lymphocytes, mostly of the small variety. The sedimentation rate was 13 mm. at the end of one hour; the heterophile antibody reaction was negative. Physical examination was negative.

Case 4.—S. P., a 5-year-old boy, had been under observation for eighteen months. In November, 1939, he was hospitalized for lobar pneumonia, and three months later he was readmitted to the hospital with bronchopneumonia. In May, 1940, he suffered his first asthmatic attack. There followed several more admissions to the hospital for severe asthma, with the last admission in August, 1941, for acute mastoiditis.

In July, 1941, the child was taken ill with what seemed to the family physician to be German measles. His elder sister, a girl of 9, had been sick with the same disease two weeks before. In July, 1941, the child came to my office for a periodic examination. At that time he appeared to be in good health and free from asthma, the last attack having occurred in November, 1940. Physical examination was negative. A blood count made on that occasion showed a lymphocyte count of 73 per cent. His sister, who was sick about the same time, had a lymphocytosis of 69 per cent, but otherwise she was in good health. The last blood counts made on both children a year later still showed a high lymphocyte count.

It is interesting to note that when the boy was admitted to the hospital in August, 1941, with acute mastoiditis, the leukocyte count was 80 per cent. The heterophile antibody reaction made three months later was negative.

Case 5.—N. S., a 13-year-old boy (the author's

son), gave a past history of measles, chicken pox, scarlet fever, pertussis, and acute mastoiditis.

Last summer, after a week-end visit to the camp where I had noticed a mild epidemic of what appeared to be a respiratory type of infectious mononucleosis, he returned home and within seven days suddenly became ill, with a high temperature, a hacking pertussis-like cough, severe headache, and a sore throat. Two days later a skin rash resembling somewhat the rash of German measles appeared. The temperature, 103 F., continued for one week. The cervical lymph nodes were moderately enlarged. The cough was persistent, coming in bouts as in whooping cough, although not of that intensity. After five days the rash disappeared, but the cough persisted for three more weeks.

A blood count made on the third day of the illness showed a hemoglobin of 15 Gm., with 6,500 white cells, of which 27 per cent were of the small type, 23 per cent large lymphocytes, 6 per cent "atypical" cells, 42 per cent polynuclears, including 15 per cent staff cells, and 2 per cent eosinophils. The heterophile antibody reaction was negative.

A week later the author's wife became ill. The only complaints were a hacking, dry cough, a feeling of fatigue, and some pains in the extremities. The temperature was normal, and the physical examination was negative.

The blood count showed 8,250 white cells, with 54 per cent lymphocytes, 40 per cent polynuclears, 2 per cent eosinophils, 1 per cent basophils, and 3 per cent monocytes. The heterophile antibody reaction was negative. The cough persisted for four weeks and could not be relieved by the ordinarily employed drugs.

Case 6.—J. F., a 5-year-old girl, was taken suddenly ill in October, 1941, with a high fever, a sore throat, and swelling of the lymph nodes on both sides of the neck. At the time the condition was diagnosed as acute tonsillitis. The temperature ran an irregular course for two months. Wet dressings of glycerin and alcohol were applied to the swollen glands. In January, 1942, a tonsillectomy was performed. Within two weeks after this operation the child suffered a severe asthmatic attack. The attacks appear now about every two or three weeks, with wheezing and coughing periods between the severe seizures.

A routine blood examination made in December, 1942, showed a hemoglobin of 15 Gm., with 5,400,000 red cells, 16,125 white cells, of which 82 per cent were lymphocytes, mostly of the small variety, with 5 per cent "atypical" cells, 14 per cent polynuclears, and 4 per cent eosinophils.

Physical examination did not reveal any abnormalities except for edema of the nasal mucosa and dry rales over both lungs. The temperature was 99 F., by rectum. The cervical lymph nodes were not enlarged. The heterophile antibody reaction was negative; the sedimentation rate was 13 mm. at the end of one hour.

Comments

It was not my intention to report a few more cases of a disease which seemingly is much more

common than is suspected or diagnosed. The purpose of this article is to present the problem from the general practitioner's viewpoint, since it is he who usually sees such cases first.

It was only natural that as our knowledge of the disease advanced, the diagnosis should become more refined and more complicated. The question therefore arises: What should our criteria be in the diagnosis of infectious mononucleosis? I am not speaking of the classical type, with the great enlargement of the cervical lymph nodes, the lymphocytic blood picture, and a positive serologic reaction. These cases are too obvious. The same, to a lesser degree, is true of those cases in which the clinical picture and the hematologic findings are present, although the opinion on this point is divided. Some authors insist on a positive serologic reaction for the diagnosis of infectious mononucleosis.

But what about those cases in which the only findings are high lymphocytic blood pictures, with negative serologic reactions and a complete absence of clinical symptoms? Shall we diagnose these cases as "asymptomatic" infectious mononucleosis, or shall we interpret the hematologic findings as evidence of the infection in the past? Personally, I am inclined to take the latter position. Analyzed from this point of view, Cases 1 and 5 would represent the acute stage of the disease; while in Cases 2, 3, 4, and 6, where the only findings were a high lymphocytic count, these findings should be interpreted as evidence that the disease occurred sometime in the past.

In the case of Mrs. M. Z., there seems to be little doubt that the disease had occurred about two years previously. The history of a sudden

swelling of the neck with a persistent lymphocytic blood picture after two years is suggestive.

As for the 5-year-old boy and his sister, it is quite probable that both were sick in May, 1941, at the time when the diagnosis of German measles was made. Kracke⁹ in his textbook, *Diseases of the Blood*, stresses how difficult it is to differentiate between the two conditions.

In the case of the little girl, J. S., and her mother the probable onset could be traced to the spring of that year, when the child was taken suddenly ill with high fever, a croupy cough, and a sore throat. The fact that the mother, who was sick with a sore throat at the same time, still showed a lymphocytosis of 61 per cent three months later would support such an assumption.

In the case of J. F., there seems little doubt that she had contracted the disease about a year previously. The history of a sore throat, glandular enlargement, and a protracted fever for two months seem to leave little doubt that the disease was not diagnosed correctly at that time.

Conclusions

The diagnosis of infectious mononucleosis should be based on at least two components of the diagnostic "triad."

A lymphocytic blood picture alone, in the absence of clinical symptoms, should be interpreted as evidence that the disease occurred in the past rather than as an indication of an active infection.

ARMY MEDICINE SUCCESSFUL

When the medical history of World War II is written, the year that elapsed following the treacherous attack by the Japanese at Pearl Harbor will be recognized as one in which the Medical Department of the United States Army was expanded tremendously in personnel, organized units, supplies, and responsibilities and in which it met all these demands quietly and efficiently. Now with more than thirty-five thousand medical officers, with hundreds of thousands of medical corps men, with double the number of general and station hospitals and well-nigh triple the bed capacity, it stands ready to meet any new obligations that may be placed upon it. During the year the only serious incident from a medical point of view was the jaundice associated with inoculation against yellow fever. The first week of February, 1943, found atypical pneumonia and meningitis the most prominent of the infectious diseases, but even these were scattering, with a few cases here and there and only a score or slightly more of cases of either in the few camps most seriously affected. From July, 1942, the maximum admissions for venereal disease had reached less than one per thousand, and admissions for both gonorrhea and syphilis had fallen in February, 1943, below the levels of November, 1942.

The remarkable records here cited are the actual evidence of the effectiveness of the organization of the Office of the Surgeon General to meet every contingency. In January, 1941, a Central Epidemic Control Board was established, including such specialists from civilian life as Drs. Francis G. Blake, of Yale; O. H. Perry Pepper, of Pennsylvania; Alphonse R. Dochez, of Columbia; E. W. Goodpasture, of Vanderbilt; Kenneth F. Maxey, of Johns Hopkins; A. J. Warren and Wilbur F. Sawyer, of the International Health Division of the Rockefeller Foundation; Oswald T. Avery, of the Rockefeller Institute; and E. S. Robinson, of the Massachusetts Department of Health. A special commission on influenza is headed by Dr. Thomas Francis, Jr., of Michigan; one on pneumonia by Colin M. McLeod, of New York University; one on hemolytic streptococcus disease by M. H. Dawson, of Columbia; one on measles by Joseph Stokes, Jr., of Pennsylvania; one on meningitis by Perrin Long, of Johns Hopkins; and one on neurotropic virus diseases by John R. Paul, of Yale.

Dr. Stanhope Bayne-Jones, of Yale, heads the commission on epidemiologic survey.

To head services in the Office of the Surgeon General have come Brig. Gen. Hugh Morgan, of Vanderbilt, for medicine, Brig. Gen. Fred Rankin for surgery, Col. Esmond R. Long for tuberculosis . . . along with Brig. Gen. Elliott Cutler, now abroad, and others who serve in organized units.

Under Brig. Gen. C. C. Hillman, professional services have been standardized, utilizing the wealth of talent assembled by the Division of Medical Sciences of the National Research Council. Facilities have been organized by which every person entering the military service is given an x-ray examination of the chest and the roentgenogram is filed permanently with his record.

Under Col. James S. Simmons epidemiologic studies have been made which will lead to adequate protection of our young men regardless of the theater of war into which they may be called. Far too often the public thinks of the army doctor only as one who treats wounds on the battlefield. However, insect control, delousing, sanitary dishwashing, development of safe water supplies, selection of clothing for various climates, occupational hygiene, and venereal disease control also come under the medical department. Then, too, the dental division, meat and dairy inspection, care of animals, nursing, and physical therapy are parts of the complex organization, which has functioned so efficiently under Surg. Gen. James C. Magee in the year of war that has passed.

Today wintertime ailments such as colds, influenza, pneumonia, and measles are well below the five-year average rate of cases in the Army, even though rates for the civil population in some parts of the country are above the five-year average for the country. Venereal disease is substantially less than during World War I, and the syphilis rate is the lowest in the history of our Army. Since January, 1941, excluding battle casualties, the death rate has been the lowest in the history of our Army. During World War I, one patient of each 3 with meningitis died; now only one in 20 dies. Prompt diagnosis, efficient care, and sulfonamides have made the difference. Overseas such conditions as malaria and dysentery are being fought with all that modern medicine has provided for the Army medical armamentarium.—*J.A.M.A.*

CONSERVATIVE MANAGEMENT OF ACUTE OSTEOMYELITIS

J. B. L'EPISCOPO, M.D., and E. D. HAGERTY, M.D., Brooklyn

WE BELIEVE that it is generally agreed by most surgeons that the concepts of treatment of acute hematogenous osteomyelitis are undergoing a definite change. The trend is definitely toward conservatism. Up to ten or twenty years ago, treatment was based almost entirely on early incision and drainage. It was thought dangerous not to open the bone immediately after the diagnosis was made. The results obtained by that method of treatment were generally poor, and the mortality was certainly quite high.

Most of us have seen or heard of cases that were not so treated for one reason or another, and have learned that many of these patients did surprisingly well without surgery. Two of the series here reported had neither drainage nor chemotherapy and are progressing satisfactorily. These observations are probably responsible for the changing attitude toward conservatism. This attitude was given further impetus by the discovery and use of chemical agents in infections, including acute osteomyelitis. The introduction of antitoxins also seemed to help in this type of case, so that now, according to Mahorner, "the real status of operation, its relative worth in combatting the disease and comparative value in relation to other measures is at present, to say the least, controversial." We are in perfect agreement with him. It is to clear up this confusion in a small way, if possible, that we are reporting this small series of cases of acute hematogenous osteomyelitis, even though we cannot report end results at this time. These cases were not chosen; they were taken consecutively, as they were admitted to the hospital.

Time will not permit us to go into details of etiology and pathology; these, however, are thoroughly covered in many other articles on the subject. It is generally agreed that acute hematogenous osteomyelitis is only a local manifestation of a general systemic infection, usually starting as a septicemia or a bacteriemia, and the severity of the disease depends upon the virulence of the invading organism and the resistance of the patient to that organism.

Treatment

It is not our purpose in this communication to evaluate the merits of the different types of treatment for acute hematogenous osteomyelitis. We do not wish to go into the merits or demerits of

early operation; we wish simply to report our observations in a series of 27 patients treated conservatively, some with delayed operation and some without operation. Our chief aim has been to treat the patient generally, and the local osteomyelitis as a secondary manifestation of the disease.

On admission to the hospital, general supportive treatment was instituted at once with bed rest, the extremity being placed in traction for immobilization and local rest. Massive hot wet packs were applied to the local lesion every two hours. Blood cultures were taken immediately and were repeated every forty-eight hours until they were negative on two successive cultures. In many cases mild sedation was employed for the relief of pain and anxiety. Infusions of saline and glucose were instituted at once, as the patients were almost all markedly dehydrated and toxic, water balance being very carefully observed and infusions continued for days, if necessary. Blood transfusions were given immediately, although they are deemed unnecessary in the acute stage by some authors. The amount varied from 150 cc. to 350 cc., and was repeated every twenty-four to forty-eight hours during the first two weeks in most of the cases and at intervals after this, as indicated.

Sulfanilamide or sulfapyradine were used in the earlier cases. Sulfathiazole was used exclusively in the last 16 cases, the organism in these latter cases being staphylococcus. The dosages of these drugs were 1 to 1½ grains per pound of body weight in infants, and in children and adults from 80 pounds up, an initial dose of 30 grains followed by 15 grains every four hours being employed. Dosage and continuation of this therapy were governed by the general clinical condition of the patient and by the blood level, which we attempted to maintain at four to seven mg. per cent. If gastric distress appeared, sodium bicarbonate was used in equal dosage with the sulfa drugs. Albuminuria or a sudden rise in an otherwise receding temperature was a signal to discontinue the sulfa drugs. All drugs were given orally. They were discontinued when the temperature remained normal for one week, when blood culture was negative, and when the local lesion was well localized and under control. The hot wet packs were continued until the lesion became well localized.

A diagnostic aspiration with a No. 13 gage needle was done as soon as possible to determine the nature of the infecting organism. Chemo-

therapy was, of course, guided by the organism found. Sulfanilamide was used in streptococcus and sulfathiazole in staphylococcus infections.

When the abscess became localized in the soft tissues, which in the majority of cases occurred within five to ten days after the onset of treatment, a therapeutic aspiration with a No. 13 gauge needle was done and was repeated as often as necessary to keep the abscess completely evacuated. The average number required per patient was 4.6. The control of the abscess with aspiration in these cases was apparently possible by the change in the character of the contents of the abscess cavity from a thick, purulent material to a serosanguineous, almost purely bloody material after the administration of the sulfa drugs for two or three days.

Operation on our cases was limited to simple soft tissue incision and drainage and was done only when the abscess could not be controlled by therapeutic aspiration or when the adjoining joint was seriously threatened by a possible extension of the abscess. In this series, it was deemed necessary to operate only four times and for the above stated reasons. In no case was the bone opened beyond the periosteum.

Survey of Cases

The age in this series varied from seven months to twenty-six years, the average being 9.9 years. Only one patient was an adult of twenty-six years. All others were children from seventeen years of age downward.

There were eighteen males and nine females, and of them, twenty-six were white patients and one was a colored patient.

The duration of symptoms before admission to hospital varied from one day to four months, the average being twenty days in the entire series, but in twenty-one of these 27 cases the average was five days.

Blood cultures were taken in 20 of the 27 cases, of which 11 showed growth, 9 being staphylococcus and 2 streptococcus. Nine showed no growth. Of the 3 patients under the age of two years, 2 were found to have had positive streptococcus blood cultures.

There were 15 cases of the 27 which required needle aspirations. This was done for diagnostic purposes alone in 5 and for diagnostic and therapeutic purposes in 10.

There were 14 positive cultures from aspiration in the 15 cases aspirated, 12 of which were staphylococcus and two streptococcus.

There was involvement of 34 bones. These were distributed as follows:

(A) Femur	19	{ Upper 10 Lower 9	55.8%
-----------	----	-----------------------	-------

(B) Humerus	6	{ Upper 4 Lower 2	17.6%
(C) Tibia	4	{ Upper 3 Lower 1	11.7%
(D) First Metatarsal		3	8.8%
(E) Radius	1	Lower Shaft	2.9%
(F) Eight Rib		1	2.9%

There were 4 cases which required delayed incision and drainage of the soft tissues, leaving 23 patients, or 85.2 per cent, who had no surgery of any sort. There was one death in this series, bringing the total mortality rate to 3.7 per cent.

In those cases requiring delayed soft tissue incision and drainage—four in number, or 14.8 per cent of the series—1 was a case of involvement of the upper tibia which was operated upon eleven days after the onset of the disease because of threatened knee joint involvement. It was treated by the Orr method, and after draining for twelve months its function was completely restored.

The second case was one of involvement of the lower femur which was operated upon fifty-nine days after the onset of the disease, also because of threatened involvement of the knee. It was treated with the Orr method and drained for ten months. Sequestrectomy was done at the end of this time, and the wound was closed tightly after the implantation of 10 Gm. of sulfathiazole. This has remained closed after six weeks' plaster immobilization.

The third case was one of an overwhelming septicemia. The patient was moribund on admission, but lived for twenty-one days with a constantly positive blood culture and had, in the terminal stages, a culture of 900 colonies of staphylococcus from an aspiration of a pericardial effusion. This patient also had effusions in both knees and the pleura.

The fourth case was one of metatarsal involvement of the foot with a large abscess which could not be controlled with aspirations. An incision and drainage of the soft tissues were done on the tenth day of the disease. Drainage followed for seven months.

Of the 23 cases that did not require surgery, 5 developed sinuses. Three of these 5 were discharged from the hospital as cured without sinus formation but returned, an average of nine months after the original infection, with exacerbation in the same sites, a spontaneous onset of drainage, and sequestrum formation. It was necessary to do a sequestrectomy on one. Another closed spontaneously after the extrusion of a sequestrum, having drained for sixty days. The remaining 3 are still draining, reaching an average of fourteen months each. All of them

have extruded from 2 to 4 small sequestra at intervals and now appear to be healing.

Including the four operated cases which had surgical drainage of the soft tissues and the five which had spontaneous drainage, there was a total of nine cases, or 33.3 per cent, which had drainage, in contrast to eighteen or 66.6 per cent which had no sinuses, scars, operations, deformity, or disability of any nature.

In 4 cases the duration of the drainage following soft tissue incision and drainage was twelve months for the longest case and ten days for the shortest case, the average duration being 9.9 months. The duration of drainage following spontaneous eruption was thirty-two months for the longest and four months for the shortest time, the average being twelve months.

In the twenty-seven cases that were not operated upon, 4 had exacerbations. Three of these had two exacerbations at original site of infection; one had three exacerbations. All 4 developed sequestra. Of these cases, three had been originally discharged as cured but returned with exacerbations and sequestrum formation in addition to drainage. The average time of the exacerbation was 4.7 months from the original onset of the disease.

The total number of cases which developed sequestra was eight out of the twenty-seven or 29.6 per cent. Of this number, six had draining sinuses, the seventh showing sequestra without drainage or surgical removal and went on to spontaneous absorption, the eighth has now had six months' duration with pathologic fractures and continuation of the infection although there has been no drainage.

Of the 4 cases requiring simple soft tissue incision and drainage, only 1 later required a sequestrectomy. This was done eleven months after the original onset and has not drained since the last operative procedure.

Of the 23 cases not operated upon originally, only one case came to sequestrectomy. The patient was operated upon twenty-three months after the original onset and has drained for eight months since operation.

Metastases were present in 4 cases of the 27. Three of these were present before admission to the hospital and only 1 showed metastasis while under treatment. Of the four cases operated upon, none showed metastasis.

Four cases of the twenty-seven showed functional impairment of adjacent joints: (1) a bilateral fracture dislocation of both femora at the hip with almost complete loss of function, (2) multiple pathologic fractures in an upper femur at the hip with apparent loss of all motion at this time, (3) an estimated loss of from 10 to 20 per cent of the motion of the hip in a case of upper

femoral involvement, and (4) an estimated loss of 20 per cent of the motion of the shoulder in a case of upper humeral involvement to date.

One other case of upper tibial involvement developed a tibia valga, probably because of the fact that the disease involved the epiphysis, with a resultant epiphyseal stimulation of growth on one side.

Patients were not permitted to bear weight, where a weight-bearing bone was involved, until all evidence of activity of the disease ceased and healing was well advanced. This was accomplished by using crutches and by keeping the affected limb up in a shoulder suspension belt attached at the heel of the shoe, maintaining the knee flexed.

The average hospital stay was 6.1 months, the minimum being five weeks and the maximum thirty-two months. At this point, it might be in order to point out that nearly all these patients were free patients in a city hospital, having poor home conditions. Therefore, they were kept in the hospital to insure proper convalescent care.

All these patients have been followed closely and were all seen in April, 1942, with the exception of one case. The longest follow-up has been since July, 1939, and the most recent since December, 1941.

In conclusion, we wish to stress that the conservative management of osteomyelitis, as above outlined, with bed rest, local rest of the part, correction of dehydration, multiple blood transfusions, sulfa drug therapy as indicated, and needle aspirations of the localized abscess is apparently adequate, except where a joint is threatened or aspirations do not control the abscess. In those cases, soft tissue incision and drainage only is indicated.

1. Early operation is not necessary, and probably is contraindicated.

2. Treatment should be directed toward the control of the systemic infection.

3. Chemotherapy is of definite value in treatment.

4. Cases with sequestra and sinus should be operated upon and sequestra removed.

5. Not sufficient time has elapsed to permit prognostication as to development of metastases in comparison with cases treated with early surgery.

Discussion

Frank S. Child, M.D., *Port Jefferson*—It is a pleasure to discuss this paper of Drs. L'Episcopo and Hagerty. I feel that it presents convincing evidence of the value of conservative treatment of acute osteomyelitis.

Until recent years it has been my practice to drill the bone cortex following the method advocated by Starr. Operation was delayed in the case of infants. Some cases made a satisfactory recovery without much bone destruction, while others developed extensive necrosis. Immobilization was by plaster-of-paris.

Dr. L'Episcopo, instead of drilling the bone, uses massive hot wet packs, and instead of plaster uses traction. His method certainly causes less shock and disturbance to a seriously ill patient. Aspirating abscesses and incising them when this does not suffice is the extent of his operative interference, thus producing the minimum surgical shock and at the same time relieving the tension of the abscess. Further, the use of traction causes much less disturbance to the patient in its application than plaster.

I thoroughly agree with Dr. L'Episcopo that acute osteomyelitis should be treated primarily as a systemic infection, and I am of the opinion that the sulfonamides are definitely valuable during the period of bacteriemia. I doubt, however, that they have any influence upon the bone infection.

Frequent blood transfusions and careful attention to the water balance by means of saline and glucose intravenously are certainly a most important part of the treatment.

The incidence of metastases in the series of cases reported is surprisingly small. It has been my impression that delayed operative treatment did not have much, if any, effect upon metastasis. Also, it has been my impression that bone destruction is not so extensive in delayed operative treatment as it is in early operative interference.

I do not believe that pathologic fractures can be avoided. I have had them occur when plaster has been used from the onset of the bone infection.

Although this series of cases is small, the low mor-

tality, as compared to the mortality in many reports of early operative treatment, certainly deserves careful consideration.

Dr. L'Episcopo has presented an excellent argument for conservative treatment of acute osteomyelitis, emphasizing in particular, the importance of control of the systemic infection.

Mather Cleveland, M.D., *New York City*—I have enjoyed this presentation, which is very provocative, and I wish to thank the authors for a chance to discuss it. As I understand it, this is a preliminary report, and final judgment should be held in abeyance. Not until end results are known can we properly evaluate any method of treatment.

I agree that this is a serious general infection which attacks young men predominantly, and it has definitely been proved that 80 per cent of the cases are due to staphylococcus. The streptococcus infections occur chiefly under the age of two and more often invade the joints primarily than do these staphylococcus infections.

This disease carries a high mortality, approximately 10 per cent. Death occurs usually in the first week or ten days. Since the series presented here was seen at an average of twenty days after onset, it may be reasonable to suppose that they have been lucky enough to treat the hardy survivors.

Each patient with acute hematogenous osteomyelitis at some time must have a positive blood culture. Unfortunately, it is not always possible to obtain a growth even with repeated cultures.

The weight-bearing bones are more apt to be invaded, and if the disease is primary in the upper femoral metaphysis, the hip joint is bound to be invaded as the metaphysis is intracapsular.

There is a feeling that the sulfonamides may be specific for osteomyelitis. For streptococcus infections they are, and at times these will heal fairly promptly by means of this drug and without surgery. Staphylococcus infections, which represent $\frac{3}{4}$ or more of these cases of acute hematogenous osteomyelitis, are not so readily amenable to sulfonamides. In addition, there is a great deal more destruction of bone from staphylococcus infections.

I am reasonably certain that in staphylococcus infections of bone I shall treat the patient systemically as outlined by the authors. Until there is more evidence to the contrary than has been presented to date, I shall prefer to drain a known staphylococcus focus of infection in bone or joint. Drainage should be accomplished without trauma to bone and soft tissue through properly placed incisions and the part should be immobilized by plaster-of-paris circular splints.

A meticulous user of the English language, whom we know as a stickler for correct pronunciation, told us recently that he had been in deep doubt as to whether we should say "raationing" or "rashioning."

He has finally reached a decision and proclaims his preference for "rashioning." He based his conclusion on the fact that there is a certain amount of rash "rashioning." He likes alliteration—seems as if.

THE TREATMENT OF HERPES ZOSTER OPHTHALMICUS WITH SMALLPOX VACCINE

WALTER I. LILLIE, M.D., Philadelphia

THE clinical syndrome called herpes zoster is the result of an inflammation affecting the ganglia, posterior roots, spinal nerves, sensory extramedullary ganglia, or the cranial nerves. It is characterized by groups of herpetic vesicles on the skin along the distribution of the nerve trunks and is accompanied by neuralgic pain. On the basis of their cause, about 50 per cent of the cases are termed essential herpes zoster and are considered to be of virus origin; the remaining 50 per cent are termed symptomatic herpes zoster, and of this latter group syphilis is considered to be the cause in about two-thirds of the cases. The remainder are due to infections, poisons, or irritations of the nerve ganglia.

The treatment of this disease varies greatly throughout the country, as do the clinical results. The usual treatment has consisted chiefly of applying ointments to the local skin lesions, pituitrin injections, roentgen ray, and the use of foreign proteins. The course of the disease usually persists from four weeks to four months, and the most annoying symptom to the patient is severe neuralgic pain.

Herpes zoster ophthalmicus belongs to the herpes group in which the fifth cranial nerve is involved. During the past four years a group of these cases with and without corneal involvement has been treated by vaccination with smallpox vaccine at intervals of from two to ten days. Regardless of the severity and duration of the disease, uniformly excellent results have been obtained.

The following selected cases from this group are reported to show how efficient the treatment has been, even though other forms of treatment previously instituted had not accomplished the desired result. All of 11 cases have been successfully treated with smallpox vaccine.

Case Reports

Case 1.—A woman, aged 35, was examined in 1939 because of severe pain over the left eye and continued skin eruptions over the upper division of the left fifth cranial nerve for three months. When the left eye became involved one week after the occurrence of the skin eruption, she was treated with pituitrin and roentgen rays, with some

relief from the pain. Local treatment in the form of dionin and atropine had also been instituted. One month later she was operated upon for a left anterior and posterior ethmoiditis, without change in the clinical course of the herpes zoster ophthalmicus.

My examination, three months later, revealed the vision in the right eye to be 6/6 and in the left eye 6/12. The left eye showed an herpetiform lesion on the cornea at 9 o'clock with infiltration and vascularization. Deposits were present on Descemet's membrane, and there were many discrete globular lens opacities. The rest of the media was clear, and the fundus was negative. Inasmuch as she had not responded to the previous therapy of pituitrin and roentgen ray, I advised the use of smallpox vaccinations. Her first vaccination produced a very severe local reaction, and within twenty-four hours the pain over the left eye had markedly decreased. She was revaccinated every third day for a series of four vaccinations. In two weeks the eye was very much improved; there was no photophobia, the conjunctiva was clear, and the corneal involvement had regressed, although a few deposits on Descemet's membrane still remained. The treatment was continued at her home, with resolution of all the skin lesions within three weeks after the smallpox vaccination treatment had been instituted.

Ten months later the patient complained of seeing double, associated with some vertigo and difficulty in walking. This had persisted for four days. Her examination revealed a weakness of the right internal rectus muscle, with a resulting crossed diplopia. The ophthalmoscopic examination was negative except that in the left eye there was a small corneal scar nasally without vascularization. There was no evidence of any deposits on Descemet's membrane. On questioning, the patient mentioned that two weeks previously she had had a localized infection of the skin on the right side of the nose and had treated it locally by expressing the contents. Following this there was some swelling of the nose and later the vertigo and diplopia developed. Complete general and neurologic examination suggested a meningo-encephalitis. Under foreign protein therapy with intravenous typhoid the condition cleared up, and she has remained well since.

Case 2.—A 65-year-old man was first observed in 1940, complaining of severe pain, burning, itching, and lacerimation of the left eye and also pain and burning over the left side of the forehead. Four weeks previously the patient had noted the pain gradually increasing in intensity over the left forehead and left upper eyelid. A few days later an herpetiform dermatitis was noted over this area, and he consulted his neighborhood physician.

THE TREATMENT OF HERPES ZOSTER OPHTHALMICUS WITH SMALLPOX VACCINE

WALTER I. LILLIE, M.D., Philadelphia

THE clinical syndrome called herpes zoster is the result of an inflammation affecting the ganglia, posterior roots, spinal nerves, sensory extramedullary ganglia, or the cranial nerves. It is characterized by groups of herpetic vesicles on the skin along the distribution of the nerve trunks and is accompanied by neuralgic pain. On the basis of their cause, about 50 per cent of the cases are termed essential herpes zoster and are considered to be of virus origin, the remaining 50 per cent are termed symptomatic herpes zoster, and of this latter group syphilis is considered to be the cause in about two-thirds of the cases. The remainder are due to infections, poisons, or irritations of the nerve ganglia.

The treatment of this disease varies greatly throughout the country, as do the clinical results. The usual treatment has consisted chiefly of applying ointments to the local skin lesions, pituitrin injections, roentgen ray, and the use of foreign proteins. The course of the disease usually persists from four weeks to four months, and the most annoying symptom to the patient is severe neuralgic pain.

Herpes zoster ophthalmicus belongs to the herpes group in which the fifth cranial nerve is involved. During the past four years a group of these cases with and without corneal involvement has been treated by vaccination with smallpox vaccine at intervals of from two to ten days. Regardless of the severity and duration of the disease, uniformly excellent results have been obtained.

The following selected cases from this group are reported to show how efficient the treatment has been, even though other forms of treatment previously instituted had not accomplished the desired result. All of 11 cases have been successfully treated with smallpox vaccine.

Case Reports

Case 1.—A woman, aged 35, was examined in 1939 because of severe pain over the left eye and continued skin eruptions over the upper division of the left fifth cranial nerve for three months. When the left eye became involved one week after the occurrence of the skin eruption, she was treated with pituitrin and roentgen rays, with some

relief from the pain. Local treatment in the form of diosin and atropine had also been instituted. One month later she was operated upon for a left anterior and posterior ethmoiditis, without change in the clinical course of the herpes zoster ophthalmicus.

My examination, three months later, revealed the vision in the right eye to be 6/6 and in the left eye 6/12. The left eye showed an herpetiform lesion on the cornea at 9 o'clock with infiltration and vascularization. Deposits were present on Descemet's membrane, and there were many discrete globular lens opacities. The rest of the media was clear, and the fundus was negative. Inasmuch as she had not responded to the previous therapy of pituitrin and roentgen ray, I advised the use of smallpox vaccinations. Her first vaccination produced a very severe local reaction, and within twenty-four hours the pain over the left eye had markedly decreased. She was revaccinated every third day for a series of four vaccinations. In two weeks the eye was very much improved; there was no photophobia, the conjunctiva was clear, and the corneal involvement had regressed, although a few deposits on Descemet's membrane still remained. The treatment was continued at her home, with resolution of all the skin lesions within three weeks after the smallpox vaccination treatment had been instituted.

Ten months later the patient complained of seeing double, associated with some vertigo and difficulty in walking. This had persisted for four days. Her examination revealed a weakness of the right internal rectus muscle, with a resulting crossed diplopia. The ophthalmoscopic examination was negative except that in the left eye there was a small corneal scar nasally without vascularization. There was no evidence of any deposits on Descemet's membrane. On questioning, the patient mentioned that two weeks previously she had had a localized infection of the skin on the right side of the nose and had treated it locally by expressing the contents. Following this there was some swelling of the nose and later the vertigo and diplopia developed. Complete general and neurologic examination suggested a meningo-encephalitis. Under foreign protein therapy with intravenous typhoid the condition cleared up, and she has remained well since.

Case 2.—A 65-year-old man was first observed in 1940, complaining of severe pain, burning, itching, and lacrimation of the left eye and also pain and burning over the left side of the forehead. Four weeks previously the patient had noted the pain gradually increasing in intensity over the left forehead and left upper eyelid. A few days later an herpetiform dermatitis was noted over this area, and he consulted his neighborhood physician.

Read by invitation at the Annual Meeting of the Medical Society of the State of New York, New York City, April 28, 1942.

From the Department of Ophthalmology, Temple University School of Medicine, Philadelphia.

He was given the usual treatment for herpes zoster ophthalmicus, consisting of ointments, pituitrin injections, roentgen ray, and local ocular treatment, without evidence of improvement. One week prior to my examination, the left eye became affected with marked itching, lacrimation, and swelling of the upper lid.

My examination of the skin over the distribution of the first division of the left fifth cranial nerve revealed numerous vesicles of various sizes and some secondarily infected. Many areas were covered with small dark-colored crusts, and the skin, where visible, was dusty-red, markedly indurated, and very tender to palpation. Examination of the left upper lid revealed a vesicle formation, while that of the lower lid was normal. There was a mild, subacute conjunctivitis with marked lacrimation, photophobia, and blepharospasm. The cornea was not involved. The right eye revealed a surgical iridectomy and also aphakia, this eye having been operated upon eight years previously. The general examination was entirely negative except for herpes zoster ophthalmicus.

A regimen of smallpox vaccinations was instituted, with vaccinations every fourth day for a series of four. On his fourth hospital day the patient was definitely improved, there being considerable lessening of the pain, lacrimation, and photophobia, although the herpetic lesions had not changed in appearance. On the sixth day, the lesions were much dryer and the subjective symptoms had practically disappeared. On the tenth day the patient did not look like the same man who had entered the hospital; he was symptom-free, most of the scales had disappeared, and healthy granulations were noted. There was no systemic reaction following any of the four vaccinations, although a local reaction and pustulation was produced by each vaccination.

Case 3.—A man, aged 56, was seen one week after an acute herpetic eruption over the right forehead had been noted by his family physician. A few days before this, the patient had had a severe pain over the right side of the head. The early diagnosis was erysipelas.

At the time of my examination he showed a typical herpes zoster ophthalmicus involving the right upper division of the fifth cranial nerve. The two lids were swollen and indurated, but the cornea was not involved. I advised smallpox vaccinations every seventh day for a series of four or five vaccinations. Inasmuch as this patient had not previously had any treatment for the herpes zoster, I was very anxious that the smallpox vaccinations be instituted immediately. After his first two smallpox vaccinations, from which he had little or no systemic reaction and only a small local reaction, the herpetic lesions of the forehead began to involute, the swelling of the lids decreased, and all subjective symptoms of the eye were minimized. After a series of five smallpox vaccinations, the skin lesions were entirely healed. A slight edema of the upper lid remained, but it subsequently disappeared. This was accomplished in twenty-eight days without any supportive treatment.

In a recent report by Davis,* excellent clinical results had been obtained in herpes simplex with smallpox vaccinations. The first case he reports is one that I had seen in 1937, at which time the patient had a definite herpetiform lesion of the cornea associated with a diagnosis, made by his dermatologist, of facial eczema. The question of allergy arose, and tests for this revealed a mild allergic reaction to certain foods. Over a period of two or three months the ocular condition improved under this regimen, but the patient continued to have episodes of dermatitis, which made him apprehensive because of the untoward ocular effects which usually followed the dermatitis. At the time of Dr. Davis' first examination, the dermatitis was that of a herpes simplex, and there was no ocular involvement. Smallpox vaccinations were instituted, with excellent results.

Although it is too early to report similar cases, I am sure that herpetiform keratitis responds as well to smallpox vaccine therapy as it does to the usual accepted therapy—or better. Although this form of treatment is not suggested as a panacea for all herpetiform ocular lesions, I believe that a virus origin must be more commonly considered, and early treatment should be instituted.

Case 1 is extremely interesting to me, inasmuch as the patient had a severe local reaction to each smallpox vaccination, and the ocular improvement was rapid even though the condition had persisted for more than three months before this vaccine treatment was instituted. The meningo-encephalitis which occurred nine months later might be of virus origin, but I feel that the infection of the skin on the nose was the more probable cause of this condition. This episode responded rapidly and successfully to intravenous typhoid therapy.

Case 2 had previously had the usual accepted treatment for herpes zoster ophthalmicus without improvement. When the smallpox vaccination treatment was instituted, definite clinical improvement, both objectively and subjectively, was noted within four or five days after the first vaccination.

Case 3 had had no previous treatment. There-sponse to the vaccine therapy was very rapid, and the clinical duration of the disease was very short in comparison with that of the other two cases. This case, I think, demonstrates the efficacy of the vaccine therapy.

Conclusions

1. Smallpox vaccination instituted early in herpes zoster ophthalmicus is efficacious in

* Davis, Park Lee, M.D.: J.A.M.A. 114: 2093 (May 25) 1940.

relieving both the subjective and objective phases of the disease.

2. The improvement has occurred, regardless of the duration of the disease and the type of the previously instituted treatment.

3. The earlier the smallpox vaccine was used, the quicker signs and symptoms were relieved.

4. Vaccine therapy could be used in all forms of herpetic lesions involving the eye and its neighborhood, not as a panacea, but perhaps for a better clinical classification of herpetic keratitis.

5. Smallpox vaccine is used because of the simplicity of use and the ease of procurement.

SULFATHIAZOLE MAY BE GONORRHEA PREVENTIVE

From results obtained in an experimental group of soldiers, sulfathiazole administered by mouth appears to be an effective preventive against gonorrhea and chancroid, Capt. James A. Loveless and Col. William Denton, Medical Corps, Army of the United States, declare in the J.A.M.A. in a preliminary report of their investigation. . . .

The test group in the study consisted of a company of approximately 1,400 Negroes and the control group of approximately 4,000 Negro troops from the same post. In summarizing their report the authors say that "A company of approximately 1,400 Negro troops was given sulfathiazole prophylaxis of 2 Gm. before leaving the fort on pass. Those taking station prophylaxis received no further drug. All others received 4 additional Gm., 2 on returning to the fort and 2 the next morning.

"In this company there has occurred a phenomenal disappearance of gonorrhea and chancroid. Excluding the 'failures' not under the influence of the drug at the time of exposure, the gonorrhea rate dropped to a level of 8 per thousand yearly as compared with 171 per thousand in the control group, and the chancroid rate dropped to 6 as compared with 52."

Commenting on their study the authors say:

"It is recognized that this presentation is preliminary in nature. However, it is believed that sufficient evidence is presented to prove that sulfathiazole prophylaxis will prevent gonorrhea and chancroid. It is our opinion that, under certain conditions and in a final form yet to be developed, prophylactic sulfathiazole administration would produce a remarkable decline in gonorrhea and chancroid in the Army. It is admitted that certain dangers are involved in administering this drug, particularly on a large scale, and that the answer to certain questions has not yet been determined. In view of the magnitude of the venereal disease problem, we believe that the risks are justified."

The authors point out that the cost of this prophylaxis has been about 10 cents per soldier monthly. In a footnote they add that since the preparation of their report 20 soldiers in the test group were subsequently admitted to the Station Hospital for various illnesses. All of them had previously received sulfathiazole as a prophylaxis. All of this group received sulfathiazole as a part of the treatment for the illness for which they were admitted to the hospital and in the entire group the treatment response to the drug was satisfactory and there were no reactions.—J.A.M.A.

TRAINING FOR FOOD CONTROL

. . . . To provide for mutual aid in maintaining and controlling the quality of food supplies during and after the war, the food and drug officials of the New England States, New York, and New Jersey have organized an Emergency Council of Food and Drug Officials of the Northeastern States. This Council is a voluntary organization but each participating state has agreed to make available for emergency service anywhere in the northeastern states inspectors, chemists, and laboratory facilities. . . .

To develop the details of this mutual-aid plan and also to provide an opportunity for a general discussion of the procedures that should be followed in the control and distribution of food supplies during emergencies, a three-day training conference for food and drug officials was held in Albany on December 8, 9, and 10. . . . Particular emphasis was placed on the action to be taken in case of enemy attack, especially if accompanied by the use of chemical warfare agents. The program

considered the properties and tactical uses of chemical warfare agents, the protection of foods from contamination, the salvage of damaged food, and methods for cleansing areas and food supplies contaminated by chemical agents or "poisonous gases." It also stressed the existing organization of the state and local communities for civilian defense and the functions of the food and drug control officials in relation to these existing organizations.

As a corollary to this conference, the Emergency Council requested that the Office of War Training of the New York State War Council organize and direct a laboratory training institute for chemists concerned with the control of food products. The sessions were held in January in the laboratories of the Albany College of Pharmacy. . . . The curriculum consisted of lectures on the chemistry and physiologic properties of chemical warfare agents, first-aid treatment for casualties, and the function of the food chemist in the organization for civil defense.—*Health News*

Therapeutics

CONFERENCES ON THERAPY

THESE are stenographic reports, slightly edited, of conferences by the members of the Departments of Pharmacology and of Medicine of Cornell University Medical College and the New York Hospital, with collaboration of other departments and institutions. The questions and discussions involve participation by members of the staff of the college and hospital, students, and visitors. The next report will appear in the June 1 issue and will concern "The Modern Treatment of Cirrhosis of the Liver and Hepatic Insufficiency."

The Status of Therapy with Anticoagulants

DR. DAVID P. BARR: The subject of our conference this morning, the use of anticoagulants, is one with which most of us as yet have had little experience. Unfortunately Dr. Charles H. Wheeler, who was to have opened the discussion, is unable to be here, but he has written some statements which will be read by Dr. McDermott.

DR. WALSH McDERMOTT: Dr. Wheeler has given me a manuscript, and accordingly I shall read you the remarks which he had hoped to deliver in person.

Thrombus formation and the embolic phenomena which so often follow it are frequent causes of disability and death. Some of the important instances of thrombus formation with which we must deal clinically are as follows:

- Primary thrombophlebitis
- Postoperative thrombophlebitis
- Cerebral sinus thrombosis
- Thrombosis of the central retinal vein
- Mesenteric thrombosis
- Mural thrombosis following myocardial infarction
- Subacute bacterial endocarditis
- Thrombo-angiitis obliterans and other types of occlusive peripheral arterial disease

Similarly there are a number of surgical procedures on blood vessels in which success is often endangered because of the formation of a thrombus at the site of incision of the vessel. As examples of these we might list the following:

- Arterial embolectomies
- Arterial suture following trauma
- Arterial anastomosis
- Venous grafts
- Repair of arteriovenous fistula

Theoretically, any agent which could be given to patients safely, and which would prevent clotting of blood in vivo, might have great value in the therapy of conditions such as those given. At the present time we have available two such agents which have been subjected to extensive clinical trial and which appear to be promising

in the field of anticoagulant therapy. These two agents are heparin and dicoumarin.

Heparin is a derivative of glycuronic acid containing calcium and sulfur in its molecule and having a molecular weight of 650. It was isolated in crude form from dog liver in 1916 by McLean, working in Howell's laboratory, and prepared in pure crystalline form as a barium salt in 1933 by workers in both Toronto and Copenhagen. It is apparently a normal constituent of the circulating blood and of many tissues of the body, particularly liver, lung, and muscle, and probably performs a physiological function as an anticoagulant.

When heparin is added to blood in vitro, or injected into the mammalian body, the coagulation time of the blood is prolonged in proportion to the amount of heparin introduced. The mechanism by which heparin prevents the clotting of blood is still imperfectly understood, but seems to depend on the fact that it prevents the conversion of prothrombin to thrombin and inhibits platelet agglutination. When administered orally, heparin has no effect. When given subcutaneously, it is much less effective and more irregular in action than when given intravenously. Accordingly, the intravenous route is employed universally in clinical practice. Following its introduction into the circulation, heparin is rapidly destroyed or inactivated in the body and only traces are detectable in the urine. The effect of heparin on the clotting time is apparent immediately, and disappears from one to three hours after cessation of treatment, even when this has been continued over a period of many days.

Because of the transient effect of single doses, heparin is usually given by means of a continuous intravenous drip when a constant prolongation of the clotting time is desired. It may be given in saline or in 5 per cent glucose solution. The administration of the drug by continuous intravenous drip does not require the introduction of a huge volume of fluid into the circulation, for it is quite possible to maintain the drip

with a total volume of not more than 1,000 cc. in twenty-four hours. By this method it is possible to maintain the clotting time of the blood at a fairly constant level.

It is not possible to state the dosage of heparin necessary to induce a given degree of prolongation of the clotting time, for the effect varies considerably in different persons. In general, however, a dose of about 20 mg. per hour by continuous intravenous drip prolongs the clotting time of the average adult to about twenty minutes. The only safe and effective method of gaging the dosage is to determine the clotting time of the blood at intervals of from three to four hours during the course of treatment and to adjust the dosage accordingly.

Heparin has now received extensive clinical trial and has been given to thousands of patients. Murray and Best, in Toronto, have used it in over 700 patients and Crafoord and Jorpes, of Copenhagen, in over 600. Most workers agree that heparin has definite value in the treatment of conditions such as those just listed. For example, Murray and Best report that they have administered heparin postoperatively to 400 patients and that not one of these has died as the result of postoperative embolism or has even developed postoperative thrombophlebitis, whereas before the routine use of heparin 10 per cent of the postoperative deaths had been due to embolic phenomena.

Finally, a word must be said about the toxicity of heparin. Since the advent of the purified crystalline preparation, no toxic effects have been encountered, except bleeding consequent to undue prolongation of the clotting time. It is noteworthy that the incidence of hemorrhage, which different workers have reported following the use of heparin, varies directly with the degree of prolongation of the clotting time which was induced. Some, such as Murray and Best, who have insisted that the clotting time should not be allowed to exceed twenty minutes, have observed a virtual absence of untoward bleeding in their patients. On the other hand, as many as 30 per cent of patients have been observed to suffer serious and often fatal hemorrhages, particularly in the brain, in series in which the clotting time was allowed to rise to an hour or more. The incidence of serious bleeding has been particularly high in patients treated with sulfonamide and heparin for subacute bacterial endocarditis, for in such patients the clotting time has usually been prolonged to an extreme degree deliberately.

Heparin is expensive, and its administration by the method of continuous intravenous drip is awkward. Consequently, workers in the field of anticoagulant therapy have long wished

for some substance which would induce effects similar to those of heparin when given by mouth, and which would be inexpensive. The new anticoagulant dicoumarin fulfills these criteria.

Dicoumarin is a complex organic compound containing the benzene ring. The anticoagulant properties of this compound were discovered by Link and his coworkers in 1940. Starting with the long-known fact that cattle that eat spoiled sweet-clover hay develop a hemorrhagic diathesis, they succeeded in isolating dicoumarin from spoiled sweet-clover and in showing that it was the offending substance in the fodder. A little later they synthesized it by an inexpensive method.

When dicoumarin is fed to animals, including man, the prothrombin and clotting times are prolonged. The same effects may be induced by injecting the disodium salt of dicoumarin intravenously. No effect on the clotting of blood is produced by dicoumarin *in vitro*. Large doses in animals produce extensive bleeding. The mechanism of action by which these effects occur is still unknown. It possibly consists of an inactivation of vitamin K or an inhibition of prothrombin formation by the liver.

The therapeutic effects of dicoumarin differ somewhat from those of heparin. The effect on coagulation time is variable, but that on prothrombin time is quite regular. Accordingly, this must be used as the gage of effect. The effect on prothrombin and clotting times does not come until from one to three days after the start of treatment. The effect may persist for many days after the withdrawal of treatment. As in the case of heparin, the amounts necessary to induce a given effect vary considerably with different individuals so that the dosage must be guided by daily determinations of the prothrombin time.

It appears that some patients are resistant to the effects of the drug when it is given by mouth, presumably because of failure in absorption, while others are peculiarly susceptible to its effects. It is possible that exaggerated responses are more likely to occur in the presence of impaired liver and impaired renal function, following starvation, and in vitamin K deficiency.

The aim of therapy should be the maintenance of the prothrombin time at a level varying between thirty-five and sixty seconds, as compared with the normal of about twenty seconds. To attain this, an initial dose of 200 to 300 mg. followed by a daily dose of 100 to 200 mg. is usually given orally. Such dosage has been continued for as long as eighteen days. However, as intimated previously, such a dose produces

very little effect in some patients and produces serious bleeding in others.

Information is available on about 1,000 patients who have been treated with dicoumarin by a number of different workers. These data indicate that hemorrhagic manifestations are the only troublesome toxic effects. However, hemorrhages of varying severity occurred in as many as 40 per cent of the patients treated in some of the series, with a fatality rate of 1 per cent in one series. The occurrence of hemorrhages could not be correlated with the increases in prothrombin and clotting times, for many patients bled when the values were lower than those in many of the patients who had no bleeding, and conversely, many of the patients with unusually high values had no bleeding.

It appears, after reviewing these data, that dicoumarin should still be regarded as being in the experimental stage.

DR. BARR: Dr. Duryee, of the New York Post-Graduate Medical School, was good enough to come this morning to tell us of some experiences that he, Dr. Wright, and others have had in the use of these substances in the treatment of various conditions, particularly peripheral vascular disease.

DR. A. WILBUR DURYEE: I apologize for presenting some of this information secondhand. I will have to do as Dr. McDermott did for Dr. Wheeler because all of the detailed work was carried on by Dr. Wright and Dr. Prandoni. Both of these men are now continuing the work in their present locations in the Army, one at the Walter Reed Hospital and one in Hot Springs, Arkansas. We are likewise proceeding with it at the Post-Graduate Hospital. It has been only within the last three months that I have had intimate contact with the investigative work, although I was able to follow, over the last two or three years, a number of patients, particularly in the field of peripheral vascular disease, who were treated with anticoagulants.

Inasmuch as Dr. Wheeler outlined the research background, I think we might discuss some practical applications of our present information.

Anticoagulant therapy was used long before heparin was discovered by Best and Murray. For many years leeches have been applied to patients suffering from phlebitis. The leeches were placed directly over the veins, where they secreted hirudin, an anticoagulant substance. Various workers have tried to purify the crude material on a commercial scale and thus eliminate the use of the leech itself. However, the expense involved was great. Its strength varied tremendously, and it never has worked well as a therapeutic agent.

Although the application of leeches was not a

pleasant form of treatment, the results were gratifying in some cases. Edwards in Boston reported a series of patients treated with leeches with good results. We treated about 20 cases of phlebitis by the direct application of leeches, and were convinced of their value. The average patient, however, does not like a leech crawling over him, and this form of therapy was not used further because of this factor.

Since heparin came into use we have used it in medical and surgical vascular problems. Dr. Pratt has done considerable vascular surgery at Post-Graduate Hospital. He has performed 18 embolectomies in which the vessels in one or both legs were occluded, several of them with the thrombosis at the bifurcation of the aorta, or saddle, type. In many of these, heparin was used during the operation. In the majority of these cases, no massive gangrene followed and no major amputation was necessary, although many of our embolectomies previously had come to major surgery. There is no question of its value.

There are, however, a few points concerning its use that I might point out. Formerly, we waited for an hour or two postoperatively before heparin injection was started. We soon realized, from the work of Best and others and from our own experience, that after such a delay it was frequently too late to obtain the benefit of heparin. The thrombus had usually reformed in the vessel by that time. Therefore, at present, heparin injection is begun on the operating table and frequently even earlier. In emergency it is given in the arm vein in the concentrated form in a dose of at least 40 to 60 mg. The average maintenance dose is 20 to 30 mg. per hour. Heparin may also be injected locally at the site of the operation and into the lumen of the artery. There is always some leakage at the suture area but it is seldom a major problem. Postoperatively heparin is continued for from five to eight days in order to prevent clotting in the injured vessel.

The medical cases in which we have used heparin are divided into two main groups: those with venous and those with arterial disease.

In patients with venous disease we have used it chiefly in thrombophlebitis and especially in migratory thrombophlebitis which presents such a difficult therapeutic problem.

Among the arterial disease problems in which we have used heparin are acute arterial thromboses starting in the periphery and rapidly working centrally, such as those seen occasionally in Buerger's disease and in arteriosclerosis.

I should like now to emphasize some of the points which Dr. Wheeler has already discussed and perhaps to bring out a few others.

Prothrombin is acted upon by thrombokinase and by calcium ions to form thrombin. If calcium ions are absent, thrombokinase acts very slowly—i.e., in the formation of thrombin. If heparin is absent or is in low concentration, coagulation occurs, but if heparin and the neutral salts are present the thrombin is neutralized and the blood remains fluid. There may be other factors present in the blood that will influence coagulation, such as antithrombin agents. The addition of thrombokinase in suitable amounts annuls the action of heparin. Therefore, it is the balance between the concentrations of heparin and thrombokinase that decides whether the blood coagulates or remains fluid.

There are several preparations of heparin that are available on the market today. The ones we are using are those of the Lederle, the Roche, and the Connaught Laboratories. Most of them are distributed in 10-cc. vials with 10 mg. per cc., and each cc. equal to the 1,000 Toronto units as defined by Best and Murray.

With continuous infusion, the clotting time rises from normal levels to twenty or thirty minutes and remains fairly constant. With injections every four hours, the clotting time frequently exceeds an hour. We believe that clotting times of over thirty or forty minutes are extremely dangerous, and, moreover, between the injections the clotting time may return to normal.

I should like to mention that the type of needle that we use for heparin infusion was described by Olovson. It may be strapped on the arm. With it in place patients are able to move around without much danger of dislocating the needle. I had a patient in the Manhattan Eye and Ear Hospital who had a migratory phlebitis whose repeated emboli became so serious that for two weeks he had an intravenous needle in place continuously, for only while the heparin was running was he free of new lesions and emboli. We were finally able to discontinue heparin, and he is now attempting to enlist in the Army. I am afraid he did not tell the Army physicians this story.

If we are to treat our patients intelligently, we ought to have certain clinical and laboratory data, except in emergencies, before we start therapy. The blood typing is often important because the only way we are able to stop the effects of dicoumarin and heparin is by transfusion with fresh blood. Banked blood loses the thrombokinase, and if it has stood three or four days the thrombokinase is so reduced in amount that it is of very little value in opposing the heparin effect.

There is also considerable evidence that in

advanced renal disease both dicoumarin and heparin are contraindicated. There are many reasons for this. Bleeding into the kidney and hematuria are frequent complications in patients treated with anticoagulants. If renal damage exists and renal hemorrhage is added, the outcome may be serious. Therefore the Mosenthal, the urea clearance, or other kidney function tests are indicated. Capillary fragility should be tested prior to therapy and variations in prothrombin time should be constantly watched during treatment.

Hemorrhage with anticoagulants appears to have very little relationship to capillary fragility in most cases. The cause of bleeding from apparently normal vessels in patients receiving anticoagulants is not known. Histologic study of these vessels shows very little alteration from normal. However, in a cut or injured vessel the continued bleeding is easily explained.

The bromsulphalein test for liver function is important, especially when dicoumarin is used. We are familiar with the relation between vitamin K and prothrombin. If vitamin K is deficient and there is associated liver damage, the use of dicoumarin is contraindicated. The blood cholesterol and cholesterol esters are further tests of liver function. The frequent determination of the blood coagulation time throughout the course of therapy has already been stressed.

We do not know yet whether achlorhydria has an effect on the absorption of dicoumarin, but apparently the drug is not so quickly absorbed when gastric acidity is low or absent.

The erythrocytic sedimentation rate is important because a sudden rise may indicate hemorrhage. Practically all the cases treated with dicoumarin that showed hemorrhage had a marked increase in sedimentation rate.

I might mention a few cases to illustrate the effects of dicoumarin. One patient received 300 mg. doses orally every other day. There was a marked increase in the coagulation and prothrombin times. After the dicoumarin was stopped on the sixth day it took eighteen or more days for the clotting time to return to normal. In another case the drug was given every day. The coagulation time rose to sixty minutes, which is dangerously high. The prothrombin time rose to 100 seconds. The patient was given 500 cc. of whole blood and 8 mg. of vitamin K, and later an additional 20 mg. of vitamin K, to neutralize the effect of the drug. Data taken from a chart of Link describe the effect of a single 150 mg. dose of dicoumarin. In 8 days the clotting time returned to normal. With graded doses of dicoumarin (37, 75, and 150 mg.), the clotting and prothrombin times increased in direct proportion to the size of the dose. It

takes from one to two days before the full effect of the drug develops.

The following toxic effects of dicoumarin were noted in a series of 17 patients. Nine of them, or about 50 per cent, had toxic symptoms. Three had purpura, 3 had sublingual ecchymosis, and 3 had conjunctival hemorrhages.

One must be careful to apply pressure for a long period, one hour or more, over the venous puncture points. Slow but massive bleeding may occur from such areas.

Epistaxis and hematuria are frequent complications with dicoumarin therapy. Hematuria is a common occurrence in the course of subacute bacterial endocarditis. It is frequently puzzling to know if the bleeding is due to emboli or to the drug itself. Lumbar pain may be due to bleeding into the lumbar muscles. The temperature becomes elevated, as is often noted in any internal hemorrhage. Vertigo and nausea may indicate cerebral bleeding. This is a complication to fear, but in our series we have had no cerebral accidents. No neutropenia from the drug was noted in any of the cases. One patient went into shock but recovered with the usual shock treatment.

DR. BARR: Dr. Forkner has had experience in the use of these substances, especially in the management of pulmonary embolism and pulmonary thrombosis. I should like to ask him to open the discussion of the preceding presentations and to tell us something about his own experiences.

DR. CLAUDE E. FORKNER: I have not made a study of this problem but have merely followed some of the facts that have been reported in the literature dealing particularly with heparin. I think it is a very good thing to hold this conference here because I feel that we have been a little slow in utilizing some of the valuable work done elsewhere, especially the work on heparin.

The chief purposes for which heparin has been used in this hospital have been the treatment of patients with subacute bacterial endocarditis (about which I hope Dr. Deitrick will say a few words later), and of some patients with pulmonary emboli, secondary to either peripheral thrombosis or to the formation of mural thrombi.

I think it should be emphasized that in patients with pulmonary emboli the procedure of causing a prolongation of the coagulation time often is a life-saving procedure. I have here the records of 3 patients whose lives I feel were saved by such a procedure. Some of you have seen the patients. Two of them were on the wards and another one was a private case.

One of the patients was a physician suffering from typhus fever who, during his convalescence, developed phlebitis, first in one leg and then in

the other. He was having pulmonary emboli very frequently, and eventually a large embolus lodged in his left axillary artery. We felt that the emboli in the lungs were coming from the phlebitis which he had in the vessels of his legs and that the embolus in his left axillary artery probably was from a mural thrombosis in the left side of the heart. As you know, typhus fever is a disease largely affecting the intima of the blood vessels. The organisms, the Rickettsia, live there, and consequently, thrombosis and embolism are fairly common in this disorder.

It was with some hesitancy that we gave this man heparin. I think Dr. Reznikoff really led us to do it. From the time that the patient was given heparin there was an immediate cessation of pulmonary emboli, and he progressively improved. Also, there was a cessation of extension of his peripheral thrombophlebitis. The embolus that lodged in his left axillary artery was treated by means of suction and pressure on the extremity together with heparinization of the patient. We feel that heparin was perhaps an important factor in saving the extremity as well.

Another patient who was recently on the wards came into the hospital with rheumatic heart disease and extensive phlebitis of both legs. She was having frequent pulmonary emboli, was almost moribund, had high fever and fluid in the chest, and was in a state of collapse. As soon as the heparin was administered she ceased having additional pulmonary emboli, the phlebitis in her legs subsided, and she finally recovered.

A third patient injured his legs in an airplane accident, and later developed an extensive phlebitis with showers of pulmonary emboli. He was in great distress from shortness of breath. X-rays showed his lungs to be full of emboli. Heparin was given, and he had no subsequent pulmonary emboli.

In each instance the life of the patient seemed to have been saved by the administration of heparin.

I do not wish to convey the impression that every patient who has pulmonary emboli should be given heparin or dicoumarin, but I do think that in pulmonary embolism, serious consideration should be given to the use of these anticoagulants.

An important point which is not usually appreciated is that prior to fatal emboli in the lungs at least 30 per cent of the patients have had emboli previously. In other words, there is a warning embolic process which precedes the fatal episode. Personally, I feel in view of the extensive evidence which has been accumulated, that we should use this antithrombic treatment on patients who have had operations after which

phlebitis or thrombosis with possible pulmonary embolism might be expected. As has been mentioned, the Toronto group and others have had about 1,000 surgical cases in which no pulmonary emboli have been encountered, whereas in a comparable control group the incidence was about 9 or 10 per cent.

Another point which I think should be mentioned here, and which has not been sufficiently stressed, is the possible value of this drug in the treatment of mesenteric thrombosis. As you know, mesenteric thrombosis carries with it a very high mortality rate. The results in the literature today show that heparinization of these patients is of extreme value when used alone or when used in addition to resection.

I think the other points I have in mind will be covered in the discussion which is to follow.

DR. BARR: I am sure there must be many questions.

DR. PAUL REZNIKOFF: I wonder whether Dr. Deitrick can tell us of the results of the treatment of coronary thrombosis.

DR. JOHN E. DEITRICK: The aspect of coronary disease in which we are interested is the prevention of progressive thrombus formation following a coronary occlusion by the use of heparin. If we could accomplish this, the collateral circulation might be more easily established. It is well known that a man can have one, two, or three coronary thromboses and survive.

About two years ago we received a rather small supply of heparin and treated four patients. All I can say is that we observed no ill effects. All four survived, although one man had, when treatment was started, a blood pressure between 80 and 90 and was practically in shock; he was given heparin continuously.

We did not know how long to carry on treatment. We tried to limit treatment to the patients who had suffered a severe attack of pain three or four hours before arriving at the hospital. We felt that heparin should be given as soon as possible after the onset of pain and should be continued for 48 to 72 hours, but we knew of no way to evaluate our results unless we had a large stock of heparin so that we could treat alternate cases and study the mortality rate.

DR. FORKNER: I should like to make two additional points. In thrombosis of a blood vessel, the mere existence of a thrombus may be less menacing than the deposit of additional material upon it and the later breaking off of portions of this material to form emboli. In coronary occlusion, one of the chief dangers may be an extension of the existing thrombus and injury to the cardiac wall so that mural thrombi are formed well after the original coronary oc-

clusion. Heparin should tend to prevent such unfavorable developments and thereby lessen the hazard of this serious disorder.

DR. REZNIKOFF: Dr. Best contends that there is no evidence that heparin will dissolve the thrombus once formed, but many people have observations which do not agree. One of the investigators who insists that heparin can dissolve an existing thrombus is Murray himself, who works with Best, although in their combined papers they say nothing about this effect.

I should like to ask Dr. Duryee whether he has any observations on the effect of heparin on an existing thrombus.

Another question I should like to ask is this: Has he any information about protamine, which Chaugus and Olson claim is an antidote to heparin? Also does protamine act as an antidote for an overdose of dicoumarin?

DR. DURYEE: The first question is: What happens when one gives dicoumarin or heparin to a patient in whom a thrombus has formed and an extension has taken place? I believe the arguments are stronger against the theory that heparin dissolves the thrombus than are those in favor of it. The chief argument against it is that usually at the beginning of heparin therapy all pulmonary emboli are stopped. Any of you who have opened a vein or have seen one opened know that the proximal end of a thrombus is usually free, not attached to the wall. Frequently it waves like a flag in the fluid blood, and if the heparin actually had a dissolving action on such a thrombus one would expect an increase in pulmonary emboli. Almost universally, pulmonary emboli are controlled.

The observers maintaining that the thrombus is dissolved usually base their evidence on examination of tissue removed a few days, a week, or ten days after primary thrombosis has occurred. During the course of the thrombosis a "clot" could be felt, but on tissue study it has disappeared. We know that a thrombus formed in the veins in acute thrombophlebitis sometimes completely disappears spontaneously in ten days or two weeks, so that examination of the tissue even four or five days later may lead erroneously to the conclusion that heparin dissolved the clot. Dr. Pratt produced thrombi chemically in the veins of animals and studied those veins one, two, five, and ten days, and up to four months later. It was extremely interesting to watch the disappearance of the thrombi. It is my belief that heparin has no effect on the dissolution of emboli.

Regarding your second question relating to the effect of protamine, I may say that we have used this substance in 3 or 4 cases in which the

clotting time became elevated to one hour or more. In each instance protamine seemed to control the clotting time and to lower it almost as rapidly as would whole blood transfusion.

I should like to bring out the indications for the use of dicoumarin versus heparin. Dicoumarin costs the patient only about \$1.00 a day while heparin costs \$20 to \$25 a day. I think our information on dicoumarin is sufficiently advanced at present to say that whenever prolonged therapy is required in the absence of immediate need for quick anticoagulant action, dicoumarin is the drug of choice. Furthermore, one may start with heparin and continue with dicoumarin after twenty-four or forty-eight hours.

Dicoumarin has certain dangers from which heparin is free. It takes days for its effect to subside, but with the use of whole blood and probably of protamine to control it, this may not restrict its use seriously. I think that in an emergency requiring anticoagulant therapy for a few days only, heparin should be chosen.

DR. MCKEEN CATTELL: With respect to correction of coagulation time by antagonistic agents, I just had the opportunity to read a report of some work that has been done in the Parke, Davis Laboratory by McGinty and Pfeiffer. They have succeeded apparently in preparing a purified solution of beef prothrombin and have found it to antagonize completely the effects of dicoumarin in dogs.

DR. FORKNER: I might say that a heparin preparation which is marketed by Hoffmann La Roche contains 10 mg. per cc. There are 100 mg. or 10,000 units in the vial.

DR. BARR: It would be very interesting to hear of Dr. Duryee's experience with the use of anticoagulants in Buerger's disease.

DR. DURYEE: We have run into a few obstinate cases of Buerger's disease. Its treatment is not the problem it used to be because if two principles of therapy are followed the course of the disease may usually be arrested successfully. These are the cessation of the use of tobacco and therapy with a vasodilator. We have used typhoid intravenously to produce fever and secondary dilatation. The cases in which the venous pathology predominates seem to be the most resistant to anticoagulant therapy.

I might discuss the case of a patient who was at Welfare Island, and who had gangrene of all four extremities, involving the tips of three fingers of each hand and all the toes. He had been followed in our clinic at Post-Graduate, and because we thought he had not discontinued the use of tobacco, he was hospitalized at Welfare Hospital. He was given dicoumarin (100 mg. at first and then 200 mg. every day). For a period of eighteen days everything was satis-

factory, but suddenly his prothrombin time went over forty seconds and he bled from everywhere—from the tips of his fingers, from the gangrenous lesions—and he developed a mild hematuria, so that we thought he was going to die. He was given 250 cc. of whole blood and a day later another 250 cc., and in twenty-four to forty-eight hours the bleeding stopped. His blood count at the end of twenty-four hours after the second transfusion was about two and one-half million RBC with about 40 per cent hemoglobin; however, without further transfusions but with a high protein diet, iron, etc., he rapidly restored the blood loss. He was polycythemic before the bleeding as are most cases of Buerger's disease. He has been followed in the clinic for six or seven months since the bleeding, with no further lesions.

I might mention a case of diabetes in which endarteritis had produced gangrenous lesions. This patient did not have severe toxic effects. The 200-mg. doses were continued for several weeks and in about eighteen days after stopping them, the coagulation time came back to normal, and the lesions healed.

Another case of thrombo-angiitis obliterans bled, although not dangerously. The 200-mg. dose was given for only six days before some hematuria occurred. This patient was thirty-seven years of age, with a gangrenous big toe which healed very rapidly following dicoumarin therapy.

DR. BARR: Do you have, Dr. Duryee, any suggestions regarding literature which summarizes some of the advances in this relatively new field of therapeutics?

DR. DURYEE: Last fall Dr. Wright presented at the New York Academy of Medicine a paper which was published in the *Bulletin of the New York Academy of Medicine* in July of 1942. I think it contains about the fullest bibliography up to that time, and it was brought up to date just before publication. It contains 117 references.

At the American Medical Association meeting of this year there was a symposium on this subject before the Section on Pharmacology. These papers were recently published in the *Journal of the American Medical Association*.

DR. BARR: Dr. Duryee, on behalf of the whole group I should like to extend our thanks to you for coming here, and giving us your experiences on this important subject.

Summary

DR. STEPHEN KROP: In conclusion, it may be said that in recent years great progress has been made in the use of anticoagulants in the treatment of disorders of embolic origin. Results of

treatment of peripheral vascular disease and of thrombosis following surgery of blood vessels by means of heparin and dicoumarin are encouraging. There are indications that anticoagulants may be useful prophylactically in connection with surgery after which phlebitis or thrombosis might be expected.

Although regarded as being in the experimental stage, dicoumarin is the drug of choice for prolonged therapy. It is effective orally, its action develops slowly but is persistent, overdosage may be counteracted by fresh whole blood transfusion and Vitamin K, and it is relatively cheap. Contraindications are hepatic and renal damage. Hemorrhage is rare if the dosage is determined primarily by the degree of prolongation of clotting and prothrombin times; it appears desirable that these be kept at about

20 minutes and 35 to 60 seconds, respectively. This is usually attainable by an oral dose of about 200 to 300 mg. and a daily maintenance dose of 100 to 200 mg. Its slow onset of action narrows considerably its usefulness in emergency as well as in conditions requiring anticoagulant therapy for a day or two only. Because of its rapid onset of action, heparin is the choice under such conditions. Prolonged therapy with heparin has two disadvantages: necessity for continuous intravenous infusion (it is ineffective orally) for maintenance of effect, and high cost. A dose of about 20 or 30 mg. per hour usually produces a safe and effective level of action; although dosage must be governed primarily by the degree of prolongation of the clotting time. The contraindications are similar to those for dicoumarin.

MEDICAL HISTORY—AS YOU LIKE IT

From as far back as Greek antiquity, and even in biblical times, the snake has been used as a symbol of medicine and health. Presumably it was because the principle of life was represented by the serpent with its ability periodically to cast off its skin and apparently renew its youth. Accordingly, tamed snakes were used in the temples of Aesculapius for the psychic effect and also to lick wounds of the patients. Aesculapius, the Grecian god of medicine, is always represented as carrying a heavy, rough staff with a single serpent entwined about it—the staff for walking and the serpent as a symbol of medical knowledge or healing powers.

The winged caduceus used today as the emblem of the medical profession is a light wand with a pair of wings at the top, having two snakes entwined about the wand. It was originally the wand of Mercury, messenger of the gods, and later symbolized the peaceful conduction of business—the mercantile world as opposed to the military. A somewhat similar form of this caduceus was also used as the staff of Hermes, who was god of many things, such as

the wind and air, as well as robbers, thieves, and traitors, and guide of souls to Hades. Some have facetiously suggested that from this latter duty of Hermes the caduceus came to symbolize the medical profession.

Just exactly how the winged caduceus, which has no legendary association with medicine, came to represent the profession is not known. It is thought, however, that certain medical printers used it as a part of their frontispieces to show the unity between medicine and letters as indicated by the two entwined snakes. From this it was probably misrepresented as being an emblem of medicine and later incorporated on the insignia of the U.S. Army Medical Corps—its misuse being practically assured from then on.

No matter how widespread its use, however, the winged caduceus with two entwined snakes is actually not a symbol of the medical profession. The only true emblem is the rough staff with a single serpent, the staff of Aesculapius, god of medicine.—*Westchester Med. Bull.*

SURGICAL FEATS BY AMATEURS

As a consequence of the emergencies of war, at least two amateur surgeons have performed operations with entirely successful results. Reported surgical feats by nonmedical men have included an appendectomy performed in a submarine submerged in Japanese waters and a leg amputation done in the thick of battle on the Tunisian front.

Thomas A. Moore, of Chino Valley, Arizona, chief surgeon's mate on the submarine *Silversides*, operated on Fireman George W. Platter, of Buffalo, to remove a severely inflamed appendix. Although

it was Moore's first appendectomy, he had witnessed several others and remembered the process.

The second bit of amateur surgery was performed by Lt. Walton Goodwin, of Richmond, Virginia, who rescued one of the members of his tank platoon from German gunfire in Tunisia, and finding the man's leg badly shattered, decided to amputate before carrying him from the field. Lt. Goodwin administered morphine and sulfanilamide, amputated the leg, and then carried his patient across the open field to cover.

Case Report

SCIATIC PAIN AS INITIAL SYMPTOM OF SUBARACHNOID HEMORRHAGE

NATHAN SAVITSKY, M.D., and ISRAEL STRAUSS, M.D., New York City

PAIN in the extremities and other evidence of root irritation has been described in spinal subarachnoid hemorrhage. Lux and Adloff and others have reported such cases. The onset of the condition may be characterized by sudden, severe sciatic pain. There has, however, been very little emphasis laid on the occurrence of such sciatic pain in subarachnoid hemorrhage caused by intracranial bleeding. Rossi and Montemezzi report severe pain in the right lower limb in the sciatic distribution two days after the sudden onset of severe neck pain, vertigo, and vomiting. Osterman refers to a case which began with severe sciatic pain on both sides two days after the sudden onset of sharp occipital headache and stiffness of the neck. Rothmann mentions pains in the sacral region radiating down into the lower limbs in a patient soon after the onset of subarachnoid hemorrhage. Libman states that he has seen basilar subarachnoid hemorrhage in which the pain began in the region of the coccyx. (See Reference.)

Case Reports

Case 1.—The first case is that of a 15-year-old boy who complained of pain of five days' duration in the left sciatic distribution. The onset of the pain was sudden and was accompanied by mild and transitory left-sided headache. Pain in the left lower limb persisted and was not relieved by analgesic medication. The pain was very severe. He was brought to the hospital by ambulance, although he was able to walk into the admitting room and to respond relevantly to all questions. Because of the severe sciatic pain, he was referred to the orthopaedic clinic. From there he was sent home. He had no other complaints at the time which justified an immediate neuropsychiatric consultation. Twenty-four hours after he had returned home, the ambulance was called again because he could not walk. On admission to the hospital he looked acutely ill, was drowsy, but responded relevantly to question. His neck was stiff and there was a bilateral Kernig; there was a right central facial and the right pupil was irregular; there was a right Babinski, a left ptosis, and left-sided internal rectus weakness. There was no tenderness of either calf; he soon after admission did not complain of pain in the lower limbs. The spinal fluid was bloody in all of 3 test tubes. Each test tube was equally bloody, and the blood did not clot. There was supernatant xanthochromia. The patient did very poorly. He became stuporous and did not respond to treatment. His pulse and temperature began to rise (he was afebrile on admission). He died seven days after admission.

In this first case the presenting symptom and outstanding complaint was pain in the left sciatic distribution. No sensory or motor changes were found in the lumbosacral distribution. The patient was considered at first a problem for the ortho-

paedist. The left-sided headache, which appeared soon after the leg pain, was not severe enough to require further study when he was seen for the first time.

Case 2.—The second case was that of a 22-year-old woman who was admitted to the hospital with a history of pain of eight months' duration in the posterior aspect of the right extremity. This pain varied in intensity, with occasional severe exacerbations. Two months before admission she complained of sudden blurring of vision. Some diminution of vision persisted to the day of admission. The examination showed raised nerve heads with blurred disk margins, concentric constriction of both visual fields, an increase in the size of both blind spots, and marked hyperopia. In addition, there was a definite positive right Laségue and hypesthesia with hyperalgesia in segments L-3 to L-5 inclusively on the right side. The spinal fluid showed a pressure of 20 mm. of water, xanthochromia with a 2 plus globulin and no cells. The total protein was 135 mg. per cent. There was no evidence of block on manometric study. The blood and spinal fluid Wassermanns were negative. The patient was discharged with a diagnosis of lumbosacral radiculitis and pseudopapilledema. After her discharge she continued to complain of pain in the lumbosacral region on both sides. Diminution of visual acuity became more marked, with stabbing pains in both eyes. This continued for two months before her readmission which took place four months after she was first admitted. On the second admission she showed papilledema of 1½ to 2 diopters and depressed tendon reflexes. The sensory changes in the lumbosacral dermatomes previously noted were not present. A lumbar puncture showed some xanthochromia and an initial pressure of 240 mm. of water. Encephalographic studies showed dilated ventricles with a cyst in the left frontal lobe which communicated with the ventricular system. The spinal fluid became more and more bloody as it was withdrawn for the encephalogram. At operation a hemangio-endotheliomatous cavernoma was found in the left frontal lobe and removed. The sciatic pain disappeared completely after operation.

This second case is somewhat more difficult to interpret. Evidence of lumbosacral root irritation had been present for over a year before operation. The spinal fluid was found to be xanthochromic without evidence of manometric block. A bleeding vascular tumor of the cerebral cortex was found to be the source of hemorrhage into the cerebrosplinal spaces. Bleeding was probably slow. There was no history of an apoplectiform onset. No other cause for the sciatic pain or lumbosacral root irritation was found. While the question of the possibility of a coincidence came up in interpreting the sciatic pain, we are inclined to accept a causal relation between the chronic and repeated meningeal bleeding and the pain in the lower limbs. We

therefore believe that there is ample proof of the theory that blood in the cerebrospinal spaces can cause irritation of the spinal roots, for this case indicates that chronic bleeding from an intracranial source can cause pain in the lower limbs.

Summary

Two cases of subarachnoid bleeding are reported. In both, the source of bleeding was intracranial. Pain in the sciatic distribution was the presenting symptom in both cases. The

cause of this pain was irritation of the spinal roots in the lumbosacral region. Acute and chronic bleeding into the subarachnoid space can cause pain in the lower limbs.

MUSCULAR EXERCISE AND FATIGUE IN DISEASE

Since 1900 many investigators have studied patients during and after muscular work. Simonson and Enzer present an analytic review of such investigations of the gaseous exchange and the circulatory and respiratory functions. Distinctions between demonstrable fatigue and complaints of fatigue must be established by precise objective methods. Following analysis of the effect of disease on performance in various types of work, it might be possible to direct patients with chronic diseases toward occupations in which their working capacity would be least reduced. Control of the tax on their working capacity would be good therapy. Investigation during work permits a better understanding of the patient's actual condition than examination during rest. The patient may still be fully compensated while at rest but not for the increased demands during and immediately after muscular work.

Thus the investigation of patients by means of exercise tests is especially important for those on the verge of cardiac decompensation. The state of the patient depends more on the interrelation of several functions than on any single function. Investigations during muscular work will help to recognize the weakest point at which decompensation is most likely to occur.

When the problem is viewed from this aspect, disease may be defined as "diminution of working capacity." Hence the measurement of the maximum working capacity should be an ideal method by which to determine the extent of the damage produced in the organism by pathologic processes. Severe lesions of the heart do not necessarily impair maximum performance for muscular work. Apparently it is not the primary lesion but the breakdown of the compensatory mechanism which leads to signs and symptoms of circulatory insufficiency.

Among the methods used to measure maximum working capacity, a number of investigators were concerned with the rate of maximum oxygen intake. Measurement of the maximum oxygen intake is an indirect method for determining the maximum minute volume of the heart, provided the pulmonary system is intact. The decrease of the maximum oxygen intake was found to be proportional to the degree of insufficiency for working condition; that is, to the decrease of the circulatory reserve. The decrease was especially pronounced for patients with mitral stenosis, whose maximum oxygen intake reached only the value of 200 to 300 cc. per minute. This is only slightly above the resting state of oxygen consumption. The rate of maximum oxygen intake is a reliable index of cardiac reserve, provided pulmonary complications are not involved.

In the latter case the maximum oxygen intake indicates the capacity of the respiratory and circulatory systems. If the maximum oxygen intake exceeds a value of 1,300 cc. per minute it may be assumed that there is no circulatory insufficiency. This is an objective method, although it depends on the patient's cooperation to work with maximum effort. Another objective method involves measurement of the maximum oxygen debt, which is the excess oxygen consumed during the recovery period. The maximum oxygen debt is lower in patients with heart disease.

Investigations of this type brought out some interesting facts. Efficiency in any type of work is considerably reduced in patients with hyperthyroidism. The deviations of efficiency here are much greater than in heart disease. In beginning exophthalmic goiter the coefficient of efficiency may be decreased before the basal metabolic rate is elevated. Thyroidectomy leads to a consistent improvement of the efficiency, while the improvement of the basal metabolic rate was not so consistent. Thus it appears that the coefficient of efficiency more nearly parallels the seriousness of the disease than does the increase of the basal metabolic rate and therefore might be of considerable diagnostic and prognostic value. Another important index in the analysis of pathologic conditions is the speed of oxidative processes. This may be determined during and after exercise by measuring (a) the speed of the increase of oxygen consumption during the period of adaptation (the first five minutes of work), (b) oxygen debt, and (c) recovery speed. Oxygen debt is contracted during the period of adaptation, so that the increase of oxygen consumption during the adaptation period is the fundamental process to which the final oxygen debt is related. The oxygen debt is considerably increased in patients with heart disease, and the increase parallels the degree of symptoms of decompensation. Hence the measurement of the oxygen debt would seem to be an ideal method for evaluating the state of patients with heart disease. Oxygen debt has been found to be increased in chronic bronchitis, emphysema, advanced lung tuberculosis, and pronounced silicosis. Oxygen debt reflects the delay of oxidative processes during the adaptation period.

On the basis of the investigative data the reviewers conclude that there is a quantitative rather than a qualitative difference of physiologic processes in exercise in disease. Fatigue and disease are intimately related. This relationship explains why fatigue is the most common complaint in disease.—J.A.M.A.

Case Report

VESICULAR ERUPTION FOLLOWING SULFATHIAZOLE INTOXICATION

EMANUEL APPELBAUM, M.D., and EDGAR H. BACHRACH, M.D., New York City

MANY observers have stressed the pronounced frequency of cutaneous manifestations with sulfathiazole medication. Haviland and Long¹ gave the incidence of this toxic reaction as 12.8 per cent in a group of 73 cases. Flippin² and his coworkers found four instances of skin reaction in 100 patients. Volini³ and his collaborators reported an incidence of 3.9 per cent in a group of 180 patients.

The various rashes encountered with sulfathiazole intoxication have been described in detail by Haviland and Long and by Volini *et al.* The lesions have been recorded as urticarial, maculopapular, nodular, or purpuric. The nodular form of rash has been regarded as particularly distinctive. These raised lesions are dark reddish and slightly tender. Some are from 2 to 5 cm. in diameter, frequently simulating erythema nodosum. They occur more commonly on the extensor surfaces of the legs and forearms although they may appear on the thighs and upper arms.

In addition to these lesions, we wish to call attention to a fine vesicular eruption which we have encountered in 2 of our patients. We could find no reference in the literature to this type of rash following sulfathiazole intoxication.

Report of Cases

Case 1.—W. S., a man aged 25, was admitted to Bellevue Hospital on October 22, 1941, with the chief complaints of vomiting, chills, and fever of twelve hours' duration. The onset of these symptoms was sudden. He complained also of headache, moderate epigastric pain, and backache. Three weeks before he had contracted an acute gonococcal urethritis, for which he was given sulfathiazole. He received from 3 to 4 Gm. of the drug daily during the three-week period. Two weeks previously he had had a mild upper respiratory infection. He gave a past history of dengue fever and of syphilis nine years before and of an attack of gonococcal urethritis three years before.

Physical examination revealed a well-nourished adult appearing acutely ill and apathetic. His skin was hot, flushed, and covered with profuse perspiration. The conjunctivae were markedly injected. The pupils reacted to light and accommodation. The ears, nose, and throat presented no abnormal findings. The lungs were clear. The heart appeared normal. The blood pressure was 120 systolic and 70 diastolic. There was slight tenderness in the epigastrium on deep pressure. The spleen was enlarged. There was a generalized skin eruption. The lesions were discrete and consisted of small macules, in the center of which were minute white elevations resembling the pustules of staphylococcus bacteriemia. All the reflexes were active and there were no pathologic reflexes. The fundi were normal. The temperature was 103.6 F., the pulse 138, and the respirations 28.

The white blood count was 6,300, with 79 per cent polymorphonuclears and 21 per cent lymphocytes. The red blood count was 4.78 million, with 95 per cent hemoglobin. The blood smear was negative for malarial parasites. The urine was essentially normal. The blood nonprotein nitrogen was 34 and the sugar 106 mg. per cent. Agglutinations for typhoid, paratyphoid A and B, melitensis, and typhus were all negative. The erythrocyte sedimentation rate was 5 mm. in one hour. The blood culture was sterile. The sulfathiazole level in the blood was 2.1 mg. per cent.

When the possibility of staphylococcus bacteriemia was considered shortly after admission, the patient was given 3 Gms. of sulfathiazole. However, it soon became apparent that the eruption was vesicular and not pustular. The skin lesions as well as the fever were then considered to be due to sulfathiazole intoxication and the use of the drug was discontinued. There was a prompt improvement in the clinical picture. Within forty-eight hours the rash disappeared and the temperature dropped to normal (Fig. 1).

In this case a diagnosis of staphylococcemia was made at first, and more sulfathiazole was administered. Fortunately the vesicular character of the rash was soon recognized and the possibility of sulfathiazole intoxication was therefore considered. Further use of the drug was promptly discontinued with most gratifying results.

Case 2.—B. S., a woman aged 44, was treated at home for thrombophlebitis with 17 Gm. of sulfathiazole and restricted fluid intake. This was followed by a rise in temperature, development of burning in the eyes, asthenia, headache, nausea, and oliguria. She was admitted to Sydenham Hospital on November 14, 1941. Her past history was essentially negative.

Physical examination revealed a rather obese adult female in a semistuporous state. The temperature was 106 F., the pulse 144, and the respirations 32. There was a marked suffusion of the conjunctivae. The pupils were small but reacted to light and accommodation. The fundi were normal. The lungs were resonant throughout and showed a few crackling rales at the bases. The breath sounds were vesicular throughout. The heart sounds were moderately muffled and there was a short systolic murmur at the apex. The blood pressure was 138 systolic and 80 diastolic. The abdomen was soft, and the spleen was not palpable. The left leg showed the features of a thrombophlebitis as characterized by cordlike areas of redness and tenderness. Over the trunk and extremities there was a polymorphous eruption consisting of three types of lesions. There were maculopapular nodules involving mainly the extremities, especially in the region of the elbows. These varied in size from 0.25 to 1 cm. in diameter and resembled somewhat the eruption of erythema nodosum. Scattered over the back were a number of small, deep-red macules and papules. The most

FIG. 1.

FIG. 2.

striking lesion was a minute vesicle surrounded by a small red areola. These vesicles were numerous and scattered all over the body. The reflexes were present but diminished. There was no nuchal rigidity and no Brudzinski or Kernig signs.

The white blood count was 12,400, with 87 per cent polymorphonuclears, 9 per cent lymphocytes, and 4 per cent monocytes. The red blood count was 4.93 million with 100 per cent hemoglobin. The urine showed a specific gravity of 1.020, traces of albumin and sugar, an occasional white blood cell per high-power field, and many sulfathiazole crystals. The blood culture was sterile. A roentgenogram of the chest revealed a generalized increase of pulmonic markings but no signs of pneumonic consolidation. The blood sulfathiazole level was 0.7 mg. per cent.

Shortly after admission the patient received 1 Gm. of sulfadiazine. However, it was soon seen that the patient was suffering from sulfathiazole intoxication and further use of sulfonamides was discontinued. No other treatment was administered except the forcing of fluids. There was prompt improvement in the clinical picture. Within seventy-two hours the temperature dropped to normal (Fig. 2). The skin lesions disappeared and the mental state cleared completely. The patient made an uneventful recovery and was discharged six days after admission.

The presence of sulfathiazole intoxication in this patient was recognized very shortly after admission. It is to be noted that in addition to the vesicular lesion the patient also presented some of the more common eruptions encountered in this form of intoxication. The general toxic appearance, and the semistupor were also conspicuous. The prompt improvement following withdrawal of the drug was very striking.

Discussion

In this paper we wish to stress particularly the vesicular eruption. As stated previously, the lesions

were discrete and consisted of minute, elevated white vesicles. Each vesicle was surrounded by a small red areola. The lesions were scattered over the body surface, involving mainly the torso. They had a superficial resemblance to the pustular eruption frequently encountered in staphylococcal bacteremia. Indeed, the diagnosis of staphylococemia was first made in Case 1. Puncture of these vesicles yielded a very small amount of serous fluid but no pus.

It is to be noted that the patients presented additional toxic manifestations. Both patients showed marked injection of the conjunctivae. This feature of sulfathiazole intoxication has been pointed out by several observers. Case 2 showed also other skin lesions, including the distinctive nodular type of eruption. The toxic appearance of the patients and their apathetic semistuporous state were very striking associated symptoms. A high fever was a characteristic accompaniment.

The usual form of eruption encountered with sulfathiazole medication as a rule offers little difficulty of diagnosis. It is not unlikely that the vesicular type of lesion which we have described has in the past escaped recognition and has, in some instances at least, been regarded as evidence of staphylococcal bacteremia. It is of paramount importance to recognize the eruption in order to discontinue further use of the drug.

Postgraduate Medical Education

Plasma Therapy and Whole Blood Transfusion

A SINGLE lecture on "Plasma Therapy and Whole Blood Transfusion" has been arranged for the Clinton County Medical Society to be held Tuesday, May 18, at 6:30 P.M. at the Hotel Witherill in Plattsburg.

The speaker will be Paul C. Clark, M.D., assistant professor of clinical medicine, Syracuse University College of Medicine, Syracuse. The instruction has been arranged by the Council Committee on Public Health and Education of the Medical Society of the State of New York and the New York State Department of Health in cooperation with the Medical Division of the Office of Civilian Defense and the Health Preparedness Commission of the State of New York.

The same sponsors presented another lecture on "Plasma Therapy and Whole Blood Transfusion" before the Greene County Medical Society on Thursday, April 29, at 9:00 P.M. in the Memorial Hospital at Catskill. Samuel Standard, M.D., assistant professor of surgery at the New York University College of Medicine in New York City, was the lecturer.

The subject of plasma therapy was also discussed before the Steuben County Medical Society at a meeting held on Thursday, April 8, at the Baron

Steuben Hotel in Corning. The speaker for the group was Joe W. Howland, M.D., instructor in medicine, University of Rochester School of Medicine and Dentistry, Rochester.

A similar lecture was heard by the Herkimer County Medical Society on Tuesday, April 14, at 4:30 P.M. Gilbert Dalldorf, M.D., director, division of laboratories, Grasslands Hospital in Valhalla, was the speaker.

The Steuben and Herkimer County lectures were presented through the cooperation of the State Department of Health and the Medical Society of the State of New York.

The Broome County Medical Society heard postgraduate instruction Tuesday, April 13, on the subject of "Plasma Therapy and Whole Blood Transfusion." The meeting was held at 8:30 P.M. in the auditorium of the Binghamton City Hospital in Binghamton.

The speaker was Earle B. Mahoney, M.D., assistant professor of surgery at the University of Rochester School of Medicine and Dentistry.

The instruction was presented through the cooperation of the State Department of Health and the Medical Society of the State of New York.

Treatment of Common Diseases

POSTGRADUATE instruction in the Treatment of Common Diseases has been arranged for the Jefferson County Medical Society by Dr. Clayton W. Greene, of the University of Buffalo School of Medicine. Meetings are to be held at 7:30 P.M. on Thursdays in the Black River Valley Club in Watertown, New York.

Lectures have already been given by the following speakers: Joseph McManus, M.D., clinical assistant in surgery, University of Buffalo School of Medicine, on "Recognition and Management of Shock"; Byron D. Bowen, M.D., associate professor of medicine, University of Buffalo School of Medicine, on "The Management of Diabetes with the Newer Forms of Insulin"; and Clayton W. Greene, M.D., professor of medicine, University of Buffalo School of Medicine, on "Treatment of

Precordial Pain." The remainder of the instruction programs will include:

May 13—"Office Management of Female Pelvic Disorders"

Clyde L. Randall, M.D., professor of gynecology, University of Buffalo School of Medicine, Buffalo.

May 20—"Evaluation of Common Drugs Used in General Practice"

A. H. Aaron, M.D., professor of clinical medicine, University of Buffalo School of Medicine, Buffalo.

Dr. McManus' lecture was presented through the cooperation of the New York State Department of Health and the Medical Society of the State of New York.

General Medicine

MEMBERS of the medical societies of Chemung, Schuyler, Steuben, Tioga, and Tompkins counties attended a Teaching Day on General Medicine on Wednesday, April 14, at the Mark Twain Hotel in Elmira. The program included:

3:00 P.M.—"Practical Application of Hormonal Therapy"

Ivan Hekimian, M.D., assistant professor of medicine, University of Buffalo School of Medicine, Buffalo.

"Office Management of Female Pelvic Disorders"

Clyde L. Randall, M.D., professor of gynecology, University of Buffalo School of Medicine, Buffalo.

6:00 P.M.—Dinner

8:00 P.M.—"Evaluation of Common Drugs Used in General Practice"

A. H. Aaron, M.D., professor of clinical medicine, University of Buffalo School of Medicine, Buffalo.

James A. Mark, M.D., chairman, Graduate Education Committee, Chemung County Medical Society, presided at the afternoon meeting, and F. Sullivan Hassett, M.D., president, Chemung County Medical Society, presided at the evening session.

The Teaching Day was sponsored by the Medical Societies of the participating counties and by the Medical Society of the State of New York.

Sulfonamide Therapy

A SINGLE lecture on "Sulfonamide Therapy" has been arranged for the Cortland County Medical Society for Friday, May 21. The lecture will be given at the Cortland County Hospital at 8:30 p.m. The speaker will be Charles D. Post, M.D., professor of clinical medicine, Syracuse University College of Medicine, Syracuse.

The lecture will be presented under the combined auspices of the Medical Society of the State of New York and the New York State Department of Health.

A Teaching Day on Sulfonamide Therapy was arranged for the Otsego County Medical Society on April 14. Instruction was given at the Mary Imogene Bassett Hospital in Cooperstown, New York. Subjects and speakers were as follows:

4:00 P.M.—"Treatment of Genitourinary Infections"

Leo E. Gibson, M.D. professor of

clinical surgery, Syracuse University College of Medicine, Syracuse.

"Local and Internal Use of Sulfonamides in Surgery"

Leon E. Sutton, M.D., professor of clinical surgery, University of Syracuse, Syracuse.

6:00 P.M.—Dinner

8:00 P.M.—"Treatment of Pneumonia"

Clayton W. Greene, M.D., professor of medicine, Buffalo University College of Medicine, Buffalo.

"Treatment of Meningitis"

A. Wilmot Jacobsen, M.D., associate professor and chairman of the Department of Pediatrics, Buffalo University School of Medicine, Buffalo.

The instruction was presented by the New York State Department of Health and the Medical Society of the State of New York.

SEASICKNESS AND AIRSICKNESS

About 40 per cent of any population group, Schwab [Schwab, R. S.: U.S. Nav. M. Bull. 40: 923 (Oct.) 1942] points out, are susceptible to seasickness on sudden exposure to rough weather at sea. . . . During wartime conditions when complete cooperation of all sea-going personnel is often required, the percentage and seriousness of seasickness may affect the efficiency of handling both merchant and combat vessels.

Schwab says in this article that chronic seasickness in naval personnel may be divided into two groups; those who are constitutionally sick with a history of car, bus, and other sickness, whose efficiency at sea is extremely low, and those who have severe seasickness without the history of other sicknesses on shore and with a fair degree of efficiency at sea. He suggests that those in the first group are not useful afloat and might be either discharged from the Navy or placed on shore duty. Those in the second group tend to improve with time or treatment or with transfer to larger ships.

Gastrointestinal abnormalities were found in over half of the whole group. . . .

A related problem of possibly even greater urgency is airsickness. Airsickness is a syndrome which includes sweating, pallor, nausea, and vomiting. . . . Flaherty [Flaherty, T. T.: U.S. Nav. M. Bull. 40: 902 (Oct.) 1942] reports that airsickness is frequently found among student pilots and usually occurs during the phase of training in acrobatics. There is, he says, a close neurologic relationship between the vestibular apparatus and the eye. Airsickness is due to poor orientation in space. It can ordinarily be overcome when a student becomes oriented in the air by using his eyes to pick up points of reference on the ground. Flaherty proposes a program to aid in ocular orientation. The program includes adjustment of the seat, tightening the safety belt, keeping the eyes out of the cockpit and on a distant object, and avoidance of repetition of a maneuver. During a ten months' period he treated an average of eighteen students a month by this means.—J.A.M.A.

GYNECOLOGIC INSTRUCTION

For the fifth consecutive season, a postgraduate course in gynecologic and obstetric pathology is being given this spring at the Israel Zion Hospital in Brooklyn. The course began on April 15.

The instruction, which is given by Dr. J. M. Ravid and staff, is sponsored by the Joint Committee of Postgraduate Education of the Long Island College of Medicine, the Medical Society of the County of Kings, and the Academy of Medicine of Brooklyn. Further information may be obtained from the registrar, 1313 Bedford Avenue, Brooklyn.

CELLULOID FOR FACE INJURIES

Developed by Dr. Neal Owens of the Tulane University School of Medicine, a new technic of rebuilding faces with celluloid has been successfully introduced, giving hopeful prospects of effectiveness in repairing face injuries of the war.

Celluloid was originally used during the first World War by an English surgeon, Dr. J. Hogarth Pringle, who tried it in repairing skull depressions. Dr. Owens' method is to mold the celluloid to form the missing contour, covering it with grafted skin. This process can be completed in one operation.

Medical News

Tuberculosis Diagnosis Campaign

FOLLOW the Example of the Armed Forces —Get a Chest X-Ray" was the slogan of the National Tuberculosis Association and its 1,700 affiliates in their sixtieth annual diagnosis campaign which was conducted throughout the month of April. The object of the campaign, according to Dr. Kendall Emerson, Managing Director of the Association, is to have industrial workers x-rayed as completely as men in the armed forces are. State and local groups all over the country carried on intensive educational drives and x-ray surveys in order to stress the necessity for discovering tuberculosis in its early, most easily curable stages.

In New York City, the Department of Health, the Coordinating Council of the Five County Medical Societies, and the Greater New York Tuberculosis and Health Advisory Committee joined

forces at a public meeting at the Fort Greene-Bedford Health Center in Brooklyn on April 1. Dr. James R. Reuling, Jr., chairman of the Advisory Committee, and president of the Queens Tuberculosis Association, presided.

Other speakers were: Hon. John Cashmore, president of the Borough of Brooklyn; Dr. J. Stanley Kenney, of the Coordinating Council of the Five County Medical Societies; Dr. Charles E. Lyght, director of health education of the National Tuberculosis Association, and Dr. Ernest L. Stebbins, commissioner of health, New York City.

A special feature of the campaign was a display of the "Healthmobile" of the Brooklyn Tuberculosis and Health Association, which portrays the story of tuberculosis through dioramas and other movable scenes.

National Negro Health Week

NATIONAL Negro Health Week was observed throughout the country from April 4 to April 11.

This custom, begun several years ago by the National Negro Business League, is observed annually. Its purpose is to disseminate health information to Negroes in every community in the United States. Negro church and civic organizations carry out the programs.

In an article published in the *Westchester Medical Bulletin*, Dr. Arthur M. Williams, of White Plains, a member of the Westchester County Medical Society and president of the White Plains Branch of the National Association for the Advancement of Colored People, writes:

"Economic factors and the general policy of segregation in the hospitalization of Negro patients definitely accentuate his health problem both as to incidence of disease and medical care. Because of his economic situation and color the greater proportion of our Negro population of Westchester County is forced to live under bad housing conditions.

"A survey of Westchester County would show that a greater number of cases of tuberculosis and other diseases of a communicable nature come from the slum areas. Westchester County, reputedly one of

the wealthiest in the nation, can ill afford to ignore disease or poor housing conditions, no matter where they exist.

"Disease, like fire, cannot be confined by an imaginary line or barrier, whether the latter be color, class, or economic status. The attention of the Medical Society of Westchester is invited during this period of Negro Health Week to the many health problems affecting Negroes directly, and all others indirectly. Your consideration might well be given to the fact that Negro physicians and nurses are not included among the members of the hospital staffs, and that in every hospital in the cities of Westchester County certain wards and a limited number of beds are designated for the use of Negro patients. When these facilities are in full use, beds in other wards are not available to the Negro patients.

"The White Plains Branch of the National Association for the Advancement of Colored People feels that these practices are both dangerous and unfair to the Negro in particular, and to the community welfare as a whole. Every effort is being exerted by the Association to cooperate with the various civic and medical groups to improve the health of Westchester."

County News

Broome County

At the meeting of the county society held in Binghamton City Hospital on April 13, the speaker was Dr. Earle B. Mahoney, assistant professor of surgery, University of Rochester School of Medicine and Dentistry. His subject was "Plasma Therapy and Whole Blood Transfusion." The program was arranged by the Council Committee on Public Health and Education of the State Society, in cooperation with the Medical Division of the Office of Civilian Defense and the Health Preparedness Commission of the State War Council.

Mr. Morris Gitlitz explained the regulations of the O.P.A. concerning additional food rations from a medical standpoint.

The following members have been appointed to represent the county society on the Council of

Social Agencies: Drs. W. J. Farrell, H. I. Johnston, and Florence Warner.

. . .

A Cancer Teaching Day, arranged under the auspices of the Council Committee on Public Health and Education of the State Society, was held in Phelps Hall at Binghamton City Hospital on April 23. Six speakers discussed cancer of the different parts of the body. They were: Dr. Fred W. Stewart, pathologist, Memorial Hospital, New York City; Dr. Chevalier Jackson, Jr., professor of clinical bronchoscopy and esophagoscopy, of the School of Medicine of Temple University, Philadelphia; Dr. Abraham H. Aaron, professor of

clinical medicine, University of Buffalo School of Medicine; Dr. Cornelius P. Rhoads, professor of radiology, Cornell University Medical College, and director of Memorial Hospital, New York City; Dr. William J. Hoffman, assistant attending surgeon, Skin and Cancer Unit, New York Post-Graduate Medical School and Hospital, and cancer consultant on the staffs of several Metropolitan hospitals; and Dr. F. D. Mooney, General Hospital, Buffalo.

There were two sessions of the meeting, one at 4:00 P.M. and the other after a dinner which was served in the Binghamton City Hospital.

Renewing the public health course which last year was conducted by members of the Broome County Medical Society, a series of films was shown at the Y.M.C.A. in April.

The subjects of the films were: April 1, "Digestion of Food," "A Family Affair," and "A New Day"; April 8, "Mechanism of Breathing," "The Heart and Circulation," and "Body Defenses Against Disease"; April 15, "The Nervous System," and "Reproduction Among Mammals"; and April 22, "Science and Modern Medicine."

The course was open to both men and women and there was no charge.*

Chautauqua County

Dr. George W. Cottis, who will retire from the presidency of the New York State Medical Society in May, was honored by 40 members of the Chautauqua County Medical Society at that group's spring luncheon on March 31 at the Hotel Jamestown.

Dr. Cottis discussed "Surgery in World Wars I and II."

Dr. Otto Lindbeck appointed Dr. C. E. Hallenbeck, of Dunkirk, to succeed Dr. F. J. Pfisterer as treasurer of the county society.*

The Jamestown Medical Society held a dinner meeting at the Hotel Jamestown on March 25, with covers for 25. Dr. Hilding A. Nelson presided. A discussion followed the dinner and business meeting.

Dr. George W. Cottis, president of the New York State Medical Society, presented a paper on "Surgery, Thirty Years Ago." This followed a sound film on the use of human blood plasma.*

Chemung County

The establishment of a prepaid medical insurance plan in Elmira and vicinity was discussed at a meeting of the county society held March 31 at the Arnot-Ogden Hospital.

The group heard explanations of the plans in effect in the Buffalo and Utica areas and in the State of Michigan, and of one designed by the Health and Credit Service of Elmira. The Michigan system is state-wide, with the state, county, and municipalities sharing in paying premiums for indigents.

The Blue Cross, which operates a hospital insurance system in Elmira and in most of New York State, will present a prepayment medical plan at the May meeting of the society.*

Appointment of Dr. George R. Murphy and Dr. Earl D. Smith as cochairmen of the Emergency Medical Service of the Chemung County War Council has been announced by Ralph D. Klebes, War Council chairman.

They succeed Dr. Ross G. Loop, chairman, who resigned because of ill health.

Dr. Murphy, Elmira pediatricist, has been assistant chairman to Dr. Loop. Dr. Smith is radiologist at the Arnot-Ogden Hospital. Their appointments were recommended by the Chemung County Medical Society.*

Clinton County

The county society held a meeting in the Cumberland Hotel in Plattsburg on March 31.*

Columbia County

Benjamin J. Slater, M.D., medical director of the Eastman Kodak Company, spoke at the annual meeting of the Tuberculosis Education Association of Columbia County on April 2 at 8 P.M. The meeting was open to the public.

Dr. Slater discussed the subject "A Planned Health Program," stressing the problems which arise during the war emergency.

As well as being medical director of the Eastman Kodak Company, Dr. Slater is president of the Seventh District Branch of the Medical Society of the State of New York, former president of the Medical Society of Monroe County, and chairman of the public health committee. He is an officer and a long-time member of the Tuberculosis and Health Association of Rochester and Monroe County. In addition, he has had a great deal of experience as a speaker on public health problems.*

Erie County

Dr. Chas. Gordon Heyd, surgeon and University of Buffalo alumnus, addressed the 66 graduates of the University of Buffalo School of Medicine at a special wartime commencement on March 24.

Dr. Heyd was president of the American Medical Association in 1936-1937 and also has been vice-president of the American College of Surgeons, treasurer and president of the New York State Medical Society, and president of the New York County Medical Society. He is a specialist in liver diseases as well as general surgery. He is chief surgeon at the Post-Graduate Hospital and clinical professor of surgery at the Columbia University College of Physicians and Surgeons in New York City. A Canadian by birth, Dr. Heyd became a citizen of the United States in 1917. In World War I he served overseas in the medical service and in 1932 France made him a member of the Legion of Honor. In 1932 also he was chairman of the American delegation to the International Congress on Gallbladder Disease, held in Vichy, France.*

The following editorial appeared in the Buffalo Courier-Express of March 28:

Dr. Louis A. Kaiser, Buffalo medical representative for the New York Athletic Commission, really hit the jackpot at the University of Buffalo. When Dr. Thomas F. Kaiser was awarded the Roswell Park prize for excellence in surgery last week it marked the completion of a remarkable cycle of family achievement in medicine. Thomas is the third of three sons to receive the surgery prize. It marked the first time in the history of the university that three sons of one

* Asterisk indicates that item is from local newspaper.

family were winners of the award. The three young doctors have had almost identical careers. Major John B., the eldest, was graduated from Canisius High School in 1927, Canisius College in 1931, and received his medical degree from the university in 1935. He is now serving with the Army in the South Pacific area. Dr. Robert A. Kaiser, now on the staff of the Buffalo General Hospital, was graduated from Canisius High in 1934. He then entered Niagara University where he starred in basketball, graduating in 1938. He gained his medical degree last year. Dr. Thomas was graduated from Canisius High in 1935, and from Canisius College in 1939. Dr. Kaiser, himself, the father, also established a record at the university. Receiving a degree in pharmacy in 1904, he was the youngest in the university's history to earn such an honor. He gained his medical degree in 1909. Nice going, Doctors!

Senescence should be made more useful with the ever increasing demands for manpower in this war, Dr. Frederick W. Filsinger, of Buffalo, told the Erie County Medical Society on March 23 in a talk entitled "The Forgotten People." Dr. Filsinger has been practicing for forty-five years and has been studying the problems of senescence for many of them.

"For many years," he said, "the public has been laboring under the impression that men between 50 and 60 have outlived their usefulness. But now, in spite of their infirmities, cramped legs, and aching heart and feet, they are proving valuable assets in special branches of work."*

Franklin County

Dr. Ernst Klein, formerly of Cologne, Germany, is now located in St. Regis Falls, having taken over the office and practice of Dr. William Gaspar there. His specialty is gynecologist surgery.

Dr. Klein has had many years of practice and has seen the greater part of the world in his former capacity as ship surgeon. He has spent considerable time in Rotterdam, Holland, where he recently made his home. He arrived in St. Regis Falls from New York City.*

Kings County

Dr. John Hubley Schall, reported to be the first Brooklyn surgeon to use oxygenated chloroform in the community when he introduced it there in 1894, was the guest of honor in Philadelphia at a dinner held by the Alumni Society of the Hahnemann Medical College of that city on March 24.

Dr. Schall, born in Philadelphia, came to Brooklyn in 1894 as house surgeon at Cumberland Hospital. He also served at the Hahnemann Hospital and Gurnsey Maternity Hospital and in 1898 was associated with Dr. William B. Van Lennip, noted Philadelphia surgeon and instructor.

In 1899, he studied at the Baden-Baden Hospital and was the first American surgeon to perform a major operation in that institution.

He was also the first to use the Billroth antiseptic treatment for extensive burns.

Dr. Schall returned to Brooklyn in 1904 as visiting surgeon at the Women's Memorial Hospital. The following year he was chief of the clinical dispensary at the Williamsburg Hospital. He was chief surgeon at Cumberland Hospital from 1914 to 1916.

He retired from hospital work in 1937.*

A drive for \$5,000 as the initial goal toward an annual budget of \$30,000 for social and welfare work

among Negroes was started at a rally of the Brooklyn Urban League-Lincoln Settlement at the Fleet Street African Methodist Episcopal Church, Brooklyn, on April 11.

Special Sessions Justice Bernard A. Kozyck, a member of the board of directors of the Brooklyn Urban League, urged all Negroes to undertake with greater zeal the solving of their own problems.

Other speakers were Lorenzo F. Davis, industrial secretary of the League in Brooklyn, and Julius A. Thomas, director of the department of industrial relations of the National Urban League. The latter emphasized as an objective the training of Negroes for both war and postwar jobs.*

Dr. J. Sturdivant Read, emeritus professor of urology and alumni trustee of the Long Island College of Medicine, urged the 88 graduates who received their Doctor of Medicine degrees from that institution on March 30 to "regard their war jobs as a complete experience rather than an interruption to their careers."

Addressing the eighty-fourth annual commencement exercises of the college at the Academy of Music, Dr. Read told the graduates, who hold reserve commissions in the Army and Navy medical corps:

"When you return you will have crowded much intensified learning and experience into your life . . . so don't think that three or five years of this sort of experience will retard you or prevent you from becoming successful practitioners in a peacetime population."

Dr. Jean Alonzo Curran, president of the college, who presented the degrees to the graduates—four of whom are women—told the class that the school was informed by the War Department that the doctor is one of the first to enter the war and always the last to be released.

"After the final gun is fired," he said, "you doctors in service will still have two to three years of experience before you as stalkers of the pestilences which are the grisly fruit of war."*

Monroe County

Two out of every 100 persons in Rochester will be found to have "hidden tuberculosis," predicted Dr. James Burns Amberson, Jr., president of the National Tuberculosis Association, who addressed the local Tuberculosis and Health Association at the twenty-fifth anniversary meeting of the Association. Doctor Amberson lauded the group's announced program for increasing its health conservation and tuberculosis prevention activities among workers in war industries. He prophesied that the program participated in by Iola Sanitarium, public health officials, school authorities and industrial physicians will successfully uncover the "hidden tuberculosis" in the Rochester area.*

Nassau County

In recognition of the work that Nassau County physicians are doing in volunteering their services at the blood donor sessions conducted by the Nassau County Red Cross chapter, a certificate of the Army-Navy E award, which the blood donor unit has won nationally, has been forwarded to the Nassau County Medical Society at its headquarters in Mineola.

At every blood donor session local physicians are in constant attendance, Dr. Richard Derby,

chairman of the Red Cross blood donor service for the county, explained. Sessions are scheduled in villages throughout the county and last five or more hours, during which doctors are present as volunteers. At most of the sessions time schedules are established so that physicians relieve each other, but at least one doctor is present at all times to conduct necessary examinations of applicants before their blood is taken.

The time schedules of the sessions show that physicians of the county are now giving the Red Cross upward of 50 hours each month in enabling the Nassau County chapter to carry on this vital war work. In many cases this has meant extra "overtime" work for the doctors to keep up with already heavy schedules.*

. . .

The county society participated in "Nassau County at War," an exposition to put the county's tremendous war production on parade and to give the people a picture of what their war bond and stamp purchases to date have bought. The exposition was held at Adelphi College, Garden City, from April 12 to April 17.*

New York County

The sixth annual campaign of the Greater New York Fund to help support 406 voluntary welfare and health agencies and hospitals will be formally launched May 3.*

Oneida County

At the March meeting of the Utica Academy of Medicine, Col. A. J. Canning spoke on "The Treatment of War Injuries." Dr. William Hale opened the discussion. Dr. John Gromann gave a "History of Hernia Operations." Discussion of his paper was opened by Dr. Frederick T. Owens.

Dinner was served in the Hotel Utica at 7:00 p.m., preceding the meeting.

Otsego County

The county society met at Homer Folks Hospital at Oneonta, on the afternoon and evening of March 24, to hear lectures by Dr. Jerome T. Syverton, associate professor of bacteriology, University of Rochester, whose subject was "Virus Diseases," and Drs. Lawrence E. Young and Paul A. Lembcke, instructors at the University, whose subject was "The Clinical and Epidemiological Aspects of Primary and Atypical Pneumonia."*

March 24 marked his forty-ninth year as a doctor for Dr. F. L. Winsor, of Laurens. A graduate of Albany Medical School and Bellevue Hospital, New York City, he has been active in his profession since March 24, 1894, for many years traveling all kinds of roads with horse and buggy.

Dr. Winsor specialized in tuberculosis and was the superintendent of the Otsego County Sanatorium. Hale and hearty, he is still on the job.*

Tioga County

The county society met for dinner and a round-table discussion of interesting cases at the Penn Wells Hotel in Elmira on March 25.*

Washington County

A talking film on "Peptic Ulcer," made at the Lahey Clinic in Boston, was shown at the quarterly meeting of the medical society of Washington County on April 13, at 9:00 p.m., in the auditorium of the Hudson Falls High School.*

Westchester County

A form of acne afflicting workers engaged in making synthetic waxes and in using the product to insulate wires and condensers is caused by irritation rather than sensitivity, Dr. Eugene F. Kelley, of Yonkers, reported at the Greater New York Safety Council's convention at the Hotel Pennsylvania in New York City on March 24.

Dr. Kelley, instructor in dermatology at Columbia University College of Physicians and Surgeons, based his statement on two years' study and treatment of the ailment.

The source of the affliction, he said, was traced to chloridiphenyl and chloronaphthalene vapors which, released from the waxes, settle upon the skin and clothing, solidify, and in time are rubbed into the follicles.

"The only certain prevention is to remove the worker from contact with the offending substances," Dr. Kelley asserted. "Workers in the same plants who are not in contact with the waxes appear to escape difficulty. Cure is affected within months, but the acne reappears upon subsequent re-exposure.

"Patch tests were said to have proved negative, indicating that contact and subsequent irritation rather than sensitivity provoke the disease."*

Hospital News

National Hospital Day to Stress Recruitment of Nurses

OWING to the war, the yearly observance of the birthday of Florence Nightingale, which in the past has featured events designed to get people inside hospitals, has given way to a functional program.

R. F. Cahalane, chairman of the A.H.A. Council on Public Education, stated recently that "hospitals haven't the personnel or time to devote to the usual observance of the day. But if we can't get the people to the hospitals, we can take the hospitals to the people through radio and newspapers. May 12 can also serve as a peg on which to hang student nurse and nurse aides recruitment programs. Accordingly, the council has made contact with the O.W.I., the National Nursing Council for War Service, and other groups, and the plans as developed emphasize hospital personnel shortages."

The American Hospital Association upon request will provide a package of posters, folders, and press releases for the publicizing of the day.

Some hospitals plan to develop elaborate programs. Donald Rosenberger, chairman of the National Hospital Day Committee for Pennsylvania, has arranged a comprehensive program for the hospitals of Erie.

Every hospital in the city will be visited by groups of high-school pupils, each of whom will write a report of her visit and the best reports will be printed in the newspapers and broadcast over local stations. Window displays have been arranged through the cooperation of the local stores, hospital supply houses, and the hospitals.

C. Rufus Rorem, of the American Hospital Association, will speak over an Erie radio station into every schoolroom in Erie. His subject will be nurse recruitment. He will also address the joint women's auxiliaries at a tea. Later in the day he will speak over WERC on an eastern states' hookup and is scheduled to lead a forum discussion over WLEU in the evening.—*The Modern Hospital*

Newsy Notes

The Brooklyn Surgical Society gave a dinner to the doctors of the United States Naval Hospital at the Bossert Hotel on April 1. The dinner was followed by discussion on medical subjects.

Among the speakers were Capt. Gardiner Robertson, of the Brooklyn Surgical Society, and Dr. Herbert Wikle, of the United States Naval Hospital, who made informal speeches.*

. . .

Doctors and nurses at Queens General Hospital, Jamaica, are tending a Victory Garden for the Hospital. The only luxury the gardeners permit themselves, according to the *Jamaica Press*, is a motor-drawn plow, for their garden is far larger than the average.

. . .

Albany Hospital's drive for men volunteers to relieve a critical male help shortage has started with an enrollment of more than 90.

Approximately 250 men are needed to ride the ambulance, serve as orderlies, help transport patients, and countless other duties, Dr. R. S. Cunningham, chief administrator, announced.

The men volunteers, wearing the blue hospital jackets which will be their uniforms, will begin work at the hospital after receiving the first four hours of a ten-hour course given by Miss Alice T. Dyer, R.N., of the nursing administrative staff, Miss Ruby Butler, R.N., and Miss Ruth Gokey, R.N.

"With a staff of 300 men volunteers, we eventually can have a twenty-four-hour volunteer staff at the hospital," Dr. Cunningham said.

"We have more than 300 women volunteers who are doing an excellent job during day and evening hours."

Men volunteers will be asked to give at least three hours' service a week at the hospital.

Volunteers may register at the hospital volunteer office either in person or by telephone.*

Texas hospitals have undertaken a "help-your-neighbor" program of exchanging or selling various items of equipment. Reports of the council on construction and plant operation of the Texas Hospital Association indicate that the program has proved quite successful.

In order to obtain data on available equipment, a check list of general items utilized in all hospital departmental functions involving equipment that is under priority regulations was sent to all Texas hospitals and clinics listed by the American Medical Association. When each institution had checked items that it was willing to exchange or sell, the list was returned to the council chairman for tabulation.

After the tabulation had been completed, the list of available articles, including the name and location of the hospitals that possessed them, was distributed to all institutions that had received the original list of equipment.

Proof of the practicality of the program was evidenced at the annual meeting of the Association, at which groups of hospital administrators got together over the lists to consummate deals.—*The Modern Hospital*

. . .

An appeal for 500 volunteers to serve as Red Cross Gray Ladies in six city hospitals has been made by Maj. Gen. Robert C. Davis, executive director of the New York Chapter of the Red Cross, at the request of city officials. The Gray Ladies are the gray-uniformed volunteers of the chapter's hospital and recreation service, enrolled and trained by the Red Cross.

Additional Gray Ladies are needed urgently because of the shortage of nurses and other personnel.

Three hundred and fifty Gray Ladies of the New York Chapter are now serving without pay in four government and twenty civilian hospitals in Manhattan and the Bronx, where they carry on work other than that of nurses and nurse's aides. The hospitals for which the city's representatives have asked more Gray Ladies are Bellevue, Gouverneur, Harlem, Fordham, Morrisania, and Metropolitan.

THE RISING CURVE OF PEPTIC ULCER IN WAR

"Peptic Ulcer ranks high as a cause of disability for military service. It . . . leads all other digestive diseases as a cause for discharge from the Regular Army."

Kantor, J. L.: Digestive Disease and Military Service, Jnl. A. M. A., Sept. 26, 1942.

THE increased incidence of peptic ulcer among the armed forces, defense workers and civilians today confronts medicine as a major problem.

Of the various types of therapy used to control this problem none has proved itself more valuable than CREAMALIN,

brand of aluminum hydroxide gel.

CREAMALIN, the first aluminum hydroxide gel to be made available to physicians, was also the first to be Council-accepted. CREAMALIN contains approximately 5.5% aluminum hydroxide.

Therapeutic Effects of CREAMALIN

- Pronounced antacid action of 12 times its volume of N/10 HCl in less than 30 minutes (Toepfer's reagent)
- Prolonged action in contrast to fleeting effect of alkalies
- Non-alkaline; non-absorbable; non-toxic
- No acid rebound; no danger of alkalosis
- Prompt and continuous pain relief in uncomplicated cases
- Rapid healing when used with regular ulcer regimen
- Mildly astringent; may reduce digestive action, thus favor clot formation
- Demulcent; gelatinous consistency affords protective coating to ulcer

Modern non-alkaline therapy for peptic ulcer and gastric hyperacidity

**OPTIMUM NUTRITION
FOR BABY...**

**MINIMUM TIME
FOR DOCTOR...**

with this complete liquid infant formula!

BIOLAC SUPPLIES milk proteins, milk minerals, iron, and vitamins A, B₁, B₂ and D in amounts which equal or exceed recognized requirements for infants. Thus with the sole exception of vitamin C, Biolac provides *complete* nutrition for the bottle-fed baby.

Biolac is a real timesaver for overworked doctors, too!
No carbohydrate or other extra formula ingredients to calculate!

Also, with Biolac there is less chance of upsets due to errors in preparing formulas. Less chance of formula contamination, too, because Biolac requires only simple dilution with boiled water, as you prescribe.

NO LACK IN BIOLAC

Borden's complete infant formula

● Biolac is prepared from whole milk, skim milk, carbohydrates—Vitamin B₁, concentrate of Vitamins A and D from cod liver oil, and ferric citrate. It is evaporated,

homogenized, and sterilized. For professional information, write Borden's Prescription Products Division, 350 Madison Avenue, New York, New York.

Now you can see at a glance

why **PRAGMASUL'S** BASE IS SUPERIOR

In PRAGMASUL the ointment base is an oil-in-water type emulsion, which ensures intimate and prolonged contact of the 'Microform'* sulfathiazole crystals with the affected tissue.

The important difference between the Pragmasul base and the two other types of ointment bases most commonly employed is strikingly illustrated below.

NOTE that in Pragmasul the oil globules and the 'Microform' sulfathiazole crystals are suspended in the continuous aqueous phase.

NOTE, also, the absence of interfacial tension between the aqueous serous exudate and the water-phase of the Pragmasul base. On the other hand, with the all-grease and

water-in-oil emulsion bases, interfacial tension is inevitable at the apposition of the mutually incompatible oil and exudate.

*Pragmasul contains 'Microform' sulfathiazole, 5%. 'Microform' is S.K.F.'s trademark for micro crystals of the sulfonamides — in the case of sulfathiazole, approximately 1/1000 the mass of ordinary commercial crystals.

PHILADELPHIA, PA.

[Continued from page 878]

Volunteers must be women between the ages of 21 and 50 who are American citizens, physically fit, and of neat, pleasant appearance. They must have free time during the day to take training courses, and must be willing to give at least one full day or two half-days a week to the work.

Their duties are varied. They work in clinics, receiving and assisting patients and keeping records. They help in children's wards, reading, playing games, and teaching simple handicrafts. They assist the social service worker in interviewing patients.*

The Associated Hospital Service of New York, in its financial statement for 1942 filed with the State Department of Insurance, showed at the year-end total assets of \$10,120,944, including \$8,299,091 in United States bonds. Cash amounted to \$1,564,011.

The report showed a surplus of \$4,498,329 assets over liabilities. Among the liabilities is a reserve fund of \$2,500,000 for epidemics and other contingencies. This is in addition to the normal reserve for unpaid hospital claims that amounts to \$1,550,000.

Louis H. Pink, president, said that enrollment figures for last year showed 148,924 new subscribers had joined the organization's 3-cents-a-day plan for hospital care. Although many subscribers have moved out of town to take positions in war industries, the total enrollment is more than 1,300,000.

Mr. Pink said that the Associated Hospital Service paid hospitals last year \$7,363,278 for the care of 117,804 subscribers. From the inception of the 3-cents-a-day plan in 1935 through last year, it has paid hospitals \$37,720,173 for the care of 600,000 subscribers.

A plaque honoring 125 doctors, interns, nurses, and staff members of Mineola's Meadowbrook Hospital who are now serving in the armed forces was unveiled on April 1 by County Executive J. Russel Sprague in the presence of more than 100 persons. The ceremony was conducted in the entrance foyer of the hospital's main building.

Tioga County General Hospital in Waverly has been presented with a resuscitator and incubator by the Waverly Lions Club.*

A rehabilitation clinic has been organized at Stuyvesant Polyclinic by H. I. Biegeleisen, M.D., to rehabilitate rejected applicants for military service. Conditions such as varicose veins, phlebitis, lymphedema, varicocele, hydrocele, hemorrhoids, pilonidal cyst, bursitis, and hernia will be treated by sclerotherapy.

A vast construction plan contemplating the replacement of virtually every building at the Binghamton State Hospital at an estimated cost of approximately \$15,000,000 is included in New York State's postwar planning program.

Details of the project are being developed by the

Among those present were George L. Hubbell, chairman of the board of managers at Meadowbrook, Superintendent A. J. McRae, Lulu B. Payne, supervisor of nurses, and Medical Examiner Theodore J. Curphey.*

The 52d General Hospital, which is the Syracuse University unit, is settled somewhere in England in the hospital that its members believe will be their station for the duration of the war, and members of the staff are becoming accustomed to life in England, according to letters written by Maj. Floyd R. Parker. The letters are published in the April issue of the *Bulletin* of the Onondaga County Medical Society and the Syracuse Academy of Medicine.

Major Parker wrote the "Around the Town" column for the *Bulletin* in peacetime and his letters are filled with observations of interest to all families of members of the hospital staff.

The grand opening of the hospital took place with much local ceremony, Major Parker said, and to the accompaniment of many clicking cameras, but the pictures will not be shown until the hospital unit returns home.*

Substantial progress in electric shock treatment of psychiatric patients at New York Hospital, Westchester Division, during 1942 was revealed in the annual report of Dr. Clarence O. Cheney, medical director. Fifty per cent of those given shock treatment were considered either cured or sufficiently improved to be released, the report states.*

Volunteer Nurses' Aides trained under the joint program of the Office of Civilian Defense and the American Red Cross may now be used in Army hospitals, according to announcements from the two agencies.

The Surgeon General of the Army has requested this service, and the sponsoring agencies have recommended that Nurses' Aides be assigned to Army general or station hospitals on request of the Commanding Officer. The aides must receive their training in civilian hospitals as heretofore.

Improvements

Division of Architecture of the State Department of Public Works.

Engineering crews of the Binghamton district of the State Department have started to survey the hospital grounds and take subsoil tests which will play an important part in the location of new buildings.*

Alterations of the east wing of the Geneva General Hospital, in Geneva, to provide space for additional beds, are rapidly nearing completion.

On April 1, Saugerties was introduced to a new sanitarium, Dale's Sanitarium, which has a fully modernized hospital equipment and will accommodate about 40 patients. The sanitarium will be under the management and supervision of Mrs. Ruth Dale, registered nurse, who has conducted Dale's Nursing Home for a number of years.*

Woman's Auxiliary

To the Medical Society of the State of New York

On to Buffalo!

GREETINGS and a hearty welcome to Buffalo, the 1943 Convention City. The State Convention of the Woman's Auxiliary to the Medical Society of the State of New York will be held from May 2-6, inclusive, at the Hotel Statler. All doctors' wives, whether members of the Auxiliary or not, are cordially invited to attend all sessions of the Auxiliary and all social functions. It has been impossible to make definite plans too far in advance, but all is well in hand now and we will give you the best convention we can, with the hope that all of you will join us. There will be sufficient accommodations for all, and because of the times, everything will be most informal. There will be no need for long dinner dresses, so your luggage will be minimum.

The entire Convention Committee will be on hand, beginning Sunday, May 2, to welcome all who arrive early.

With best wishes for a successful convention, in which each of you has an important part, and again welcoming you to Buffalo, I am,

Most sincerely,

MAXINE C. JOHNSON
1943 Convention Chairman

To Mrs. J. Emerson Noll, our retiring president, I speak for all your committees. We have enjoyed working with you and serving our state and county organizations. We leave this thought for you:

Life brings many, many changes,

As we live from year to year,

But there certainly is one thing

That will never disappear!

So enduring is our friendship

That, whatever else may end,

We shall have the joy of knowing

That you always are our friend.

To our president-elect, Mrs. F. Leslie Sullivan, we wish you and your committees the best of luck and cooperation at all times. These few words we bring to you:

And may life always bring to you

The very best of Everything.

Congratulations to the officers of 1943-1944.

Meet you all in Buffalo, May 2-6.

JUNE M. MOREY
Publicity Chairman

County News

Columbia County. The monthly meeting of the woman's auxiliary was held in the afternoon at the Nurses' Home of the Hudson City Hospital. A letter of thanks was read from the Hudson City Hospital for the auxiliary's gift of \$25 to the Student Nurses' Fund, and one from the Physicians' Home in New York City for the auxiliary's gift of \$10. Mrs. John L. Edwards, of Hudson, was appointed chairman of the nominating committee.

Mrs. H. G. Henry, of Germantown, will represent the auxiliary at the Annual Convention of the Woman's Auxiliary to the Medical Society of New York State, which will be held at Buffalo on May 2-6. Mrs. H. J. Noerling, of Valatie, and Mrs. Everett A. Jacobs, of Hudson, will attend as delegates from the local auxiliary, with Mrs. Edwards as alternate.

Saratoga County. Mrs. Alfred Madden, of Albany, our state legislative chairman, spoke on medical legislation at the meeting held Tuesday, April 6, at 8 p.m. Mrs. G. Scott Towne, of Saratoga Springs, was hostess. Mrs. Edward J. Callahan, of Schuylerville, reported for Mrs. Thomas Bullard, program chairman.

Herkimer County. Members of the county auxiliary held their April meeting at the Dyett Tearoom in Ilion.

Mrs. Byron G. Schults, of Herkimer, was elected president. Committees for the year will be announced later. Mrs. Helen Buckbee gave a report of the Board meeting in Albany, at which nineteen members were present. The next meeting will be held in June.

PEPYS LEARNS ABOUT ORANGE JUICE

"March 9th, 1669. With my wife and Bab. and Betty Pepys and W. Hewer, whom I carried all this day with me, to my cozen Stradwick's, where I have not been ever since my brother Tom died, there being some difference between my father and them, upon the account of my cozen Scott; and I was glad of this opportunity of seeing them, they being good and substantial people, and kind, and here, which I never did before, I drank a glass, of a pint, I be-

lieve, at one draught, of the juice of oranges, of whose peel they make comfits; and here they drink the juice as wine with sugar; and it is a very fine drink; but, it being new, I was doubtful whether it might not do me hurt.

"They are very good people. So home, and then after signing my letters, my eyes being bad, to supper and to bed." (Samuel Pepy's Diary.)—Reprinted in *Nutrition Reviews*.

The art of anatomic illustration entered a new epoch upon the publication of the *Tabulae Anatomicae* of Giulio Casserio (Venice, 1627). This female figure is one of Casserio's most beautiful copperplates.

THEELIN AQUEOUS SUSPENSION

For patients requiring high potencies, and for those who do not tolerate oil injections.

THEELIN AQUEOUS SUSPENSION provides the same pure, natural crystalline estrogen as Theelin in Oil, and the same effective clinical results may be expected in the treatment of the menopausal syndrome and other conditions due to diminishing estrogenic secretion. Theelin Aqueous Suspension is administered intramuscularly. Normal saline solution—no suspending agent—is used in preparing this product and the ampoule need only be shaken gently before the preparation is drawn into the syringe.

The uniform potency of Theelin is certified by the Laboratories of both Parke, Davis & Company and St. Louis University. Kapseals Theelol (Oral) and Theelin Suppositories (Vaginal) are available for maintenance therapy and for use in milder hypogonadal conditions.

THEELIN AQUEOUS SUSPENSION

1-cc. ampoules, each cc. containing 2 mg. (20,000 I.U.) of Theelin suspended in normal saline solution.

THEELIN IN OIL

1-cc. ampoules in strengths up to 1 mg. (10,000 I.U.) of Theelin per cc.

REVIEWED

Medical Parasitology. By James T. Culbertson. Octavo of 285 pages, illustrated. New York, Columbia University Press, 1942. Cloth, \$4.25.

This book has been designed and written "chiefly for medical students and medical practitioners" at a time when the national emergency has made of greater practical importance than ever before a knowledge of the fundamentals of human parasitology.

The essential facts concerning the important animal parasites of man are briefly but adequately presented in a clear and straightforward manner in this volume. Each species of parasite has been considered with respect to geographic distribution, epidemiology, pathology, symptomatology, diagnosis, and treatment, and in the handling of the subject material a wealth of detail, which in a more extensive work might have proved confusing to the student, has been avoided. The text is accompanied by a number of helpful tables, drawings, and plates. Excellent chapters of general scope, in which are discussed the principles of infection, immunity, epidemiology, and prophylaxis, are included, as well as a section on the arthropods of medical importance and a technical appendix.

The usefulness of this text to the practicing physician would probably have been enhanced by inclusion, in the sections on therapy, of information as to the usual dosages of the drugs exhibited. In all other respects the book should admirably fulfill the purposes for which it was written.

ELBERTON J. TIFFANY

The Pharmacopoeia of the United States—America. (United States Pharmacopoeia.) Twelfth Revision (U. S. P. XII). By authority of United States Pharmacopoeial Convention. Prepared by the Committee of Revision and Published by the Board of Trustees. Octavo of 880 pages. Easton, Pa., Mack Printing Company, 1943. Cloth, \$7.50.

The Twelfth Revision of the *United States Pharmacopoeia* became official November 1, 1942. The *Pharmacopoeia* will attempt to keep pace with the rapid development of medicine and its related sciences by issuing a new revision every five years as well as a bound "Supplement" halfway between the times of revisions. In addition, "Interim Revision Announcements" or sheet "Supplements" will be published as they are required to meet the frequently changing situations.

The committee on revision considered carefully the clinical value and use of new drugs before accepting them for inclusion in the new edition. They were governed by the same underlying principles that were set forth by Dr. Lyman Spalding, the founder and chairman of the first U. S. P. convention, who maintained in 1820, "It is the object of a Pharmacopoeia to select from among substances which possess medicinal power, those, the utility of which is most fully established and best understood."

An additional 153 articles were included in U. S. P. XII, which also has 17 articles previously published.

[Continued on page 888]

and recent history into small space, terminating very properly with a real tribute to two prominent surgeons, Francis Bacon and William H. Carmalt, bringing Dr. Carmalt's contribution down to our own days.

Connecticut can lay claim to a rich surgical heritage through the fact that born beneath the elms of Connecticut were such prominent surgeons as Charles Peck, Joseph Blake, Nathan Smith, Harvey Cushing, William Halsted, and John A. Hartwell.

Many other separate topics are covered, some with much of the colonial about them and all bearing the impress of personal authorship by doctors proud of their state and of their own medical forebears.

This little volume will be found well worth perusal in more than idle moments by those seeking a purely academic rendering of the facts concerning the heritage of Connecticut medicine.

CASSIUS H. WATSON

Synopsis of Pathology. By W. A. D. Anderson, M.D. Duodecimo of 661 pages, illustrated. St. Louis, C. V. Mosby Company, 1942. Cloth, \$6.00.

This handy volume presents pathology in compact and condensed form. It is up to date and contains the main features in pathology with which every medical student and clinician should be familiar.

The first portion of the book is devoted to general pathology, including chapters describing the virus and rickettsial diseases. There is also a chapter dealing with vitamin deficiencies. The rest of the book describes the pathology in diseases of the various systems. The text is very well illustrated, containing a number of colored plates, and lends itself to easy reading.

E. H. NIMISH

Textbook of Clinical Parasitology Including Laboratory Identification and Technic. By David L. Belding, M.D. Quarto of 888 pages, illustrated. New York, D. Appleton-Century Company, 1942. Cloth, \$8.50.

With so many of our physicians in the armed forces, we think no book could be more welcome to the medical profession than one on parasitology.

This work is concise, the morphologic descriptions are excellent, and the grouping and tabulations are very well done. The technical methods in diagnosis will be of great assistance to many of our colleagues who are specializing in parasitic diseases.

We can highly recommend this volume, with its many illustrations, to all members of the medical profession.

M. J. FEIN

Changes in the Knee Joint at Various Ages With Particular Reference to the Nature and Development of Degenerative Joint Disease. By Granville A. Bennett, M.D., Hans Waine, M.D., and Walter Bauer, M.D. Quarto of 97 pages, with 31 plates. New York, The Commonwealth Fund, 1942. Cloth, \$2.50.

If a modern student of arthritis were to make the statement that in every subject over the age of 15 some degenerative changes in the knee were observable, he would find no detailed pathologic studies to support this observation. Yet surgeons who have had reason to explore the knee joint in patients in the early decades of life have often been surprised at the actual amount of pathologic change in the cartilaginous surfaces of these joints. To these

[Continued on page 890]

The importance of keeping all skilled hands in condition to work at full capacity, particularly during our war time emergency, cannot be over-emphasized. Every pair of hands plays a major role in the victory effort.

Acidolate* skin cleanser is offered to the physician as an aid in the management of those dermatoses which may be irritated by soap. By a process of emulsification, Acidolate destroys the adherent nature of cutaneous soil, and facilitates its removal with water. This same property makes it useful in removing residual ointments, grease, or oils from the hair or skin.

Acidolate is supplied in 8 ounce dispenser bottles and in gallons. It is available through better drug stores everywhere.

Literature and samples will be sent to physicians on request.

added to the U. S. P. XI by means of supplements. Eighty-six articles listed in the U. S. P. XI were deleted from the U. S. P. XII. A radical departure from previous revisions was the inclusion of many drugs in tablet form. Whereas the U. S. P. XI listed only 3 tablets, the U. S. P. XII lists 47.

An interesting feature is the addition of preparations for parenteral use, listed under the heading "Injections." These include 20 preparations, a few of which are caffeine and sodium benzoate, dextrose, dextrose and sodium chloride, digitalis, epinephrine hydrochloride, mercuric salicylate, mercurophylline, mersalyl and theophylline, theophylline ethylenediamine, ouabain, strophanthin, and picrotoxin.

With the inclusion of so many useful drugs, especially in the convenient forms such as capsules, tablets, and injections, U. S. P. XII should supply the needs of physicians for scientific and rational prescribing.

CHARLES SOLOMON

Doctors of the Mind. The Story of Psychiatry. By Marie B. Ray. Octavo of 335 pages. Boston, Little, Brown and Company, 1942. Cloth, \$3.00.

A most entertaining story, this *Doctors of the Mind*. The author has taken the trouble to lay before the reader the trials and tribulations of men of science, their problems and their manner of attacking them, their close scrutiny of their work at the drawing of their conclusions. Here we see the birth of ideas, their replacement by others if the former are found untenable. All this is told in dramatic manner which lends charm to the book. Lay persons especially will find the story of psychiatry most interesting. The author is to be congratulated for a very able presentation of her subject.

JOSEPH SMITH

The Heritage of Connecticut Medicine. Octavo of 223 pages. New Haven Connecticut State Medical Society, 1942. Cloth, \$3.00.

This interesting volume is a compilation of important medical developments over the years as conceived by a conclave of Connecticut physicians. The prompting of this endeavor is a most worthy one and should be copied by other states, for in varied commentaries of this sort there can be compiled an unprejudiced and, at the same time, democratic evaluation of professional brethren of the long ago. The editor deserves a vote of thanks for this splendid compilation.

"Four years after Connecticut joined the United States, in 1788, the Connecticut State Medical Society held its first meeting." With this as a pivotal point the details connected with the development of the Yale Medical School are most interestingly told.

The outstanding figure of the early years, and in fact for all time, has been William Beaumont, and Chapter Nine, by Dr. Russell Chittenden, is a splendid summary of his activities.

In like manner, Dr. Henry Erving describes the part played by Dr. Horace Wells, of Hartford, in the initial discovery of anesthesia.

Dr. Charles Bartlett summarizes in a splendid story the events that led up to the discovery and elimination of the diploma mill.

One of the most interesting sections is the contribution by Dr. Charles Burlingame covering the details of the life history of The Hartford Neuro-Psychiatric Institute, known over the years as the Hartford Retreat.

"Connecticut Surgery," by Dr. Samuel Harvey, crowds much pre-Revolutionary, Revolutionary,

6th Edition

Stitt's Diagnosis, Prevention and Treatment of Tropical Diseases

By Richard P. Strong, M.D., Sc.D., *Professor of Tropical Medicine, Emeritus, Harvard University*

This edition gives special attention to public health problems relating to the prevention of infectious diseases. It gives an up-to-date account of cosmopolitan diseases that may be encountered in warm countries and of diseases of tropical origin that may become endemic in temperate climates. A number of useful maps recently prepared by the League of Nations showing the geographical distribution of diseases are included. 398 Illus. 1826 Pages Two Volumes \$21.00.

surgeons and students of arthritis the excellent correlation of x-rays, photographs, and microscopic studies found in this volume will prove a most welcome approach to a concept of pathogenesis regarding hypertrophic arthritis (also commonly known as osteoarthritis, deformative arthritis, and arthritis deformans).

The authors, after completing an exhaustive study of the available literature on arthritis and physiopathology of the knee, decided to make a detailed postmortem study of 63 knee joints of subjects ranging in age from one month to 90 years. None of the patients from whom these limbs were amputated or autopsied had presented any symptomatology related to joint diseases. In this way the authors have made one of the first organized attempts at creating a norm for future studies.

This new approach in the study of so universal and devastating a disease as arthritis is especially enlightening in that it makes careful use of histologic studies to prove that positive findings become apparent earlier in life than many heretofore have assumed because of an optimistic reliance upon x-ray studies alone. This latter fact cannot be emphasized too strongly.

We most enthusiastically recommend that students of arthritis make a careful study of the photographic histologic and roentgenographic reproductions contained in this volume.

FOSTER J. DATRI

The Surgery of Pancreatic Tumors. By Alexander Brunschwig, M.D. Quarto of 421 pages, illustrated. St. Louis, C. V. Mosby Company, 1942. Cloth, \$7.50.

This volume is probably the only one of its kind in existence today. It represents a tremendous amount of work on the part of the author, who has covered this surgically limited field in an exceptionally orderly and complete manner, including the history, anatomy, embryology, experimental research, diagnosis, prognosis, and treatment of every type of tumor found in the pancreas. The excellent illustrations, along with the clear-cut detailed description of the surgical treatment of various tumors in the pancreas, should stimulate more surgeons to neglected pathology.

we are sure, as an authoritative text, and the author deserves every praise for his contribution. Although this book is of primary interest to the surgeon, it should be of equal interest to the internist and the research worker.

HERBERT T. WIKLE

The Essentials of Emergency Treatment. Octavo of 144 pages. Hartford, 54 Church Street, Connecticut State Medical Journal, 1942. Cloth, \$2.00.

This book is a compilation of articles by 19 physicians and surgeons, most of them from the State of Connecticut. There are few illustrations—five or six—with a chapter on the organization and function of the emergency medical service in Connecticut.

Each of the various authors discusses in a brief chapter subjects in which he has been especially prepared. The volume is sponsored by the Connecticut State Medical Journal. Its purpose is to prepare physicians for any emergency which may arise as a result of bombing or as a result of injuries received on the highways or in large factories where, owing to the complicated machinery, accidents and injuries frequently occur.

"STANDING ROOM" MORE COSTLY

The effects of the standing position of the human body upon efficiency and resistance to fatigue and ailment was the point of an investigation made recently at the Teachers College of Columbia University. The findings of this special research, conducted by Dr. Harriet Graham McCormick, instructor in the Department of Health and Physical Education at the College, have been described in a treatise, "The Metabolic Cost of Maintaining Standing Position," published by Columbia University.

According to the results of the investigation, maintenance of a standing posture involves the expenditure of an average of 18 per cent more of the body's energy than a sitting or lying down position. Viewed as to the effect on the productive power of millions of men and women engaged in war production the information may have a great significance. Slouching, however, appeared a natural method of reducing the expenditure of body energy, although the investigator does not recommend that men and women should always assume a lax, slouchy position. A more practical position might often be the one involving the expenditure of considerable body energy to maintain.

To arrive at the conclusions, Dr. McCormick measured the metabolic rate in a number of grown-up persons. When a large group of women were tested in a standing position, the metabolism increased from 5.7 per cent to 36.8 per cent as compared with the basal metabolism of this test group. In working, however, the ideal position is the one that is consistent with the least expense of energy required to perform a particular task most efficiently.

To minimize the expenditure of energy where workers may have to stand at long periods, it is suggested that some kind of a leaning-post or support be installed for employees in factories and shops.

This would be a contribution to efficiency.

SELF-PRESERVATION—He takes care of everybody. . . except himself!

Here he comes. . . busy Doctor Larabee.

A friend of the whole community. Out of bed at midnight, many a night. . . brought half the young ones in Tyler County into the world. Knows every ache and pain for miles around.

Doc's seen a lot of life in his twenty years of service. He's seen folks born. . . and seen 'em die. He's seen families left comfortable—and others without a penny. . .

Yet for years now, whenever Doc's life insurance man has come around, Doc's brushed him aside. "Too busy!" he says. Yes—too busy looking after everybody else's family to give much thought to his own. . . in the future that seems so far away. . .

Guess Doc doesn't appreciate that saying, "The future belongs to those who prepare for it." Funny, isn't it? There seems to be a little of Doctor Larabee in all of us. It's just so easy for us to say, "Too busy!" or "Maybe tomorrow". . . when tomorrow may be too late.—*The Prudential*

RATIONING'S DIETARY EFFECTS

M. S. Rukeyser, *Journal-American* columnist, recently took a long look at the least considered side of rationing, and proceeded to tell his readers that—"Apparently for the duration we are to be nourished on statistical averages."

Rukeyser calls rationing an equalitarian system based on a belief that what is sauce for the goose is sauce for the gander. While the system has merit for its present use and is doubtless needed under abnormal conditions, he sees danger ahead if it is continued after victory, for it runs counter to the known principles of biology. "Contrary to equal rationing based on statistical averages, the caloric needs of the individual vary according to size, amount of work done, age and other factors," he comments.

"Yet for convenience, ration tickets assume not only that all men are created equal but that their needs for food are precisely the same."

As Rukeyser views it, we Americans will adjust ourselves to the extension of point rationing even if we dissent from some of the theoretical assumptions on which bureaucrats base their policies. Yet, he remarked, the "freeze" on butter gave satisfaction to "some of us oldsters" who had accumulated reserves of fats, etc., around the

waist. Although this kind of hoarding was done in direct violation of the best medical advice, such biological corporations will now prove of some value. At least the conscientious patriot will have an opportunity to cut down his demand where and when the supply of butter fats and their equivalent is limited. "And as such patriots draw on their excess reserves around the girth, the war as an indirect benefit will be aiding the slenderizing which had long been neglected."

"In rationing," the writer observes, "the O.P.A. will provide extra supplies for invalids, infants and others who can adduce evidence from physicians that they need more. As an offset to this, it would seem in order to cut down a little on the rations of the overstuffed and overfed—at least until they approached figures making for optimum health . . .

"As for theorists who are dreaming of continuing such machinery for 'economic planning' after the war, it is likely that after victory the public will be tired of being bossed by bureaucrats and will be yearning nostalgically for their days of freedom. It will be in accord with human nature to want to reverse the policies of regimentation after the war need has passed."

WE DO READ ADVERTISEMENTS

Many outstanding advertisements appear in our newspapers and magazines, and seldom is there one that does not derive some benefit from its appearing in print. However, it is only on a rare occasion that an ad catches the public imagination and sweeps the country from coast to coast.

Such an ad did appear recently, sponsored by the New Haven Railroad. It was entitled "The Kid in Upper Four."

It dramatized a young soldier in a Pullman upper—what he was thinking about and what he was setting out to accomplish and why it was deemed an honor to subordinate everything else to the job of transporting him comfortably and efficiently.

The first day the ad ran in the papers, phones started to ring all over the New Haven system. Folks wanted to congratulate the New Haven on the ad, wanted copies to send to their friends. Mothers, dads, wives and sweethearts of service men wanted it to send on to their boys in service. The U. S. Wholesale Grocers' Association asked for 3,000 copies for their food distributors. A mid-western utility wanted copies to send to all their state legislators. The Treasury Department wanted it to help sell War Bonds.

Eddie Cantor and Ben Bernie phoned for permission to read the ad on their broadcasts. Kate Smith recommended "The Kid" to her millions of radio listeners. Travel Agents wrote to say the ad made it easier to sell "best available" Pullman space.

Just "The Kid in Upper Four," but it could have been anyone's boy—or husband—or dad. Reprints suitable for framing are available for the asking. Just write to the Public Relations Department, New Haven Railroad, South Station, Boston.

this enriched infant
Cereal Food...*

CEREVim

*Provides nutrient elements plus Thiamine, Riboflavin,
Niacinamide and Iron.*

Not Rationed!

PACKAGES: 1½ lb. and 1 lb.

The cereal grains—wheat, oats, corn—from which infant foods are commonly prepared, supply the B complex vitamins which are now recognized as essential in the diet, but such cereals are bulky. Infants cannot take sufficient to obtain the full amount of B vitamins needed daily. To fill this need, CEREVIM was enriched by the addition of extra thiamine, riboflavin, calcium pantothenate*, niacinamide and iron. A single one-ounce feeding supplies the full recommended daily allowances of thiamine, riboflavin, niacinamide and iron for infants and children up to 3 years of age.¹

CEREVIM's low fiber content and smooth texture are often important advantages in cases of spastic constipation in infants and children.

Cereal Food...*

CEREVIM

*Provides nutrient elements plus Thiamine, Riboflavin,
Niacinamide and Iron.*

Not Rationed!

PACKAGES: 1½ lb. and 1 lb.

The cereal grains—wheat, oats, corn—from which infant foods are commonly prepared, supply the B complex vitamins which are now recognized as essential in the diet but such cereals are bulky. Infants cannot take sufficient to obtain the full amount of B vitamins needed daily. To fill this need, CEREVIM was enriched by the addition of extra thiamine, riboflavin, calcium pantothenate,* niacinamide and iron. A single one ounce feeding supplies the full recommended daily allowances of thiamine, riboflavin, niacinamide and iron for infants and children up to 3 years of age.¹

CEREVIM's low fiber content and smooth texture are often important advantages in cases of spastic constipation in infants and children.

¹Rees and L. D. Lary. *Abstracts from Nutrition Bulletin*, National Research Council (May) 1941.

STRESS ON HEART EASED WITH

DIURBITAL

DIURBITAL* exerts vasodilating, relaxing effects on the blood vessels in hypertension. It eases the fluid burden on the heart and helps check possible cerebral or peripheral edema by active diuresis... and serves to dilate coronary arteries for myocardial stimulation. Relief from headache, vertigo, fear, irritability, insomnia, etc. occurs as blood pressure gradually descends. Enteric coating of DIURBITAL avoids gastric insult. DIURBITAL TABLETS CONTAIN EACH: Theobromine Sodium Salicylate 3 grs.; Phenobarbital ½ gr.; Calcium Lactate 1½ grs. Bottles of 25 and 100 tablets at your pharmacy.

Help wanted for Women at Work..

Today, more and more women man factories, mills, offices . . . many of them unaccustomed to the strain of industrial jobs.

Result: fatigue,

too frequent "rests", slowed production, "absenteeism" . . . much of it traceable to poor body mechanics.

In the *relief of certain types of workers' fatigue*, Camp Supports play an increasingly important role. For these supports are *designed along anatomical lines*; they lessen back strain and protect against sprain.

It is a matter of medical record at these supports have—for 30 years—successfully aided men and women to achieve better posture . . . hence to feel more fit . . . do more work with less fatigue.

H. CAMP & CO., Jackson, Mich.

World's largest manufacturers of scientific supports. Offices in New York, Chicago, Windsor, Ont., London, Eng.

● Difficult to realize how far we have progressed in nutrition since World War I! For instance, tomato juice! Doctors knew about its anti-scorbutic value and widely recommended the juice of canned tomatoes for infant feeding. But tomato juice as we know it today was not commercially available until ten years after World War I, when Kemp brothers introduced their now famous Kemp's Sun-Rayed. ...Tomato juice is being enjoyed by our "boys" everywhere, and we at home are glad to share with them the whole-tomato goodness of Kemp's Sun-Rayed.

An Important Contribution to BILE ACID THERAPY

TRIKETOL is a distinct laboratory achievement representing years of original research in bile derivative chemistry. This research culminated in the production, by *proper oxidation*, of crystalline-pure, therapeutic bile acids, free from toxic, irritating contaminants inherent in crude bile. New formulations plus new equipment, of original design, contribute greatly to the exclusive ENDO method of producing TRIKETOL.

Exhibiting the two essential bile acids—dehydrocholic and dehydrodesoxycholic—at maximum therapeutic efficiency, TRIKETOL is indicated wherever an active hydrocholeretic and cholegenic is appropriate, as in chronic cholecystitis, biliary stasis and other hepatobiliary disorders.

Moreover, its ability to increase production of bile (and in subsequent secretion as thin, limpid bile) is proving highly effective in the management of constipation due to biliary stasis.

TRIKETOL

Trade Mark

Available in bottles of 40 and
100 tablets, $3\frac{3}{4}$ grains each,
at prescription pharmacies.

The Popularity of **THESODATE (*Brewer*)**

(the original enteric-coated tablet of Theobromine Sodium Acetate)*

is due to three factors:

1. IT IS CLINICALLY PROVED.
2. IT IS EFFECTIVELY ENTERIC COATED.
3. IT IS DECIDEDLY LESS EXPENSIVE.

Indicated in treatment of coronary artery disease, edema and hypertension.

Dosage: One 7½-grain tablet four times a day, before meals and upon retiring.

Available on prescription in 7½-grain tablets, with or without Phenobarbital (½ grain), or 3¾-grain tablets with or without Phenobarbital (¼ grain), and Theobromine Sodium Acetate 5 grs. with Potassium Iodide 2 grs. and Phenobarbital ¼ gr., 100 per bottle.

*Capsules are now available for those few patients who need extra medication.

MULTIPLE THERAPY FOR

MULTIPLE DEFICIENCIES A logical method of supporting the diet during periods of increased need or restricted vitamin intake is the use of—

WHITE'S NEO MULTI-VI CAPSULES

- One Neo Multi-Vi Capsule provides every major vitamin, including all those clinically established, in amounts substantially greater than adult Basic Daily Requirements*—yet does not burden the patient with the cost of supplemental vitamins in amounts beyond his needs and perhaps even beyond his power to assimilate.
- Supplied in bottles of 25, 100, 500 and 5000 capsules.
- Reinforcement with these clinically important vitamin factors is most frequently indicated in—

Surgery
Pregnancy and lactation
Convalescence

Debilitating diseases
Restricted diets
Hypermetabolic states

MAXITATE

MANNITOL HEXANITRATE STRASENBURGH

*Pioneered by
STRASENBURGH
Research*

In essential hypertension Maxitate offers your patient three important advantages:

- 5 to 6 hours of vasodilation;
- Forestalls attacks of angina pectoris;
- Absence of commonly encountered nitrite toxic effects.

• Since the vasodilation following Maxitate is gradual, shock is avoided. The vascular relaxation may be extended indefinitely, by regulation of dosage. For excitable patients, Maxitate in combination with Phenobarbital helps calm nervous tension, encouraging maximum and prompt benefit to the patient.

Distinguishable by Color for Convenience of Physician:

Maxitate, in $\frac{1}{4}$ and $\frac{1}{2}$ gr. tablets (white)
 Maxitate, $\frac{1}{2}$ gr., with Phenobarbital, $\frac{1}{4}$ gr. (blue)
 Maxitate, $\frac{1}{2}$ gr., with Phenobarbital, $\frac{1}{2}$ gr. (pink)
 Maxitate, $\frac{1}{2}$ gr., with Nitroglycerin, 1/100 gr. (violet)

PHARMACEUTICAL CHEMISTS SINCE 1886

ROCHESTER, NEW YORK

KARO Red Label
and Blue Label
are equally
effective in
MILK MODIFICATION

The chemical compositions and caloric values of these two types of KARO are practically identical.

Therefore the slight difference in flavor (hardly noticeable in the milk mixture) in no way affects the value of KARO as a milk modifier.

Either type may be prescribed for prematures, newborns and infants.

How much KARO for Infant Formulas?

The amount of KARO prescribed is 6 to 8% of the total quantity of milk used in the formula—one ounce of KARO in the newborn's formula is gradually increased to two ounces at six months.

CORN PRODUCTS REFINING CO.

PLAIN, UNFLAVORED KNOX GELATINE

Recommended by Physicians
for special dietaries in treatment of:

... Peptic Ulcer ... Reducing
... Diabetes ... Convalescence
... Colitis ... Infant Feeding
... Debility

caused by lack of adequate protein

NOTE. Knox Gelatine should not be confused with ready-flavored gelatine dessert powders. They are only about $\frac{1}{2}$ protein, mostly acid-flavored. Knox is all gelatine, no sugar...a pure wholesome protein. Contains 7 of the 10 essential protein parts.

If you would like information, reprints or suggested recipes for any of the above, simply check the subjects, clip this ad to a prescription blank and mail to Knox Gelatine, Dept. 474, Johnstown, N. Y.

TO BURN UP FAT

Prescribe Lipolysin in obesity to stimulate oxidation process that "burn up" fatty tissue. A dependable endocrine product; free from dinitrophenol. Tablets—bottles 100; Capsules—bottles 50, 120; Ampuls—boxes 12. Send for literature, Dept. N, Cavendish Pharmaceutical Corp., 25 West Broadway, New York.

LIPOLYSIN
MALE FEMALE

Time to Collect

IT IS NEWS when a collection firm gets fan mail. A doctor writes, "You are wizards." A hospital superintendent says, "Your skillful methods bring checks in every mail." The truth of the matter is that patients who were unable to pay medical fees a few years ago are now receiving fat pay checks. These days there is no such thing as a hopeless account. We are willing to try to collect any of your bills at a moderate percentage of the amount recouped.

Now is the time to write for details.
CRANE DISCOUNT CORPORATION
230 W. 41st St. New York, N. Y.

Fully effective—Most vitamin B deficiencies are multiple and require the complete B-Complex for really effective results. Elixir Bepadin "works" because it contains all the natural B-Complex factors found in liver concentrate, yeast concentrate and rice bran extract together with added synthetic vitamins.

Extremely palatable—The exceptionally pleasant flavor of the sherry wine overcomes objections to taste which often are associated with preparations containing yeast or liver.

Elixir Bepadin costs less than other high quality preparations. Patients appreciate the saving when they continue using Elixir Bepadin for any length of time.

Other I. V. C. Preparations

I.V.C. also offers a complete line of ethical, professionally accepted vitamin products for preventive therapy and vitamin specifics for pathologic vitamin deficiencies. Many I.V.C. vitamin preparations are accepted by the Council on Pharmacy and Chemistry of the American Medical Association.

SIMILAC

SIMILAR TO BREAST MILK

A powdered, modified milk product especially prepared for infant feeding, made from tuberculin tested cow's milk (casein modified) from which part of the butterfat is removed and to which has been added lactose, olive oil, coconut oil, corn oil, and cod liver oil concentrate.

Similac provides breast milk proportions of fat, protein, carbohydrate and minerals, in forms that are physically and metabolically suited to the infant's requirements. Similac dependably nourishes — *from birth until weaning.*

One level tablespoon of Similac powder added to *two* ounces of water makes *two* fluid ounces of Similac. This is the normal mixture and the caloric value is approximately 20 calories per fluid ounce.

M & R DIETETIC LABORATORIES, INC. • COLUMBUS, OHIO

After the Plasma Donation

When the "languid blood" of the over-zealous donor needs to be restored, an intravenous injection or two may be the quickest, surest means of aiding the hematopoietic system.

For 24 years Ferro-Arsen has been satisfying physicians; not those who haven't used it, but those who have—and there are thousands of them.

Ten cc ampuls of Ferro-Arsen are prepared from Ferric Chloride 0.15 Gm. and Sodium Cacodylate 0.32 Gm. Five cc ampuls containing half these amounts are also available. Thus 10 cc contain as much iron and as much arsenic as in 4 ordinary iron cacodylate ampuls. Yet Ferro-Arsen is not irritating and its use has been singularly free from toxicity.

COLLOIDAL IRON *VS* IONIZABLE IRON

In the CONVALESCENT INTESTINE

COLLOIDAL IRON PROTEIN
NON-IRRITATING, READILY
ABSORBED

IRON SALT PRECIPITATES
DEHYDRATING AND
CONSTIPATING

IN CONVALESCENCE, the intestine plays an important role as an absorption center for nutrient, but it is characteristically subject to upsets. For these reasons, the intrinsic advantages of colloidal iron over ionizable iron in hematinic therapy are especially significant. Iron salts (sulphates, citrates, etc.) are ionized by the gastric juice. In the alkaline medium of the intestine they form precipitates which are not readily absorbed and are dehydrating and constipating. OVOFERRIN, on the other hand, is *colloidal iron-protein*. It is not in ionic form, and is not broken up by the digestive juices. It

remains assimilable since nutritive material in colloidal form is readily absorbed from the intestine. As it is fully hydrated, it *cannot* cause dehydration and constipation. It contains no acid radicle to irritate. Such is the biochemical basis for OVOFERRIN'S world-wide reputation as the rapid blood builder.

In addition, OVOFERRIN is odorless and tasteless, contains no sugar, does not irritate the stomach, and does not stain or dissolve tooth enamel. Prescribed in 11-oz. bottles—one tablespoonful in a wine glass of milk or water at meals and bedtime.

Group Malpractice Insurance

This year marks the twenty-second anniversary of the Group Malpractice Insurance Plan of the Medical Society of the State of New York. Since 1921, when the plan was adopted, over 3,500 suits and claims have been closed by the companies operating under it, with the assistance of the legal counsel of the Society, and all liabilities have been fully discharged.

It may be said that progress is being made toward bringing about an improved experience which may ultimately lead to the benefit of lower rates for this kind of protection. Mr. Louis H. Pink, speaking before the Medical Society of the County of Kings, recently said in part: "Nothing can substitute for experience; sound insurance underwriting is based upon a sufficient accumula-

tion of experience and accurate interpretation of its lessons; the price of experience is time, and it can never be had at cut rates." As recent Superintendent of Insurance of the State of New York, Mr. Pink should know.

Experience is being slowly accumulated under the Group Plan of the Society, and those interested in the historical development of the plan under the auspices of the Society will find in this issue* such a résumé, together with a discussion of the principles and practice under which it is operated. We hope our membership will better acquaint itself with this important protective function of the Society, now in its twenty-second year of successful operation.

* See page 925.

Medical Student Training

A program of premedical and medical education for thousands of soldiers and sailors conducted by the Army and Navy is expected to be in full operation by June, 1943. The Army plans to train about 14,000 young men and the Navy about 4,750.

To maintain a continuous production of 4,100 medical officers every nine months, fifteen months are scheduled for premedical training, followed by the compressed three-year medical course now in operation, with a following year of internship. Sixty-three months from larva to leech. The students

will be uniformed, will be under military discipline, and will receive pay, allowances, and equipment from the government. Certainly this is an interesting experiment in medical education to be closely watched for what lessons it may teach.

Says Medical Economics:

"A picture of what Army-style premedical education may be like was painted in a recent address by Brigadier General Joe N. Dalton:

"Soldiers will be under the direction of a commandant who will be responsible for discipline and control. Housing, feeding, instruction, and other services will be provided by contract between the institution and the Army. . . .

Changing Tuberculosis

Diseases change their clinical pattern from generation to generation. Scarlet fever and diphtheria, formerly greatly feared infections, now tend to pursue a relatively mild course. The dread influenzal pneumonia of 1918 is replaced by a viral pneumonia of low mortality. Outbursts of fulminating epidemic meningitis may follow in the wake of sporadic milder forms of this disease. Often the altered virulence and epidemiology are not fully understood, but we do know that increase of transportation means increase of contact and of exposure to disease agents. In some instances advancement of epidemiologic knowledge and improved prophylactic measures have definitely decreased the morbidity and mortality and have changed the clinical picture of certain contagions. Such is the case with tuberculosis.

The past decade has witnessed a continuous lowering of the incidence of tuberculosis. Old figures showed, according to the section studied, that from 50 to 90 per cent of children up to 15 years of age had already been infected with tuberculosis.¹ Recent statistics reveal a reduction of more than 50 per cent in the same age group.² Since the child today is better protected against tuberculosis, the primary infection will often be postponed to adult life. Phthisiologists have already noted that the childhood or primary form of tuberculosis now is much more commonly encountered in adults than it has been previously, and the clinical picture is colored thereby.

The pathologic differences between the primary infection and the reinfection have recently been well summarized.³ Any part of the lung may be the site of the primary infection, and the regional lymph nodes at the hilum are generally implicated. These nodes often caseate and appear more conspicuous than the primary lung focus. The usual course is healing with calcification, but not infrequently the infection may be so acute that there is no opportunity for the formation of cavities. Death results from tuberculous meningitis or miliary tuberculosis from hematogenous dissemination. With recovery, calcified scars remain in the lungs and regional lymph nodes.

The reinfection or adult type of tuberculosis differs conspicuously from the childhood form. The apex is almost invariably the site; the course is protracted; cavity formation is prominent, and there is scant tendency for spread by lymphatics or blood stream. Even if the whole lobe is impli-

cated, the regional nodes do not undergo gross caseation. Spread of the adult type is from above downward by way of the bronchial tree.

As more children escape tuberculosis, the disease in the adult assumes many characteristics of the childhood form. It tends to become rapidly progressive, manifesting itself as a tuberculous pneumonia with ulcerative cavities. Any part of the lung may be affected. Dissemination may take place by the lymphatics or blood stream. Whether or not previous immunization has existed is the essential difference between the forms of adult and childhood tuberculosis.

The clinical changes have fortunately been emphasized.⁴ Whereas the age prevalence of tuberculosis was formerly from 15 to 30 years of age, it is now 25 to 50 years of age. Recent exposure is required for infection now, which was not true in earlier years. Now the infection may begin in a tuberculin-negative patient, whereas it occurred previously in tuberculin-positive patients. In former days the source lesion was chiefly from lympho-hematogenous secondary lesions; today the source is equally from recurrent primary and secondary foci. The origin is now exogenous instead of endogenous. The classical tuberculosis was always apical or subapical, but today any lung area may be involved. The lesions, formerly nodular, now are often infiltrative, and tend to pursue a more rapid course, of one to two years, instead of many.

War always threatens a recrudescence of tuberculosis. We must be on our guard for a form of tuberculosis not classically apical and chronic, but with acute lesions occurring in any part of the lung and a rapid course which we formerly associated almost exclusively with children. These early lesions can be disclosed only by x-rays, and their early detection is extremely important because of the rapid progression of this altered tuberculosis. Routine x-ray examination of the chest in young adults should be performed not only by the Army, industry, and the universities, but by all physicians at selected intervals.

3. Opie, E. L.: *Chinese M. J.* 56: 197 (Sept.) 1939.

4. Mayer, E.: *New York State J. Med.* 42: 1723 (Sept. 15) 1942.

"Soldiers will rise at 6:30 A.M. and from then until taps at 10:30 P.M. that night their day will be as rigorous as it was during the basic training period. A typical week will include twenty-four hours of academic classroom work, including laboratory periods, and twenty-four hours of supervised study time. In addition, there will be six hours a week of supervised physical conditioning and about five hours a week of military instruction. . . . There will be sufficient free time each day for personal affairs, and the men will be off duty from late afternoon on Saturday until the Sunday evening meal.' ""*

It should not be forgotten that this program is designed primarily to provide doctors for the armed forces. Of the total capacity of the approved medical schools in the United States, about 18,750 of the possible 23,000 students will be service men. The balance will be civilian students, roughly about 20 per cent. Intern training will be largely conducted, we understand, in civilian hospitals.

A program of such proportions will merit close study by the profession, especially

* Medical Economics, April, 1943.

with respect to the choice of student material selected from the induction and training centers. This choice and the criteria exercised should be of vital interest and importance to the profession and we hope that the men best qualified in medical education will be freely consulted, as we feel they will be, on these matters. The shortened premedical course naturally cuts down the time in which observation of the character and capabilities of the students can be scrutinized, but if sufficiently expert opinion can be brought to bear during this time in the final selection of those who will be permitted to continue, the experiment should get off to a good start. Once this procedure is placed upon a sound and reasonable basis, we believe that further difficulties will be overcome without too much waste and that educational standards can be maintained. Certainly, it is to the advantage of all that this be done. Nobody wants poorly selected students or poorly trained physicians.

Plasma Therapy and Whole Blood Transfusion

Few subjects have aroused more interest in these war years than plasma therapy. Its applicability to civilian disaster as well as to war medicine and surgery has made it a prime choice for a program of postgraduate teaching.

Plans have been completed recently to present to the medical profession of New York State the very latest information concerning blood plasma therapy and whole blood transfusion. This program is sponsored by the Medical Society of the State of New York, the Office of Civilian Defense, the Health Preparedness Commission of the State War Council, and the State Department of Health. The instruction is presented by a group of especially interested and prepared physicians. The physicians available for lectures and demonstrations at meetings of county medical societies and hospital staffs attended a conference on Friday, February 26, 1943, in the State Office Building, Albany, New York. Leading

authorities on plasma therapy and whole blood transfusion addressed the group, and there were also round-table discussions.

It is now possible to cover the entire state by a well-planned and comprehensive program on these topics. Lectures are presented as special single sessions or in connection with formal courses or for special or regular meetings of county medical societies. The societies have been supplied with the names of the speakers.

Many requests have been received, and up to the present time the Council Committee on Public Health and Education has completed arrangements for instruction at meetings of the following county medical societies: Broome, Clinton, Cortland, Franklin, Greene, Herkimer, Onondaga, Rensselaer, Richmond, St. Lawrence, and Steuben.

We hope that the remaining counties of the state will avail themselves of this timely course of instruction.

Thomas Aloysius McGoldrick, M.D.

Dr. Thomas A. McGoldrick was born in Brooklyn on September 13, 1874. A graduate of St. James Academy in Brooklyn, he attended Manhattan College, where he obtained the degrees of A.B. and A.M., and Long Island College Hospital, where in 1896 he received the degree of M.D. He interned at Brooklyn Hospital and subsequently entered medical practice in Brooklyn. He was a delegate from the Kings County Medical Society from 1933 to 1942, inclusive, and a delegate from the State Society to the American Medical Association from 1938 through 1943.

He was former Chief Surgeon of the Police Department, City of New York, from which office he retired in 1937. In 1938, he was a member of the World's Fair Committee and a member also of the Committee on Matters Pertaining to Public Health. He has been Borough Chief Medical Officer, OCD, Borough of Brooklyn. In 1942, he became President-Elect of the Medical Society of the State of New York.

Dr. McGoldrick is Director of Medicine, St. Peter's Hospital, Brooklyn; St. Anthony's Hospital, Woodhaven; and Welfare Hospital, Welfare Island, New York City.

MALPRACTICE INSURANCE AND DEFENSE

The Importance of the Group Plan

An historical review prepared by the Council Committee on Malpractice Defense and Insurance of the Medical Society of the State of New York.—Editor

MAY 1, 1943, was the twenty-second anniversary of the inauguration of the Group Plan of Malpractice Defense and Insurance of the Medical Society of the State of New York. On May 1, 1921, the House of Delegates, at the Annual Convention, held in Brooklyn that year, ratified an agreement made with an insurance carrier, and the Group Plan came into existence forthwith.

Since the inception of the Group Plan of the Society, there have been various insurance companies that have entered the malpractice insurance field in competition by offering cheaper annual premium rates. It has been noted that, after a few years' loss experience, these companies have materially increased their rates or conveniently withdrawn from the market, thereby subscribing to the soundness of the financial operation of the Society's Group Plan.

To the busy doctor, with little time to make a thorough personal investigation, a lower premium rate has an immediate appeal. However, he fails to realize that if a malpractice action is brought against him, that his good name, reputation, and ethical standing in his community are vitally at stake and that unless he has the best possible medicolegal defense to defend the action, he may injure unalterably those sterling qualities by attempting to save a few dollars in premium cost.

Recently, as the guest speaker before the Medical Society of the County of Kings, Mr. Louis H. Pink, recent Superintendent of Insurance for the State of New York, in speaking about insurance, stated "that nothing can substitute for experience, that sound insurance underwriting is based upon a sufficient accumulation of experience and accurate interpretation of its lessons, that the price of experience is time and it can never be had at cut rates." Mr. Pink further cautioned against listening to those who suggest that lost time can be made up by skipping over all of the evolutionary steps and improvising a mature and workable system in excellence of anything developed after decades of painstaking experiment.

If the time ever comes when the majority of the members fails to support the Group Plan of malpractice insurance, it will result in a heyday for all insurance companies. A disintegrated support will mean a return to the chaotic times

prior to 1921. No longer will organized medicine have a voice in malpractice insurance policy underwriting, a voice as to the coverage afforded, or a hand in establishing annual premium rates. In place of the companies meeting the necessities of the assured, the assured will be forced to accept that which the companies deem best, purely for the interest of the companies and not for the assured.

Twenty-five or thirty years ago the problems of malpractice insurance and defense were relatively unimportant factors in the practice of medicine in the state. The number of suits filed against members of the Society was small, even compared with the smaller membership list of those days. The cost of operating the Society's legal defense service was moderate, and the facilities of the office of the legal counsel were adequate to handle, with a satisfactory degree of success, all of the suits and claims filed. In addition, there were several good insurance companies willing to sell malpractice insurance policies at rates between \$12 and \$15.

A change began to take place, however, at about the time that World War I broke out in Europe. Each year showed an increase in the number of suits and claims filed against members throughout the state and similar increases were reported from other parts of the country. Similarly, the activities of the ambulance-chasing type of attorney increased. The awards made by juries also rose sharply and the seriousness of the situation soon forced itself upon the attention of the entire profession. In this state, the astonishing increase in the number of suits filed and the cost of disposing of them was regarded simply as an abnormal run of chance that would flatten out when the unsettled conditions, following the war, returned to normal. But as time went on, the situation grew worse, instead of better, until it became apparent that what had once been considered as normal had to be discarded as out of date. The medical profession finally concluded that it faced malpractice hazards that increased at about the same rapid rate as the traffic hazards on crowded streets.

The officers of the Society watched these changes closely, fully appreciating the nature of the danger that lay ahead. They foresaw that unless some strong and positive action was taken, to unite all available defense elements into a

Correspondence

February 3, 1943

Dr. Joseph S. Lawrence
100 State Street
Albany, New York

Dear Dr. Lawrence:

I am under the impression that the Medical Society of the State of New York, which you so ably represent, has had few opportunities to be informed of the volume of work which is being done by the Department, the Board of Regents, and the Office of Professional Conduct in the interest of the medical profession. It has been the policy of the Board of Regents not to give newspaper publicity to disciplinary cases on the assumption that when a physician's license is suspended for a period of time and subsequent publicity is given to this suspension that such discipline actually results in a more severe penalty than is intended, and in some cases it amounts to revocation because of the reaction of the public to the person who has been disciplined.

It has occurred to me that it would be helpful if I sent you a kind of monthly report which you might pass on to your constituency in any way you desire. The latest report I have covers the period between December 15 and January 19. During that month 25 additional disciplinary complaints were received which, added to 222 complaints pending, make a total of 247 complaints which received attention during the month. Of these, 8 were closed by com-

mittee action; 137 were under investigation; 11 were referred to the Attorney General; 55 were before the Medical Grievance Committee for informal action and 9 for formal action; and 24 cases were before the Board of Regents.

Twenty-five criminal complaints were received during the period which, added to 140 complaints pending, make a total of 165. Of these, 1 was closed by warning, 17 on the basis of no violation or evidence; 22 were pending in court; 7 were closed by the court; 111 were under investigation; and 7 were referred to the Attorney General.

As you will see, the volume of business in the field of medicine is considerable. This particular period covered by the present statement is not an exception. The work has increased to such an extent in recent months that we have asked the Medical Grievance Committee to furnish us two subcommittees every week until further notice, and the full Grievance Committee, which ordinarily meets twice a year, has agreed to meet four times a year. The Board of Regents is making an extraordinary effort to meet the situation, and in recent weeks we have completely reorganized the record system and the administrative procedure in the Office of Professional Conduct in order that we might render the best possible service to the profession.

With kind regards, I am

Yours very sincerely,
J. HILLIS MILLER

The attention of physicians qualified under the Workmen's Compensation Law is directed to the following Resolution adopted by the Industrial Board, Department of Labor, on April 9, 1943:

"Resolved, that in cases in which the claimant's physician prescribes a surgical appliance, or dental treatment, or denture, for a claimant, the physician shall notify the employer or carrier of the need for such appliance, or dental aid, and direct the claimant to the employer or carrier for the purpose of securing from said employer or carrier authorization for the purchase of such appliance or dental aid before the same is furnished to the claimant by the appliance dealer or dentist.

"A statement to this effect shall be inserted on all medical forms issued by this Department.

"Further resolved, that the medical societies of the State of New York be requested to cooperate with this Department in the enforcement of this requirement by physicians.

ROSE SCHNEIDERMAN, *Secretary*"

The Director has been requested to circularize this Resolution to all physicians authorized to treat compensation cases.

Please note that when a surgical appliance, dental treatment, or denture is necessary, the attending physician shall notify the employer or carrier of the need for such appliance or treatment and obtain authorization for the purchase of the appliance or the rendering of dental care before same is furnished to the claimant.

Very truly yours,

DAVID J. KALISKI, M.D., *Director,*
Committee on Workmen's Compensation
Medical Society, The State of New York

member, insured or not, only the Yorkshire Indemnity Company utilizes the valuable services of our Counsel from the inception of every notice of claim to its ultimate conclusion. The Yorkshire Indemnity Company and its officers are at all times at our service, and they will welcome any inquiry or question which may occur to any individual member and which has to do with the Insurance Company's participation in your Malpractice Group Plan.

In a group plan, it is essential to determine and agree beforehand on the exact manner in which the cost shall be computed, covering, among other things, the amount which shall be added for operating expenses. Similar provisions were made in the original arrangement with the Aetna Company in 1921. At that time, it was agreed that the Group Plan would be charged with an expense loading substantially less than the published expense ratio of the Company. This favorable differential was possible for a number of reasons, all of which tended to reduce the cost of operating the Group Plan. From time to time other economies made it possible to further reduce this charge until, at the present time, the Plan is being operated with a lower overhead than that charged to any other stock insurance operation in the state.

One of the outstanding changes arranged with the Yorkshire Indemnity Company is as follows: The Company has agreed to furnish the Society with a loss voucher form covering each suit or claim closed, with a complete analysis of all expenditures in connection therewith. At the conclusion of each case, this form is prepared in triplicate and sent to the Legal Counsel of the Society to be checked and approved. One copy is retained by him, one is sent to the Insurance Representative of the Society, and one is returned to the Company. No charges are made against the Group Plan except from approved vouchers. This system not only furnishes a check upon the losses charged to the Society's experience, but furnishes data from which it is possible to make any kind of loss analysis that might be required in the future.

It is of interest to note that over 3,500 suits and claims have been closed since 1921, with all liabilities fully discharged. While this is a record in which insured members can find ample cause for confidence and a feeling of security, they should remember that this achievement would not have been possible except for the cooperation and supervision of the Plan by the State Society through its legal and insurance departments. Without that direction by the Society, no scheme for writing malpractice insurance in this state can succeed at rates less than nearly double those required by the Group Plan.

While everyone who has watched the defense of a malpractice suit in his community is familiar with the splendid work of the Society's legal department, only the members of the Insurance Committee come in contact with the work of the insurance department where the business is managed. In that department individual records are kept, tabulations checked, reserves tested, rates computed, plans made, controversies settled, and needed changes initiated and worked out. And it is through this agency that the organized group power of the Society as a whole is brought to bear upon the malpractice insurance situation in the state. The work of this department would never appeal to the interest of a busy doctor, but its labor protects his malpractice insurance welfare quite as much as does any other effort put forth on his behalf.

For twenty-two years the Group Plan has held together the malpractice insurance situation in New York and prevented the high costs and chaotic conditions that most certainly would have existed without it. It stands as a monument to the wisdom and foresight of the State Society, and no one can examine its history or the extent to which it is controlled for the benefit of the members by the Society through its Insurance Committee and Insurance and Legal Representatives without a feeling of comfort and security in the protection which it offers for the future.

DR. CLARENCE G. BANDLER, *Chairman*
Committee on Malpractice Defense and
Insurance

BRITISH DAY AT BLOOD DONOR SERVICE

May 24, 1943, has been designated by the American Red Cross Blood Donor Service as "British Day" in order to enable Britishers and their friends to show their loyalty to the cause of the United Nations by donating a pint of their blood.

Donors who wish to give their blood on British Day may make appointments now by registering at the Service headquarters at 2 East 37 Street. Hours are from 10:30 A.M. to 8:00 P.M. A thorough

physical examination is made and a medical history taken for every donor before he is accepted by the Red Cross.

No one who is not in good health or who has had malaria, diabetes, or tuberculosis within the last fifteen years is eligible to volunteer.

British Day plans are being made by Mrs. William Armour and Miss Gertrude Lawrence, co-chairmen

solid front, medical men would shortly become ready targets for every damage-chasing lawyer who could get to their patients. In the absence of dependable insurance of some kind, members would have nothing standing between them and certain worry, with possible financial loss, except the malpractice defense service of the Society. Even that service might have to be modified unless the Society were able to shoulder the steadily increasing expense that was required to operate it.

The Society had concluded that malpractice indemnity and defense could be provided at reasonable costs in this state only by combining the machinery and funds of an insurance company with the cooperation and defense service of the State Society. It was apparent that if a plan of that kind could be made feasible, it was necessary that it be made equitable to all concerned, together with a comprehensive scheme for malpractice defense by the Society. After a number of conferences, a plan for such an arrangement was drafted, having as its object three fundamental requirements. They were:

First, to relieve the Society of some part of its malpractice defense cost so that it might continue that service for uninsured members without increasing its defense appropriation.

Second, to prevent, if possible, a heavy increase in the cost of malpractice insurance rates for individual members.

Third, to preserve for all members those excellent and highly necessary principles of defense that the Society through its legal counsel had so painstakingly established.

The formula was conceived and the detailed organization carried out by Mr. Wanvig. It is obvious that the organization and operation of a cooperative enterprise, such as the Group Plan, requires management by someone thoroughly familiar with the insurance problem and one whose viewpoint and experience are quite different from those acquired by insurance agents and insurance brokers. In working out the details of group insurance since its inception, it was necessary for our Society to have an insurance specialist who was familiar with every detail of malpractice insurance. He had to enjoy the confidence of the company on the one hand and of the Society on the other, and he had to know exactly to what the insurance company was entitled but in a larger measure to what the members of the Society were entitled, and how to keep the details of organization and operation constantly in order for the benefit of the Society.

In addition to covering many routine matters that had to be provided for, the arrangement with the company was based upon three provisions giving the essence of the undertaking:

1. That all suits and claims against insured members would be handled exclusively by the Legal Counsel of the Society.

This was a bold experiment because, so far as we know, it was the first time in the history of insurance that a company had been induced to turn over the defense of claims, for which it was liable, to the legal counsel of the policyholder. It was a very important provision so far as the members were concerned, as that was the only way in which highly specialized and competent legal defense could be guaranteed to them.

2. That the company would issue policies only to members of the State Society in good standing.

This was likewise an important provision because it eliminated the possibility of suits and claims against nonaffiliated doctors having an unfavorable influence on the loss experience charged to the Society.

3. That the company would conduct the business for the Society on what amounted to a cost-plus basis.

The arrangement provided in detail for the manner in which the cost would be computed and fixed the amount which would be charged to the Society's experience for expenses. Under such an arrangement there could be no question of unfairness to either the policyholder or the company, and no opportunity for one to profit at the expense of the other.

In 1936, the Yorkshire Indemnity Company became the official carrier of the Malpractice Group Insurance Plan of the Medical Society of the State of New York. The coming of the Yorkshire into the picture was the culmination of a development of a problem which had arisen months prior to that time. The Yorkshire by its very background was interested in malpractice insurance because a challenge was presented in setting a course and carrying through with a program that requires constancy to a long view. You have read of the trials and difficulties of malpractice insurance as they were experienced in New York State.

We are now in the eighth year of our association with the Yorkshire, and it can be said that progress is being made toward bringing about an improved experience so that ultimately the membership of the Society may benefit by lower rates. This has necessitated the reduction of factors which were improperly weighing heavily upon the experience as a whole. This was accomplished through the development of a closer working arrangement with our Counsel, our Indemnity Representative, and the Carrier than heretofore had been possible. We believe that it is in order to point out that while it is true that our Counsel is available to every

of the prison system. I would give my name to the prisoner, tell him of my voluntary status, and tell him that, while subject to the rules and regulations of the prison system, I owed no one any account of what we would talk about. I would tell him that I was a physician, a psychiatrist, interested in people like himself, that I could give him no help whatsoever as far as his status was concerned, and that should anything transpire in the course of our talks that might prove of helpful value to him, I would report it if he would permit me. I would also make clear to him that he need not talk to me if he did not want to, that as far as I was concerned he was an absolutely free agent. I would state that if he had anything special to do which he would not want interrupted by our interviews, he should feel free to say so in advance and I would see him at some more convenient time, that I did not want to interfere with anything he wished to do.

This rather simple and brief statement never failed to elicit a responsive warmth on the part of the prisoners. The more cautious or the more intelligent would ask for explanations: What kind of doctor are you? Why did they let you in here, if—etc.? What do you want me to tell you? To these questions the frankest answers were given. Great care was taken not to stress the fact that I was interested in the criminal act or acts which had brought the men into prison. The crime itself was treated at first as casually and as remotely as possible.

The interviews lasted half an hour and there were no more than two each week. The importance of the first interview must be underscored. Here, within the prison walls, behind bars, the unfree man, his civic personality abolished by law, himself but one number in a gray herd of other numbers, is at once given the opportunity to have the innermost independence of his human personality resuscitated as if from the dead. We know how powerful an influence psychological reality exerts on one's life, and here the chief psychological goal is to galvanize this particular reality in the prisoner for therapeutic purposes. The whole system of retributive justice, with its ironclad régime and ironbound omnipotence, acquires from the psychological point of view only the meaning of a harsh—almost fatal—reality, which is yet unable to crush self-respect or the awareness of one's own ego. This psychological trend does not always establish itself at once during the first interview, but the start in the right direction, which never fails to make a deep impression, very soon leads to a state of humble self-respect—an orientation invaluable for the therapeutic influence of criminal cases. In addition, the

criminal in this situation, for the very first time since his arrest or even since he committed the transgression of law, faces another person of whom he is not afraid, who has no power over him, and who does not appear to derive any material benefit from his particular "case." In this respect the therapist is psychologically in a more advantageous position than even the criminal's defense attorney.

It is tempting, of course, to relate here in detail a number of cases which I had the good fortune to treat in Sing Sing, but a complete report will have to be deferred until a later date. A few years ago I reported to the New York Neurological Society one of the most extraordinary cases of murder, in which there was complete amnesia for the act of murder as well as for the motive. The law was not at all puzzled about the matter, as the law never is. It thought that the amnesia was a fake and that the motive was robbery. The murderer was really unaware of the fact of murder; he was in a sort of twilight state. In his dreams, however, the place of the crime, the crime itself, and its inner motivation—which incidentally had nothing to do with robbery and nothing to do with the victim himself—all came out with startling and almost undisguised directness. This man (in his late twenties) was treated for only a few months, but during this brief period he gave ample evidence that his whole personality, his comparatively minor past transgressions, and his final crime, presented an uninterrupted chain of psychological developmental links. These he began to understand with a great deal of interest and satisfaction. As far as I know, he is still in prison and will stay there for another twenty years or so. As long as this man is alive and as long as he is still apt to rejoin normal life some day outside the prison, one is reluctant to publish the full details of the case. It is difficult to make predictions, but on the basis of the data obtained during the investigative therapeutic period, it is equally difficult not to believe that this man could be fully cured.

The same may be said of a number of other murderers who were treated in the same way. There was a blind man; his optic decussation had been severed by a bullet with which he had shot himself after he had shot his love-partner as a result of a suicide pact. The girl did not survive, and the "criminal," with an arm band reading "blind" on each of his sleeves, partly amnesic and partly delusional about the event, led a prisoner's existence. His response to the therapeutic approach was remarkable despite his age (his early sixties or late fifties).

Again, there was an Italian plasterer who had killed the doctor who attended his favorite child,

INVESTIGATIVE PSYCHOTHERAPY IN CERTAIN TYPES OF CRIMINALS

GREGORY ZILBOORG, M.D., New York City

STRICTLY speaking, it would not be out of place or out of order for the psychiatrist who is interested in forensic psychiatry to re-examine his field of interest and to redefine some of the basic phenomena with which he deals and some of the fundamental concepts that he customarily uses. A certain general confusion has begun to infiltrate our terminology as well as our methods of approach. The word "criminal" requires careful pondering; the term "antisocial behavior" requires elucidation. Is a fifth-columnist antisocial and criminal, and if so, could he be cured by means of psychotherapy? Is a striker antisocial, or criminal, and could he be benefited by a psychotherapeutic approach? Is an army deserter antisocial and criminal in the sense in which we use these words, and could he be psychoanalyzed out of his wish to desert the army? Evidently we call criminal and antisocial the individual who either has already transgressed the law, is already serving a sentence, or has been paroled.

In other words, quite imperceptibly and unwittingly, we have drifted into silently accepting the definition of the criminal as given us by the law and not by psychiatry. There may be no objection to our accepting the legal definition, provided we keep always in mind the fact that the definition is not ours. Our attitude toward the criminal should remain our own, regardless of the attitude of the law. If we consider the criminal an individual in trouble, curable or potentially curable, and his crime a symptomatic phenomenon, we may perhaps find ourselves in a better position as therapists of this particular type of disorder or human misfortune. This is a point of prime importance, for the therapist cannot be an ally of the law. He need not and should not necessarily be an opponent of the law, but he cannot be an active proponent. He must treat the law itself, first, merely as a social phenomenon, and, second, as a condition, a circumstance, a potent factor which the individual called the criminal has to face and meet and handle psychologically, and to which he must adjust himself.

No true therapeutic situation is really possible without the doctor's detached observational attitude toward these matters. Moreover, the doctor vitiates the therapeutic situation in all respects unless his relationship to the prisoner or the paroled criminal is totally free from any administrative authority. A doctor who has

official administrative control over the patient has almost insurmountable difficulties in his therapeutic efforts. More than that, a doctor who has control over a prisoner, who is an official part of the prison machinery administering justice, is in my opinion almost totally unable to exercise any true therapeutic influence on the prisoner.

These considerations are not merely theoretic assumptions; they are based on many years' experience of many psychotherapists. They are easily verified and corroborated by anyone who has done work in prisons, an opportunity that I had when I worked as a volunteer in Sing Sing Prison. I found that the classification clinic, no matter how good its work, was considered by the criminal to be a part of the prison—that is, a part of the punitive system. The criminal complied with its demands and its routine because he had to; moreover, he was convinced that, no matter how humane the attitude of the prison psychiatrist, whatever he, a prisoner, would say or reveal had to become a part of the record. He felt keenly that whatever kindness was extended to him and whatever tests he was subjected to, they all—to use the words of Bernard Glueck—tended to make him a better prisoner rather than a better citizen. Under these circumstances, the prisoner seldom, if ever, found himself in a state of therapeutic compliance; he was, instead, in his usual state of enforced administrative compliance.

From this point of view, my brief investigative experience seemed to me instructive enough to warrant sharing it with others.

I was received in Sing Sing with the reluctant welcome characteristic of such institutions, but thanks to kindly understanding on the part of Dr. Amos T. Baker, then head of the classification clinic in Sing Sing, I was permitted to speak with any prisoner in whom I was particularly interested—to speak with him alone and freely, without owing any account of what I learned to any authority. As long as I obeyed the rules of the prison, I was free to work.

A list of prisoners I wished to see was given in advance to the proper office, and on my next visit the prisoners were ready and waiting in a room nearby. I would see each one alone, in a separate room, behind a closed door. I would address the prisoner as Mr. So-and-So, would shake hands with him. During the initial interview, I would state that I was not a part

OSTEOGENIC SARCOMA OF VERTEBRAE SECONDARY TO PAGET'S DISEASE

Report of Three Cases with Compression of Spinal Cord and Cauda Equina

ELDRIDGE CAMPBELL, M.D., and ROBERT D. WHITFIELD, M.D., Albany, New York

OSTEOGENIC sarcoma occurs not infrequently in patients with Paget's disease of bone. These tumors have been reported as having arisen in the long bones, the pelvis, and the skull. Despite the fact that the vertebrae are among the more frequent sites of predilection for osteitis deformans, malignant degeneration therein has seldom been recorded. The authors' recent observation of 3 such cases makes them wonder if this condition is as unusual as has hitherto been supposed. It therefore appears worth while at least to call the attention of the profession to this experience.

Case Reports

Case 1.—I. T. M. (A. H. 77397), a 52-year-old white blacksmith, entered the Albany Hospital December 10, 1940, having been referred by Dr Irving Gage, of Albany. He complained of pains of four months' duration in the right hip, thigh, and leg. These had gradually become more severe and were accentuated by coughing or straining. Weight-bearing on the right leg was no longer possible because of pain, and for the same reason morphine was required. Sensations of numbness and coldness were present along the posterior and lateral surfaces of the right leg and thigh. There was no history of weight loss.

The past history was of interest in that during the period from ten to five years before admission the patient had noted an increase in his hat size from 7 to 7 $\frac{3}{4}$ and at the same time the occurrence of severe headaches. At the end of that time the pains ceased and no larger hats became necessary. No change in height had been noted. He recalled having slightly sprained his back eighteen months previously. Since then he had suffered recurrent attacks of lower back pains, but these had not been sufficiently severe to keep him from work. For one month before admission, he had developed moderate frequency of urination. For this reason he had been cystoscoped but was told that no abnormality of the bladder or prostate had been found. The family history was noncontributory.

Physical examination: Examination disclosed a strong, well-muscled individual, obviously suffering excruciating pains. These were localized principally in the right calf and ankle, and were greatly accentuated by even slight movements of the back or right leg. Save for moderate enlargement of the calvarium, and for bilateral diminution of hearing,

the general physical and neurologic examinations were negative, with the following exceptions: There was evident atrophy in the muscles of the right thigh; at corresponding levels the circumference was 16 inches in the right thigh and 17 inches in the left; the calves each measured 11 $\frac{3}{4}$ inches. Fibrillary twitching was observed in the muscles of the lower extremities, especially those of the right thigh. The knee jerks were hyperactive, to a greater degree on the right; both ankle jerks were abolished. No abnormal reflexes were elicited. Appreciation of cotton-wool and pinprick was totally absent on the posterior surface of the right thigh and on the posterolateral surfaces of the right calf and foot. Appreciation of heat and cold was impaired on the posterior aspect of the right thigh in a small area just below the gluteal fold. Position sense was unimpaired. Vibratory sensation was lost over the sacrum and coccyx. Straight leg raising was limited to 45 degrees on the right and to 60 degrees on the left. Patrick's sign was positive bilaterally. There was marked flattening of the lumbar curve with spasm of the right sacrospinalis muscle.

Laboratory data: Hemoglobin, 14.5 Gm. per 100 cc.; red blood cells, 5,000,000; white blood cells, 12,600. The differential white blood count was normal, as were the erythrocytes on the stained smear. The Wassermann and Kahn reactions on the blood serum were negative, and urinalysis showed no abnormalities.

A cauda equina tumor was suspected.

Roentgenologic report (Dr. W. P. Howard): "There are changes which are suggestive of Paget's disease in the sacrum and pelvis. The interpedicular measurements of the third and fourth lumbar vertebrae are normal. That of the fifth cannot be ascertained because the pedicles cannot be identified from the radiographs.

"There are also changes in the skull suggestive of Paget's disease.

"Following the instillation of lipiodol, a persistent filling defect is visible opposite the joint between the fourth and fifth lumbar vertebrae and extending below it (Fig. 1). The material as a whole is displaced to the left, and none of it extends downward opposite the lumbosacral joint when the patient is in an erect position.

"While the changes in the spinal canal may be due to a displaced disk, it is possible that they may be an expression of osteogenic tumor associated with Paget's disease."

In view of these findings, it was suspected that the tumor was a sarcoma arising on the basis of a pre-existing osteitis deformans. Operation was carried out on December 12, 1940. Under avertin

a little boy. The man was convicted to death, spent many months in the death house, saw thirteen murderers—including Ruth Schneider—pass by his cell on their way to the electric chair, was granted a new trial, and sentenced to five to ten years' imprisonment. This man did not realize what he had done till after the crime. He believed at the time of the act and later in prison that the doctor was responsible for the death of his child. Factual and psychological evidence would seem to corroborate his belief. The doctor's behavior only enhanced the man's conviction, for he asked the desperate father not to say anything to anyone and offered, as a compensation for his silence, to pay for the funeral of the little boy, whose body was at the time duly laid out in the kitchen. The paternal and religious pride of the man was enraged: "I am an Italian man," he cried, "and I bury my child myself." He struck the doctor, who fell unconscious. In a fugue-like rage, the father rushed into the kitchen where the family stood around the open coffin, seized a knife, returned to the doctor who still lay unconscious on the floor, and stuck the knife in his throat. As he saw blood, he returned to his family, announced that he had committed a crime, left at once to call on his older brother who lived many miles away, told him the story, and they both peacefully decided that his duty was to surrender to the police, which he at once did. This simple and honest plasterer may never again commit another crime. If he does not, it will not be because of the preventive power of the prison term.

He was a plasterer in Brooklyn, he was a plasterer in Sing Sing, and he continues to be an honest plasterer now in the outside world.

The psychological picture of this criminal act was highly instructive, and it shed a great deal of light on the sudden accumulation of murderous drives in an individual.

This period of investigative therapy gave rise to the following trend of thought:

1. Our prison system would do well if outsiders who have nothing whatsoever to do with the prison system would be permitted to undertake systematic individual psychotherapy within the prisons. This investigative therapy would not only permit the psychiatrist to gain extremely valuable information otherwise totally unobtainable, but it might—and if pursued long enough probably would—bring about good therapeutic results which would not only help the future adjustment and rehabilitation of the criminal, but would also help in the problem of true understanding of the origin and meaning of crime. Perhaps this understanding would offer a really potent tool for the reform of the criminal law.

2. The brief experience in Sing Sing seems also to suggest in a rather convincing manner that psychiatry could be therapeutically most effective in criminal cases if it were organized for this purpose independently of any agencies of criminal law. Such an organization of therapists, acting under its own auspices or under the auspices of the public health authorities, could then come to a workable agreement with the prison authorities, under which the psychotherapist as a free agent could treat the prisoner as if the latter were also a free and self-respecting individual. Only in an atmosphere of this type of free therapeutic endeavor might many an aspiration of forensic psychiatry for true reform come to fruition.

EXAMINATIONS IN OBSTETRICS AND GYNECOLOGY

The general oral and pathologic examinations (Part II) in obstetrics and gynecology will be conducted in Pittsburgh by the entire American Board of Obstetrics and Gynecology from Thursday, May 20, through Tuesday, May 25, 1943. The Hotel Schenley in Pittsburgh will be the headquarters for the Board, and formal notice of the exact time of each candidate's examination will be sent to him in advance of the examination dates. Hotel reservations may be made by writing to the hotel.

The Pittsburgh Obstetrical and Gynecological Society will hold an informal subscription dinner meeting at the Hotel Schenley, on Saturday evening, May 22, at 7:00 P.M. Visitors, present for the examinations, are cordially invited to make arrangements to attend. Reservations may be made by writing to Dr. Joseph A. Hepp, Secretary of the Society, at 121 University Place, Pittsburgh.

The Office of the Surgeon General (U.S. Army) has issued instructions that men in service who are eligible for Board examinations be encouraged to apply, and that they may request orders to Detached Duty for the purpose of taking these examinations whenever possible.

Candidates in military or naval service are requested to keep the Secretary's Office informed of any change in address.

Deferment without time penalty under a waiver of the Board's published regulations applying to civilian candidates will be granted if a candidate in service finds it impossible to proceed with the examinations of the Board.

Applications are now being received for the 1944 examinations. For further information and application blanks, address Dr. Paul Titus, Secretary, 1015 Highland Building, Pittsburgh (6), Pennsylvania.

Soon after returning home, the patient began to lose weight. The pains became more severe and more widespread throughout the legs, hips, and lower back, requiring frequent, large doses of morphine. He died on May 26, 1941, five and one-half months after operation and nine and one-half months after the first symptoms.

The history and neurologic findings were typically those of a cauda equina tumor. This was confirmed roentgenographically following lipiodol injection. Paget's disease of the sacrum and skull were also demonstrated. This combination of factors strongly suggested the probability of sarcoma.

It was hoped that removal of the intraspinal tumor and division of the first sacral nerve would afford considerable relief of pain. In retrospect, it would have been desirable to have performed a more extensive posterior rhizotomy or, perhaps better still, a cordotomy, when the nature and location of the tumor were disclosed.

Histologically, this tumor more closely resembled a chondrosarcoma than an osteosarcoma. The latter type is that which has usually been encountered in Paget's disease.

Case 2.—E. K. (S. P. H. 41-3403), a 53-year-old white painter, was admitted to St. Peter's Hospital on November 24, 1941, at the instance of Dr. James F. Rooney. For the previous month he had complained of pain in the upper back, radiating to both shoulders, and in the sacral region. He had continued to work, however, until seven days before entering the hospital, when weakness and numbness appeared in both legs, and the pain previously noted became intolerable. In the right knee and the right side of the abdomen, he experienced almost continuous painful sensations of pressure. Urinary symptoms had not occurred prior to admission. There was no history of weight loss.

The past history was significant in that, beginning two years before, his stature had decreased. During this time he had become noticeably hunch-backed. He had not observed any change in the size of the head, but he stated that for many years he had worn the largest size hat available, usually 7 $\frac{3}{4}$. There was also a history of mild hypertension, for which he had been under a physician's care for five years.

Physical examination: Although he was one of those bravely cheerful individuals who tend to minimize discomfort, his suffering was nevertheless obvious. The head, or rather the calvarium, was large. Temperature, pulse, and respirations were normal. Blood pressure was 120/90. Abnormal physical findings were as follows: The scalp was thin, making tortuous temporal arteries and scalp veins stand out all the more prominently. Marked kyphosis was evident in the upper dorsal region. No bowing of the femora or tibiae was present. The chest was barrel-shaped and hyperresonant. The heart was slightly enlarged, and a soft systolic murmur was audible at the apex. There was

FIG. 3. Case 1. Microphotograph showing chondrosarcoma. Note cartilaginous tumor tissue on the left and neoplastic bone formation on the right. H. and E. $\times 120$.

some thickening and tortuosity of the radial and brachial arteries.

Marked spasticity and weakness of both lower extremities were found. A sensory level was discovered bilaterally at the seventh dorsal dermatome, below which all forms of sensation were partially abolished. Deep reflexes in the legs were hyperactive and plantar responses were bilaterally extensor in type. The bladder was distended; the patient was unable to void.

By the following morning the weakness of the legs was much more marked, while the sensory loss below the seventh dorsal dermatome was almost complete. A small area of considerable tenderness was found over the spinous processes of the fifth and sixth dorsal vertebrae.

Laboratory data: Hemoglobin, 61 per cent; red blood count, 3,420,000; white blood count, 6,000. The differential white blood count showed no abnormalities. Urinalysis disclosed a trace of albumin and a few fine granular casts, but was otherwise negative.

Blood chemistry: Calcium 8.0 mg. per cent; phosphorus, 4.1 mg. per cent; phosphatase, 23.1 Bodansky units.

Roentgenographic study of the thoracic spine (Dr. I. J. Murnane): In many of the vertebrae, coarsened trabeculation and some increase in the density of the cortices could be seen. There was almost complete destruction of the body of the seventh thoracic vertebra and partial destruction of the body of the eighth with collapse, causing rather marked kyphosis in the midthoracic region (Fig. 4). There were also extensive hypertrophic arthritic changes throughout the thoracic spine—in places causing almost complete bridging between the bodies.

Films made following the cisternal instillation of lipiodol disclosed a complete block at the level of the fifth to sixth dorsal vertebrae.

Thick, coarse trabeculation was visible also in the upper end of the left humerus, and there was some thickening of the cortex of the left clavicle.

FIG. 1. Case 1. Lipiodol myelogram showing complete obstruction of the spinal canal opposite the fifth lumbar vertebra. The roentgenographic changes characteristic of Paget's disease are unsatisfactorily reproduced in this film.

anesthesia the spinous process and laminae of the fifth lumbar vertebra were removed. A tough, elastic extradural tumor was found on the right side, partially filling the lower lumbar and sacral canal.

When the upper sacral laminae were rongeuired away, the mass was seen to be attached to the bone in the region of the first right sacral foramen. The first sacral root was surrounded by tumor and was resected with it (Fig. 2). Within the canal, the other sacral nerves were somewhat compressed by the growth. It was obvious that the tumor was malignant, and that it extended beyond feasible limits of resection. The wound was closed in layers with fine silk.

Pathologic report (Dr. A. W. Wright): "The specimen consists of one large and five small, irregular pieces of pinkish-red, dense, smooth, shiny fibro-elastic tissue. The large piece measures 5.0 by 1.0 by 0.5 cm. The small pieces measure about 0.8 by 0.6 by 0.3 cm. Together they weigh about 4.0 Gm. On section the tumor feels gritty and firm and appears quite vascular. The cut surfaces are pale white and homogeneous.

FIG. 2. Case 1. Chondrosarcoma of sacrum after partial excision. The smooth oblong portion extended upward into the lumbar canal. The tumor was entirely extradural.

"On microscopic examination (Fig. 3) the tissue is seen to consist chiefly of small masses of differentiated hyalin cartilage arranged in somewhat nodular fashion with a definite perichondrium. In some areas, however, the mesenchymal cells have not fully differentiated into cartilage, but are oval or spindle-shaped, with much intercellular hyalin material. Calcium deposits can be seen near these areas among the cartilage cells, and adjacent to them lie many multinucleate giant cells, apparently osteoclasts.

"Reference to an authoritative monograph on bone diseases does not disclose any description of a histological appearance of this sort as an integral part of Paget's disease. The extradural mass is considered to be a true neoplasm of mesenchymal origin, growing chiefly as a chondroma, but containing foci of undifferentiated cells which may represent early sarcomatous change."

The incision healed promptly, and for a few days the patient appeared to be slightly improved. Soon, however, the pain recurred and became so severe that opiates again had to be administered. Deep x-ray therapy was instituted. When a total of 1,125 r had been given over a period of ten days, the treatments were discontinued at the request of the patient.

At discharge, four weeks after operation, he was able to walk unassisted. Straight leg raising was accomplished to 90 degrees on either side. The neurologic findings were essentially unchanged, save for hypo-esthesia in the third and fourth right sacral dermatomes. A small hard mass on the anterior surface of the upper sacrum could be felt by rectum.

Soon after returning home, the patient began to lose weight. The pains became more severe and more widespread throughout the legs, hips, and lower back, requiring frequent, large doses of morphine. He died on May 26, 1941, five and one-half months after operation and nine and one-half months after the first symptoms.

The history and neurologic findings were typically those of a cauda equina tumor. This was confirmed roentgenographically following lipiodol injection. Paget's disease of the sacrum and skull were also demonstrated. This combination of factors strongly suggested the probability of sarcoma.

It was hoped that removal of the intraspinal tumor and division of the first sacral nerve would afford considerable relief of pain. In retrospect, it would have been desirable to have performed a more extensive posterior rhizotomy or, perhaps better still, a cordotomy, when the nature and location of the tumor were disclosed.

Histologically, this tumor more closely resembled a chondrosarcoma than an osteosarcoma. The latter type is that which has usually been encountered in Paget's disease.

Case 2.—E. K. (S. P. H. 41-3403), a 53-year-old white painter, was admitted to St. Peter's Hospital on November 24, 1941, at the instance of Dr. James F. Rooney. Blood chemistry: Calcium 8.0 mg. per cent; phosphorus, 4.1 mg. per cent; phosphatase, 23.1 Bodansky units.

Roentgenographic study of the thoracic spine (Dr. I. J. Murnane): In many of the vertebrae, coarsened trabeculation and some increase in the density of the cortices could be seen. There was almost complete destruction of the body of the seventh thoracic vertebra and partial destruction of the body of the eighth with collapse, causing rather marked kyphosis in the midthoracic region (Fig. 4). There were also extensive hypertrophic arthritic changes throughout the thoracic spine—in places causing almost complete bridging between the bodies.

Films made following the cisternal instillation of lipiodol disclosed a complete block at the level of the fifth to sixth dorsal vertebrae.

Thick, coarse trabeculation was visible also in the upper end of the left humerus, and there was some thickening of the cortex of the left clavicle.

FIG. 4. Case 2. A. and B. Anteroposterior and lateral roentgenograms of spine showing extensive changes characteristic of Paget's disease from the fifth to the eleventh dorsal vertebrae. Note the kyphosis beginning at the collapsed bodies of the seventh and eighth. The type of collapse is that characteristic of pathologic fracture. Irregularly increased density and coarsened trabeculation are evident.

The cranial vault (Fig. 5) was markedly thickened, this process having involved both inner and outer tables. Diffuse mottling was present.

On the basis of these findings, a diagnosis was made of Paget's disease with pathologic fractures of the seventh and eighth dorsal vertebrae. In view of the destruction evident in the body of the seventh vertebra and of our experience with the previous case, a tentative diagnosis of sarcoma was made.

Operation (November 25, 1941): Under novocain infiltration anesthesia, the spinous processes and laminae of the fifth, sixth, and seventh dorsal vertebrae were removed. Lying outside the dura was a large, grayish-red tumor. It was not so tough as was that in Case 1, but it was more vascular. It was situated principally on the right side of the spinal canal and extended into the intervertebral foramina. The pedicles, laminae, and apparently the bodies of the fifth and sixth dorsal vertebrae were involved. A large tongue of tumor tissue was present anterior to the dura, thrusting the cord backward. The chief portion of the tumor within the spinal canal was removed. All tissues were unusually vascular, particularly the bones. This was true not only of the spinous processes and laminae involved in the sarcoma, but also of those in which the pathologic process was limited to osteitis deformans. Osseous tissue everywhere was so soft and spongy that it could readily be cut with a knife. One wondered why the kyphosis had not been even more marked!

It was necessary to make a 4 or 5-cm. opening in the dura in order to gain satisfactory decompression.

Closure was then effected in layers, using interrupted sutures of fine silk. A transfusion of 500 cc. of whole blood was given at the end of the operation.

Pathologic study of the tumor (Dr. John J. Clemmer, Bender Laboratory): "The specimen consists of three masses of friable, opaque, yellowish-gray, somewhat granular tissue, the largest measuring 2.5 by 1 by 0.6 cm. and the smallest 0.9 by 0.5 by 0.4 cm. The largest appears to contain numerous minute bony trabeculae.

"Also received were numerous ragged fragments of bone with attached striated muscle and fibroadipose tissue forming a mass together about 3.5 cm. in diameter. Some of these fragments appear somewhat more brittle than normal and show poorly defined architecture.

"Microscopic examination: Sections of the soft tissue (Fig. 6) show large polygonal-shaped cells with ovoid nuclei of variable size and much bluish-red, intercellular material resembling osteomucin. Scattered foci of partial calcification, staining deep purple, are noted. Multinucleate tumor giant cells are numerous, and spindle-cells are intermingled with the other types mentioned. Mitotic figures are moderately numerous.

"Sections of bone tissue, which apparently has been submitted from the Paget's lesions (Fig. 7) at a distance from the tumor, show irregular bony trabeculae with intermingled loose fibrous tissue. Large multinucleated, giant osteoclasts are scattered about, and many of the bony trabeculae exhibit

crenated margins suggesting osteolysis. Other trabeculae show osteoblasts along the margins, with evidence of osteogenesis. The fibrous tissue contains relatively few blood cells. Those cells present included lymphocytes, myelocytes, nucleated reds, and a rare polymorphonuclear.

"Diagnosis: Osteogenic sarcoma of the sixth and seventh thoracic vertebrae; Paget's disease of bone."

Recovery from operation was satisfactory, and the wound healed per primam. The patient was soon able to move both legs; the knee and ankle jerks returned; and the plantar responses became flexor in type. Bladder control was regained for a time. Sensation, however, was little improved, the sensory level to all modalities save cotton-wool remaining at the seventh dorsal dermatome. Appreciation of light touch became normal over the entire body at first although it later faded out again.

The patient was discharged to a nursing home on January 3, 1942. Within a few weeks, evidence of cord compression was again noted. This has progressed to a point of total motor and sensory paralysis below the level of the tumor. At the present time he is still free from pain but is steadily losing weight and going downhill. No evidence of metastasis is apparent, although another roentgenogram of the chest has not been made.

As in the first case, the development of symptoms was relatively rapid. The onset of pain had occurred but a month before and the patient had worked as a painter until seven days before the transverse myelitis became almost complete. Operation relieved his pain but afforded only a brief respite from cord compression.*

In the following case the existence of sarcoma was unproved either by operation or by autopsy. However, the history, physical, and roentgenologic findings and subsequent course were so strikingly similar to those in the first two patients that it has been included here.

Case 3.—A. M. A. (A. H., 89485), a 64-year-old white widow, was admitted to the Albany Hospital under the care of Dr. T. J. C. von Storch on December 9, 1941. For the previous three and one-half months, she had complained of pains which began in the midsternal region and radiated around the costal margins. At first these were on the right side only, but soon they became bilateral. Four weeks before admission weakness and numbness of both legs had appeared. This had progressed until two days before entry when she became completely paralyzed below the waist. She was incontinent of both feces and urine.

In the past history it was of interest that she had suffered a right hemiplegia fifteen years previously. This had almost cleared up, leaving but slight

FIG. 5. Case 2. Lateral roentgenogram showing Paget's disease of skull with typical "cotton-wool" appearance of calvarium.

lameness in the right leg. For many years vision in the right eye had been poor because of a slowly developing cataract. The family history was non-contributory.

Physical examination: The patient was an obese white woman exhibiting a somewhat enlarged heart, evidence of generalized arteriosclerosis, and a mature cataract in the right eye. The abnormal physical findings were as follows: There was spastic paraplegia in extension of the lower extremities, with the absence of all voluntary movement save in the toes of the right foot. The deep reflexes in the lower extremities were markedly hyperactive, with bilateral, sustained ankle clonus. The abdominal reflexes were absent while the plantars were extensor in type. There was a sensory level for all modalities of sensation (save for vibratory sense, which was imperfectly preserved everywhere) at the level of the sixth dorsal dermatome.

Laboratory data: Hemoglobin 14.5 Gm. per 100 cc.; red blood cells, 4,890,000; white blood cells, 5,4000. The differential white blood count was normal, and the erythrocytes appeared normal on the stained smear. Urinalysis disclosed no abnormalities.

Blood chemistry: Calcium, 10 mg. per cent; phosphorus, 3.5 mg. per cent; phosphatase, 10.5 Bodansky units.

Roentgenographic examination of the stomach and colon disclosed no abnormalities. That of the skeleton showed (Dr. W. P. Howard): "The bodies of the fourth, fifth, sixth, and seventh dorsal vertebrae are unusually dense and the anterior portion superiorly of the body of the eighth has similar changes (Fig. 8). The body of the sixth dorsal

* Following the submission of this paper, the patient described in Case 2 died on May 3, 1942. A complete post-mortem examination was made showing osteogenic sarcoma of the fifth and sixth thoracic vertebrae with compression of thoracic portion of spinal cord by tumor; osteogenic sarcoma, metastatic, of the right lung and pleura; and Paget's disease of vertebrae and skull.

FIG. 6. Case 2. Microphotograph of osteogenic sarcoma showing pleomorphism of tumor cells and an abortive attempt at bone formation. The neoplasm is well vascularized and mitotic figures are relatively frequent. H. and E. $\times 120$.

FIG. 7. Case 2. Microphotograph of spinous process uninvolved by tumor mass. Note the diffuse fibrosis, the numerous osteoblasts lining newly formed bone, the destruction of bone by osteoclasts, and the irregular bone trabeculae resulting from this simultaneous osteogenesis and osteolysis. These changes may be considered typical of osteitis deformans. H. and E. $\times 120$.

vertebra is reduced to one-half of its vertical diameter, and the intervertebral articulations between these bodies show evidence of partial destruction of the cartilage.

"Similar changes are visible in the left side of the pelvis involving the ilium, the acetabulum, and the superior and inferior rami of the pubis (Fig. 9). The rami are unusually thick.

"The findings in this case are those of Paget's disease. However, tumor cannot be definitely excluded.

"There are no changes visible in the bones of the skull."

The presence of a sarcoma is suggested by the invasion of the articular cartilages, which does not occur in uncomplicated osteitis deformans.

That the patient had Paget's disease was clear. The level of the spinal cord lesion was opposite the collapsed body of the sixth dorsal vertebra. Both the history and the roentgenologic findings were consistent with the diagnosis of sarcoma arising on the basis of osteitis deformans. However, it is quite possible that the vertebral collapse was simply due to the softening of Paget's disease, as has been described by Wyllie¹ and others.

Laminectomy was recommended but was refused by the patient. She was discharged to her home, where she died three weeks later. Permission for autopsy was not granted.

Discussion

Incidence of Paget's Disease.—That Paget's disease is not a rarity may be judged from the fact that 146 cases have been discovered (among 94,962 patients) in the Department of Roentgenology of the Albany Hospital during the

past ten years. This represents an incidence of 1:650. While these figures are somewhat higher than those of certain observers (Bird,² 1:3,000; Hurwitz,³ 1:10,000), they nevertheless attest the general frequency with which this malady may be encountered.

Occurrence of Malignant Degeneration.—In his original description of the disease which bears his name, Paget⁴ recorded an instance of sarcoma arising from osteitis deformans of the radius. Numerous subsequent reports have shown that this dreadful complication is to be expected in a small percentage of cases. Packard, Steele, and Kirkbridge⁵ found 5 instances of sarcoma among 67 cases, an incidence of 7.5 per cent. An example of multiple sarcoma formation was that recorded by Gruner, Scrimger, and Foster.⁶ Bird² added 9 verified cases, an incidence in his series of about 10 per cent, while Ochsner and Gage⁷ and Breslich⁸ added one each.

After studying the files of the Bone Tumor Registry, Codman⁹ stated: "Apparently bone sarcoma does not arise in the unhealthy after 50 except in cases of Paget's disease. If the patient was in poor health at the time of onset, the probabilities favor the tumor being inflammatory—tuberculosis, syphilis, osteitis, etc. With the exception of cases which also have Paget's disease, 12 in number, we have no instance of osteogenic sarcoma in a patient over 50. Paget's disease rarely occurs before 50. As recently computed by Bird and Sosman, the incidence of osteogenic sarcoma in Paget's disease is 12 to 14 per cent (personal communication)."

FIG. 8. Case 3. A. and B. Anteroposterior and lateral roentgenograms of dorsal spine showing increased density in the bodies of the fifth, sixth, and seventh vertebrae with partial collapse of the sixth. The intervertebral spaces in this region appear narrow. The diagnosis of sarcoma cannot be positively made but was suggested by the appearance of the vertebrae and the subsequent clinical course.

The experience of Coley and Sharp¹⁰ was similar. They also drew attention to the fact that these tumors are resistant to radiation, and that of their 20 patients none had survived five years.

Compression of the Spinal Cord in Paget's Disease.—Several instances of transverse myelitis of varying degrees have been reported. Many of these were associated with kyphosis and vertebral body collapse, others with marked local narrowing of the spinal canal by thickened bone, with little disturbance of its normal curvature. On the other hand, a careful search of the literature has revealed but 3 cases^{11,12,13} with sarcoma of the vertebrae. In each there were malignant tumors in other bones, so that it was difficult to determine which was the primary growth.

Diagnosis.—The clinical pictures presented by our 3 patients had certain common features. All complained of increasingly severe backache, evidence of compression of either the spinal cord or of the cauda equina, and of radiating pains corresponding to more than one spinal nerve. All were over 50 and all showed definite clinical and roentgenologic evidence of osteitis deformans. Essentially the picture was that of an extradural malignant tumor in a patient who was found to be suffering with Paget's disease.

Treatment.—Neither the prevention nor the cure of Paget's disease is known; by the same

token osteogenic sarcoma, which sometimes arises from it, cannot be prevented, and when it does occur, little can be done toward effecting a cure. In long bones, amputation offers slight hope, while in the skull a wide excision is occasionally possible. In the spine, resection is obviously out of the question. These tumors are notoriously resistant to radiation, as has been previously pointed out.

FIG. 9. Case 3. Anteroposterior roentgenogram of pelvis showing changes typical of Paget's disease in the left ilium, ischium, and pubic rami.

Laminectomy may, in certain instances, be worth while. Decompression of the cord can thus be effected, and at the same time one may further relieve pain by dividing any posterior roots which are already encroached upon by the tumor or seem likely to be encroached upon later. Although our small experience does not bear it out, it would appear from the case reports in the literature that cord compression in Paget's disease is usually *not* due to malignant degeneration. This is all the more reason for advising operation, since a prolonged or permanent benefit might be expected under such circumstances. This, indeed, has been the experience of Schwarz and Reback¹⁴ and others.¹⁵

Before recommending surgical intervention in any particular case, it is well to bear in mind that these patients are not the best of operative risks. Osteitis deformans is frequently associated with a marked degree of arteriosclerosis. Furthermore, the affected bones are quite vascular, and bleeding may prove troublesome, whether or not malignancy coexists. In Case 2, a transfusion of whole blood was necessary at the close of the operation.

Summary and Conclusion

Sarcoma may arise from the vertebrae as well as from any other bone affected with osteitis deformans. Compression of the spinal cord and nerves follows quickly. Three such cases (one unconfirmed) are recorded. The first was a chondrosarcoma, the other an osteogenic sarcoma. These tumors, both in our experience and in that of others, are highly malignant. Radiation offers little or nothing, while resection is obviously out of the question. Actually, however, we have found no record of a five-year cure following excision even when the tumor occurred in the skull or long bones.

The spinal cord may be compressed by the buckling of vertebrae softened by osteitis deformans, unassociated with malignant degeneration. Hence laminectomy is often indicated, particularly if there be any doubt regarding the diagnosis. Under such circumstances, very satisfactory relief of symptoms has been known to result. If, on the other hand, a sarcoma is discovered, some temporary benefit may result from decompression and from division of the involved posterior nerve roots. The prognosis in sar-

coma of any bone secondary to Paget's disease is very poor.

Discussion

Dr. Jefferson Browder, *Brooklyn*—Drs. Campbell and Whitfield have called attention to a rather uncommon lesion which may encroach upon the vertebral canal and eventually implicate the spinal nerves and spinal cord. It is to be recalled that Paget's disease may produce bone changes that result in spinal cord compression without there being a demonstrable neoplastic process. In addition, fractures of the softened vertebrae occur which also have been the causative agent in spinal cord dysfunction. My own experience with Paget's disease implicating the spinal cord is limited to 4 cases. Three of these showed evidence on roentgen ray examination of vertebral body collapse resulting from pathologic fractures, whereas in the fourth instance the pedicles and laminae were sufficiently enlarged to compress the spinal cord. Under these circumstances the problem is rather simple from a therapeutic point of view—namely, wide unroofing of the spinal intradural structures. A rather interesting feature of this lesion is the marked vascularity of the disease and bone encountered at operation. The tumefaction produced by a sarcoma arising from Paget's disease of the vertebrae probably presents a rather difficult situation surgically. Although I have had no such cases, it seems that the best one could expect would be temporary improvement following partial removal of the mass. Drs. Campbell and Whitfield are to be congratulated on their management of the patients in this group.

SCHOOLS TEACH FIRST AID

During the present school term, all seniors in the New York City high schools and vocational schools are receiving Red Cross first aid instruction as a

substitute for the usual fourth-year hygiene course. This step was taken as a war measure so that every family may have first aid training.

MEDICOLEGAL ASPECTS OF TRAUMA AND MALIGNANT TESTIS TUMORS

JUDSON B. GILBERT, M.D., F.A.C.S., Schenectady, New York

THE eternal lure of a single cause and a single cure for tumors has intensified the belief in "traumatic" cancer. Such fallacy has been perpetuated by wishful thinking on the part of the layman, the medical, and the legal professions. In a disease such as testis cancer, where an exposed organ is subject to frequent injury, and which normally accounts for approximately 1 per cent of malignant disease, the incidence would be immensely increased if trauma were a causative factor.

In general, much more sound opinion has been given by medical experts than by legal minds. However, an obvious lack of accurate observation and diagnosis by the first physician consulted is noted in the entire study of cancer of the testis.

The pitfalls in general diagnosis,¹ and in small tumors in particular,² have been discussed previously in detail. It is enlightening that in 150 small testis tumors, 59 were diagnosed as benign scrotal lesions, and only 32 of these were suspected to be tumors. The majority had already metastasized into the abdomen, thorax, or neck. If these difficulties are found in cases not involving litigation, how much more difficult is the problem when real or alleged trauma is involved. Until the early handling of these cases improves in general, little progress will be made in proper diagnosis, adequate treatment, or the equitable settlement of claims.

Baring's excellent monograph,³ written in 1833, is a discussion of this relationship with a viewpoint that is almost modern. On the whole, he concluded that an uncritical attitude existed toward such injuries, and he did not believe in the direct relationship between injury and trauma. He emphasized that "unconscious" trauma was frequent and not usually called to the physician's attention.

In a classic paper concerning the modern attitude toward traumatic cancer, Ewing⁴ laid down sound rules for the investigation of these cases. Both Ewing and Knox⁵ reviewed the literature critically and came to the general conclusion that much early writing was based neither on adequate medical observation nor on sound legal opinion, many reports being merely a "collection of anecdotes!"

The standard medicolegal criteria cannot be too often repeated. They are: (1) authenticity and adequacy of the trauma, (2) previous integrity of the wounded part (traumas reveal more malignant tumors than they cause), (3) origin of tumor at the exact point of injury, (4) reasonable time limit between injury and appearance of the tumor—the continuity of symptoms, and (5) positive diagnosis of presence and nature of tumor.

Histories covering the related sequence of events, with definite time intervals, are extremely rare in the entire cancer literature, and no less so in testis tumors. Several patients with widespread metastases have been examined by Dean,⁶ claiming damages because of testicular injuries received within the preceding three or four weeks. Obviously the primary tumors were present before the injury occurred.

From 1880 to 1939, inclusive, 331 authors reported 649 individual cases of alleged trauma preceding tumor development. No collective reviews are included. Of this total only 15, or 2.4 per cent, were reported as true hematomas or hematoceles associated with tumors. The most obvious mistake is usually the omission of a competent examination prior to employment or war service, or in the course of insurance examinations, in which the scrotum is carefully palpated and definitely noted to be normal. Such examinations are extremely rare.

The histories of tumors developing during or after war service appear to be the only records available for such study. A reasonable assumption can be made that these men were apparently found healthy during induction examinations.

Through the courtesy of Colonel Ash,⁷ Curator of the Army Medical Museum, a survey of all the testis tumor material was made prior to August, 1940. A small number of these cases may be unrelated to active army service. From a total of 142 cases, 25 histories contained references to alleged trauma, giving an incidence of 17 per cent. In two of these cases, Nos. 21 and 25, the alleged injuries were probably sustained to enlarged testes—in other words, to previously existing, symptomless tumors.

The clinical diagnoses in this series of 25 cases were: probable tumor, 13; orchitis and hydrocele, 3 each; kidney tumor (due to metastases), 2; epididymitis, gumma, benign tumor, and appendicitis, 1 each.

In the examination of 21 tumors developing

Read at the Annual Meeting of the Medical Society of the State of New York, New York City, April 29, 1942.

This paper is No. 7 in a series of "Studies in Malignant Testis Tumors."

* Two cases of injury to pre-existing tumor

incidental to army and war injuries, it was found that the diagnosis of tumor was made after slight delay. Hematoceles were diagnosed by Lucarelli (1933) and Wuethrich (1936). Two were treated as hernia by Edel (1931) and Heinicke (1935). Pfeiffer (1926) diagnosed tuberculosis, and Ullrichs (1929), atrophy.

Compensation awards were made in the cases of Chimisso (1922) in the Italian army, and Ullrichs (1929), and Wuethrich (1936) in the German army. In the other cases, while no decision was stated, the inference is probable that such awards were made, since only Edel's patient was denied compensation. On careful questioning, Dean completely exposed the lack of alleged trauma directly to the scrotum in two patients who claimed compensation after World War I. In one a rifle butt had struck the inner aspect of the thigh, while the other had been kicked on the buttock by a mule.

Finney, in a study of cancer in the United States Army between 1917 and 1919, found reports of 9 cases, but gave no detailed information. Six of the 21 war reports specifically stated injuries from bayonet wounds, bullets, or shells. The remaining 15 cases were related to general

injuries which could occur in strenuous civil activity.

Differential Diagnosis

The incidence of benign intrascrotal lesions other than tumors is high. The more common are:

(a) Epididymitis. The chronic enlargement of the epididymis, without pain, will usually be due to tuberculosis, residual gonorrheal, or non-specific infection. The true tumors of this organ are almost invariably misdiagnosed as tuberculosis. As there is nothing definitely characteristic about these firm, irregular enlargements, open exploration and epididymectomy are indicated. Beading or induration of the vas is often present, and infections of the prostate and seminal vesicles are usually associated with chronic epididymitis. A most unusual combination of diseases that would tax the ability of the best diagnostician was reported by Wesson⁸ in Case 23. A 39-year-old patient, who had had gonorrhea and syphilis at the age of 25, suffered an alleged injury while riding horseback. A left epididymitis, prostatitis, and seminal vesiculitis, together with an enlarged

testis (7 by 7 by 10 cm.), were present. Right orchidectomy revealed a seminoma of the testis.

(b) Hematocele may occur spontaneously. When it does, acute pain is the rule, and the correct diagnosis can usually be made. Hematocele also frequently follows the tapping of hydrocele. If there is trauma, then the underlying condition is often confused with a pre-existing tumor. There is discoloration of the scrotal skin, and the organ is heavy and solid in consistency. After active bleeding stops, the pain generally subsides. Prompt open operation is indicated, which both establishes the diagnosis and permits the ligation of vessels and evacuation of the blood clot.

Three authors give interesting histories of spontaneous hematocele followed by or coincident with tumor development. These two conditions can coexist, indicating the care necessary in careful differential diagnosis.

Guibe (1908, No. 2): A 25-year-old patient was operated upon for a painful hematocele five months prior to the removal of a seminoma of the right testicle. Two months later a local recurrence was removed and the left testis, which contained a "nodule," was transposed to the right scrotum.

Fayol (1912, No. 2): A 35-year-old patient suffered pain in the right scrotum for three days. Hematocele was diagnosed, together with a bilateral inguinal hernia. Orchidectomy revealed a myxosarcoma (teratoma?).

Contini (1935): A 46-year-old patient had a left varicocele removed when he was 21 years old. Twenty-five years later the right testis became enlarged for a period of four months, when a seminoma associated with hematocele was removed.

A severely traumatized testicle was immediately removed by Dean,⁶ under the probable diagnosis of hematocele. Careful study of the center of the mass showed the presence of early cancer.

The particularly scanty literature on hematocele since 1900 is noteworthy. Only 43 references exist in the English periodical literature from 1799, and since the usual textbook description is very brief, the end-result studies of such cases are practically nil. Considering the great danger of malignant tumors and the common complaint of scrotal injuries to compensation courts, this lack of knowledge of the natural history of hematocele is a serious defect in the accurate judgment of these injuries.

A study of 235 malignant intrascrotal but extratesticular tumors showed that in 41 tumors of the tunica vaginalis, the trauma incidence was 14.5 per cent; in 90 tumors of the epididymis, the incidence was 16.5 per cent, and also 16.5 per cent in 104 tumors of the spermatic cord. It is interesting that this incidence of 15 per cent is about the same as in the testis tumors proper.

The sufficiency of the trauma cannot be doubted in cases where traumatic displacement or forcible luxation of the testis has been described. Twenty such reports are given in reasonable detail. A remarkably long average interval of seventeen years elapsed between this violent trauma and recognized tumor development as stated by the patient. The shortest interval, of 2.5 years, occurred in the teratoid group, while in the unicellular tumors the average interval was 20.5 years. The admitted pre-operative duration was seventeen months. Violence of the trauma is indicated by the fact that 12 were displaced into the abdomen, while the remaining 8 were transposed into the inguinum. The great Thomas Huxley had a similar situation

in mind when he said, "The greatest tragedy of science—the slaying of a beautiful hypothesis by an ugly fact."

These unusually long intervals, especially in the unicellular group, would indicate the general unimportance of injuries as direct predisposing causes of cancer development. In another series of 20 cases where the testis was surgically replaced into the abdomen, when scrotal fixation was impossible, or during hernia operations, the average time interval between displacement and recognition of the tumor was eleven years.

Congenital displacement or inguinal ectopy shows a significantly higher percentage of alleged traumatic injuries. Compared with the average trauma incidence in scrotal tumors, of 15 per cent, the incidence was as follows: 259 unicellular tumors, 17 per cent; 56 teratoid tumors, 38 per cent, and 32 cases diagnosed merely as malignant tumors, 27 per cent.

Under present compensation law procedure, it is most difficult to obtain an unbiased opinion from the injured workmen or from the family doctor, both of whom are well aware of the medicolegal-financial possibilities. Wesson⁹ has aptly stated that trauma is an eagerly remembered coincidence, and its relationship has been accepted through politeness.

Fifteen cases could be found in over 5,500 individual reports where testes were known to be enlarged prior to injury. The interval varied from a few months to many years. The injuries in these cases merely brought the patient to medical examination and corroborated Ewing's opinion that trauma discloses more tumors than it produces.

Increased enlargement of the testis following injury was definitely stated in the cases of Army Medical Museum No. 61174 by Lefort, Villar, Edel, and Deitermann. The comparison of such cases with those *without* injuries is not possible, as nontraumatized organs often take on an unexplained rapid growth.

Through the courtesy of Dr. C. W. Woodall,¹⁰ the report of an interesting problem in diagnosis and jurisprudence is cited:

Case Reports

F. L., a 34-year-old patient, was first examined by another surgeon in June, 1936. He admitted having had some discomfort in the left testicle three months prior to an automobile accident on May 3, 1936, but the testis did not become enlarged until after the accident. The day following the accident he was examined by his family doctor for possible hernia, and no enlargement of the testis was noted. Within six weeks a solid, hard, opaque, painless mass "the size of a small orange" had replaced the left testis. A left orchidectomy, performed on June 17, 1936, revealed an embryonal carcinoma 9 cm. in diameter. The patient received 8 roentgen ray treatments in eighteen days, for a total of about 3,619 roentgens, but nevertheless he developed metastases in the left cervical region and retroperitoneal space, and died on January 8, 1937.

As the result of the automobile accident and alleged trauma to the scrotum, the case came to court. Negligence was ruled and no compensation was allowed. Diverse testimony was given, both that the tumor was caused by the accident and that injury aggravated a pre-existing tumor. Since immediate examination following the alleged injury showed no evidence of recent scrotal trauma, the testimony was entirely against the evidence that trauma caused the tumor growth. The fact that a general practitioner, examining this patient shortly after the accident, failed to note the enlarged testicle, is noteworthy, especially since the patient admitted to the surgeon enlargement of the testis for three months prior to the alleged accident.

A large industry in Schenectady has been confronted only twice in the last ten years with the problem of testis tumors developing in employees. The record of one is referred to here in abstract and discloses the usual dilemma on the part of

the patient, who believed that a fall and injury to the right knee was associated with a large tumor, evidently of long standing, in the right testis. No evidence of recent scrotal injury was determined. As Wesson* has already ably pointed out, the scrotal lesions commonly observed are usually epididymitis, secondary to infections of the prostate and seminal vesicles or distant foci.

T. D., a 57-year-old Italian laborer, received an alleged injury to his right leg, when a piece of falling steel broke a plank on which he was standing, in November, 1941, a few days prior to urologic examination. The day after the accident examination disclosed no obvious injury to the knee, but an irregularly enlarged, slightly tender, right epididymis was found, and a suspensory was recommended. Tenderness persisted, and the growth increased slightly in size until February, when a diagnosis of probable tumor was made. Orchidectomy revealed an irregular mass, mainly in the epididymal region, measuring 4 by 5 by 8.5 cm., and proving to be embryonal carcinoma with lymphoid stroma. Aschheim-Zondek reactions after operation were negative, and prophylactic irradiation was instituted.

A review of 21 medicolegal records from the personal files of Dr. Ewing¹¹ showed the appallingly high incidence of 25 per cent of misdiagnoses, and two cases proved not to be tumors at all, but gumma and hematocele instead.

Of 19 cases, the following diseases were originally diagnosed: probable tumor, 5; orchitis, 3; hematocele and hydrocele, 2 each; torsion, hernia, lumbago, appendicitis, and abdominal tumor, 1 each. No clinical diagnosis was recorded in 2 other cases. The original diagnosis was correct in only 25 per cent of the cases in this series. Diagnosis of other scrotal lesions was made in 9 cases, while in 3 others distant metastases clouded the correct diagnosis of testis cancer.

Ewing accepted a possible relation between the trauma and accelerated tumor growth in 4 cases. In 3 others the time interval was considered too short to be of etiological significance. In 4 instances the trauma apparently called attention to the pre-existing tumor, and in the remainder there was considered no possible relationship whatsoever.

The analysis of the end result of the personal records of Dr. Ewing was practically impossible, mainly because the originals were submitted by 13 different insurance companies or law firms. The general lack of accessible material on this subject is due to wide variations in the present compensation laws, and the lack of compilation and analysis of cases reviewed. This complexity is evidenced by the fact that no centralized bureau exists for sorting such information.

This unfortunate situation is well described by W. J. Nunan, who stated that "more than 40 of the States in the Union have compensation acts. These are all administered by different State bodies, some of which maintain statistical divisions and some of which do not. In addition, the Territories of Hawaii, Alaska, and Puerto Rico have their own compensation laws. There is also a Federal Employees Compensation Act and a Federal Compensation Law for Longshoremen and Harbor Workers. Both of these latter acts are administered by the United States Employees Compensation Commission. I do not know of any centralized authority which controls statistics dealing with cases arising under all of these different jurisdictions."¹²

Moritz¹³ recently recommended that medical schools should exert their influence in behalf of legislation which will insure that medicolegal investigations shall become the responsibility of properly qualified persons; that such persons shall be given proper statutory authority for the conduct of scientific investigations; and that

adequate financial support be given to insure the necessary matériel and supporting personnel.

Two personal cases are included, which illustrate the difficulties and pitfalls in reasoning where no compensation was involved. Trauma to the first patient was violent, but tumor developed six years later in the opposite testis, while in the second patient violent strain was apparently followed by rapid tumor growth.

N. H., a 33-year-old laborer was examined April 3, 1936, for low left-sided abdominal pain of one month's duration. In July, 1928, he had received a severe kick in the right scrotum during athletic maneuvers, followed by severe right inguinal and abdominal pain for two hours but without evidence of scrotal hemorrhage. The apparently normal right testicle was forcibly dislocated into the upper inguinal canal. In September, 1934, he noted a gradual, painless, firm enlargement of the left testis. Orchidectomy performed in May, 1935, disclosed an embryonal carcinoma with lymphoid stroma. The small, atrophic, right testicle was placed by orchidopexy into the left scrotum after removal of the tumor. Postoperative roentgen-ray therapy was carried out, but the patient died of diffuse metastases on October 19, 1936.

J. S., a 27-year-old engineer, was examined by me for the first time in March, 1935, for injury to the left scrotum when he fell on an icy sidewalk November 20, 1933. About five hours after the accident he had severe pain in the left testis, lasting about 45 minutes, which gradually subsided after rest, and during the following ten days he noted a painless enlargement of this testis. A physician, consulted in early December, advised a scrotal support, apparently on a diagnosis of simple contusion. Four days later another physician concurred with this diagnosis and treated the testis with hot packs and drugs given by mouth. In January, 1934, a urologist made a diagnosis of tumor, and orchidectomy revealed a teratoma 6.5 by 6.5 cm. Prophylactic irradiation was administered, and the patient has remained alive and well for eight years after operation.

In this patient, an ordinary fall resulting in a twisting strain and trauma to the scrotum was without external evidence of tissue damage. Pain was delayed several hours, and gradual growth followed, which was misdiagnosed twice before urological consultation revealed the presence of tumor. No question of compensation was involved, but the possibilities of litigation in such a case under ordinary employment would be great.

Summary

Only individual, detailed reports can serve to clarify the complex relation of trauma to cancer. The citation of collective studies are without value, and such figures are generally

misleading. Individual tumor case records presented in this study consist of:

1. Army Medical Museum—25 cases (Table 1), 2 with trauma to pre-existing tumors.

2. Personal medicolegal records of Dr. James Ewing—21 cases, 19 of tumors which have been proved cancer.

3. Records from 6 armies, which disclosed 21 tumors related to war service (Table 2). Nine others from the U.S. Army are mentioned, but without detail.

4. Trauma producing proved hematocele and testis tumors—16 cases (Table 3). Three others demonstrate the possibility of spontaneous hematocele with tumor.

5. Industrial injuries are briefly discussed, with a personal report of a case.

6. Summary of 20 cases (separately listed elsewhere) which followed traumatic displacement or complete luxation.

7. The admitted presence of tumors prior to injury as recorded in 15 cases (Table 4).

8. Two personal reports illustrating the misleading features of alleged trauma in noncompensation cases.

In the study of scrotal cancer cases, a general incidence of alleged trauma was approximately 15 per cent. Ectopic inguinal tumors were associated with a much higher figure of 27 per cent.

Twenty-one tumors developed in soldiers of different countries, as result of either service or war injuries, and are recorded in detail. The assumption is made that reasonably adequate examinations were made prior to induction. This group may be considered as a control series. A diagnosis was made shortly after injury in most cases, and the patients were later kept under observation. In only one instance was the claim disallowed.

Correct diagnosis is generally difficult. All known benign intrascrotal conditions have been confused with tumors, and even metastases have been operated upon without the proper recognition of the site of primary tumor. Epididymitis and hematocele are the most confusing conditions to be considered. Hematocele following trauma has been reported with malignant tumors sixteen times, while 3 spontaneous hematoceles with tumor are recorded.

The proved sufficiency of trauma with luxation of testis is recorded in 20 cases. The mean intervals from trauma to tumor development varied greatly, from 2.5 years in the teratoid tumors, to 20.5 years in the unicellular tumors.

A total of 235 intrascrotal, but extratesticular tumors of the epididymis, tunica vaginalis, and spermatic cord disclose an alleged trauma incidence of 15 per cent.

Tumors existing prior to injury were reported fifteen times. Pre-existing enlargement of the testis can be determined only be painstaking histories of the sequence of events.

Diverse medicolegal opinions here and abroad come to a general conclusion that trauma does not induce tumor growth, and have proved instead that direct violent injury may accelerate growth of tumors already present.

Finally, a plea is made for: (1) better written and edited medical reports in the literature; (2) a centralized medicolegal museum of complete historical data, x-ray films, and specimens of cancer cases associated with alleged trauma; (3) institution of a urological testis cancer registry, similar to the existing bladder and kidney tumor registries.

Conclusions

Trauma does not cause cancer, but may accelerate its course. Exact diagnosis, being difficult,

is not often made by the first examiner. Litigation cases in general have been inadequately examined and reported, and claims have been settled on the basis of sympathy, not science. From available printed records no conclusions can be drawn between the etiological relationship of trauma and testis cancer, but all present evidence is against this assumption.

PREVENTION OF BLINDNESS IN LATIN AMERICA

There are between 180,000 and 240,000 blind persons in the twenty Latin American countries, it is estimated by Dr. Moacyr E. Alvaro, of Sao Paulo, Brazil, in a report published here by the National Society for the Prevention of Blindness. Dr. Alvaro is Secretary-General of the Brazilian National Committee for the Prevention of Blindness and Secretary-General of the Pan-American Congress of Ophthalmology.

Describing Latin American developments in the prevention of blindness, Dr. Alvaro says that active efforts for protection of eyesight and the conservation of vision are now under way in many of the Central and South American countries, and there is increased interest in the possibilities for saving eyesight through legislation and public education along the lines which have been successful in the United States.

"In the last fifteen or twenty years," the report states, "a number of committees for the prevention of blindness have been formed in the various Latin American countries Some of these agencies for prevention of blindness in South America have brought about the establishment of routine examination of the eyes of school children, measures for the protection of workers from ac-

cidents in industry, better medical care for eye patients, and legislation to make compulsory the use of a prophylactic solution in the eyes of infants as a safeguard against ophthalmia neonatorum.

"Regarding indirect measures . . . substantial progress has been made or is being made in campaigns against syphilitic, gonococcal, and tuberculous infections, in general measures against communicable diseases, better industrial hygiene, multiplication of local health agencies, improvement of housing conditions and nutrition habits, better facilities for the care of the sick, higher educational standards, etc. In spite of all these improvements, however, the problem of conservation of sight in Latin America is far from being solved. . . .

"A great problem in Latin America is the fact that there are only 1,000 ophthalmologists scattered over the whole area to give their services to a population of 120,000,000 people. This number, small in itself, is relatively still smaller when the difficulties in transportation have to be taken into consideration. The improvement of facilities for training good eye specialists or for imparting good ophthalmologic knowledge to general practitioners is highly important."

MILKING MACHINE DEvised FOR MICE

A milking machine for mice is being used at the National Institute of Cancer Research at Bethesda, Maryland. But it is not because of the labor shortage in this case; there is just no one who has

hands small enough for milking a mouse. The Institute is studying the transmission of cancer through milk. A mouse gives about one-fourth thimbleful of milk per day.—*Mississippi Doctor*

DIAGNOSIS AND TREATMENT OF OBSTRUCTIVE JAUNDICE

JOHN D. STEWART, M.D., Buffalo

FIVE or six years ago the postoperative mortality rate in obstructive jaundice, as reported from various clinics, was excessively high. Palliative operation for carcinomatous biliary obstruction entailed a risk of 35 to 50 per cent, and in persistent calculous jaundice the postoperative mortality figures ranged from 10 to 30 per cent. Patients with protracted biliary obstruction of high degree, which is the group my remarks are concerned with, are as a rule middle-aged or elderly, and show a high incidence of associated diseases, such as cardiovascular degeneration, nephritis, diabetes, and obesity. Biliary infection is usually present, even though such outspoken signs as chills, fever, pain, and tenderness may be lacking. Hepatic and renal impairment and multiple nutritional deficiencies are part of the picture. Lack in specific nutritional factors, such as carbohydrate, protein, vitamin A, and vitamin C, has been shown to be of common occurrence in this group of patients.

Largely as the result of quickened interest in preoperative and postoperative care during the past few years, a sharp improvement in the results of operation for obstructive jaundice has been brought about. For example, at the Massachusetts General Hospital since 1938 the postoperative mortality rate in cancerous biliary obstruction has dropped from 50 per cent to 17 per cent, while in calculous biliary obstruction a lowering from 15.8 to 5.7 per cent has resulted. Similar figures are being reported from other large clinics and in general indicate a reduction in operative risk of from one-third to one-half. I should like to emphasize the fact that this remarkable advance in a difficult field of surgery is not attributable solely to the introduction of vitamin K, for there is a tendency to overlook the less dramatic importance of other factors. The disturbances in obstructive jaundice are various and complex, and the surgeon must not suppose that the use of vitamin K is enough to convert a dangerous operation into a safe one.

Diagnosis

Jaundice can be simply and usefully classified as hemolytic, hepatogenous, or obstructive in origin. Hemolytic jaundice usually presents no diagnostic difficulties, though it must be remem-

bered that pigment stones may be formed in the biliary tract in chronic hemolytic jaundice and may produce obstruction. The lesions producing obstructive jaundice in order of frequency are gallstones, carcinoma, and traumatic stricture, and a rare additional cause is chronic pancreatitis, involving the region of the common duct papilla.

In my experience the diagnosis can be made with assurance in about 90 per cent of the cases. However, the unusual case of either hepatogenous or obstructive jaundice may baffle the most experienced clinician. The necessity for performing exploratory laparotomy in such instances should be recognized, and the operation should not be postponed indefinitely while inconclusive tests are being performed. Arbitrary rules are undesirable, but I believe clinical experience justifies the view that the patient who has jaundice of undetermined origin should be prepared for operation by the end of the fourth week in the hospital, unless the jaundice is rapidly subsiding at that time. The risk of delay in calculous or neoplastic obstruction, as from ascending infection and irreversible changes in liver and kidneys, is of more significance in the long run than is the danger of carefully performed operation in chronic hepatitis.

In the diagnosis of obstructive jaundice evidence simply obtained at the bedside is of paramount importance. Characteristically in calculous jaundice the patient is a middle-aged, obese woman who gives a history of chronic dyspepsia or bouts of pain and soreness in the right hypochondrium. In the series of cases forming the basis for this discussion, elevation of oral temperature above 100 F. was present in half the cases, and pain of varying severity was noticed in 75 per cent of the cases. One-quarter of the patients with calculous jaundice had little or no pain, and therefore had jaundice due to silent stone in the common duct. Likewise, in about one-quarter of the cases the block produced by stone was complete enough to result in clay-colored stools. The urine is deeply colored with bile pigment. Itching is present in half the cases, being less common than in obstruction caused by carcinoma. Typical findings on physical examination are jaundice of orange hue rather than the darker, almost mahogany color of the patient with protracted carcinomatous jaundice; tenderness in the right hypochondrium or epigastrium and absence of abdominal masses are the rule. The gallbladder, spleen, and liver usually cannot be felt. Anemia and

Read at the Annual Meeting of the Medical Society of the State of New York, New York City, April 30, 1942.

From the Department of Surgery of the University of Buffalo Medical School and the Edward J. Meyer Memorial Hospital, Buffalo.

peripheral edema are unusual and when present indicate liver damage and malnutrition.

The patient with cancerous biliary obstruction is typically a middle-aged or elderly man who has obviously lost much weight. A history can usually be obtained of indefinite ill-health and loss of appetite and strength over a period of several months before the onset of jaundice. Pain is complained of in half the cases and, contrary to usual belief, is occasionally severe enough to require hypodermic medication. The pain is not well localized and may be referred to the left upper abdomen and upper lumbar region. Pruritus is severe and the obstruction to bile flow is commonly complete, so that the stools are persistently clay-colored. Occasionally, however, carcinoma of the head of the pancreas may produce partial block, with mild jaundice and some color in the stools, especially when associated cholangitis and hepatitis are a part of the picture. Fever has been present in over one-third of the patients whom I have seen and indicates a secondary cholangitis. The liver is usually enlarged and palpable; the spleen is not. Unless covered over by an enlarged right hepatic lobe, the gallbladder is distended and palpable. In my series of cases the gallbladder was enlarged in 53 of 65 cases, while stones in the common duct produced enlargement and jaundice (that is, exception to Courvoisier's law) in only 3 out of 62 cases. Anemia and peripheral edema are not uncommon in the patient with carcinomatous biliary obstruction and denote severe malnutrition and liver damage.

In certain cases of toxic or infectious hepatitis, as pointed out above, the clinical picture may be indistinguishable from that of calculous obstructive jaundice. In these cases it is important to search carefully for history of exposure to hepatotoxic agents, including alcohol, cinchophen, phosphorus, and carbon tetrachloride. Enlargement of the spleen and absence of pain, fever, and upper abdominal tenderness are more characteristic of hepatitis than of calculous jaundice.

Stricture of the common duct is usually of traumatic origin, and a history is obtained of previous cholecystectomy during which technical difficulties were encountered, particularly in regard to hemostasis. Drainage of bile from the wound and jaundice appear together or alternately soon afterward. Fever and pain denote the presence of secondary cholangitis and hepatitis. In many instances the stricture is partial, and variable amounts of bile gain access to the intestine. The recurring bouts of biliary infection superimposed on persistent obstruction to bile flow eventuate in biliary cirrhosis, hepatic enlargement, and splenomegaly.

External biliary fistula following operation on the biliary tree may be due to residual stone in the common duct, neoplastic obstruction, traumatic stricture, or a combination of these lesions.

Helpful laboratory data which may be regarded as routinely desirable include prothrombin time before and after administration of vitamin K, concentration in the serum of bilirubin, albumin, and globulin, nonprotein nitrogen, and total and free cholesterol. The stools should be repeatedly examined for bile and occult blood. X-ray study of the gastrointestinal tract is occasionally of value in demonstrating unsuspected primary malignant growth, or neoplastic expansion and distortion of the duodenal loop, but unless bile is escaping freely into the intestine, cholecystography is likely to be a waste of time. If bile flow is only partially blocked, information of diagnostic significance may be obtained from duodenal drainage and examination of the centrifuged sediment microscopically for crystals of cholesterol and calcium bilirubinate. I have seen this procedure prove valuable in the difficult problem of distinguishing between incomplete painless obstruction due to stone and persistent hepatogenous jaundice. Peritoneoscopy has proved disappointing, in my experience, as a diagnostic aid in jaundice.

Liver function tests will not be discussed except to remind you that such measurements usually indicate depression of one or more of the physiologic activities of the liver, and do not identify the cause. However, knowledge of the extent of hepatic impairment is of importance in the management of the case and when added to the rest of the clinical evidence may aid in the diagnosis. On the whole the findings in the history, physical examination, and routine study of stools and urine help us most. The aggregate of the evidence is important, and if we total values from different sources separately, inconclusive mistakes can almost always be avoided.

Preoperative Care

When a jaundiced patient enters the hospital, preoperative therapeutic measures should be started at once and carried out while laboratory studies are being made, for no matter whether the jaundice is hepatogenous or obstructive in origin the same regimen is helpful. Dehydration is corrected by infusions of salt solution. A high carbohydrate, moderate protein, low fat diet is prescribed, and a record of daily food intake is posted. If the patient is unable to take at least 300 Gm. of carbohydrate daily, infusions of 10 per cent glucose solution are given. There is some evidence that the proteins of milk and eggs may be beneficial in liver disease, rather than harmful, as formerly thought. I have given

DIAGNOSIS AND TREATMENT OF OBSTRUCTIVE JAUNDICE

JOHN D. STEWART, M.D., Buffalo

FIVE or six years ago the postoperative mortality rate in obstructive jaundice, as reported from various clinics, was excessively high. Palliative operation for carcinomatous biliary obstruction entailed a risk of 35 to 50 per cent, and in persistent calculous jaundice the postoperative mortality figures ranged from 10 to 30 per cent. Two-stage operation in the palliative treatment of carcinomatous biliary obstruction does not seem to me a rational procedure, although some reduction in immediate postoperative mortality rate may be effected thereby. In anastomosing the gallbladder to the stomach, duodenum, or jejunum, care should be taken to make the opening large enough, preferably not less than 2 cm. in size. Allowance is thus made for shrinkage in healing and for the fact that an overlooked coincidental gallstone may become impacted in the anastomosis. In 14 per cent of cases of cancerous biliary obstruction gallstones are also present. I have not used any of the proposed methods of making a valvular cholecysto-gastrostomy, as such technic has seemed to me elaborate and of questionable applicability. When the jejunal mesentery is sufficiently long, cholecysto-jejunostomy, and distal jejuno-jejunostomy may be performed, as proposed by Monprofit and recently revived by Whipple in the two-stage excision of carcinoma of the head of the pancreas. This arrangement provides free drainage of the biliary tree and possibly lessens the danger of ascending cholangitis from the peristaltic injection of food and bacteria into the gallbladder.

Occasionally we hear a note of pessimism as to the surgical treatment of cancerous obstruction of the biliary tract. In my opinion such an attitude is to be strongly condemned. I believe that every patient suspected of having carcinomatous biliary obstruction should be operated upon unless the patient is moribund, and for the following reasons:

1. The diagnosis can never be certain until proved at operation or autopsy. Painless stone or obstructing pancreatitis will be found now and again in a patient who might otherwise have been abandoned.

2. The palliative value of cholecysto-gastrostomy, and if there is duodenal obstruction also, gastro-enterostomy, is of real importance. Relief of itching alone justifies the operation.

3. Every cancer of the bile ducts or pancreas is to be considered as surgically removable until proved otherwise at laparotomy. Whipple has played a leading part in stimulating the interest of surgeons in what used to be an invariable hopeless lesion, and an increasing number of cases of radical extirpation of carcinoma of the head of the pancreas are being reported.

In the severely depleted case of obstructive jaundice, jejunostomy at the time of operation on the biliary tree is occasionally indicated. By this means after-care is greatly simplified. Carbohydrate, protein, vitamins, minerals, and fluid can be given in adequate quantity beginning immediately after operation and without de-

pendence upon veins which may have been thrombosed from repeated venipunctures and infusions.

The special technical problems presented by stricture of the common duct will not be dealt with, as much time would be needed. I should like to point out to you, however, that repair over a vitallium tube, as introduced by Pearse, of Rochester, is being successfully used in a number of clinics. The disadvantages of using a rubber catheter for this purpose are well known.

Postoperative Care

Following operation, oxygen therapy, preferably administered by means of an oxygen tent, is in order for 24 to 48 hours, both because of the respiratory embarrassment resulting from extensive upper abdominal operation in an enfeebled patient, and because of possible diminished arterial blood oxygen saturation in liver disease. High carbohydrate, moderate protein diet is resumed as soon as possible, and meanwhile glucose infusions are given generously. Salt solution should be given sparingly, because edema and oliguria are to be avoided, and salt solution tends to be retained in the body. It has been shown that a postoperative drop in prothrombin concentration of 20 to 30 per cent occurs within the first 48 hours after operation, and it is therefore important to continue the daily administration of vitamin K without interruption. In most instances, vitamin K should be given for at least two weeks after release of biliary obstruction. Even though bile flow into the intestine is re-established immediately, biochemical analyses show that bile formed by the recently decompressed liver is deficient in bile salts.

Experimental evidence on the point is inconclusive, but I believe that the daily intake of one to two Gm. of bile salts following relief of biliary obstruction is a helpful measure, and may increase the rate of elimination of retained pigment. The practice of refeeding nauseating infected bile is to be avoided, particularly since such bile may be low in its content of the essential cholic acid, and since cholic acid derivatives can be so easily taken in tablet or capsule form.

It should be kept in mind that large amounts of fluid and electrolyte may be lost through the common duct drainage catheter following operation. After release of obstruction the damaged liver not infrequently forms a copious dilute bile. As much as 1,700 cc. daily may drain from the common duct catheter in some instances of postoperative choleremia. The patient should be given an equal amount of physiologic salt solution to repair such losses. McDonald, of St. Catherine's, recommends postoperative perfusion of the biliary tree with warm physiologic

infusions of amino acid solutions before and after operation for obstructive jaundice with results which have been entirely satisfactory to date. In this manner the elements essential in protein metabolism can be supplied in large amount and without reaction. Reduced concentration of plasma protein, peripheral edema, and anemia are indications for plasma or whole blood transfusions. A blood transfusion is routinely given at the time of operation, however, and in most cases preliminary transfusion has not been necessary. Vitamins A, B complex, C, and K are given orally or parenterally. If these are given orally 1 to 2 Gm. of bile salts should also be given to facilitate absorption of the fat-soluble elements, A and K. Adequate amounts of certain members of the B group, and vitamins A, C, and K can be given parenterally to the patient who is vomiting or uncooperative. As little sedative as possible should be given, for undesirable depression may result from morphine or the barbiturates when liver function is severely impaired. In the control of pain from stone in the common duct, however, morphine is often necessary.

A question of considerable interest is, shall we give sulfonamide drugs to the patient with obstructive jaundice and coexisting infection? Cholangitis, cholecystitis, postoperative pneumonia, or wound infection in the jaundiced patient may raise the indication for chemotherapy. The sulfonamide drugs are known to exert a toxic action on the liver, and their use in obstructive jaundice may increase hepatic or renal impairment. However, my practice has been to use these agents despite liver damage if indicated, and so far I have seen no ill effects. There is some reason to believe that adequate intake of fluid and protein has value in the protection of the liver and kidneys from the sulfonamide drugs, and therapy is directed accordingly.

How long should preparation for operation in the case of obstructive jaundice require? Does evidence of cholangitis, such as fever, or fever and chills, mean that operation should be done earlier, or that it should be postponed? In most cases a preoperative regimen lasting from one to two weeks is in order, and unless the jaundice is then rapidly subsiding, the surgeon should proceed with the operation. The presence of signs of biliary infection, in my opinion, calls for earlier operation. Suppurative cholangitis and liver abscesses are fatal complications, the best preventive of which may be free drainage of the common duct. We can all recall cases in which cholangitis, fever, and chills subsided immediately after removal of stone from the common duct and drainage, or anastomosis of

gallbladder to stomach or duodenum for carcinoma of the head of the pancreas.

Operative Technic

There is difference of opinion about the choice of anesthetic agent in operation for obstructive jaundice. I have found ether anesthesia as administered in an oxygen-rich mixture entirely satisfactory in these cases, as it ensures quiet breathing, adequate relaxation, good oxygenation, and minimal disturbances in cardiovascular dynamics and liver function. The administration must be skillfully done, however, or the advantages of the method may be lost. Spinal anesthesia is satisfactory except for the depression in blood pressure that it not infrequently produces. Even though the period of hypotension be brief there is danger of thrombosis of cerebral, coronary, or renal vessels in the elderly arteriosclerotic patient. It has also been shown that reduction in blood flow to the liver impairs the ability of the liver to withstand trauma, a factor of possible importance when hepatic function is already badly crippled.

I have inclined more and more to the use of the transverse or oblique rather than the vertical paramedian incision in operations on the biliary tree, as I believe the latter incision is more embarrassing to respiration and is less suitable for drainage. In my opinion there is a definite place for two-stage operation in the occasional case of calculous jaundice with cholangitis and severe liver damage. At the first operation the gallbladder or common duct can be drained under local anesthesia, the final cholecystectomy and clean-out of the ducts being deferred until jaundice and infection have subsided. In operating for obstructive jaundice, the gallbladder should never be removed until the common duct and papilla have been carefully explored. A frequent mistake in common duct surgery is to open the duct too high, thereby making it difficult to remove stones from the lower end and to verify the patency of the papilla. If the duodenum be mobilized, by freeing its lateral peritoneal attachments this difficulty can be avoided. In about one-quarter of the cases of severe calculous jaundice I have considered it necessary to explore the papilla transduodenally, and I have found no reason to regret this. Allen, of Boston, stresses the value of graduated gentle dilatation of the papilla of Vater by means of acorn-tipped sounds, a method which I have used with satisfaction. Some surgeons, including Mixer, of Boston, and Smith, of Buffalo, find cholangiography at the operating table a useful maneuver, but I have had no personal experience with the method.

REDUCED TEMPERATURE TREATMENT FOR BURNS AND FROST-BITE

FREDERICK M. ALLEN, M.D., LYMAN WEEKS CROSSMAN, M.D., F.A.C.S., and
FRANK K. SAFFORD, JR., M.D., New York City

THE feasibility of superficial anesthesia applied with cold and without a tourniquet was illustrated by a case in our early experience in City Hospital in which a skin graft was removed from the abdomen. Mock¹ has reported a series of such cases and recommends the method for skin grafts.

A burn is the commonest form of trauma of such a superficial character that treatment with cold is not limited to the limbs but can be easily and effectively applied in any part of the body. Frost-bite and burns are identical from this standpoint. Other authors who have had more plentiful opportunities have preceded us in recommending reduced temperature for the treatment of frost-bite, "trench foot," and other forms of injury from exposure to cold. Our studies of burns could have advanced more rapidly except for the fact that in this locality most of these cases are sent to other institutions. In the beginning we thought that we were pioneers with a new procedure, but prior observations by others have now come to our notice.

Our general papers on refrigeration elicited correspondence with a layman, Mr. R. E. Gardiner, of Brisbane, Australia, whose position had given him intelligent acquaintance over a number of years with the treatment of burns. He described very marked relief of pain and all other consequences by immersion in ice water, for localized treatment and also for generalized therapy, as in one case of a man who fell into a vat of boiling molasses.

Priority in scientific evidence for cryotherapy in burns evidently belongs to Temple Fay, this being one of several phases of his work which have not received deserved attention. In a recent letter, Fay² states that the reduced temperature "controls pain, prevents infection, diminishes shock, and decreases loss of serum. In addition, the scar that is formed is pliable and soft, rather than hard and firm."

Another letter from Major Roswell K. Brown made reference to the experiments of Elman, Cox, Lischer, and Mueller³ showing that rats made the best recovery from extensive burns when they were kept in an environmental temperature of 75 F., and that the mortality was increased by either raising the temperature to 99 F. or lowering it to 55 F.

Modification of the systemic temperature, as done by Fay, or of the environmental tempera-

ture in the rat experiments, differs from our procedure, which consists in cooling the burned areas while keeping the systemic temperature normal. Perhaps our work, therefore, may still be new in this respect, although the question of the optimum level of rectal temperature remains open, including the possibility that extensive burns may be best treated by a combination of the two methods. The high incidence of burns in war is the reason for making this small but encouraging report of the experience with local refrigeration to date.

The usual treatment in this Hospital includes thorough and gentle cleansing of the area, then sprinkling with sulfadiazine powder, followed by the application of vaseline gauze. Pressure bandaging may be used, but the need seems to be diminished by cold. For treatment with cold, the dressings are made very light, with only one or two thicknesses of gauze with ice bags outside. The electrical refrigerating equipment,* however, gives a more convenient, constant, and dependable effect, with minimum weight. Occasionally we are also trying the use of the cold chamber of this apparatus without dressings. One advantage of the use of cold in general is that it does not interfere with any of the usual treatments of burns but can be used in combination with them.

The first three cases in this series are from the service of Dr. Isidor Kross, whom we wish to thank for his cooperation and for the privilege of this publication.

Case Reports

Case 1.—A janitor, aged 54, sustained second and third degree burns of the entire face and hands in a gas explosion. After the usual débridement and the use of sulfadiazine and vaseline gauze, the burned surfaces were covered with ice bags. The swelling of the face, so great that the eyes could not be opened, subsided rapidly during the first twenty-four and forty-eight hours. On admission morphine was required to quiet the patient and to deaden his pain, but the relief with ice was such that no more sedatives were needed after the first dose. The ice was gradually withdrawn during the first week. Healing was complete within two to three weeks, without complications and without skin grafts.

Case 2.—A laborer, aged 55, was burned by accidentally dipping his right hand and forearm into a pail of scalding water. The entire burned surface was red and covered with blebs. The usual treatment was applied, with a pressure bandage over wet

* Supplied by the Therm-O-Rite Products Co., Buffalo.

salt solution through the common duct catheter, having in mind not only mechanical cleansing of the ducts, but also the possible beneficial effects of heat on liver function.

When should the common duct catheter be removed? My practice is to remove it only after the jaundice has cleared. Invariably before the catheter is removed, cholangiograms are made under fluoroscopic control, to demonstrate beyond doubt the absence of obstruction and the condition of the biliary tree.

Conclusions

1. The postoperative mortality rate in patients with obstructive jaundice has been sharply re-

duced in the past few years, largely as the result of improvement in preoperative and postoperative care.

2. The diagnosis can usually be made with assurance on the basis of bedside evidence.

3. When the cause of jaundice is uncertain, early exploratory laparotomy by a competent surgeon should be done.

4. Palliative operation in carcinomatous biliary obstruction is of real value, and the surgeon experienced in biliary tract surgery should be alert in every case for the possibility of excising the growth.

VENEREAL DISEASE THREATENS MANPOWER

"While the fight against the venereal diseases is going better in the present war than it did in the first World War, it is not going well enough, and the loss to the armed forces will be colossal unless civilians do their part much better," Dr. Walter Clarke, executive director of the American Social Hygiene Association, said in making public the Association's Annual Report for 1942.

"The Federal government has announced its intention of building the armed forces up to 10,800,000 men," Dr. Clarke said. "If a venereal disease rate only one-half that of the first World War is achieved, about 378,000 of these men will acquire syphilis or gonorrhea each year. If the infected men lose on the average only one-half the time lost by first-World-War victims, the loss will total 7,560,000 man days per year. This figure is equivalent to 21,000 men out of service, and a burden to the medical facilities of the armed forces for one full year.

"Where will these 378,000 men become infected? Every one of them will be infected in civilian com-

munities which allow prostitutes and promiscuous women and girls to spread disease to soldiers, sailors, marines, and coast guardsmen. It is perfectly possible to prevent a large part of this waste if civilian communities will use the scientific weapons—legal, medical, social, and educational—which are available. . . ."

In the report, Dr. Clarke stated that the greatest achievement during the past year is the obvious conversion of public opinion and particularly of lay and government leaders in strategic communities from coast to coast to a realization of the importance of the fight on venereal diseases and to a belief that the conditions which lead to their spread can and must be corrected. The report warns that the prostitution interests and the racketeers are not yet defeated and that the fight begun so successfully is not yet won. The report of the Association calls for expanded activities, constant vigilance, and increased vigor during 1943 as our armed forces grow and our war industries approach peak production.

RABIES REPORTED FROM FIVE COUNTIES

All stray dogs should be eliminated in areas where rabies is prevalent if the spread of this fatal disease is to be checked, the State Department of Health warned recently.

The Department statement says that until April of this year, the prevalence of rabies among dogs was limited to the counties of Orange, Rockland, Sullivan, and Ulster, which are located along the west shore of the Hudson River, but in April canine rabies was also reported from Cayuga County.

From January 1 to April 15, 1943, 62 rabid dogs

were reported from these areas. Of the 62 dogs, 2 were reported from Cayuga County; 4 from Sullivan County; 7 from Orange County; 12 from Rockland County; and 37 from Ulster County. During the same period there were also reported a rabid squirrel from Rockland County and a rabid wild fox from Otsego County. A rabid skunk was reported in Rensselaer County on December 29, 1942.

Effective control of canine rabies requires close cooperation between the public and health officials, according to the Health Department.

THE ROLE OF THE BRONCHOSCOPIST IN THE DIAGNOSIS AND TREATMENT OF DISEASES OF THE BRONCHIAL PULMONARY TRACT

ARTHUR Q. PENTA, M.D., Schenectady, New York

BECAUSE of the demands of the rapid progress of medical science during the past decade, bronchoscopy has come to play an important role in the diagnosis and treatment of bronchial pulmonary diseases. To quote that famous teacher of bronchoscopy, Chevalier Jackson: "Look and see" is the order of the day. In every accessible region of the body, the aid of direct vision is called upon to contribute to diagnosis and treatment.¹

In the diagnosis of thoracic diseases, the internist, by means of external inspection, percussion, and auscultation, usually obtains sufficient information to establish a tentative diagnosis. His findings may be further corroborated by the roentgenologist, who by means of fluoroscopic and x-ray examination has an opportunity, as it were, to look through the chest. But it remains for the bronchoscopist, by means of direct visual inspection, to look inside the bronchial tree and observe the underlying pathologic condition. It becomes evident, then, that when there exists such a close association between the internist, the roentgenologist, and the bronchoscopist, the diagnosis of bronchial pulmonary conditions is greatly facilitated.

Aside from the removal of aspirated foreign bodies in lungs, for which no procedure other than bronchoscopy is worthy of a moment's consideration, the profession at large has not realized that the greatest value of the bronchoscope is in diagnosis. A recent statistical survey of the patients admitted to several of the large bronchoscopic clinics in this country revealed that only 2 per cent of the admissions were for the removal of foreign bodies. As Dr. Howard Lilienthal, one of the great teachers of thoracic diseases, has aptly said: "The scope of bronchoscopy has rapidly widened from the mere extraction of foreign bodies to the diagnosis and treatment of many pulmonary lesions, such as abscess of the lung, tumor of the lung, bronchial narrowing, bronchial ulceration, postoperative atelectasis, and as an aid to the thoracic surgeon in the localization of thoracic diseases."

In the field of diagnosis the bronchoscopist by means of direct vision is able to inspect the inside of the bronchial tree and remove tissue for histologic examination, thereby establishing, in many instances, the early diagnosis of bronchial carcinoma. By means of special aspirators intro-

duced through the bronchoscope, it is possible to remove purulent secretions for the relief of bronchial obstruction. Also secretions removed by this method, being free of oral contamination, assure a more desirable bacteriologic study, and are of greater value if a vaccine is to be prepared.

That bronchoscopic examination is not a hazardous procedure is best illustrated by the fact that during the seven years that the bronchoscopic clinic of the Schenectady City Hospital has been in operation—during which period over 1,200 bronchoscopic procedures have been performed—more than 90 per cent of the cases treated or examined were handled as outpatients.

Bronchoscopy and Diagnosis

Carcinoma of the Lung.—A relatively common disease, carcinoma of the lung is responsible for approximately 10 per cent of all cancer deaths, an occurrence which is frequent enough to arouse interest on the part of the medical profession. Bronchoscopic examination with removal of the tissue for histologic study is by far the most important diagnostic procedure available, and if an early diagnosis is to be made, bronchoscopy should be employed early. In a recent study of the subject, Overholt² calls attention to the fact that approximately three-fourths of all primary lung tumors are situated in the major bronchi so that they are within range of bronchoscopic vision. His findings are in complete agreement with those of C. L. Jackson,³ who in a recent article stated that bronchoscopic biopsy will be positive in about 75 per cent of the cases of bronchial carcinoma. In a series of 44 cases personally examined by the author during the past five years, a positive biopsy was obtained in 32 cases. This high percentage of positive biopsies is definite evidence that bronchoscopic examination plays an important role in the diagnosis of lung carcinoma.

The symptoms produced in primary carcinoma of the lung depend to a great extent on the degree of bronchial obstruction. By far the most important early symptom is a dry, hacking cough accompanied by slight bronchial wheezing. Physical examination during this early stage may reveal a few coarse moist rales and asthmatic wheezing over the involved pulmonary area. Roentgenographic studies of the chest during this stage may be entirely negative since the tumor is not large enough to cast a shadow. At this time the patient usually seeks medical ad-

¹Read at the Annual Meeting of the Medical Society of the State of New York, New York City, April 30, 1942.

dressings and ice outside. Pain was relieved, and healing was rapid and uncomplicated.

Case 3.—A laborer, aged 65, was brought to the hospital immediately after being rescued from a burning house. There were second and third degree burns of the face and limbs and also of large areas of the body; the scalp hair was completely burned off, and the soles of the feet had third degree burns. The patient was noisy and persistently irrational. There was hemoconcentration (hemoglobin, 20 Gm. per cent) and 2 plus albuminuria. Ice bags were applied over the usual dressings on the principal lesions after delay had allowed considerable swelling to occur, and plasma injections were given for shock. For three days the progress was so encouraging that hopes for complete recovery were aroused. On the fourth day, however, the patient's physical and mental state became worse. On the fifth day the temperature rose to 105 F., and death occurred.

Locally the cold wherever applied seemed definitely beneficial in reducing the original swelling, inhibiting infection, and keeping the surfaces unusually clean and healthy. Death from pneumonia is the usual result in such cases. Granting that inhalation was not a factor, the generally accepted cause is absorption of toxins from the burned tissues. Theoretically, the reduced local temperature is expected to reduce the formation and absorption of such substances. In the future we shall proceed on the assumption that the reduction of temperature was not efficient enough in this instance and also that it was a mistake to limit the cold to only a part of the burned surfaces.

Case 4.—An elderly white man was found unconscious on the street in the coldest weather of the winter. He had no idea of the length of time he had been exposed; it is also uncertain whether he had been slugged, according to his own theory, or whether he was intoxicated. When he was brought to City Hospital on February 15 he was suffering from general exposure and from various minor lesions, but his bare hands had suffered most. Both of them showed severe frost-bite, with huge swelling and beginning bleb formation.

Ordinary dressings were applied at first, and spe-

cial treatment was begun the next day. The left hand was dressed with vaseline gauze and placed on an ice bag. The right hand, which appeared worse than the other and was more painful, was placed in an electrically refrigerated box at 50 degrees F. and was left bare. The patient reported almost immediate relief of pain in the right hand. Examination a day later showed no important reduction of temperature in the left hand because of insulation by the dressings and failure to hold the hand on the ice bag.

The difference between the two hands was very striking, the swelling and blebs being greatly reduced in the right. As only one refrigerating box was available, the dressing was removed from the left hand and it was placed on a bare ice bag, with instructions to the patient to rest sometimes the palmar and sometimes the dorsal surface on the bag. All pain was thus relieved, and the patient pronounced himself comfortable without sedatives.

After one week his hands were gradually restored to normal temperature. Healing was complete within five weeks after admission, with far less tissue loss than had been anticipated, and with no residual complaint except some reduction of touch sensation. The rapid subsidence of pain and swelling, control of infection, and avoidance of extensive gangrene appeared exceptional for such a case.

Conclusions

Theoretically, the reduced temperature treatment of burns offers more or less complete control of pain, edema (including blistering and oozing), necrosis of partially injured tissue, infection, and shock. Our small experience with burns and frost-bite treated with local application of cold seemed to confirm both these advantages and also Fay's observation of the favorable character of the healing and scars.

WAR CONFERENCE

The medical, surgical, and industrial hygiene experts who are so ably safeguarding the well-being of more than 20 million industrial workers have agreed to pool their knowledge and exchange their experiences regarding the many new and complex problems of today's wartime production. For this purpose their organizations—the American Association of Industrial Physicians and Surgeons, the American Industrial Hygiene Association, and the National Conference of Governmental Hygienists—are combining their annual meetings in a four-day "War Conference" at Rochester, May 24-27.

This joint meeting will be a report on the state of the nation, by the men who know, in matters of industrial health. Dr. William A. Sawyer, Medical Director of Eastman Kodak, is general chairman; Dr. James H. Sterner and Lieut. Comm. J. J. Bloomfield are arranging the programs for the industrial hygienists.

Physicians and surgeons, hygienists, engineers, nurses, executives—all who are interested in the problems of industrial health and their solution—are invited to attend as many of the sessions as they can arrange for; no registration fee is required.

FIG. 2A. Preliminary lipiodol study in a patient aged 46, showing a marked stenosis of the left main stem bronchus. Subsequent bronchoscopic examination with biopsy removal revealed a tumor mass of the left main stem bronchus located at about the level of the left upper lobe orifice. The patient refused operation and died one year later.

FIG. 2B. Patient, aged 45, diagnosed and treated for tuberculosis because of radiographic evidence of infiltration in the upper lobe of the left lung and the spitting of blood. During the two months that he was in the sanatorium his sputum had been repeatedly negative for tubercle bacilli. It was not until he developed a complete atelectasis that some thought was given to the possibility of a malignant neoplasm. The patient was finally referred for bronchoscopic examination, which revealed a large fungating ulcerative tumor mass obstructing the left main stem bronchus at the level of the carina. Histologic examination from the tissue removed at biopsy revealed a carcinoma of indifferent type, Grade 4. Within a very short time the patient developed massive pulmonary infection and died several months later.

Benign Neoplasms of the Tracheobronchial Tree.

—Without the aid of bronchoscopic inspection, the diagnosis of benign neoplasms of the trachea or bronchi would probably never be made except by inference. The symptoms and physical signs produced depend to a great extent on the degree of bronchial obstruction and the presence of infection. It is always to be remembered that the first symptoms produced in early bronchial obstruction, regardless of the cause, are those of wheezing and coughing. If coughing is associated with blood-streaked sputum, bronchial neoplasm should always be considered in the differential diagnosis.

Because the bronchi normally elongate and become widened on inspiration and become shortened and narrowed on expiration, benign tumors, particularly papillomas, will often produce a check-valve mechanism, resulting either in obstructive emphysema or atelectasis of the involved pulmonary area. In obstructive emphysema a very important fluoroscopic finding is the slight shifting of the heart toward the uninvolved side; whereas, in atelectasis, the heart and mediastinum are displaced toward the

affected side. Benign tumors of the trachea or bronchi can usually be successfully removed by bronchoscopic procedure. It is important that the diagnosis be established early, before any degree of bronchial obstruction and pulmonary infection has taken place.

Bronchial Stenosis.—This condition results from (1) inflammatory reaction produced by foreign bodies, (2) specific infections such as syphilis and tuberculosis, or (3) congenital tendencies. The clinical symptoms and physical signs produced are chiefly those of bronchial obstruction. Once the preliminary physical, x-ray, and lipiodol study suggests the possibility of bronchial stenosis, bronchoscopic dilatation should be immediately carried out. Holinger⁴ calls attention to the fact that inflammatory bronchial stenoses, if untreated, may eventually lead to atelectasis and then to bronchiectasis. Most forms of bronchial stenoses, with the ex-

Fig. 1. Chest x-ray of a patient aged 48, who, because of the symptoms of wheezing and dyspnea, was treated for bronchial asthma. Later, because of hemoptysis, he was sent to a sanatorium for the treatment of tuberculosis. Because the sputum was repeatedly negative for tubercle bacilli, a bronchoscopic examination was recommended. Bronchoscopy revealed a tumor mass obstructing the orifice of the right upper lobe bronchus. Thoracic surgery was immediately recommended. The patient made an uneventful recovery from the operation and two months later returned to light employment. Six months after the operation, while working, he was suddenly seized with an attack of dyspnea from which he did not recover. Postmortem examination revealed a retrograde thrombus of the right pulmonary artery at the site of ligation, extending into and involving the left pulmonary artery. There was no evidence of residual tumor tissue.

vice because of the cough and wheezing. In spite of the fact that no improvement is usually shown after several weeks or several months of medical treatment, very little thought is given to the possibility of bronchial carcinoma.

Slight asthmatic wheezing is a very important early symptom. It is commonly present in all cases of bronchial carcinoma. Wheezing means only one thing—partial bronchial obstruction, which may be produced by a variety or combination of conditions, among which is bronchial carcinoma. The importance of this one symptom alone cannot be too strongly emphasized. In the series of 44 cases of bronchial carcinoma bronchoscopically examined by the author during the

Fig. 2. Biopsy obtained by diagnostic bronchoscopy revealed a squamous cell carcinoma, Grade 3

past five years, it was astonishing to learn that 15 of the patients, because of recent wheezing and slight dyspnea, had been previously treated for bronchial asthma. Any patient, particularly of the cancer age group, presenting this symptom, should immediately be x-rayed and should have the benefit of a diagnostic bronchoscopy. The appearance of blood-streaked sputum or frank hemoptysis are also frequent early symptoms and are usually due to the trauma of coughing and ulceration of the tumor mass. Pain, as in other malignancies throughout other parts of the body, is definitely not an early symptom.

For the purpose of clinical study, Overholt divides the clinical course of primary lung carcinoma into the following divisions: (1) the stage before bronchial occlusion, (2) the stage of bronchial occlusion, and (3) bronchial occlusion with secondary infection. (Figs. 1, 2, 2A, 2B, 2C.)

It is important that in order to increase the operability of this condition, which in the past has had a mortality of 100 per cent, and in order to take advantage of the rapid progress already made to date in the field of thoracic surgery, the diagnosis should be established early, before the stage of bronchial occlusion. By far the most diagnostic procedure available at the present time is bronchoscopic examination.

mucosal edema, thick purulent secretions, and granulation tissue. Once the affected pulmonary segment is carefully localized by preliminary physical and x-ray examination, the bronchoscopic procedure consists of locating and draining the involved bronchus. Whenever possible, the intrabronchoscopic injection of lipiodol directly into the draining bronchus and into the abscess cavity will materially aid drainage by its displacement of tenacious purulent secretions. Since the advent of the sulfonamide group of drugs in the treatment of many types of pulmonary infections, this form of chemotherapy has also been employed in combination with the treatment by bronchoscopy. In several cases treated during this past year, sulfathiazole was insufflated directly into the draining bronchus. If bacteriologic examination also reveals the presence of fusospirochetal organisms, intravenous injections of neosarsphenamines are given at weekly intervals.

In the treatment of chronic lung abscess, except as a preliminary aid to the thoracic surgeon, bronchoscopy is of small value. Cases having a well-defined, densely organized abscess wall are strictly a surgical problem.

Treatment of Bronchiectasis.—The only treatment offering a complete cure in bronchiectasis is lobectomy or total pneumonectomy. However, where surgery is contraindicated because of advanced age, multilobar involvement, and cardiac disease, routine bronchoscopic aspirations, postural drainage, and intratracheal instillation of lipiodol offer a marked palliative relief to the patient.

As an aid in the surgical treatment of bronchiectasis, bronchoscopic aspiration of purulent secretions immediately before, and occasionally during and following the operation, serves to reduce the incidence of postoperative complications. This simple procedure often proves to be a life-saving measure.

Cause and Prevention of Bronchiectasis.—One of the most important roles assigned to the field of bronchoscopy is in the prevention of primary or acquired atelectasis. The accumulated clinical, experimental, and postmortem studies clearly indicate that bronchial dilatation is practically always due to infection of the bronchial wall with destruction of the elastic tissue framework, resulting from prolonged bronchial occlusion and atelectasis. In the majority of cases this condition is chronic and its evolution is gradual. Occasionally bronchiectasis is met with in the acute form following infectious diseases, characterized by marked bronchial irritation, as in whooping cough and influenza.

Children and infants suffering from upper respiratory infection with persistent aspiration of

postnasal drainage material are in constant danger of developing atelectasis and finally bronchiectasis. It is most important that if this condition is to be prevented and the chronic source of bronchial irritation removed, the upper respiratory infection should be eliminated. Also after the successful removal of aspirated foreign bodies which have caused some inflammatory reaction, patients should be kept under observation and should undergo periodic chest examinations for a period of several months.

Holinger⁴ and Tucker⁵ describe various stages in the development of bronchiectasis, in which, if bronchoscopic aspiration is frequently done and bronchial drainage is re-established, the existing pathologic process is still reversible. Anspach⁶ calls attention to the so-called triangular shadows at the base of the lungs, which he regards as an area of localized atelectasis, where, under certain conditions, bronchiectasis may develop. To Anspach also goes the credit for calling the attention of his fellow pediatricians to the value of bronchoscopic aspiration in the prevention of bronchiectasis in children presenting this basal involvement.

The rapidity with which bronchiectasis develops after pulmonary atelectasis will to a great extent depend on the type of organisms present in the trapped secretions. Because of the airless state produced by the atelectasis, a state of anaerobiosis is soon established. If anaerobic organisms are present, they will multiply in great numbers and hasten the destruction of the elastic tissue framework of the bronchial structures. Smith⁷ believes that fusospirochetal organisms aspirated from the oral cavity and always present in the secretions of obstructive lesions of the bronchial tract play a very important role in the development of bronchiectasis.

The diagnosis of bronchiectasis can only be definitely established by means of bronchoscopy and pneumonography. Neither the internist nor the radiologist should attempt to make a positive diagnosis unless the above procedures have been first carried out.

Postoperative Atelectasis.—This development usually results from a bronchial obstruction by aspirated secretions or vomitus during or immediately following operation. The condition is more common following operations in the upper abdominal quadrant because of voluntarily decreased diaphragmatic movement in an attempt to reduce abdominal pain. Although postoperative atelectasis was clearly described as early as 1900, its frequency has been fully appreciated only in recent years. Improved x-ray technic and the many papers published on obstructive atelectasis have stimulated both internists and surgeons, with the result that this condition is

FIG. 2C. Chest x-ray of patient shown in Fig. 2B, showing a marked atelectasis of the left lung.

ception of the well-developed fibrostenotic type resulting from endobronchial tuberculosis, are easily dilated.

Nonopaque Foreign Bodies.—Particularly in children and infants, foreign bodies present a most troublesome problem in diagnosis, since, in many instances, they are overlooked as a diagnostic possibility. It is only when severe pulmonary reaction has already taken place that these patients are sent to the bronchoscopist for examination. Unfortunately, because of inadequate history and because of the fact that these foreign bodies are not visualized by the x-ray, many of the patients developing pulmonary involvement are at first treated for pneumonia. In every child, seen for the first time, who is suffering from obvious pulmonary infection a careful history obtained from the parents should include information regarding recent attack of coughing and choking while eating or drinking. Vegetal foreign bodies, peanut kernels in particular, set up a violent reaction that will prove quickly fatal if the foreign body is not removed.

As a rule, once a vegetal foreign body has lodged in the bronchus, a local reaction soon follows, causing a marked edema of the bronchial mucosa, which soon results in a beginning obstructive emphysema. The symptoms during this early stage are mainly those of wheezing, dyspnea, cough, and slight elevation of temperature. The physical examination usually reveals diminished diaphragmatic excursion of the af-

ected side, bronchial wheezing, mucous rales, slight roughness, and prolongation of the expiratory sound. During this early stage, the conventional x-ray chest films may be of little value. It is by means of physical and fluoroscopic examination of the chest that the diagnosis of obstructive emphysema can be definitely established during its early stage. Fluoroscopic examination of patients with obstructive emphysema will reveal a shifting of the heart shadow toward the uninvolved side during expiration. On the affected side there is decreased diaphragmatic motion, widening of the intercostal spaces, with slight depression and flattening of the dome of the diaphragm. If the foreign body is not quickly removed, the bronchial occlusion becomes more complete and the stage of obstructive emphysema soon changes to that of partial atelectasis. Finally, with complete obstruction to both the entrance and exit of air, massive atelectasis, with the inevitable complication of drowned lung and abscess formation, soon takes place. Even at this late stage, bronchoscopic removal of the foreign body, with re-establishment of pulmonary drainage and ventilation, offers the patient a fair prognosis toward complete recovery.

This last stage of massive atelectasis, with subsequent pulmonary destruction, might never be reached if every pediatrician and general practitioner of medicine would strongly consider the diagnostic possibility of aspirated foreign bodies as the causative factor in both children and infants presenting the symptoms of laryngeal stridor, bronchial wheezing, dyspnea, cough, and elevation of temperature.

Bronchoscopy and Treatment

Treatment of Lung Abscess.—In the field of therapy, bronchoscopic aspiration for the treatment of suppurative diseases of the bronchial tract is now a well-established procedure. By no means is it necessary to recommend all cases of lung abscess for thoracic surgery. In a series of 28 cases of early lung abscess seen by the author during the past five years, in only 8 cases was it necessary to employ surgical intervention. The 20 cases not requiring surgery made uneventful recoveries following bronchoscopic aspiration and medical treatment. It is to be made clear, however, that bronchoscopic aspiration and conservative measures should be carried out only for a period of six weeks. If, during or at the end of that period of time, no improvement has been shown, either clinically or by roentgenographic study, surgery is immediately advocated.

The desired factor in the bronchoscopic treatment of lung abscess is to facilitate drainage from the abscess cavity. Usually the draining bronchus leading from the cavity becomes blocked by

and type of bronchial infection present. In the chronic form of bronchial asthma secondary infection is invariably present and degenerative changes of the bronchial tract with defective ciliary drainage are a constant finding.

The author, in the repeated bronchoscopic examination of numerous patients of all ages suffering from intractable asthma, has never observed the phenomenon of bronchial spasm to be present in the major bronchi. The constant finding of bronchial obstruction by mucosal edema with congestion has led the author to reconsider the previously accepted theory that status asthmaticus was primarily due to a spasm of the circular fibers of the bronchial wall. While the hypothesis of bronchial spasm is the one most generally advanced as the immediate cause of the attack, it is quite probable that the factor of bronchial edema with congestion plays a very important part and that both, rather than either one alone, are involved in producing the phenomenon of an asthmatic seizure. Bronchoscopy, by means of direct visual inspection of the inside of the bronchial tree, affords an open door to the further study of this complex disease.

Bronchoscopy in the Treatment of Bronchial Asthma.—The treatment of this condition, regardless of method or combination of therapy employed, makes up one of the gloomy chapters in the history of medicine. In many instances when the attacks occur early in life and tend to persist and increase in severity, the patient inevitably develops chronic emphysema and sooner or later becomes a confirmed "asthmatic." Both the severity and duration of the seizures will determine to a great extent the rapidity with which this emphysematous state is reached.

Bronchoscopic aspiration of retained secretions during an asthmatic attack which has failed to respond to the commonly accepted methods of treatment will in many instances result in the quick subsiding of the attack. Ramirez and St. George⁸ believe that bronchoscopy is of undoubted value in the so-called nonallergic forms which are associated with chronic bronchitis and bronchorrhea. The benefit is derived not only from the removal of the thick mucus and the endobronchial medication but also from the vaccines prepared from the bronchoscopically aspirated secretions. Autogenous vaccines prepared in this manner, free from oral contamination, seem to be more effective than those prepared from sputum. Clerf⁹ has obtained excellent palliative results following bronchoscopic aspiration of secretion in certain cases of asthma in which there was a tracheobronchitis or definite suppuration of the lung. Halliday¹⁰ believes that the marked improvement and relief from distressing symptoms

following bronchoscopic aspiration and instillation of medication render this procedure an important aid in the treatment.

In certain cases of intractable asthma with heavy, retained secretions not responding to any form of allergenic or adrenalin therapy, the author has obtained a marked symptomatic improvement following frequent intratracheal instillation of a 40 per cent iodized oil. The oil, because its specific gravity is greater than that of the bronchial secretion, displaces and floats the secretion into the larger bronchi and trachea, from where it may be coughed up with ease. There is also a possibility that the free iodine being constantly liberated may serve in stimulating the sympathetic system in relieving bronchial spasticity.

The author is in complete accord with Clerf, who states that before a patient is accepted for bronchoscopic treatment, systematic studies should be made to elicit all possible causative factors. The investigation should include a complete x-ray study of the chest, rhinologic examination, and a thorough allergic study.

Endobronchial Tuberculosis.—Bronchoscopy has opened up a relatively new and important field in the diagnosis and treatment of tracheobronchial tuberculosis. The inexplicably bad results of collapse therapy in the past were no doubt due in part to the presence of bronchial tuberculosis, which was frequently overlooked. The importance of this condition is best illustrated by the fact that today it is a standard procedure with the majority of thoracic surgeons that all patients being contemplated for any form of collapse therapy must first undergo a diagnostic bronchoscopy to rule out tracheobronchial involvement. If the bronchial tract is involved, postponement of operation is preferred and specific intrabronchoscopic treatment is immediately instituted.

The symptoms of bronchial tuberculosis are chiefly those of partial bronchial obstruction. In some instances the obstruction becomes complete and a state of atelectasis soon develops. When a formerly asymptomatic patient, undergoing treatment for pulmonary tuberculosis, suddenly develops the symptom of wheezing with rhonchi which is soon followed by dyspnea, elevation of temperature, recurrence of the positive sputum, and, later, hemoptysis, the possibility of bronchial tuberculosis should be strongly considered. In a small group of cases with positive sputum and hemoptysis in which there is no demonstrable x-ray evidence of pulmonary disease, bronchoscopic examination often reveals the presence of tuberculous bronchial ulceration.

Many tuberculosis institutions throughout the country, realizing the importance of bronchos-

now a definite entity with definite clinical and x-ray evidence.

The symptoms and the observations made of this postoperative complication usually follow a rather definite pattern. Within several hours or longer, following operation, the patient complains of dyspnea, which is usually out of all proportion to the degree of pulmonary involvement. There is a sense of discomfort over the lung involved, the pulse becomes rapid, there is sudden increase in temperature, and cyanosis becomes apparent. Contrary to general opinion, the diagnosis of this condition in its early stage is dependent more upon the physical examination than the x-ray findings. Physical findings during this early stage are usually those of obstructive emphysema.

As the bronchial obstruction increases, early signs of atelectasis begin to appear. The x-ray findings in the early cases of atelectasis may reveal little or no increase in density over the lung involved, but later the shadow may be dense or homogeneous. In the more severe cases, there are elevation of the diaphragm on the affected side, narrowing of the intercostal spaces, and marked displacement of the heart and mediastinum.

Treatment of Postoperative Atelectasis.—Postoperative atelectasis can be best treated by means of bronchoscopic aspiration, with the removal of the obstructing bronchial secretions. It is important that if an early diagnosis is to be established, the surgical intern and the surgeon be ever on the alert for the possibility of this surgical complication. Fortunately for the patients who come to operation in the author's community, surgeons and internists are wide awake regarding this complication and lose no time in asking for bronchoscopic consultation. In the past, patients developing this unfortunate condition were treated for pneumonia, a procedure that was usually followed by a high mortality. Today practically all patients treated for postoperative atelectasis by bronchoscopic aspirations make an uneventful recovery. In the majority of cases treated there is a sudden drop in the temperature, pulse, and respiratory rate. Almost immediately the patient feels relieved of the dyspnea and is able to cough up with ease the remaining secretions. It is to be made clear, however, that the diagnosis must be made early, for if atelectasis is allowed to exist for many hours, secondary pneumonitis and pulmonary suppuration may develop. In several well-known surgical clinics in this country, patients exhibiting signs of respiratory obstruction are immediately bronchoscoped during the operation and again before leaving the operating room. It is a standard rule in these clinics that no patient shall leave the operating room with a "wet lung."

In addition to bronchoscopic aspiration, patients developing postoperative atelectasis are administered a 5 per cent carbon dioxide-oxygen mixture for a period of five minutes at intervals of from one to two hours until respiration and pulse rate return to a normal postoperative level. Instructions are also given to have the patient frequently rotated from side to side. With this added treatment, the patient is usually able to cough up the remaining retained secretions.

Prevention of Postoperative Atelectasis.—In the prevention of this complication many important details should be attended to before and during the operation. One important detail is the question of heavy preoperative sedation in patients who are known to have a chronic bronchitis or sinusitis. Many of these patients spend considerable time on awakening every morning in clearing their nasopharynx and tracheobronchial tree of accumulated secretions aspirated during the sleeping hours. If the cough reflex is depressed by heavy sedation given the evening before and on the morning of operation, these patients are not able to clear out their airways. Before taking the morning sedation, then, these patients should be encouraged to cough and clear themselves of retained secretions.

If morphine is used postoperatively it should be given cautiously, since it will tend to depress the cough reflex. Atropine and scopolamine should also be used judiciously because they tend to dry up secretions, making it impossible for the delicate ciliated epithelium to move up secretions in the larger bronchi and trachea from which they can be easily expectorated.

If there is any question whatsoever of respiratory disease a complete x-ray study of the chest should be made and, if possible, operation should be postponed if the x-ray reveals any pulmonary pathology.

Bronchoscopy in Bronchial Asthma.—If possible, every case of bronchial asthma being contemplated for allergenic treatment should undergo a diagnostic bronchoscopy. To recall the words of Dr. Chevalier Jackson: "All that wheezes is not asthma." Time and again, bronchoscopic examination of patients diagnosed and treated for this condition has revealed that the underlying cause of wheezing and dyspnea was the presence of intrabronchial pathology in the form of neoplasm, bronchial stricture, bronchiectasis, localized atelectasis, endobronchial tuberculosis, varicose forms of bronchitis, nonopaque foreign bodies, laryngeal papillomata, and pressure on the trachea and bronchi from extrinsic causes.

The bronchoscopic findings in bronchial asthma are chiefly those of mucosal edema with congestion. The amount and character of the secretion usually depend in a large measure on the severity

THE USE AND ADVANTAGES OF AUGMENTED UNIPOLAR EXTREMITY LEADS (aV-LEADS) IN THE ELECTROCARDIOGRAPHIC DIAGNOSIS OF MYOCARDIAL INFARCTION (DUE TO CORONARY ARTERY OCCLUSION AND ACUTE CORONARY INSUFFICIENCY)

EMANUEL GOLDBERGER, M.D., Bronx, New York

IN A paper recently published in the *American Heart Journal*¹ I described a technic of obtaining augmented unipolar extremity leads, together with a description of a very simple indifferent electrode necessary for use with these leads. The standards and principles required for proper use of the leads were then further established in another article.²

In this paper I shall demonstrate the applicability of my system of electrocardiography, especially in the diagnosis of myocardial infarction, when standard leads show atypical signs or show no pathognomonic signs at all.

First, however, let me briefly review definitions of terms and details of technic which are as yet unknown to the general medical public.

Definitions

1. *Standard lead* electrocardiograms represent, in reality, the difference in potential between the two extremities being recorded.³ In other words, the *standard lead* is a *bipolar extremity lead*.⁴

2. *Unipolar extremity leads*, on the other hand, record the potentials from any one of the three extremities, using an indifferent electrode of zero potential. (Either the author's¹ or Wilson's⁵ may be used.)

3. *Augmented unipolar extremity leads* (aV-leads) are like the ordinary or unaugmented unipolar extremity leads in that they also record the potentials from only one extremity. However, the hookup is such that even though the electrocardiograph is standardized in the usual manner, in the finished record the augmented unipolar extremity leads electrocardiograms have potentials $\frac{3}{2}$ greater than the ordinary unipolar extremity lead records.¹

The three aV-leads (augmented unipolar extremity leads*) used are: (a) the aV_I lead, the augmented left arm extremity lead; (b) the aV_R lead, the augmented right arm extremity lead; and (c) the aV_F lead, the augmented left leg extremity lead.

4. *Precordial leads* are taken in accordance with the conventions established by the American

Heart Association⁶ for use with an indifferent electrode of zero potential. The leads are named V₁, V₂, V₃, V₄, V₅, and V₆. Lead V₄ corresponds to the usual precordial lead taken along with standard leads.

Construction of the Author's Indifferent Electrode of Zero Potential¹

Three single lengths of ordinary No. 18 electric wire, and four battery clips (Fig. 1) are needed. The wire should be about 4 feet in length.

1. Arrange the three lengths as they are arranged in Fig. 1, exposing their ends.

2. Join the three loose ends at T, and apply one of the battery clips (Fig. 1).

3. To the other ends of the three lengths, additional battery clips may be attached. Tips may be soldered, or such alterations made as are necessitated by variations in the construction of different kinds of electrocardiographs.

The Technic of Taking the aV- and Precordial V-Leads (Fig. 1)

1. *The aV_I Lead*.—Set electrocardiograph for lead 1.

2. Place electrodes on the patient's right and left forearms and left leg.

3. Attach the indifferent electrode as illustrated in Fig. 1 to the electrodes on the right forearm and left leg. The third end of the indifferent electrode is left free.

4. Attach the RA lead wire (from the electrocardiograph) to the central terminal of the indifferent electrode.

5. Attach the LA lead wire to the electrode on the left forearm.

6. Standardize the electrocardiograph so that 1 cm. = 1 mv.

7. Run the record.

In the finished record, positivity will be represented by an upward deflection, and 1.5-cm. deflection of the waves will be equivalent to a potential of 1 mv. (The standardization mark should rise or fall only 1 cm.)

8. *The aV_R Lead*.—After the aV_I lead has been taken, remove one of the ends of the indifferent electrode from the right forearm and attach it to the electrode on the left forearm.

9. Attach the LA lead wire to the electrode on the right forearm.

¹ Awarded the Merrit H. Cash Prize by the Medical Society of the State of New York, April 28, 1942.

² From the Department of Medicine, Lincoln Hospital, New York, Dr. Leander H. Shearer, Director.

³ The unaugmented ordinary unipolar extremity leads are known as leads V_I, V_R, and V_F, respectively.⁴

copy as an aid in the diagnosis and treatment of this serious complication of pulmonary tuberculosis, have now added a bronchoscopic clinic as an integral part of the surgical department.

Bronchoscopy as an Aid to Thoracic Surgery.—The rapid progress already made to date in the field of thoracic surgery has been in no small way due to the aid of the bronchoscopist, who by careful endoscopic examination has aided in the correct localization of pulmonary lesions. Probably the greatest aid of bronchoscopy to the thoracic surgeon has been in the early diagnosis of primary carcinoma of the lung. In the diagnosis of tracheobronchial tuberculosis, the bronchoscopist has been of great aid to the surgeon in calling his attention to the existing contraindication for collapse therapy. In certain instances bronchoscopic aspiration before, during, and following thoracic operations has served to reduce post-operative mortality. The advances still to be made in the field of thoracic surgery will no doubt depend in part on further bronchoscopic research on the behavior of the normal and diseased bronchi.

Summary

In this brief review of the role of the bronchoscopist in the diagnosis and treatment of diseases of the bronchial pulmonary tract, the author has attempted to emphasize the following facts:

1. Aside from the well-known procedure for the removal of aspirated foreign bodies, bronchoscopy has come to play an important rôle in the diagnosis and treatment of diseases of the bronchial pulmonary tract.

2. There are many conditions of the lower res-

piratory tract that often remain undiagnosed because of lack of bronchoscopic study.

3. In the diagnosis of primary carcinoma of the lung, bronchoscopic examination is by far the most important diagnostic procedure available.

4. Close cooperation between the internist, radiologist, and bronchoscopist will in many instances facilitate the diagnosis of obscure conditions of the bronchial pulmonary tract.

5. Many suppurative conditions of the lungs if diagnosed early will respond to bronchoscopic and medical management.

6. Bronchoscopy is of aid in the removal of bronchial obstruction, thus preventing the development of atelectasis and subsequent pulmonary destruction.

7. Bronchoscopy is of aid to the thoracic surgeon in the localization of pulmonary lesions.

8. Bronchoscopy is not a hazardous procedure, and the majority of patients treated are handled as outpatients.

RESEARCH ON QUININE SUBSTITUTES

Through the combined efforts of chemists all over the nation, new drugs that will replace quinine in the treatment of malaria are being developed, together with other remedies for the control of yellow fever and similar tropical diseases. Furthermore, most of these drugs are less toxic than quinine and some of its earlier substitutes.

At a symposium on malaria at the American Chemical Society's meeting in Detroit, it was explained that the loss of the quinine supply to the Japanese has been compensated for by the production of atabrine. According to A. E. Shernald, of the Winthrop Chemical Company, the quinine supply was sufficient before the war to treat 50,000-100,000 cases of malaria, but the expansion of atabrine production has made it possible to treat even more than this number, and the production goal is set at twice the present figure.

A further suggestion was made at the meeting that the biotin-inactivating substance, avidin, recently isolated from uncooked egg white, is a

promising new agent in the present fight against malaria.

The manufacture of synthetic quinine is being aided by chemistry students at the College of the City of New York. Under the direction of Professor William L. Prager, students at the college are combining raw chemicals into compounds called "intermediates," which are shipped to plants and put through the final processes.

The Rockefeller Foundation, it was revealed in the report of Raymond B. Fosdick, president, is also contributing to the research on combating tropical diseases and has already developed a new type of vaccine for yellow fever. Four million doses were distributed to American and Allied troops in Africa, and mass vaccination of the population in Africa has been undertaken. Without this protection troops could not be assigned to some of the areas in which they are now stationed.

The Rockefeller Foundation is also engaged in research for quinine substitutes.

FIG. 2. The patterns of axis deviation and ventricular preponderance. LAD—left axis deviation. RAD—right axis deviation. LVP—left ventricular preponderance. RVP—right ventricular preponderance.

attached. When the aV-leads are taken, one end of the indifferent electrode also remains unattached.

Terminology

All measurements should be made in terms of millimeters, *not* millivolts. P, T and U waves are described as usual.

The QRS Complex.—Since the QRS complex, physiologically, is a single entity, separate identification of the individual waves is done for purposes of description only.

The nomenclature described below is in accord with the request of the American Heart Association to have standard terminology applicable to *all* leads:

- Q—an initial downward (–) deflection, if followed by an upward deflection.
- QS—an initial downward (–) deflection if not followed by an upward deflection.
- R—the first upward (+) deflection.
- S—a downward (–) deflection, if present, following R.
- R', R''—additional upward (+) deflections, after the first R.
- S', S''—additional downward (–) deflections, after the first S.

The relative sizes of the deflections can be described by the use of small and capital letters, i.e., qR, Rs, etc.

Normal Patterns² {Fig. 2}

The aVr Lead.—The basic normal pattern of the aVr lead consists of a (–) P: a (–) ventricular complex comprising a QS, an iso-electric

RS-T segment, and a (–) T. The normal variations are the presence of either or both a small r or r'.

The aVf Lead.—The basic pattern of the aVf lead is just the reverse of the aVr lead: a (+) P; monophasic (+) R, and a (+) T, with similar normal variations.

The aVl Lead.—The aVl lead may resemble the aVf or the aVr leads. P is usually (+) though it may be (–). When the main ventricular deflection is (+), T is (+). When the main ventricular deflection is (–), T may be (–), especially if the patient is recumbent.

The Precordial Leads.—Standards for these have been well established and need not concern us here.⁷

The Patterns in Axis Deviation

aV-leads vary directly with the electrical axis of the heart. Elaboration on this subject is not necessary here, for it has been clearly shown that the potential of the aVl lead is a good index of axis deviation; a large (+) deflection is an indication of left axis deviation; and a (–) main ventricular deflection indicates a right axis deviation.^{2,5,7}

In Fig. 2 are shown the usual patterns observed in cases of axis deviation and ventricular preponderance.

Myocardial Infarction

So much, then, for introductory remarks. Now for a discussion of the patterns in acute myocardial infarction due to coronary artery occlusion (thrombosis or embolism) and coronary insufficiency.

FIG. 1. Hookup to take augmented unipolar extremity leads (aV-leads) and unipolar precordial leads with the author's indifferent electrode of zero potential.

The electrocardiograph should be set for lead 1.

Un.—unattached. The left leg lead wire from the electrocardiograph is always left unattached. When the extremity leads are taken, one end of the indifferent electrode is also left unattached.

10. Standardize and run the record

11. *The aVf Lead.*—Remove the end of the indifferent electrode from the left leg, and attach one of its ends to the electrode on the right forearm.

12. After removing the LA lead wire from the right forearm, attach it to the electrode on the left leg.

13. Standardize and run the record.

14. *The Precordial V Leads.*—Attach the third end of the indifferent electrode to the electrode on the left leg. (The other two ends

are attached to the electrodes on right and left forearms if the procedure above has been followed.)

15. Using a regulation precordial electrode, attach the LA lead wire to it, and place it on the desired part of the thorax.

16. Standardize and run the record.

In the precordial leads, as with the aV-leads, positivity will be represented by an upward deflection, but here 1-cm. deflection = 1 mv.

Throughout this procedure, the left leg lead wire from the electrocardiograph remains un-

tive. It is as if a hole were cut in the heart and the electrode placed over it. Consequently, the initial deflection is $(-)$ (a Q wave).^{10,11}

To summarize, only unipolar leads overlying or facing the infarct can record a Q and a $(+)$ RS-T deviation.

Fourth, T wave changes later develop in a direction opposite to that of the RS-T segment deviation. The mechanism for this is as follows:

It was mentioned above that as the impulse sweeps over the heart, it may be considered as a wave with a $(+)$ pole in the direction to which the impulse is spreading, and a $(-)$ pole in the region from which the impulse is passing. During the regression of activity, these conditions are reversed, and the $(-)$ pole of the impulse is in the direction to which the regression wave is progressing. Normally, in the heart the paths of activation and of regression are not identical. In the healing stages of infarction this discrepancy is more marked, because, as has been experimentally demonstrated, in the region surrounding the healing infarct, the duration of the regression of activity is unduly prolonged.¹⁶ The effect of this is to cause the regression wave (with its $(-)$ forward pole) to travel in this direction. Thus, the electrode overlying the infarct, which had previously recorded a $(+)$ RS-T deviation, now records a $(-)$ T wave, or vice versa.

In applying these principles to human myocardial infarction, certain facts must be kept in mind:

1. The infarct that develops after coronary artery occlusion (thrombosis or embolism) may be analyzed as if it were localized to the sub-epicardial region, as with experimental injury to the surface of the ventricles.⁸

2. The region of the heart affected may be the anterolateral surface of the left ventricle (anterior infarcts); or the inferior surface of the left ventricle (posterior infarcts).¹²

3. The pathology observed with acute coronary insufficiency may be compared to sub-endocardial injury produced experimentally.^{13,14}

Anterior Infarcts (Q-1-T-1 Type)

On the basis of the theoretic considerations outlined above, the anterior precordial leads and the aVl lead which overlie and face the infarct¹² should present a Q wave and a $(+)$ RS-T segment deviation. The aVr and the aVf leads, facing the surrounding vital tissue, should record a $(-)$ RS-T segment deviation.

This actually occurs, and the characteristics of anterior infarcts are illustrated in Fig. 3.

It will be noted that there is a reciprocal relation between the RS-T segment deviations and the later T wave changes of the aVl and aVf

leads, RS-T being $(+)$ in the aVl lead, $(-)$ in the aVf lead, and T becoming $(-)$ in the aVl lead and $(+)$ in the aVf lead.

There is still another important point to be made. The Q in the aVl lead creates the potentiality for Q-1.^{2,4} Its presence, therefore, may be considered as more significant than a Q-1. (However, a small Q-aVl like a small Q-1 may be present normally.)²

Anterior Infarction Without Characteristic Patterns in the Standard Leads

When the infarct is small, Q waves may not appear, and the RS-T segment deviations, limited to the leads facing the infarct, may, in the case of anterior infarction, be seen in only one of the precordial leads, and the aVl lead. In such cases the aVl lead has a small Q and a characteristic flattening of the RS-T segment, with a coved or $(-)$ T (Fig. 4).

In fact, if the infarct is situated on the lateral surface of the left ventricle, even the precordial leads may show only minimal changes. In such cases, the standard leads will show only inconstant and atypical changes in the T wave, which cannot be interpreted as indicating an acute infarct.

The pattern in the aVl lead may therefore be the sole electrocardiographic evidence of a recent occlusion. We have seen many such cases, and Fig. 4 illustrates this well. It will be noted that although the precordial lead at the onset of the infarction was characteristic—even when this had returned to approximately its normal pattern—the aVl lead retained evidence of the cardiac damage.

Posterior Infarcts (Q3-T3 Type)

Again on theoretic analysis, an electrode placed over the infarct (as a low esophageal lead¹⁵) or facing it, as in the aVf lead, or leads from the lower posterior back, should present a pattern similar to that obtained with precordial and aVl leads in anterior infarction—namely, a Q wave and a $(+)$ RS-T segment deviation.^{1,12,15}

Furthermore, the aVr and the aVl leads which face the surrounding vital tissue should record a $(-)$ RS-T segment deviation. This actually occurs,^{2,12,15} and the characteristics of posterior infarction are described in Fig. 3.

As with anterior infarcts, there is a reciprocal relation between the patterns of the aVl and aVf leads. In this instance the RS-T of the aVl lead is $(-)$; that of the aVf lead, $(+)$. Later the T of the aVl lead becomes $(+)$, and that of the aVf lead $(-)$.

Here again it will be noted that the Q of the aVf lead contributes the potentiality for Q3. Therefore, a Q-aVf when present is more significant

FIG. 3. Unipolar lead patterns in myocardial infarction due to coronary artery occlusion and acute coronary insufficiency.

When one of the coronary vessels is occluded, or when there is anoxemia of the cardiac musculature, tissue injury occurs, and certain physiologic changes take place, regardless of the nature of the damaging agent, or of the location of the infarct.

First, there is the production of a current of injury. This is due to the fact that injured tissue as well as active tissue is relatively (-) to uninjured or inactive tissue. Therefore, if a strip of muscle be injured, a potential difference will exist at the boundary between the vital and injured muscle. This would be recorded by the electrocardiograph as a constant deflection of the string if it were not for the fact that its effect is neutralized during standardization. The original current of injury, therefore, does not appear on the electrocardiogram.

Second, RS-T deviations appear, for the following reason: As the electrical impulse reaches the boundary between vital and injured muscle, the difference in potential and the injury current between these two regions disappear. However, the neutralization current, flowing in the opposite direction to the original injury current, is still in the circuit; its effect is to make the string move exactly in a direction opposite to that which the original current of

injury would have moved it. This produces the RS-T deviation. As long as the area adjacent to the injured muscle is electrically active, the RS-T deviation persists.

Whether the RS-T deviation will be (+) or (-) depends solely on the relation of the electrode to the infarcted area. An electrode overlying or "facing" the infarcted area will produce a (+) RS-T deviation; one that faces the normal surrounding and underlying tissue will produce a (-) RS-T segment deviation.^{2,8,12}

Third, accompanying the RS-T segment deviations, Q wave patterns may appear if the infarct is large and extensive enough. The reason for their appearance is that the impulse in the heart travels from within outward so that the endocardium remains relatively negative to the epicardium, and a lead facing the endocardium (as within the ventricular cavity; over one of the large valvular orifices at the base of the heart; or from the aVr lead) will tend to be negative throughout the QRS complex.²

When a large area of the ventricular wall has been damaged, the electrical effects normally present in the tissue disappear, and an electrode overlying the infarct may be considered as facing the endocardial cavity, which is nega-

FIG. 5. Atypical posterior infarction. ♂ 42.

(a) Twenty-four hours after attack. Standard leads and 6 precordial leads (only V4 shown above) within normal. In the aVf lead (from left leg) there is a characteristic pattern present, consisting of a small diphasic QRS with an initial Q, and a coved T. (See also small box.)

(b) Ten days later. All leads have returned to normal

Pericarditis

A complicating pericarditis may further obscure the picture of anterior or posterior infarction. Since the patterns of pericarditis are due to damage of the subepicardial muscle,⁹ the RS-T deviations and T wave changes may be explained as in myocardial infarction.

When the pericarditis is extensive, (+) RS-T segment deviations occur in the aVl and aVf leads without Q waves, so that an anterior, or a posterior, infarct complicated by extensive pericarditis will lose the reciprocal relations between the aVf and aVl leads, and the RS-T segment deviations in both leads will be (+). If there are signs of both anterior and posterior infarction (with Q wave changes), it may be impossible to diagnose a complicating pericarditis electrocardiographically.

Conclusions

In the preceding pages, the technic and principles underlying the use of the author's system of augmented unipolar extremity leads were briefly reviewed.

The use of these leads is based on fundamental physiologic principles which can be directly applied.

This I did in analyzing the patterns of myocardial infarction due both to coronary artery thrombosis and to acute coronary insufficiency. I also pointed out how even the patterns of pericarditis could be analyzed with this technic.

However, the great value of augmented unipolar extremity leads lies in the diagnosis of coronary artery disease when standard leads are equivocal. Not only have I employed augmented unipolar extremity leads in diagnosing myocardial infarction; but I have found that cases of suspected angina pectoris, where standard leads are normal, will often show evidence of myocardial damage in the augmented unipolar extremity leads (to be reported in a separate communication). Furthermore, I have used these leads in the diagnosis of pulmonary embolism, which may simulate posterior occlusion in standard leads. However, the limitations of this paper prevent full discussion of these problems, the effects of digitalis and other drugs, as well as many other aspects of electrocardiography. Some, as I have already stated, have appeared;^{1,2} others are in preparation.

Summary

Although the research worker has studied unipolar extremity potentials for some time, now,

FIG. 4. Atypical anterior infarction. ♂ 39.

(a) Forty-eight hours after attack. Standard leads are normal. Precordial lead V4 has a (-) T. The aVL lead (from left arm) shows a characteristic small Q, flattening of the RS-T, and a (-) T. (In the small box a typical pattern is drawn.)

(b) Six weeks later. Standard and precordial leads are within normal. The aVL lead is still abnormal. The Q in the aVF lead is also abnormal.

than a Q3 (when its amplitude tends to be $\frac{1}{3}$ or more of the entire QRS complex).

Posterior Infarction Without Characteristic Patterns in the Standard Leads

When the infarct is small, precordial leads as well as standard leads are often within normal limits. In such instances, the aVF lead, which faces the infarct, will show a characteristic pattern: a Q wave associated with a small QRS complex, and a (+) RS-T segment deviation with a coved T (Fig. 5).

Acute Coronary Insufficiency

In acute coronary insufficiency there occur scattered focal areas of myomalacia and necrosis, most marked in the subendocardial region.

Using a line of reasoning similar to that employed for anterior and posterior infarction, one would expect that a lead facing the endocardium, the aVR lead, would record a (+) RS-T segment deviation, whereas the aVL, the aVF, and the

precordial leads, which face the surrounding vital tissue, should record (-) RS-T segment deviations. Since a Q is a normal phenomenon in the aVR lead, its presence is not pathognomonic.

Fig. 3 illustrates the characteristic pattern of acute coronary insufficiency. The patterns in angina pectoris depend on a similar mechanism.

Multiple Infarcts

Not only may a recent infarct occur in a heart previously damaged, but also multiple acute infarcts may occur. Old infarction may often be recognized by Q wave patterns which may be permanent.

When multiple acute infarcts occur, signs of anterior infarction overshadow those of posterior infarcts in the precordial leads, whereas the characteristic RS-T segment deviations and Q waves of both types will be seen in the aVF leads and a VL leads. The aVR lead responds, in a general way, similarly to either anterior or posterior infarction. (Fig. 3).

FIG. 5. Atypical posterior infarction. ♂ 42.

(a) Twenty-four hours after attack. Standard leads and 6 precordial leads (only V4 shown above) within normal. In the aVf lead (from left leg) there is a characteristic pattern present, consisting of a small diphasic QRS with an initial Q, and a coved T. (See also small box.)

(b) Ten days later. All leads have returned to normal

Pericarditis

A complicating pericarditis may further obscure the picture of anterior or posterior infarction. Since the patterns of pericarditis are due to damage of the subepicardial muscle,⁹ the RS-T deviations and T wave changes may be explained as in myocardial infarction.

When the pericarditis is extensive, (+) RS-T segment deviations occur in the aVl and aVf leads without Q waves, so that an anterior, or a posterior, infarct complicated by extensive pericarditis will lose the reciprocal relations between the aVf and aVl leads, and the RS-T segment deviations in both leads will be (+). If there are signs of both anterior and posterior infarction (with Q wave changes), it may be impossible to diagnose a complicating pericarditis electrocardiographically.

Conclusions

In the preceding pages, the technic and principles underlying the use of the author's system of augmented unipolar extremity leads were briefly reviewed.

The use of these leads is based on fundamental physiologic principles which can be directly applied.

This I did in analyzing the patterns of myocardial infarction due both to coronary artery thrombosis and to acute coronary insufficiency. I also pointed out how even the patterns of pericarditis could be analyzed with this technic.

However, the great value of augmented unipolar extremity leads lies in the diagnosis of coronary artery disease when standard leads are equivocal. Not only have I employed augmented unipolar extremity leads in diagnosing myocardial infarction; but I have found that cases of suspected angina pectoris, where standard leads are normal, will often show evidence of myocardial damage in the augmented unipolar extremity leads (to be reported in a separate communication). Furthermore, I have used these leads in the diagnosis of pulmonary embolism, which may simulate posterior occlusion in standard leads. However, the limitations of this paper prevent full discussion of these problems, the effects of digitalis and other drugs, as well as many other aspects of electrocardiography. Some, as I have already stated, have appeared;^{1,2} others are in preparation.

Summary

Although the research worker has studied unipolar extremity potentials for some time, now,

with the use of augmented unipolar extremity leads, the *clinician* has access to this new and simple modality of electrocardiography.

FITTING HANDICAPPED WORKERS TO JOBS

Industry, which in normal times has been loath to employ the handicapped worker, is now recognizing that many handicapped persons may be as efficient as those with full physical equipment and may be safer workers if they can be properly placed, trained, and supervised. *Manpower Review*, a publication of the War Manpower Commission, has recently considered the use of handicapped persons in industry as an aid to the war effort. The fitting of a handicapped person to his job demands that there be a breakdown of the requirements for all jobs in specific relationship to the exact procedures required, such as the degree of skill and strength demanded and conditions which surround the job.

Dovetailing with the detailed job analysis there must be an equally detailed analysis of the capability of the worker. When these frameworks of information have been established, adaptation of the handicapped person to the job becomes relatively simple. Adaptations of machinery may be made, such as shifting hand or foot levers so that they can be used by workmen with missing hands or feet.

From Germany comes a report concerning measur-

ing devices which use variations in tonal qualities of sound, such as a bell to enable blind workers to "read" the instrument. Persons unable to stand or walk much may be placed in sedentary jobs to which all material is brought and from which finished products are taken away by other workers or conveyors. A sample job analysis sheet indicates the demands for walking, standing, sitting, climbing, etc.

A tabulation of the estimated number of persons with various types of impairment by types of pre-employment service needed indicated that there were 901,000 with hearing impairment, 337,000 blind in one or both eyes, 1,849,000 with orthopaedic impairment, 1,186,000 with hernia, 976,000 with hemorrhoids, and more than 11,000,000 with chronic diseases. This list was based on an estimate by the United States Public Health Service. The latent manpower in these handicapped workers can be significant in the war effort. The physician, particularly the industrial surgeon, management, and labor can cooperate in the constructive utilization of this vast potential reserve.—*J.A.M.A.*

VITAMIN C CONTENT OF ORANGES

In a recent study of the relation of season, weight, and price to the vitamin C content of oranges, Arthur D. Holmes, Ph.D., James A. Patch, S.B., and Francis Tripp, M.S., report in the *New England Journal of Medicine* that oranges contribute about 624,080,000 Gm. of vitamin C annually to the human dietary.

In their study the authors selected oranges from local retail stores, both chain store organizations and privately owned shops, and also from street hucksters, in order to get a cross section of the types of oranges eaten by the average family.

Representative fruit was purchased in March, June, September, and December. Average per orange values for the March fruit are: weight, 206 Gm.; cost 28 cents per dozen; juice, 77 cc.; vitamin C content per 100 cc. of juice, 52 mg. In order to obtain the 75 mg. of vitamin C that is considered

adequate for the average adult, 144 cc. of juice, at a cost of 4.8 cents, are required. Similar values for June were 150 Gm.; 29 cents per dozen; 74 cc. of juice; 45 mg. of vitamin C, and 176 cc. of juice at a cost of 5.9 cents. In September the values were 160 Gm.; 27 cents per dozen; 76 cc. of juice; 39 mg. of vitamin C; and 196 cc. of juice at a cost of 5.9 cents.

The December values of fruit tested were 212 Gm.; 31 cents per dozen; 101 cc. of juice, 56 mg. of vitamin C, and 136 cc. of juice at 3.6 cents.

The weight of the oranges varied greatly at all seasons of the year, but the winter oranges were slightly more than one-third heavier than the fruit of the fall and summer seasons.

There was no consistent relation between cost and weight during the different seasons, and the cost was varied throughout the year.

CLINICOPATHOLOGIC CONFERENCES

DEPARTMENTS OF MEDICINE AND PATHOLOGY, NEW YORK POST-GRADUATE
MEDICAL SCHOOL AND HOSPITAL, COLUMBIA UNIVERSITY

Conducted by: HERMAN O. MOSENTHAL, M.D., and MAURICE N. RICHTER, M.D.

Date: November 17, 1942

History

Case J66833

DR. SYDNEY STEINBERG: This patient was first seen at another institution on October 3, 1941, where the following facts were obtained:

Since 1936 she had suffered frequent bilateral frontal headaches which were accompanied at times by dizziness and spots before her eyes. She had had episodes of joint pains for nine months, when the ankles, hands, and fingers became swollen, red, and tender. Fever was often present with these attacks. For the past half-year there had been red skin lesions on the arms, legs, and face. Since June, 1941, she had complained of an occasional sore in her mouth and pain in the lower right side of her chest. She had lost 30 pounds since February, 1941. For one week it was noticed that there were occasional involuntary movements of her hands.

Physical Examination.—Physical examination revealed a well-developed, fairly well-nourished white woman who appeared chronically ill. She smacked her lips frequently, had slight difficulty in forming her words, and manifested an occasional involuntary twitch of her hands. In the butterfly area of her face there were numerous dilated venules. There were pink maculopapular and occasional nodular lesions over the forehead and cheeks. Polymorphous erythematous lesions which were covered with a whitish scale were present on the arms and legs. In the left fundus were 2 whitish exudates. Small ulcerations with a whitish exudate were present on the right anterior tip of the tongue. The lymph nodes were moderately enlarged throughout. The lungs were clear except for dullness and diminished breath sounds over the right lower lobe. The heart was normal. The blood pressure was 138/96 mm. of mercury. Abdominal, genital, and neurologic examinations were essentially negative.

Laboratory Data.—Blood count: hemoglobin 95 per cent, white blood count 2,800; normal differential—platelets 45,000, reticulocytes less than $\frac{1}{2}$ per cent. Urinalysis: A specific gravity

of from 1.012 to 1.018, a trace to 3 plus protein, a trace of bile, 1:10 urobilin, an occasional hyaline cast, 1 or 2 red blood cells, an occasional white blood cell. Phenolsulfonphthalein test: 25 per cent excretion in two hours. Tourniquet test: strongly positive. Sedimentation rate, 45 mm. per hour. Blood chemistry: urea nitrogen 14 mg. per cent, sugar 60 mg. per cent, cholesterol 380 mg. per cent, total serum proteins 6.0 Gm. per cent, serum albumin 2.3 Gm. per cent, serum globulin 3.9 Gm. per cent, serum calcium 7.4 mg. per cent, phosphorus 4.2 mg. per cent, chlorides 585 mg. per cent, uric acid 4.7 mg. per cent, icterus index 11 units, phosphatase 136 I.A. units, bilirubin 1.3 mg. per cent, Van den Bergh delayed positive. The blood Wassermann was anticomplementary, the Kahn test was negative, and a blood culture was negative. Red cell fragility test was normal. The tuberculin test was negative. The bone marrow was hypoplastic with a normal cell distribution. Stool examination was negative for occult blood. The basal metabolic rate varied from plus 26 to plus 1. Blood heterophils negative. Biopsy of skin: degenerative collagen changes and hemorrhages in the upper corium compatible with a diagnosis of lupus erythematosus. Electrocardiogram: right axis deviation, QRS low, T_2 and T_3 low, T_4 semi-inverted. X-ray of the chest showed a small collection of fluid at the right base. A flat plate of the abdomen was negative.

The patient was discharged to the care of her private physician.

Post-Graduate Hospital Admission

She was admitted to the Post-Graduate Hospital on April 30, 1942. Since her discharge from the first hospital the patient had been bedridden. Her chief complaints were of joint pains, right chest pain, and point tenderness of the skin. Nourishment was well taken until two days prior to admission. She had run a low-grade temperature with occasional spikes to 103 or 104 F. Her pulse ranged from 120 to 130 per minute. For five weeks before admission there were periods lasting from fifteen to twenty minutes during which she was irrational.

Physical examination revealed an emaciated, chronically ill woman who was irrational. She rolled her head from side to side, moved her arms about purposelessly, and was incontinent of urine and feces. There were small dilated venules over the butterfly area of the face and a very small erythematous lesion below the left breast. Neither jaundice nor cyanosis was present. Eyes, ears, nose, and throat examinations were negative. Fundi were not examined. There was dullness, breath sounds were diminished, and medium moist rales were present over the base of the right lung. The heart showed nothing significant except for a pulse rate of 130 per minute. The abdomen was negative. There was marked weakness and muscle atrophy of the upper and lower extremities. The reflexes were physiologic.

Laboratory Data.—Blood count: red blood count 3,410,000, hemoglobin 11 Gm., white blood count 6,250; differential—polymorphonuclears 88.5 per cent, lymphocytes 9.5 per cent, monocytes 4.0 per cent. Corpuscular volume was 32 per cent. Urinalysis: specific gravity 1,008 to 1,012, protein 1 to 4 plus, a few red blood cells, 1 white blood cell per high power field, many hyaline and fine and coarse granular casts. Blood chemistry: cholesterol 240 mg. per cent, esters 125 mg. per cent, ratio 51 per cent; urea nitrogen 22.9 mg. per cent, nonprotein nitrogen 38 mg. per cent, ratio 59 per cent; creatinine 1.3 mg. per cent, chlorides 610 mg. per cent, glucose 65 mg. per cent, inorganic phosphates 5.8 mg. per cent, total calcium 8.0 mg. per cent. Serum proteins: (May 4, 1942) total 4.9 Gm. per cent, albumin 1.9 Gm. per cent, globulin 3.0 Gm. per cent, ratio 0.6; (May 25, 1942) total 4.2 Gm. per cent, albumin 1.9 Gm. per cent, globulin 2.3 Gm. per cent, ratio 0.8. Carbon dioxide combining power was 31.5 volumes per cent. The icterus index was 5.5 units. The sedimentation rate was 110 mm. per hour. Blood Wassermann was negative and a blood culture was negative. X-ray of chest: the heart was relatively a shade large and there was slight peripheral interlobar thickening.

Clinical Course.—The temperature ranged from 98.6 to 106 F. with an average daily fluctuation ranging from 100 to 102 F. The pulse rate ranged from 88 to 180, running generally at about 120. The patient remained irrational throughout and had no sphincter control. Two blood transfusions were given. Sulfadiazine was administered from May 13 to May 20 until a total of 40 Gm. was reached and a blood level of 28 mg. per cent was obtained. However, the patient's course was steadily downhill, and she died thirty-three days after admission. The day

before death, the blood pressure was 180/110 mm. of mercury.

Discussion

DR. A. WILBUR DURYEE: This patient probably died from lupus erythematosus disseminatus. The diagnosis was made by skin biopsy. Let us review her past and present history and the laboratory findings and determine, if possible, the relationship of the symptoms and signs to this disease and other possible diseases.

The onset of her symptoms was about six years prior to her death. They started with cerebral complaints of headaches, dizzy sensations, and "spots before her eyes." Since we have no record of any objective findings at that date we can only conjecture as to the exact cause of these symptoms. As it is now known that lupus erythematosus involves practically all parts of the body, the headache, dizziness, and visual disturbances could have been primary either in the brain tissue (collagenous tissue) or in the vascular supply to the brain. It seems unlikely that renal, cardiac, or other damage found at a later date was severe enough to produce these complaints at the onset. A third possibility is that there was no relationship between the reported symptoms of 1936 and the primary disease. A sinusitis or other pathology could have been responsible. This is likely, for there was an interval of nearly five years during which no new symptoms were reported. The usual prodromal periods generally last weeks or months. Symptoms and signs definitely related to this disease did appear about nine months before her first hospital admission on October 3, 1940. A high percentage of all patients with lupus erythematosus complain of body aches and pains with joint involvement as manifested by redness, swelling, and tenderness.

Six months previous to the patient's first admission, the typical skin lesions first appeared. The literature reports that the butterfly red area on the face is present in a large number of these patients. However, since we now recognize the fact that pathologic changes in this disease are similar to those in scleroderma, dermatomyositis, etc., it is possible that this statement may mislead us and that there may be cases that are overlooked because this finding is not present. The reported lesions on the tongue may or may not have been caused by this disease. It is possible that they were traumatic or secondary or not related. It is, however, very likely that the fundus exudates were associated with vascular lesions, especially since this woman had many symptoms suggestive of active pathology in the brain, as manifested by speech difficulty and the involuntary twitches

of her hands (despite the reported normal neurologic examinations).

In her first reported physical examination, it is interesting to note there were no cardiac signs. Since about 20 per cent of all cases have gross cardiac pathology, one naturally would devote special attention to the heart. The electrocardiogram showed changes which would suggest poor cardiac muscle function and this in turn might be an indication of active disease in the heart. The only other finding of note on her admission physical report is observed in the right lower lobe of the lung. She had complained of pain in this location, and a pleurisy or pneumonitis on the basis of the primary disease is quite likely. Glandular adenopathy is an almost constant finding.

Turning to the laboratory data, we note many findings which confirm the diagnosis of lupus erythematosus.

Blood count and bone marrow: The leukopenia and the thrombocytopenia have been reported frequently in this disease. Bone marrow studies usually show a depression of activity in the early stages of the disease, but many reported cases show a leukocytosis at a later date, especially if a complicating infection occurs.

Urinalysis: Since in this disease the kidneys usually show marked changes in the vascular elements, especially in the afferent glomerular arterioles, the proteinuria, the red blood cells, and the casts noted in this case are to be expected. Likewise, the reported reduced phenolsulfonphthalein secretion of 25 per cent would follow.

Tourniquet test: There is little in the literature concerning capillary fragility in this disease. However, skin hemorrhages are reported frequently and petechiae are sometimes mentioned, and with the pathology affecting the vascular system one may expect a "strongly positive" test.

Sedimentation test: An increased rate is nearly always reported, and one would expect this, unless undue liver damage was present coincidentally.

Tuberculin test: The negative report is in agreement with the present feeling that this disease is not due to the tubercle bacillus. However, in acute stages of tuberculosis this test may be negative, and it therefore does not rule this out.

Basal metabolic rate: One would expect variations in this rate depending on remissions, exacerbations, and febrile states. Actual changes in the thyroid gland might be directly responsible for the variations.

Wassermann test: False-positive reactions and anticomplementary reports are often found in the case reports. I will leave their explanation to the serologist.

Blood chemistry: In reports in the literature, these findings vary greatly, depending largely on the extent and site of the various lesions, especially those involving the kidneys. In this patient there seems to have been a loss of albumin as noted in the urine and blood serum albumin. Together with this alteration, the serum calcium seems to have been lost and the phosphates held back, while the cholesterol was elevated. Thus, we have a picture simulating nephrosis. There was no nitrogen retention of any degree.

The alteration in the calcium and phosphorus could be associated with the reduced parathyroid activity on the basis of local lesions in these glands. The reported involuntary movements might indicate a hypoparathyroidism. No Chvostek sign is reported.

Elevated blood uric acid has been reported in this disease, in scleroderma, and in dermatomyositis. The slight changes in the icterus index, bilirubin, and the Van den Bergh test suggest some liver involvement.

Blood culture: Negative reports are invariably the rule.

Blood heterophils, red cell fragility test: Negative results tend to rule out blood dyscrasias as the primary disease.

Biopsy of the skin: The biopsy of the skin, as reported, is not typical for lupus erythematosus but might be found in scleroderma, Libman-Sachs syndrome, periarteritis nodosa, and dermatomyositis.

Electrocardiogram: This is suggestive of myocardial damage, with low voltage QRS and low T_2 and T_3 and semi-inverted T_1 .

X-ray of chest: Polyserositis is common in lupus erythematosus, and the pleural effusion therefore helps to confirm the diagnosis.

Clinical Course.—At the time of the patient's discharge from the first hospital, one would be justified in making a diagnosis of lupus erythematosus from the above information. When discussing differential diagnosis, other possible diseases will be mentioned and the reasons for ruling them out presented.

The period from her discharge, including readmission and study at the Post-Graduate Hospital, helps to confirm the diagnosis of lupus erythematosus. Lesions progressed and continued to involve the joints, the pleural cavity, and also the skin. Either the primary cerebral lesion was extended or the toxic manifestations of brain irritation became progressively worse. The presence of low-grade fever with an occasional spike in temperature is almost a constant finding in this malignant form of the disease.

The increased tachycardia would indicate

primary heart involvement or secondary toxic effects.

From the laboratory standpoint, the findings at the Post-Graduate Hospital confirmed those previously discussed. The white blood count remained low or normal, but there was an increase in the polymorphonuclear count; a secondary anemia was developing.

The urine continued to point to renal damage of a considerable degree, although the blood nitrogenous products remained relatively low.

The calcium and phosphorus findings were consistent with those reported and discussed above. There was a progressive drop in the total serum proteins at the expense of the albumin, and a secondary acidosis.

The normal ratio of cholesterol and esters and the normal icterus index would indicate relatively little involvement of the liver. Likewise, there had been a drop in the blood cholesterol.

Treatment.—As in most reported cases, treatment failed, although in the literature there is one case (the diagnosis not entirely proved) which apparently was cured by sulfonamides. This patient under discussion here, however, showed no beneficial effect from this therapy, despite a blood level of sulfadiazine of 28 mg. per cent. Until we know more of the cause of this disease, all discussion of therapy must naturally be on a theoretic basis. Treatment must be symptomatic.

Cause of Death.—In a disease with such diffuse distribution of the pathologic process, the actual cause of death depends on the organ most severely damaged and its relative importance in maintaining life. In this case, it would appear that the renal damage was the most marked and consequently was the likely cause of death. The terminal rise in blood pressure would be in favor of this explanation against cardiac failure. However, one would expect to find myocardial damage as a close second cause. Cerebral involvement (primary or toxic) did not seem to manifest sufficient signs to be considered as the cause of death. There was no reported picture of tetany or acidosis severe enough to cause death. Pulmonary or liver damage was apparently only moderate, and the gastrointestinal system seemed only slightly affected. Except for the parathyroids, the other endocrine glands seemed to be relatively free of involvement as well as can be determined from the information at hand.

Differential Diagnosis

Typhoid fever is suggested by the headaches, leukopenia, body pains, and fever. It is ruled out, however, by the course of the disease, the

rapid pulse, the negative blood cultures, and the lack of gastrointestinal symptoms.

Polyarthritis of a rheumatoid type is suggested by the joint involvement. It is ruled out by findings pointing to systemic disease, although at onset this diagnosis would suggest itself and be substantiated by a high sedimentation rate and the local findings.

Tuberculosis would be suggested by the loss of weight, the fever, and the chest findings of pleural effusion. This disease tends to be ruled out by the lack of lung involvement (x-ray), the finding of renal lesions, and other visual lesions. However, in view of no sputum reports, no examination of urine, stool, or gastric contents for tubercle bacilli, one cannot definitely disregard this causative agent. Although the tubercle bacillus rarely has been isolated in this disease, it has been accused frequently of being the causative agent, probably because of the similarity of the skin lesions.

Syphilis.—The anticomplementary Wassermann, although not even suggestive of lues, makes one want to repeat this test, as any disease affecting the body as a whole must suggest syphilis. However, lues is apt to be limited to lesions of vascular or neurologic tissues. The reported renal and other visceral lesions are rarely luetic. Further blood serologic studies rule out this disease.

Blood dyscrasias, especially the leukemias, are suggested by the leukopenia, the thrombocytopenia, the enlarged lymph glands, the skin lesions, the fever, malaise, loss of weight, etc. However, further blood studies (counts, etc.), the skin biopsy, and the lack of splenic or liver enlargement tend to rule out these diseases.

Brucellosis.—Joint involvement, an irregular fever, a varying white blood count, and glandular adenopathy, suggest this diagnosis. On the other hand, negative blood cultures, renal involvement, the presence of skin lesions, and the course of the disease do not support a diagnosis of brucellosis. One would have liked to see agglutination tests for this disease done on the patient.

Acute Infectious Mononucleosis.—The glandular adenopathy, the fever, and the body pains suggest this disease. It is ruled out by the blood count, the heterophil reaction, and the clinical course.

Because of the generalized involvement of the pathologic process, many other diseases are suggested, and unless one considers the entire picture, he is apt to be led into faulty diagnoses. Primary renal disease, neoplasms, subacute bacterial endocarditis, Pick's disease, etc., should be quite readily eliminated.

Finally, since this disease is so difficult, from

a pathologic standpoint, to differentiate from periarteritis nodosa, dermatomyositis, and scleroderma, these disorders must be ruled out. However, the patient showed no skin changes typical of scleroderma, no eosinophilia, as found in periarteritis nodosa, and no clear-cut muscular changes, as found in dermatomyositis. However, it could be any one of this group in an atypical form.

Pathology.—Although this part of the discussion is in the hands of another department, I shall, in closing, attempt to prognosticate the changes that one would expect to find in this case from its history, clinical course, and laboratory findings.

If the diagnosis of lupus erythematosus is correct (or if the patient had an atypical form of any of its associated diseases), we should expect to find changes in the collagen throughout the body as demonstrated by swelling and fibrinous degeneration.

In the blood vessels this will be found by basement membrane changes in the intima with swelling and closure of the lumen and in some cases by similar changes throughout the entire wall of the vessels. This may be complicated by an arteritis in certain organs.

The skin changes have been reported by biopsy.

The cerebral changes are probably on a vascular or toxic basis.

The cardiac changes probably involve the collagenous material in the muscle and perhaps in the coronary vessels. There should be no major coronary vessel occlusions (unless terminal). The endocardium may be involved, but the clinical picture does not point to vegetations or valvular involvement to any degree. Aschoff bodies should not be found (although a few reports have noted them).

The kidneys should show considerable involvement of the glomeruli, especially with involvement of the afferent arterioles with possible areas of degeneration or necrosis in the tuft and the "wire loop" picture frequently described. There may be some basement membrane changes in the tubules.

The lymph glands may show areas of necrosis and healing.

The parathyroids may show vascular changes and alterations in the collagenous material. The liver may show local areas of necrosis. Similar changes should be found in the pleura and perhaps in the lung tissue.

Any other tissue may reveal changes of a similar nature but insufficient to have produced symptoms.

Dr. Duryee's Diagnosis

Lupus erythematosus disseminatus.

Pathology

DR. MAURICE N. RICHTER: Much of the discussion can be eliminated because the case is fairly typical of lupus erythematosus, and we can confine ourselves to the actual findings. On the mitral valve there were small rounded verrucae on the valve cusp. Near the tip of the left ventricle there was a soft grayish mass beneath the endocardium and in the right ventricle there were 3 similar soft masses, also on the endocardial surface. In the lungs there were scattered areas of lobular pneumonia, with one small gangrenous area in the right lower lobe. There was no fluid in either pleural cavity.

The kidneys had coarsely granular surfaces. On the upper surface of the liver was a triangular area that was softer and a deeper red than the surrounding liver tissue, with a central grayish area, apparently necrotic. The other gross features are not of much interest.

Microscopically, the changes in the heart were of somewhat different types. They were found in both myocardium and endocardium. In the myocardium there were areas of interstitial edema with a basophilic change in the collagen that is best brought out in azure-eosin preparations. The areas in the ventricle that were noted grossly are places where this change had reached the endocardial surface. This fibrinoid degeneration of collagen and edema were accompanied by the presence of mononuclear cells, mainly lymphoid in type. The nodules described in the mitral valve were small verrucae in which a somewhat similar collagen change was noted.

This collagen change was not limited to the heart. Sections of the skin also showed change in collagen as well as degenerative changes in the walls of some of the smaller vessels.

In the kidney, changes in the glomerular loops were particularly striking. The capillary loops throughout the glomeruli were conspicuous and the basal membranes were thickened, producing a form of the so-called "wire loop" lesions. These glomerular changes were accompanied by hyaline or colloid droplets of the renal epithelium. Recent investigations indicate that this is not necessarily a degenerative lesion as formerly thought, but may be an indication of protein absorption from the tubules.

In the spleen a number of the central arterioles of the Malpighian corpuscles showed rather conspicuous concentric lamellae of fibrous tissue around them. This is the periarteriolar fibrosis that has been described recently as one of the characteristic changes in lupus erythematosus. The lymph nodes were not enlarged, but a number of them showed a considerable increase

in the number of plasma cells, as well as edema. These changes and others have been described recently by Fox and Rosahn as changes found in their cases of lupus erythematosus.

The triangular area of discoloration observed in the liver was probably an infarct. In the central portion the tissue is necrotic. A moderate amount of scarring was present, and it is possible that the change in the liver was there for some time. I have learned that while this patient was in another hospital a transient episode of rise in the icteric index occurred, but the conditions disappeared after a short time.

In the lung, as previously stated, there were areas of lobular pneumonia and an area of gangrene associated with thrombosis of one of the vessels.

Minute thrombi appear in other parts of the body—as, for example, the spleen. Numerous small thrombi of this type were observed, many of which appeared to be platelet thrombi.

There were also a few lesions that were not strictly associated with lupus erythematosus. One was in the esophagus where an area of ulceration occurred. A moderate amount of arteriosclerosis, particularly in the aorta, was also noted.

Pathologic Diagnoses

LUPUS ERYTHEMATOSUS DISSEMINATUS.

Verrucous endocarditis of mitral valve.

Mural thrombi, right and left ventricles.

Thrombosis of branches of pulmonary arteries.

Lobular pneumonia, bilateral.

Gangrene of lung, localized.

Infarction of the liver.

Arteriolar sclerosis of the kidneys.

Acute necrotizing arteritis of kidneys, skin, and diaphragm.

Periarterial fibrosis of spleen.

Acute esophagitis.

Chronic lymphadenitis, generalized.

Atherosclerosis of the aorta.

MAYER FELLOWSHIPS

The Committee on Medical Education of the New York Academy of Medicine has been entrusted with the award of four Fellowships of \$2,000.00 each for research with a view to advancement of knowledge in the following subjects: (1) the use of choline and other lipotropic factors in the prevention and treatment of fatty infiltration of the liver and hepatic insufficiency; (2) the action of ingested choline, lecithin, methionine, and inositol on precancerous lesions and disorders associated with neoplastic disease; (3) the effects of riboflavin, certain amino acids, and casein on the development and growth of cancer; and (4) study of the relationship between precancerous lesions of the mouth, hepatic insufficiency, and gastrointestinal disorders.

The funds for these Fellowships have been provided by Dr. Charles Mayer, of New York City.

The Committee requests that research workers, or laboratories engaged in studies along these lines or interested in research on these specified problems,

who desire consideration by the Committee charged with awarding these Fellowships, submit application for the desired award. This application should state the name of the individual who will conduct the research, the name of the laboratory or institution in which the work will be conducted, the special qualification, interest, or attribute of the investigator, and the institution which may justify the award. If the applicant has already conducted research in the specified field for which the award is sought, this fact should be stated and reprints of publications in this work by the author should accompany the application, together with any other facts or information deemed pertinent.

An approval of the director of the laboratory should accompany the application, if the application is not made by the director.

All applications should be sent in triplicate to Dr. Mahlon Ashford, Secretary of the Committee, not later than October 30, 1913.

YUCCA WOOD FOR SPLINTS

The Joshua tree, sometimes called the "Lily of the Desert," because of its huge blooms on crooked, upturned branches, has become an important factor in war surgery. Splints made from the big logs of the tree are very light, porous to the extent of supplying good air circulation, and pliable enough to be adapted to the shape of the injured limb. In Southern California and other parts of the Southwest the

extensive forests of Joshua trees, a genus of the yucca tree family, are being harvested, with eight-foot logs cut from the stems of the "giant lilies." The Joshua tree logs are hauled to Riverside, California, and other centers of Riverside and San Bernardino Counties, where they are cut, veneered, sanded, and made into splints. . . . *What Scientists Are Doing*, New York Herald Tribune

Postgraduate Medical Education

Programs arranged by the Council Committee on Public Health and Education of the Medical Society of the State of New York are published in this section of the JOURNAL. Members of the committee are Oliver W. H. Mitchell, M.D., chairman; George Baehr, M.D.; and Charles D. Post, M.D.

Cancer Teaching Day

A CANCER Teaching Day was held on April 28 at Phelps Hall in Binghamton. The afternoon program, beginning at 4:00 p.m., included the following subjects: "The Importance of Pathologists in the Cancer Program," Fred W. Stewart, M.D., pathologist, Memorial Hospital, New York City; "Treatment of Cancer of Head and Neck," William J. Hoffman, M.D., assistant attending surgeon, New York Post-Graduate Hospital, New York City; and "Cancer of the Larynx, Bronchi, and Esophagus," Chevalier L. Jackson, M.D., professor of clinical bronchoscopy and esophagoscopy, School of Medicine, Temple University, Philadelphia.

Following a dinner served at 6:15 p.m. at the Binghamton City Hospital, an evening program was heard. Subjects and speakers were: "Recent

Advances in the Etiology of Cancer," Cornelius P. Rhoads, M.D., director, Memorial Hospital, New York City, and professor of pathology, Cornell University Medical School, New York City; and "Cancer of the Stomach—The Problem of the Active Practitioner," A. H. Aaron, M.D., professor of clinical medicine, University of Buffalo, and Harry M. Murphy, M.D., instructor in medicine, University of Buffalo.

The instruction was presented under the auspices of the Broome County Medical Society, the Sixth District Branch of the Medical Society of the State of New York, the Tumor Clinic Association of the State of New York, the Medical Society of the State of New York, and the New York State Department of Health, Division of Cancer Control.

Plasma Therapy and Whole Blood Transfusion

A SINGLE lecture on "Plasma Therapy and Whole Blood Transfusion" was presented before the Rensselaer County Medical Society on May 11 by Earle B. Mahoney, M.D., assistant professor of surgery, University of Rochester School of Medicine and Dentistry, Rochester.

The meeting, which was held at 8:30 p.m. in the Health Center in Troy, was sponsored by the Medical Society of the State of New York, the State Department of Health, the Office of Civilian

Defense, and the Health Preparedness Commission of the State War Council.

These sponsors also presented a similar lecture for the Richmond County Medical Society on May 12 at 9:00 p.m. The meeting was held in the Public Health Building, Stuyvesant Place, St. George, Staten Island.

The speaker for the Richmond County group was Samuel Standard, M.D., assistant professor of surgery, New York University College of Medicine.

NEW NARCOTIC REGULATIONS

Under a recent amendment by the Treasury Department to Federal Narcotic Regulations No. 5, each narcotic prescription issued by a military physician for filling by a civilian pharmacy must show his signature, title, and other information which definitely establishes his identity.

In treating the personnel of the armed forces and their families, military physicians use, or prescribe from, official government stocks of narcotic drugs. Not all narcotics, however, are included in these official stocks and on occasion the required medication must be obtained from an outside source. In such instances, a prescription written on the stationery of the physician or of an Army or Navy hospital may be accepted by a civilian pharmacy for filling.

Military physicians are not required to be registered for narcotic privileges. Consequently, they do not have a number which in civilian practice must appear on each narcotic prescription and which the pharmacist usually looks for. However, military physicians who treat private patients in camp areas, or while on leave, must be registered and pay the special tax.—*Health News*

THE NEW PHARMACOPEIA

The appearance of a new edition of the *United States Pharmacopeia* is always an event in the allied professions of medicine and pharmacy. U.S.P. XII will, if anything, play an even larger part than its predecessors. So many pharmaceutical products have disappeared from the market or become difficult to obtain that a compendium of dependable basic medicines is more than ever important.

The new U.S.P. XII contains a total of 659 medicinal products, 160 of them new. Its standards will continue to furnish the basis of law enforcement for state and federal drug laws. It is official, not only in this country, but also in Puerto Rico, the Philippines, Cuba, Costa Rica, Panama, the Dominican Republic, Nicaragua, and other Latin American countries. There has been a Spanish edition for forty years.

Leaders in medicine and pharmacy have long held that the best type of medical practice demands individualized prescription, designed to meet the peculiar needs of each patient. The *United States Pharmacopeia* helps the practitioner to select the best drugs, standardized to ensure their quality, purity, and strength.—*J. Med. Soc. N.Y. Co.*

American Medical Association 1943 Annual Meeting

Official Call

To the Officers, Fellows, and Members of the American Medical Association:

THE regular annual session of the House of Delegates of the American Medical Association will be held in Chicago, Illinois, beginning Monday, June 7, 1943.

There will be no Scientific Assembly of the Association during the year 1943.

The President-Elect will be installed as President at a meeting to be held at 8 p.m., Tuesday, June 8.

Attest:

OLIN WEST, *Secretary*
Chicago, Illinois
April 5, 1943

FRED W. RANKIN, *President*
H. H. SHOULDERS, *Speaker*
of the House of Delegates

Medical Insurance Plan for New York City

MAYOR F. H. LaGuardia has announced the formation of a committee to devise a cooperative medical insurance plan for moderate-income families in New York City.

The purpose of the plan is to insure families against heavy unexpected medical or surgical expenses by providing medical or surgical care, when necessary, in return for nominal periodic payments. It would be similar and supplementary to the hospital insurance plan of the Associated Hospital Service of New York.

The enterprise will be sponsored by the city, and various city agencies will cooperate as far as it is proper for them to do so. Presumably, however, the city will have no financial interest in the plan.

The members, in addition to Mayor LaGuardia, are as follows:

Dr. Ernest L. Stebbins, Health Commissioner; Dr. Edward M. Bernecker, Commissioner of Hospitals; Dr. Willard C. Rappleye, dean of the College of Physicians and Surgeons of Columbia University and former Commissioner of Hospitals; William Reid, City Collector; David M. Heyman, president of the Public Health Research Institute

of New York; Dr. J. Stanley Kenney, president of the Medical Society of the County of New York; Dr. Arthur F. Chace, president of the New York Academy of Medicine; Dr. David J. Kaliski, former president of the New York Academy of Medicine; Louis H. Pink, president of Associated Hospital Service; Dr. George Baehr, of the United States Public Health Service, who is chief of the division of health of the Office of Civilian Defense; Dr. William B. Rawls, chairman of the coordinating committee of the medical societies of the five counties in New York; Dr. Leo Price, head of the health center of the International Ladies' Garment Workers' Union; Miss Minnie Teitelbaum, representing the Congress of Industrial Organizations; Miss Constance Kyle, social worker, representing the American Federation of Labor; Dr. Neva Deardorf, representing the Greater New York Fund.

In addition to the committee, the Mayor said he was organizing the Friends of Medical Security, a group of those who are interested in the plan, but too numerous to serve on the committee. The friends, he said, will be kept in touch with developments by mail.

Women Doctors to Get Commissions

WITH the signing of the Sparkman Bill by President Roosevelt on April 17, women physicians became eligible for commissions in the Medical Corps of the U.S. Army and Navy.

On April 20 the announcement was made in Washington that the Navy and the U.S. Public Health Service had requested the Procurement and Assignment Service of the War Manpower Commission to select for them immediately 600 women physicians and surgeons for assignment as officers in their medical services, and at the same time a spokesman for the Army Medical Corps was quoted in the press as having said that "we can use all the women doctors they will let us have."

Once commissioned in the Medical Corps of the Army or Navy, women physicians will be entitled to the same ranks and privileges as men members of the corps. They have been eligible for assignments in the U.S. Public Health Service for several years and have been attached to the U.S. Army as contract surgeons since the time of the Spanish-American War.

A small group of women doctors from the United States went to England in 1941 as members of the emergency medical service. One of these was a New York physician—Dr. Barbara Stimson—who became a major in the Royal Army Medical Corps. Dr. Eleanor Peck, Poughkeepsie, is still in England.

County News

Albany County

A symposium on "Civilian Medical Care" was presented at the meeting of the county society on April 28. Dr. E. S. Godfrey, Commissioner of Health, State of New York, spoke on "Activities of the State Health Department in Civilian Medical

Care." Dr. Robert Hannon, Secretary of the Board of Medical Examiners of the State Department of Education, had as his subject "Consideration of the Licensure of Physicians During

the Present Emergency." Other programs for civilian medical care were covered in a talk by Dr. John J. Bourke, of the U.S. Public Health Service, who is also Acting Regional Medical Officer of the Second Civilian Defense Region. General discussion followed the main addresses.

Bronx County

More than 100 leading New York and Bronx physicians recently gathered at the Hotel Commodore to pledge full support of the profession to the campaign of the United Jewish Appeal for Refugees, Overseas Needs, and Palestine.

Among those who attended were Dr. Emanuel Libman, honorary chairman of the United Jewish Appeal, Physicians Division; Dr. Leo Mayer, chairman of the Joint Disease unit of the Division; Dr. Abraham Rongy, honorary chairman; Dr. Iago Galdston, executive secretary of the Bureau of Public Relations of the Academy of Medicine; Commander Julius F. Neuburger, commanding officer of the Brooklyn Naval Hospital; Dr. Burrill B. Crohn, Division chairman; Dr. Herman Schwarz, honorary chairman; and Dr. Harold B. Davidson, vice-chairman.

Franklin County

Dr. Francis B. Trudeau was the principal speaker at the annual meeting of the Franklin County Tuberculosis and Public Health Association, which was held in the Franklin Hotel in Malone on April 28.*

Herkimer County

The county society met at the Mohawk Valley Country Club on April 20, and viewed a motion picture and then a demonstration of a new surgical stitching instrument manufactured by the Singer Sewing Machine Company.*

Kings County

On April 20, Phi Delta Epsilon, Zeta Chapter, at the Long Island College of Medicine in Brooklyn, presented a symposium, with Dr. Samuel Z. Levine, professor of pediatrics at Cornell Medical College, speaking on "The Handicaps of the Premature Infant."

Discussion was given by Dr. Charles A. Weymuller, professor of pediatrics, and Dr. Murray B. Gordon, professor of clinical pediatrics, Long Island College of Medicine.

Livingston County

A meeting of the county society was held at the LaDelfa Hotel in Mt. Morris on April 8. Following dinner at 6:30 p.m. there was a business meeting, and talks were given by Drs. George Doolittle, Vincent Bonafede, and Eugene Davidoff, members of the medical staff at Craig Colony.*

Monroe County

An exhibit of interest to women, "Health and War," was held in Bausch Hall of the Rochester Museum of Arts and Sciences during the month of April.

In conjunction with the exhibit, a program was presented by the Museum Association at 8:00 p.m. on April 6. Dr. Charles B. F. Gibbs, chairman of the committee on nutrition of the Monroe County Medical Society, opened the program with a discussion of "A Victory Diet." Following his talk, a sound movie, "The Doctor's Daughter," was

shown through the cooperation of Miss Elizabeth Henry, president of the Rochester Dietetic Association. The film is concerned with present-day food fads, picturing a doctor's problem in his own daughter's poor food habits.

Material from the British Information Services was included in the exhibit, giving a picture not only of arrangements for care of Britain's civilian war casualties, but also of the balanced, adequate diet that rationing makes possible.*

. . .

Speaking on April 19 at the formal opening of the 1,000,000-volt x-ray laboratory of the University of Rochester, which equipment he designed, Dr. E. E. Charlton, of the Research Laboratories of the General Electric Company, said that "we see no fixed barrier to the extension of our present design to considerably higher voltages."

He disclosed that experiments are now under way on an electronic accelerator through which x-rays of 1,000,000 to 100,000,000 volts may be generated. He asserted that it is "well within the range of possibility to produce man-made beams of cosmic ray."

"The future possibilities of multimillion volt x-rays are vast and unknown," Dr. Charlton commented. "But we may be certain that when we have machines that can produce them in controllable quantity and quality, the new knowledge will lead to new and useful applications in the service of mankind."*

Nassau County

The Nassau County Tuberculosis and Public Health Association opened its sixteenth annual early diagnosis campaign on April 21, and urged every resident of the county to visit his doctor for a physical check-up.*

New York County

A campaign to raise the 1943 maintenance fund for the Association for the Aid of Crippled Children began on April 19.

The association operates the only orthopaedic home-nursing service for crippled children in Manhattan, Queens, and the Bronx, and \$64,000 is needed through contributions to carry on this service, which includes health supervision, occupational therapy, summer vacations, braces, and transportation to and from clinics.

The age limit for cases served by the association has been 16 years. This is being raised to 21 years in Manhattan as a result of the recommendation made in 1940 by the Commission for the Study of Crippled Children, appointed by Mayor F. H. LaGuardia.*

. . .

Dr. George T. Pack will give an address before the 76th Annual Meeting of the West Virginia State Medical Association, which is to be held at Charleston, West Virginia, on May 18. The subject of his address will be "A Brief Excursion into the Extension of Radical Surgery in the Treatment of Cancer."

. . .

A modified technic for the complete construction of an auricle in two stages is described by Dr. Morton I. Berson, in the April issue of *The American Journal of Surgery*.

551 FIFTH AVENUE, NEW YORK, N. Y.

[Continued from page 978]

The monthly meeting of the county society was held on April 26 at 8:15 p.m. at the New York Academy of Medicine.

The program included a symposium on tropical medicine from the Department of Public Health and Preventive Medicine, Cornell University Medical College. Subjects and speakers were "Parasitology, Epidemiology, and Treatment of Malaria," by Morton C. Kahn, M.D., associate professor of public health and preventive medicine; "Hookworm Disease," by Wilson G. Smilie, M.D., professor of public health and preventive medicine; and "Symptomatology, Diagnosis, and Treatment of Amebiasis," by Ralph W. Nauss, M.D., instructor in preventive medicine.

. . .

Realizing that wartime suspension of the meetings of national medical societies has deprived many research workers of an opportunity to present their work, the New York Academy of Medicine will hold a meeting on Thursday, May 27, for the purpose of enabling these men to present the results of their clinical research in all branches of medicine.

Preparation of this program has been entrusted to the Committee on Medical Education of the Academy, which extends a cordial invitation to research workers in the Metropolitan Area to submit to its secretary, Dr. Mahlon Ashford, 2 East 103 Street, New York City, a 200-word abstract of original clinical investigation which they may desire to present.

Each presentation will be limited to twelve minutes and will be followed by a brief period of free discussion. The publication of presentations is not a necessary condition, but the *Bulletin* of the Academy is prepared to publish abstracts if the author desires it.

. . .

Dr. Edward C. Reifenstein, professor of medicine, Syracuse University, was the main speaker at the April meeting of the Utica Academy of Medicine on April 15. His subject was "Cardiology." Discussion was opened by Dr. James W. W. Dimon.

A lecture on "Observations on Spinal Anesthesia" was given by Dr. D. D. Reals, of Utica, with discussion opened by Dr. R. G. Kibbey.

The meeting, which was preceded by dinner at 7:00 p.m., was held in the Hotel Utica.

Oneida County

Medical officers of the Rome Air Depot presented the scientific program at the quarterly meeting of the county society at the depot on April 13.

Led by Dr. Bradford F. Golly, of Rome, society president, the physicians were conducted on a tour of the depot hospital by Lt. Col. Irwin Alper, post surgeon, who gave a talk on "Medical Service to the Civilians."

The program also included the following scientific papers:

"Newer Medical Facts on the Effects of High-Altitude Flying," Capt. Samuel E. Bechtold, chief of the physical examinations department; "Chest Injuries and Treatment in Total War," Capt. Robert J. O'Doherty, chief of the surgical service; "Treatment of Psychoneuroses in Wartime," Maj. David B. Davis, chief of the department of psychiatry; and "Field First Aid and Sanitation," Capt. Ellsworth M. Tracy, chief of the medical service and medical enlisted assistants.*

Onondaga County

The second graduation of the College of Medicine of Syracuse University in the current war was held Monday, March 22, in the auditorium of the College.

The 41 graduates, 16 of them from Syracuse, heard Rear Admiral Ross T. McIntire, Surgeon General of the Navy, and also personal physician to President Roosevelt, deliver the commencement address.

Ontario County

The county society held its second quarterly meeting at the Clifton Springs Sanitarium, Tuesday, April 13. The business meeting was followed by dinner at 6:00 p.m. and the scientific session at 7:30 p.m. "Clinic on Fractures of the Hip" was given by the surgical staff of the Sanitarium and Clinic.*

Queens County

Negro physicians, pharmacists, and dentists were honored by the Queens Tuberculosis and Health Association at a dinner in the Amber Lantern, Flushing, on April 22.

The occasion was the fourth annual dinner for the Queens Clinical Society, Negro medical association, by the tuberculosis association in recognition of the fact that medical men are the "first line of defense in the fight against tuberculosis."

Guest speakers were Dr. Winifred C. Cullis, of London, and Special Sessions Judge Myles A. Paige, of Brooklyn. Godias J. Drolet, of Flushing, first vice-president of the Queensboro Tuberculosis Association, presided.*

. . .

A stated meeting of the county society was held Tuesday, April 27, at 8:30 p.m. A clinicopathologic conference on "Surgical Diagnosis of Tumors" was given by Drs. Leonard Goldman and Edward Santora.

Dr. Elise S. L'Esperance, laboratory director New York Infirmary for Women and Children, an serologist at Memorial Hospital, spoke on "Cancer Prevention Clinics." Her paper was discussed by Dr. Cornelius P. Rhoads, director, Memorial Hospital.

Dinner was served at the Forest Hills Inn at 7:00 p.m., with the guest speakers present.

Rensselaer County

The regular meeting of the Rensselaer County Medical Society was held on April 13 at the Health Center in Troy. A paper was presented by Drs. Stewart H. Jones and G. H. Klinck, director of laboratories at the Samaritan Hospital.

Dr. Jones addressed the meeting on the subject "Torula Meningitis" and Dr. Klinck presented lantern slide demonstrations. Dr. Stephen H. Curtis opened the discussion.*

. . .

Rheumatic fever was characterized as "Public Enemy No. 1" by Dr. Frank Mastrianni, city health officer, who spoke on "Children's Diseases" at a Parent-Teacher Association meeting in Troy on April 14.*

. . .

The progress of the medical care program of the Troy Welfare Department, developed along departmental lines a year ago by the department with

FOOTWEAR

You don't expect to restore normalcy to feet that even nature has failed to aid, but you do expect to relieve your foot-patient from conditions that create agony and handicap.

There is no "standardized" form or last in shoes to cover every case, so a wide range of shoes is essential for correction. In **PEDIFORME FOOTWEAR** you will find both general features and individual construction points variable enough to take care of the most difficult case. These orthopedic shoes are attractive, too.

the cooperation of the county society, was reviewed on April 7 at a meeting of welfare officials with the society's advisory committee on public medical care.

The physicians' committee included Dr. Crawford R. Green, chairman, Dr. Richard P. Doody, Dr. Stephen H. Curtis, Dr. John T. H. Hogan, and Dr. John J. Noonan.

The welfare department was represented by Commissioner John J. Givney and Dr. John J. Rainey, medical consultant to the department.*

Schenectady County

The regular monthly meeting of the county society was held in the Ellis Hospital in Schenectady on April 6. Six speakers took part in a Symposium on Cancer. Dr. E. MacD. Stanton gave a "Further Report on Cases of Carcinoma of the Breast." Dr. J. B. Gilbert spoke on "Early Diagnosis of Genito-Urinary Carcinoma." "The Frei Test in Cancer of the Rectum" was presented by Dr. F. L. Sullivan. The other three addresses were: "A Rare Malignant Tumor of the Femur," by Dr. Louis Cohen; "Radiation Treatment of Common Forms of Cancer," by Dr. K. L. Mitton; and "Progress in Cancer Research," by Dr. Ellis Kellert.

Steuben County

The spring meeting of the county society was held at the Baron Steuben Hotel in Corning on April 8.

Following a luncheon at 12:30 P.M., a business session was held, and the delegates to the State Society were instructed to vote in favor of the Basic Science law.

With respect to the nonprofit medical insurance plan, it was recommended that the president appoint a committee, one of whom shall be the secretary, to investigate the plan and report at the next meeting.

Dr. Joe W. Howland, instructor in medicine, University of Rochester, School of Medicine and Dentistry, gave an interesting and instructive lecture on "Plasma Therapy and Whole Blood Transfusion." This program was arranged by the Council on Public Health and Education of the Medical Society of the State of New York and the New York State Department of Health, in cooperation with the Office of Civilian Defense and the Health Preparedness Commission of the State War Council.

Thirty-five members were present.

A Neutral Cleanser for the Skin

Because CREAM OF SOAP is neutral it has insignificant chemical action on the skin, and produces minimal disturbance of the acid balance. For this reason CREAM OF SOAP is virtually non-irritating. Yet it is so effective as a detergent that it will remove a mixture of kerosene, oil and lampblack that has been rubbed into the skin. CREAM OF SOAP can be used as frequently as needed to keep the skin free from accumulations of grease with ill effect. When employed as a cleanser in contact dermatitis it can be restricted to the exact area desired. CREAM OF SOAP is accepted for advertising in publications of the A.M.A. Sample literature sent to physicians on request. Retails \$1. per box. Your druggist can secure it.

REVIEWED

Ovarian Tumors. By Samuel H. Geist, M.D. Octavo of 527 pages, illustrated. New York, Paul B. Hoeber, Inc., 1942. Cloth, \$10.50.

Dr. Geist's book on ovarian tumors brings up to date the entire subject of ovarian neoplasms. In it he has incorporated all the recent information on the embryology, anatomy, and physiology of the ovary. The newer views dealing with the origin and classification of ovarian tumors are thoroughly reviewed. The material is well arranged and in each chapter the author discusses the etiology, anatomy, clinical aspects, prognosis, and therapy of the various types of tumors.

The text is profusely illustrated, containing 266 black-and-white drawings and microphotographs. The latter are excellent and should be extremely valuable to the pathologist.

Another outstanding feature of this book is the author's discussion and treatment of ovarian tumors complicating other conditions, such as pregnancy.

For those interested in further study, each chapter ends with an exhaustive bibliography.

The information contained within this book should be especially valuable to the gynecologist, abdominal surgeon, and pathologist.

MORRIS GLASS

Infant and Child in the Culture of Today. By Arnold Gesell, M.D., and Frances L. Ilg, M.D. Quarto of 399 pages, illustrated. New York, Harper & Brothers, 1943. Cloth, \$4.00.

This book is divided into three parts. The first deals with the growing child in a modern culture. The main body of the book is included in the second part, which is devoted to a factual statement of the mental growth and characteristics of the first five years of life. Twelve behavior profiles, each accompanied by a behavior day, are included in the division of the first five years of life. The behavior profile gives a picture of the type of child with which the culture has to deal at a particular stage of his maturity. The behavior day shows how the growth and maturity of the child is fostered at different ages.

The third part is devoted in a broad way to the guidance of growth. It discusses general topics of developmental philosophy, habits such as sleep, feeding, and parental guidance. The appendix contains a behavior day chart for self-regulation, scheduling a list of toys, play materials and equipment, books for preschool children, musical records for infants and young children, and selected readings.

This book is of value to parents and teachers. For physicians, much of the ground has been covered in a previous work by Gesell and Armatruda called *Developmental Diagnosis*. However, for those particularly interested in the field of child development, the present volume should serve in a complementary way.

STANLEY S. LAMM

Gynecologic Surgery. By Morris A. Goldberger, M.D. (Oxford Medical Outline Series.) Octavo of 164 pages. New York, Oxford University Press, 1942. Cloth, \$2.00.

This book gives in outline form a résumé of operative gynecology. As is stated in the preface, it is not intended to replace any of the standard and illustrated works on gynecology, but to serve as a general working guide for the subject.

The facts are more briefly and simply presented than they usually are in outline books of this kind. Blank pages are inserted for notes and sketches, so that the reader may record in the volume a brief account of his own experiences. Of its kind and within its limitations, the book should be useful for medical students and for the younger specialists in this field.

FRANCIS B. DOYLE

Synopsis of Traumatic Injuries of the Face and Jaws. By Douglas B. Parker, M.D. Duodecim of 334 pages, illustrated. St. Louis, C. V. Mosby Co., 1942. Cloth, \$4.50.

Seldom has a book come to this reviewer that fill an immediate need for both the dental and medical professions as does this one by Douglas Parker. Ever-increasing injuries to the face and jaws occurring in civil life as the result of automotive accidents together with those that are the result of military action make this little volume a must in the library of all practicing physicians and dentists.

Starting with a brief review of applied anatomy of the face and jaws, the author proceeds to the initial treatment at the scene of an accident. A chapter on the treatment of shock is followed by one on the control of infection, in which the use of the sulfu drugs is covered. The chapter on the treatment of wounds has many good illustrations, both photographs and roentgenograms; suturing is gone into in detail. Grant's technic of tying knots without the use of the fingers is very well diagrammed. Then come chapters on burns of the face, bone injuries, and the stabilization of fractures, the latter containing excellent illustrations of the mechanical devices used in the stabilization of the mandible and maxilla.

Complication of fractures is discussed in detail, and in the chapter on surgical reconstruction, the reader will find excellent material on bone and tissue grafts. The dentist will be particularly interested in the review of surgical prosthetic restorations.

This book follows a logical sequence. It is decidedly up to date. The illustrations are new and well done. The author has drawn on his vast experience to bring out in concise form the information that the general practitioners of medicine and dentistry will desire to have on hand when they are called to treat accidents of all types, military, industrial, and automotive. The book is well printed. References are liberal, and it is well indexed.

Manual of Dermatology. Issued under the Auspices of the Committee on Medicine of the Division of Medical Sciences of the National Research Council. By Donald M. Pillsbury, M.D., Marion B. Sulzberger, M.D., and Clarence S. Livingood, M.D. Octavo of 421 pages, illustrated. Philadelphia, W. B. Saunders Company, 1942. Cloth, \$2.00.

This is an excellent book; all who are interested in the management of skin diseases can profit by reference to it. Its use is not confined to conditions peculiar to service with the armed forces.

The book is distinguished by its conciseness, clarity, and orderliness, and by the presentation of a mass of data on the diagnosis and treatment of all of the common, and many less common, dermatoses. Detailed treatment of the diagnosis and management of venereal diseases is not within the scope of the manual. After a short chapter of practical directions for the use of the book there follow three sections devoted to diagnosis. These are based, respectively, upon primary and secondary lesions, the distribution and the sites commonly involved in skin diseases. The last-named section includes a series of 80 informative black-and-white photographs occupying 78 pages.

In the fifth chapter are discussed pharmacologic principles underlying the use of topical agents and x-ray in dermatology, as well as the practical details of the use of these modalities. Each of the succeeding thirteen chapters is devoted to a group of allied dermatoses—for example, "Eczema-Dermatitis" (Chapter VI), "Fungal Infections" (Chapter VII), "Drug Eruptions" (Chapter XIV), and so on. A formulary, presented as an appendix, lists 82 different topical remedies, many in the form of prescriptions, together with indications and contraindications for their use. The index is unusually complete and occupies almost one-tenth of the space of the text. The errors are few and chiefly typographical. Factual errors are to be found in a caption for an illustration of granuloma inguinal (page 115) and in the directions for evaluating the Frei reaction (page 35). These in no way detract from the general excellence of the book.

ARTHUR W. GRACE

Medical Clinics of North America. Volume 26, No. 6. November, 1942. Octavo. Illustrated. Philadelphia, W. B. Saunders Company, 1942. Published bimonthly (six numbers a year). Cloth, \$16 net; paper, \$12 net.

This number of the *Clinics* is devoted to the important field of endocrinology. The first three articles cover most of the important aspects of the pituitary gland. Although this is an important structure, little advance has been made in treating it. The authors cover the medical and surgical treatment adequately.

Much more solid matter is found in the three articles covering thyroid disease, particularly in the one by Edward Rose. There is a useful chapter on x-ray treatment of hyperthyroidism.

There is a good article on the pancreas and an equally interesting one on the adrenal gland. In addition to this there are four helpful reviews of male and female gonad disturbances.

The final article covers a topic that is little known to most clinicians and is therefore worth a careful reading. It gives a concise abstract of the normal and abnormal figures for quantitative assay of the various hormones. The technic is simply described. Although most laboratories are not prepared to perform many of those tedious tests, it is good to know, roughly, how they are done and what they mean.

This issue of the *Clinics* is as useful as are the preceding numbers for 1942.

A. M. BABEY

Urology. By William H. Mencher, M.D. (Oxford Medical Outline Series.) Octavo of 204 pages. New York, Oxford University Press, 1942. Cloth, \$2.00.

This small volume is a comprehensive compendium. A more suitable name for it would be a "Syllabus," as it is a serial word outline of the various lesions of the urinary tract, including their diagnosis and treatment. There are no illustrations.

The book should be useful particularly to medical students and class teachers in urology. It is a factual listing of data, lacking in clinical features.

AUGUSTUS HARRIS

Fractures. By Paul B. Magnuson, M.D. Fourth edition. Octavo of 511 pages, illustrated. Philadelphia, J. B. Lippincott Company, 1942. Cloth, \$5.50.

The author has packed within the covers of this comparatively small volume a complete coverage of the subject in all its details.

He briefly, yet clearly, analyzes the various methods of treatment with indications and recommendations for a choice method in a given type of fracture. He suggests to the reader, from his vast store of experience, some personal ideas which are in a great measure simple, useful, and easily applied by a surgeon of less experience.

The chapter on general emergency treatments deserves special commendation because of its timeliness and thoroughness, dealing as it does with conditions now confronted by both civilian and army surgeons. In this chapter the author outlines up-to-date methods found to be most practical and beneficial in shock, emergency war wounds, compound fractures, etc.

The explanations of the muscle pull, at or near the fractured bones, indicate to the reader how to counter or make use of this force in the treatment of such fractures.

Fractures of the pelvic bones are well described but the writer fails to indicate what is now considered a very efficient method described by Dr. Jahss, which makes it possible to overcome any overriding by distraction or to correct separation of the bones by compression.

As a whole, this book fills a gap between the small textbook for the student and general practitioner and the voluminous systems dealing with fractures. Yet any surgeon, no matter what his experience or qualifications are, will benefit by perusing its pages. It is an ideal refresher of the whole subject.

NATHAN H. RACHLIN

Fundamentals of Psychiatry. By Edward A. Strecker, M.D. Duodecimo of 201 pages, illustrated. Philadelphia, J. B. Lippincott Company, 1942. Cloth, \$3.00.

This is a handy little volume—just what its name implies. It contains a great deal of information crammed into a small space, the history of psychiatry and its progress being briefly traced. In addition to classification and description, interpretation of reactions is stressed. Treatment is brought up to date. There is also a chapter on the psychiatry of the war. This book is recommended for physicians, who are more and more realizing the importance of the psychiatric component in all afflicted persons, both in military and civil life. Supplemented by collateral reading it could be a serviceable guide to the medical student.

A. E. SOPER

A belief among some of the profession that Saratoga Spa serves only the rich, is *not* true. This New York State health center makes provision for the sick, including those who must keep costs within limited means.

The cost of a stay at the Spa is entirely within the control and taste of the individual patient. There is luxury here. But for people of modest circumstances there are pensions and moderately priced hotels that offer excellent service and special or individual diets. As a matter of fact, exclusive of traveling expenses, the traditional three weeks' stay can be covered for as little as \$125.

Nature created at Saratoga carbonated mineral waters of established therapeutic value. Surrounding them, the State has organized facilities physicians require. The Spa Medical Staff does not practice. It only *oversees* the treatments you prescribe for chronic heart, circulatory and rheumatic cases; for conditions of obesity and for cases of general debility—aggravated by the unusual tension of the times.

For professional publications of The Spa, physician's sample carton of the bottled waters, with their analyses, write W. S. McClellan, M. D., Medical Director, Saratoga Spa, 155 Saratoga Springs, N. Y.

"AGAINST 'WEAK' ENDS"

Ralph A. Bard, Assistant Secretary of the Navy, writing for the United Press, recommended that private industry should make an effort to put in effect short vacations every 90 days or four months as a regard to those with a good record of steady working performance.

The railroad managements are also calling attention to the developments in England, where the bank holidays are being lengthened in an effort to check the spread of occupational diseases.

Bus and air line officials are also anxious to let the public know that there is space available on many of their carriers. Week-end travel on these lines continues heavy but during the week the story is different. Employers undoubtedly will be encouraged to begin vacations in midweek on an even larger scale than in 1942.

* * *

LIVING TOMORROW—What will your "miracle home" of tomorrow be like. Some of America's foremost architects give you this glimpse of the future. . .

Movable walls and disappearing sound-proof partitions will enable you to change the size and shape of rooms with ease, to meet changing space needs! Bedroom windows will open and close automatically at the turn of a bedside dial! Sound-conditional ceilings and walls will bring new privacy and restful quiet. Built-in sofas, tables, chests and lighting fixtures will make rooms more spacious, bring new comfort and cleaning ease. Manufactured weather and "climate-proof" construction will maintain perfect temperature, humidity and circulation of pure, odorless air every day in the year.—*Celotex.*

HUMOR IN "LIFE ON A RATION BOARD"

These might be reasons why examiners go mad:

A young doctor applied for a C book for gasoline. Doctors are entitled to this, but his application showed that he was attached to a central-city clinic and made no calls on patients. Questioned, he was evasive at first, replying only, "As a doctor, I'm entitled to it." But after some pressure, he blurted out, "I must have that C sticker to maintain my social standing. If my neighbors don't see it on my car, they won't believe I'm a doctor."

Then there was the undertaker who demanded extra gasoline on the premise that he "had to make periodic calls upon prospective customers."

A bond salesman, who had a uniformed chauffeur to drive him in a limousine to the homes and offices of his clients, had been allowed a B card, for which he had been eligible at the time under the occupational driving regulations, but now demanded a C book. His argument was that if he did not get the extra gasoline, he wouldn't be able to make enough money to afford a chauffeur; therefore the ration board would be responsible for the chauffeur losing his job.

And then there was the wealthy manufacturer who thumped the desk with his fist and swore that he had been driven between his swank Westchester home and his Manhattan office every week day for fifteen years and wasn't going to put up with this New Deal nonsense now.

But the common plea runs: "Look, mister, I've got a boy in the Army. I've got a wife and smaller kids at home. I put ten per cent every week in war bonds. All I want is enough gas to make a living."

THE MAPLES INC., OCEANSIDE, L.I.

A sanitarium especially for invalids, convalescents, chronic patients, post-operative, special diets, and body building. Six acres of landscaped lawns. Five buildings (two devoted exclusively to private rooms). Resident Physician. Rates \$18 to \$45 Weekly

TEETH DECAY

State Sen. Thomas C. Desmond, chairman of the New York State Joint Legislative Committee on Nutrition, recently penned the following item for *The Saturday Evening Post*.

"In Portland Oregon, and San Diego, California, representative groups of children underwent a special kind of medical test. The two sets of youngsters might have looked much the same to a casual observer, but one striking difference became apparent to the examiners. For 95 per cent of the Portland children showed some of the symptoms of rickets, against 73 per cent of the San Diego group. And more than twice as many of the San Diego children had no decayed teeth.

"Why? San Diego, located farther south, gets about 3,000 hours of sunlight a year, compared with 2,200 for Portland. And the sun's ultraviolet rays convert certain substances in the skin into vitamin D, essential for turning the calcium and phosphorus we get in our food into strong teeth and bones.

"This is no isolated example. Army rejection rates for defective teeth—which accounted for 20 per cent of the first 1,000,000 rejections in this war—are highest in the New England States and lowest in the South; the Army has had to institute the expensive practice of rehabilitating draftees' teeth whenever possible. A nation-wide survey of more than 500,000 children showed that tooth decay decreased in areas receiving more sunshine.

"The same study also revealed that the proportion of poor teeth was greater in the larger cities, which have more impurities in the air—and higher buildings—to obscure the sunlight. Nature evidently intended us to get our vitamin D from the sun, for none of our ordinary foods—not even milk—contains enough to meet minimum needs . . . The only answer is to add vitamin D to the diet. Infants generally get it in the form of fish-liver oils, although this is usually discontinued by the time the child enters school. The dairy industry is increasingly going in for the addition of vitamin D to milk . . . the most suitable as a carrier of added vitamin D.

"This was recently tested among a group of school children near New York City. All got the same basic diet—with vitamin D being added to the milk of one set. Tooth decay increased twice as fast among those who drank ordinary milk as among those who drank the vitamin D kind."

THE PHYSICIANS' HOME

Our part in this most critical period of our Nation's history is not on the battle front, but here on the home front.

Our job, in this insecure world, is to meet the needs of aged and worthy colleagues of our profession. In these trying times it is a responsibility which symbolizes a way of life among professional people.

The Physicians' Home has won the confidence of the Physicians of the State of New York. It must continue to serve.

WHAT ARE THE ADS WHISPERING

TELEPHONES—Two-thirds of all Bell telephones are now dial. There would be more if the necessary materials were not needed for war.

Today's rush of business couldn't be handled without dial telephones. They take care of more than 75,000,000 calls a day.

Even with millions of dial telephones in use, the number of operators increased more than 23,000 last year. The total number is now over 160,000.

—Bell Telephone System.

* * *

TRANSPORTATION—If, like the eagle, you could look down on the amount of railroad equipment it takes to move a single armored division, here is what you would see... 75 trains!

Many passenger trains, many freight trains—all required to move just one division... Now, in terms of trains, those 75 taken out of civilian service and put into military service, are about equal to the number of passenger trains running daily over the Pennsylvania Railroad between two of the busiest places on the face of the globe—New York and Washington.

Multiply this one division by the many moving in this country and you can understand why... you may have difficulty getting a berth... or be obliged to stand in a coach... or arrive at your destination late...

But Americans are taking all this like good soldiers. For they know this is a war of movement, and that movement begins right here—in America, on the rails.—*Pennsylvania Railroad.*

* * *

MEXICO NOW THE "EUROPEAN SPA"

Mexico's great spa has received a little more attention since the closing of the once popular European spas.

The truth is that doctors in Mexico have known for years about the efficacy of Mexico's radium-activated water. Doctors in Europe, too, have known that they were equal to the waters of the famous Carlsbad Spa... some say even better. And now, even Americans are beginning to speak with the greatest enthusiasm of Mexico's San Jose Purua, and a continuous flow of tourists come to "take the waters" and spend a couple of restful weeks.

The noted urologist, Dr. Lichtenberg, famous as a specialist in Europe before he came to Mexico, keeps a couple of rooms at San Jose Purua at all times, for his patients, so strong is his belief in the beneficial powers of these hot springs.

CANADIAN PASSPORTS TO U. S. LIFTED

On the strength of an agreement reached recently between the Canadian and United States governments, Canadian citizens may in the future travel into the United States without being obliged to possess a passport, as long as the stay across the border does not exceed 29 days.

Identification cards will be issued free of charge by United States consular offices in Canada to those wishing to visit this country. These cards must be endorsed by a Canadian immigration official in order to guarantee the bearer's re-admittance into Canada. These cards will be valid for one year with the condition that no one visit to the United States exceed the 29-day limit.

These cards are available to Britains domiciled in Canada as well as to Canadian citizens.

"FEELING LOUSY"

The following advice to its readers was given in an article by a daily newspaper.

"Don't go to pieces," said the item, "if some health addict begins rattling off 17 known vitamins and the deficiency diseases that may result if you don't get enough of them. Vitamins are not pills like aspirin and quinine, to cure definite ills like headaches and malaria. The chief disease you or your family will get from any vitamin lack is—'feeling lousy.' The results, such as poor appetite, sleeping badly, constipation, frequent colds, or no energy, will be much the same no matter which vitamin you are low on.

"The cure, unless you have a doctor's prescription, is not a fancy assortment of pills, but more of the right food."

BUT—then the article contradicts itself by explaining how hard it is to get a sufficient amount of vitamin B₁—"five slices of whole wheat bread give you only a fifth of your daily requirement Add to this a pint of milk, whole wheat cereal, brown rice, lean port, oysters, nuts, and mushrooms, and you have probably covered your daily requirement"

Enlightening—and helpful.

TRAVEL MEDICINE "RECREATION AS USUAL"

"Within reasonable limits," pronounced President Roosevelt last year, "I believe that the war effort will not be hampered but actually improved by sensible participation in healthy recreational pursuits. It must be borne in mind, however, that 'recreation as usual' is just as bad as 'business as usual.'"

"Recreation under present conditions can be undertaken solely with the purpose of building up the body and the mind and with the chief thought that this will help win the war. At the same time it has been proven beyond doubt that human beings cannot sustain continued and prolonged work for very long, without obtaining a proper balance between work on the one hand and vacations and recreation on the other"

7 ways TO GIVE INFANTS AND CHILDREN THEIR DAILY VITAMIN REQUIREMENTS

FOR INFANTS:

1. FORMULA. One of the easiest ways to give vitamins is to add Vi-Penta Drops to the baby's formula or milk.

2. ORANGE JUICE, tomato juice, or any fruit juice makes an excellent vehicle for Vi-Penta Drops.

FOR CHILDREN:

3. MILK. The flavor of even such a bland food as milk is not affected by the addition of Vi-Penta Drops.

FOR CHILDREN cont'd.

4. CEREALS are good bases to which to add the child's needed additional vitamins at breakfast time.

5. VEGETABLES served with the noon or evening meal, can be enriched with Vi-Penta Drops, too.

6. FRUITS. Vi-Penta Drops seem to have a natural affinity for stewed fruits—apricots, apples, prunes, etc.

7. DESSERTS. Many mothers enrich desserts and puddings with Vi-Penta Drops.

... using easy-to-use Vi-Penta Drops that do not affect the flavor of food

Here is a remarkable liquid multivitamin preparation which makes it possible for the physician to prescribe a liberal vitamin regime that the mother can easily carry out. Not only do Vi-Penta Drops contain 5 principal vitamins (see chart), but these drops also possess the remarkable advantage of mixing readily with various foods, *without affecting the taste*. When you prescribe Vi-Penta Drops, suggest their use in the several ways pictured here. Mothers will appreciate the information.

10 minims of Vi-Penta Drops contains:	A 4000 U.S.P. units	B ₁ 333 U.S.P. units	B ₂ 100 gamma riboflavin	C 500 U.S.P. units	D 400 U.S.P. units
---	---------------------------	---------------------------------------	---	--------------------------	--------------------------

Vi-Penta Perles—tiny gelatin globules, each containing the same amount of the vitamins as 10 minims of the Drops. Supplied in packages of 25, 100, and 250.

VI-PENTA DROPS *Roche*

Hoffmann-La Roche, Inc., Nutley, N. J.

Calcium and Vitamin D
in pleasant-tasting, easy-to-take form—

CALCI-DELTA TABLETS

(Dicalcium Phosphate and Vitamin D)

TO MEET the exceptional metabolic demands for calcium made upon the body at certain times—during pregnancy, lactation, early childhood—Lederle now makes available “Calci-Delta Tablets Lederle.” These new tablets serve as an excellent source of calcium, phosphorus and Vitamin D. They are easily chewed and swallowed and their pleasant flavor disguises the rather disagreeable taste typical of calcium salts.

If the mother does not receive an adequate calcium, phosphorus and Vitamin D intake during pregnancy and lactation, either in the diet or in supplements thereto, she may suffer from tooth decalcification and other forms of calcium deficiency. Likewise, the fetus may be adversely affected, if enough of these elements are not supplied for its structural growth. “Calci-Delta Tablets Lederle” are in a palatable form, which makes them appreciated by pregnant and lactating women.

“Calci-Delta Tablets Lederle” are also especially suitable for children to prevent rickets and promote normal tooth and bone development in early childhood.

nascent **OXYGEN** for **LEUKORRHEA**

CLINICALLY TESTED*: (a) eliminates unpleasant odor of discharge; (b) cuts down or eliminates irritations inside and without the vagina; (c) reduces quantity and density of the discharge, including that following cauterization... Non-irritating and non-toxic in contradistinction to the arsenic and picrate preparations, is equally effective and actually soothing, especially in the (a) infantile vagina, (b) senile vagina, (c) trichomonas vaginalis vaginitis of pregnancy.

*Barrows: N. Y. St. Jr. Med. Vol. 41, 1/15/41

nascent **OXYGEN** for **DRESSINGS**

CLINICALLY TESTED*: As a surgical dressing: gauze, saturated with STA-O-GEN (a) does not adhere to wounds, (b) reduces discharge, (c) eliminates unpleasant odor, (d) wounds heal faster and appear healthier, (e) dressings are easily applied, continue effective longer and cause no burning or pain when changed, (f) there is no irritation of the skin about the wound edge, (g) particularly effective around perianal region in post-operative work (h) stainless.

*Cowell: Meet, N. Y. Proc. Soc. 4/15/42

STA-O-GEN is a bland ozonide of olive oil. On application, it releases nascent oxygen continuously for hours—deodorizing, germicidal, fungicidal, healing. Available in Liquid or Ointment; also Vag-I-Caps for leukorrhoea prescription. For your convenience, druggists may obtain from any jobber.

LATIMER LABORATORY, INC., 41 E. 21 STREET, N. Y. C.

SAFE • SIMPLE • SOUND

CHILDREN NEED THE MOST FOOD WHEN THEY ARE MOST ACTIVE

The combined effects of rapid growth, muscular development and an apparently inexhaustible output of energy unite to increase the caloric and nutritional requirements of the school-age child.

Particularly valuable, therefore, during such periods is the high calorie, easily digested, palatable liquid nutrient—

HORLICK'S FORTIFIED

Prepared from man's most staple foods—full cream milk, wheat and barley—Horlick's offers:

HIGH FOOD VALUE

Practically doubles the nutritive and energy value of the milk.

PROTECTIVE FACTORS

Furnishes bone-building calcium as well as maintenance doses of A, B₁, D and more than 50% of G.

Recommend
HORLICK'S

The Complete Malted Milk—Not Just a Malt Flavoring for Milk

HORLICK'S

20 YEARS

15 YEARS

EVEN IN CASES OF LONG DURATION

13 YEARS

17 YEARS

A preliminary report of the results obtained in a series of arthritis cases—many of 13 or more years' duration—in which ERTON was the one common factor employed, showed very favorable results in the majority of cases:

“Following the general systemic improvement, there was diminution of pain, decrease of soft tissue swelling, increase in range of motion, better muscular tone and greater endurance.”

LEVINTHAL, D. H. and LOGAN, C. F.
The Orthopedic and Medical Management of
Arthritis, *Journal-Lancet*, 63:48-50, (February) 1943.

This is but one of the many clinical investigations, reports of which have recently been added to the large bibliography on ERTON in arthritis.

Ertronize

From the reports on many large series of cases in which *Ertronization* was employed, the reason for the success of this therapeutic measure becomes evident: ERTRON is a non-toxic agent which acts systemically; beneficial results are defined not only in terms of pain-relief but in terms of systemic improvement—muscular improvement, increased appetite, weight gain and improved general condition.

Ertronize Means: Employ ERTRON in adequate dosage over a sufficiently long period to produce beneficial results. Gradually increase the dosage to six capsules a day. Maintain this dosage until maximum improvement occurs. ERTRON, the only high potency, activated, vaporized ergosterol (Whittier Process) is made only in the distinctive two-color gelatin capsule.

A file card containing dosage suggestions in detail is available to interested physicians.

ERTRON is promoted only through the medical profession.

ERTRON*

THESODATE *Brewer*

(the original enteric-coated tablet of Theobromine Sodium Acetate)

for

CLINICALLY EFFECTIVE
LOW TOXICITY
EFFECTIVELY ENTERIC COATED

CORONARY ARTERY DISEASE AND EDEMA

Medical authorities in journals and books have substantiated the value of Theobromine Sodium Acetate in treating certain Cardiovascular and Renal Diseases. Actual clinical use has proven the usefulness of Thesodate (Brewer).

The enteric coating of Thesodate tablets permits adequate dosage, so necessary for best results with xanthines, for as prolonged a period of time as necessary.

Supplied with or without Phenobarbital, also with Potassium Iodide and Phenobarbital, in potencies for controllable dosage.

Samples and literature on request.

**QUICK RELIEF
IN EARLY
POLLEN ALLERGY**

Estivin

During the Spring months, the distressing ocular and nasal symptoms of pollen-allergy, commonly known as "Rose Cold," may be effectively relieved with Estivin.

One drop of Estivin in each eye, two or three times daily is generally sufficient to keep the average patient comfortable during the entire season. In more severe cases, additional applications whenever the symptoms recur will keep such patients relieved throughout the day.

Hard Work and Dietary Requirements

An investigation¹ to determine the effect of Vitamin B Complex deficiency upon men doing hard manual labor established that:

1. Thiamine alone is not sufficient to maintain physical fitness in manual laborers.
2. When supplementation with Vitamin B Complex is indicated, a natural source containing all components should be employed.

With the increase in number of persons doing heavy, muscle-tiring work, the problem of adequate nutrition assumes added importance.

An efficient means of supplying the entire B Complex is provided in

BEZON* **Whole Natural** **Vitamin B Complex**

*Trade Mark

—concentrated to high potency from natural sources—no synthetic vitamin factors are added. Only in the Whole Natural Vitamin B Complex can all 16 vitamin B factors be obtained.

BEZON is made only in the distinctive two-color gelatin capsule. Supplied in bottles of 30 and 100 capsules.

***Etiologic Eradication* TAKES TIME...**

THE PATIENT — DEMANDS RELIEF NOW

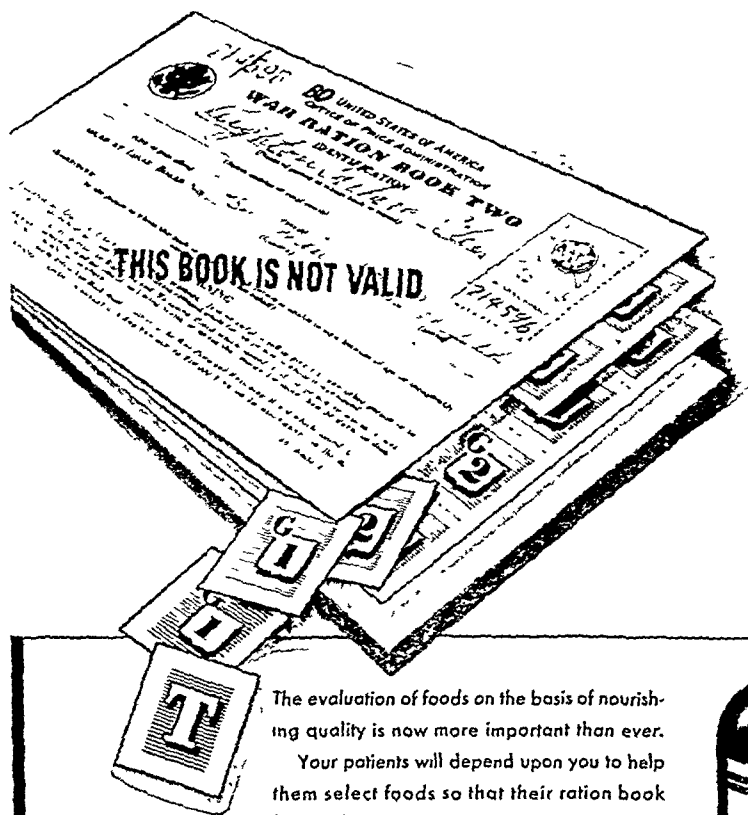

Most pruritic skin lesions require a relatively extensive diagnostic search before their true nature is learned, and before specific therapy can be instituted. In the interim, however, relief from the agonizing torment of itching must be provided the patient. For this purpose, Calmitol is specific. It exerts its antipruritic influence regardless of the causative lesion, hence it may be prescribed on the first visit with complete assurance of the relief it will bring. A single application is effective for hours, overcoming the desire to scratch and preventing secondary traumatic lesions. The wide range of applicability of Calmitol embraces contact dermatitis (including ivy and oak poisoning), food and drug rashes, eczema, urticaria, prurigo and intertrigo, ringworm, and pruritus ani, vulvae, and senilis. Physicians are invited to send for samples.

Calmitol exerts its antipruritic influence by blocking cutaneous receptor organs and nerve endings. Its active ingredients are chloriodo-camphoric aldehyde, levo-hyosine oleinate, and menthol, incorporated in an alcohol-chloroform-ether vehicle. Calmitol is protective, bacteriostatic, and induces mild active hyperemia

"Habit is a sort of Second Nature"

CICERO De finibus, V c 50 BC

*...and Petrogalar makes it easy to
establish "habit-time" for bowel movement*

One of the many reasons physicians like Petrogalar is that it helps to make "Habit Time" second nature with patients.

An aqueous suspension of mineral oil, Petrogalar brings effective, yet gentle relief. How? By adding unabsorbable fluid in the colon, Petrogalar brings about comfortable elimination with no straining . . . no discomfort. Furthermore, Petrogalar supplies moisture . . . retains moisture . . . counteracts excessive dehydration.

Miscibility and even dissemination are assured by the fine division of suspended oil globules.

Petrogalar is also pleasant to take. It may be thinned with water, milk or fruit juices.

Five types offer a choice in treating a wide range of conditions.

Try Petrogalar on your next group of patients.

*Reg U S Pat Off Petrogalar is an aqueous suspension of pure mineral oil. Each 100 cc of which contains 65 cc pure mineral oil suspended in a flavored aqueous gel.

Caudal Anesthesia in Obstetrics

During the last century many methods for the relief of the pains of childbirth have been advocated. Inhalation anesthesia, first suggested by Sir James Simpson, was followed by the administration of drugs, orally, or by hypodermic injection, or by rectum. All methods were partially successful, but all had their peculiar dangers among which were the many babies born more or less asphyxiated.

Recently Hingson and Edwards have reported a new method for producing painless childbirth by injecting a cocaine derivative into the caudal canal at various intervals, thus producing analgesia during labor and anesthesia for delivery. Experience with this method of procedure and an analysis of 218 cases is presented on page 1023 of this issue by Drs. Francis R. Irving, C. Albertson Lippincott, and Frank C. Meyer, of Syracuse, New York, in which contribution the authors, in a preliminary report, enumerate the disadvantages and contraindications for use of this procedure.

In 218 cases, 29 instances of fetal distress, or 13.3 per cent, were noted; in 118 cases, a sustained fall in blood pressure in 22, or 18.6 per cent, was found; of the 12 cases of fetal distress in the last 118 cases, 9, or 75 per cent, "occurred in patients manifesting a sustained low blood pressure. In each of the remaining 3 cases there was clear obstetric explanation for the fetal distress.

"One stillbirth is presented for which there is no apparent obstetric reason and which was probably a result of the caudal anesthesia."

These disadvantages and contraindications should be carefully studied by those who contemplate the use of this method. Aside from the high percentage of fetal distress and sustained drop in maternal blood pressure, it should be considered that the invasion of the caudal canal is, in itself, a major surgical procedure. "Since most of the dangers, drawbacks, and untoward effects have been associated with certain technical difficulties which could not be foreseen in the early phases of the work by even experienced physicians, it is suggested that, for the present, at least, the use of the method be confined to institutional practice by persons trained and experienced in caudal anesthesia."¹

Let us reiterate. The method of giving the anesthesia is a major surgical procedure. A patient receiving continuous caudal anesthesia requires meticulous care and frequent observation of blood pressure and fetal heart rate. The technic is relatively new. A few undesirable results following its use by those not fully aware of the hazards may bring about unwarranted condemnation of what may be a helpful and valuable procedure. Its use should be restrained. It seems at present to be a proper procedure only for larger institutions possessing well-trained assistants, especially with respect to the technic of anesthesia of this kind. Considerably more investigation seems warranted before it is made generally available to the public.

¹ J.A.M.A. 122: 158 (May 15) 1943.

Meningococcus Meningitis

Reports from the Division of Communicable Diseases of the State Department of Health indicate an increase in the incidence of this disease throughout the State. A similar increase seems to be apparent throughout the country. In New York State there was no appreciable increase over the previous (1938-1942) five-year average until June of last year. Throughout the rest of 1942 the number of cases reported each month was usually about double the average number reported during the corresponding month in the previous five years. For 1942, the total for the State was 183 and for New York City 418, as against 122 and 153, respectively, the average for the previous five years in each category.

From January 1 to May 15, 319 cases have been reported throughout the State exclusive of New York City, and in New York City, from January 1 to May 13, 708 cases. Under these circumstances the decision of the Council Committee on Public Health and Education to provide speakers on meningococcus meningitis and to feature

this aspect of its postgraduate teaching program deserves the hearty cooperation of all medical groups within the State. The Committee has stressed the diagnosis and treatment of meningococcus meningitis as a part of its sulfonamide program during the current year, but in view of the markedly increased incidence of this disease a special program is now being developed concerning which special announcements and a list of speakers on this topic should be published shortly.

The importance of this program cannot be overemphasized. All medical groups are urged to cooperate with the State Society through its Council Committee on Public Health and Education, and to bring these well-qualified speakers before their membership as soon as this can be arranged. General participation in this postgraduate program, alertness on the part of the profession to recognize the disease in its inception, and immediate isolation and treatment are urgently indicated. To be forewarned is to be forearmed.

Prevention of Rheumatic Reinfection

Rheumatic fever is a much more frequent crippling scourge than poliomyelitis. The first attack may not infrequently be fatal, but its tendency to recurrence, thereby adding new injuries to the old, not only increases the mortality rate but leaves the afflicted handicapped for life from permanent cardiac changes. Since the causative agent of rheumatic fever is still undiscovered, previous attempts to avoid recrudescences have necessarily been along non-specific lines. Recognition of the important precipitating role of *Streptococcus haemolyticus* infections has focused attention on measures to prevent such infections.¹ Avoidance of contact with streptococcus-infected individuals and climatic retreat to regions of low rheumatic incidence have been, until recently, the chief effective strategies. The last resort is really a drastic one, for it means disruption of normal family life and the wrecking of environmental influences.

Discovery of sulfanilamide and its proved bacteriostatic effect upon the *Strep. haemolyticus* inevitably led to its use as a prophylactic agent

against rheumatic reinfection. The earliest studies of such prophylaxis yielded encouraging data.^{2,3} Sulfanilamide-treated subjects who had suffered previous rheumatic infections developed few recurrences as compared with control groups of comparable untreated patients. Since children undergo more severe rheumatic infections and are more susceptible to recurrences than adults, further studies in children offered a searching test of sulfanilamide prophylaxis. Publication of two well-controlled series, dealing solely with children, and producing substantially the same results as have been obtained with adult rheumatic patients, was a most welcome confirmation.^{4,5}

The dosage of sulfanilamide employed prophylactically was small as compared with the therapeutic dose in active, acute infections. The most common dose was 1 to 2 Gm. daily, according to age and size, given in two or three divided doses. The blood level so attained was usually around 2 mg. per cent. Toxic reactions occurred in 10 to 15 per cent of cases, largely in the form of fever, eruptions, and granulopenia.

Acute hemolytic anemia was conspicuous by its absence, although a slight fall of hemoglobin was frequent. One death has been reported as resulting from this method of therapy.⁶

In spite of obvious inherent dangers which demand constant supervision and periodic blood examinations, the prophylactic administration of sulfanilamide (or a related sulfa drug) to rheumatic-susceptible individuals, offers the greatest promise of any method yet devised to prevent rheumatic reinfection. Furthermore, it can be universally applied, for the economic factor is negligible, and there is no domestic and environmental cleavage. Since the ultimate prognosis of rheumatic fever is largely determined by reinfection, the prophylactic use of sulfanilamide bids fair to improve greatly the prognosis of the rheumatic patient. It must be emphasized that this therapeutic method is

not designed for use during active rheumatic infection, when it is ineffective, but only for the prevention of reinfection. Its benefits are conferred only while the drug is taken. Administration will probably be of a seasonal nature repeated over a span of years, until the time when it is believed that the rheumatic infection is unlikely to recur.

Hemoglobin Regeneration

Dissemination of knowledge regarding the importance and uses of blood and plasma in both military and civil life has had a profound public influence. From patriotic and kindred social motives thousands have gladly donated their blood. Abstraction of this huge amount of blood is chiefly performed through the medium of blood banks which, while not called into being at the behest of the public, are kept in continuous operation by numerous willing contributors.

This grand movement raises several problems. How much blood can be safely contributed? How frequently may one be a blood donor without harm to himself? What measures can or should be taken to hasten the restoration of blood in the donor? These and other pertinent questions have been definitely and mathematically answered by investigators interested in hemoglobin regeneration following phlebotomy.

It has been demonstrated that iron therapy, 12 grains of ferrous sulfate daily, greatly increased the rate of hemoglobin regeneration after a blood donation.¹ Withdrawal of 500 to 600 cc. of blood required an average time of 49.6 days for the hemoglobin to return to its original level.² Hemoglobin was regenerated at the rate of 0.04595 Gm. per 100 cc. of blood per day. With iron therapy, daily hemoglobin regeneration, under similar circumstances, rose to 0.0772 Gm. per 100 cc. of blood per day, an increase of almost 50 per cent.³ The recovery period was shortened from 49.6 days to 35.2 days. Without therapy, about 75 per cent of the donors had a return of

hemoglobin to the original level in eight weeks or less, and 25 per cent required up to fifteen weeks for a similar regeneration, but with iron therapy 93½ per cent regained their normal hemoglobin in eight weeks.

Unfortunately, iron therapy given continuously, exerted little influence upon the rate of hemoglobin regeneration and the period of hemoglobin restoration when blood was donated more than once. After the second donation there was a sharp decline of the augmented hemoglobin regeneration to the rate previously attained without iron therapy. This inefficacy of continuous iron therapy in constantly augmenting hemoglobin regeneration deprives us of the hope of thus permanently increasing the frequency or amount of blood given by the individual donor. This is not due to lack of iron absorption, for balance studies showed more iron was retained than was metabolized into hemoglobin.⁴ These facts seem to indicate that iron therapy after repeated blood donations is not simple replacement therapy.

Other interesting and related features have also been established. There is no evidence of bone marrow exhaustion after repeated donations. Blood donors subsisting on defective diets are liable to anemia as a result of this loss of blood. Such anemia is of a microcytic type, however, and responds to iron therapy.⁵ Women are not as successful blood donors as men are, for they are prone to develop anemia.

From these studies we learn that the male is the preferable donor; that his diet must be ade-

quate for hemoglobin regeneration; that the optimum amount of blood donated at one time is 500 to 600 cc.; that two or three months is the interval of choice. Iron therapy will hasten the recovery period by increasing hemoglobin regeneration after the first donation of blood. This process does not continue to operate during subsequent donations, for there is a sharp return to normal hemoglobin regeneration after the second

blood donation when iron therapy is relatively futile.

1943 Scientific Exhibits Awards

The Committee on Scientific Awards is pleased to render the following report after careful study and evaluation of the Scientific Exhibits at the 1943 Annual Meeting of the Medical Society of the State of New York:

RESEARCH AWARDS

First Award: Abraham L. Kornzweig, M.D., Mount Sinai Hospital, New York—"Embryologic Development of the Cornea, Sclera, and Corneo-Scleral Junction."

Second Award: Udall J. Salmon, M.D., Samuel Geist, M.D., Charles S. Poole, M.D., and A. Austin Salmon, Mount Sinai Hospital, New York—"A Two-Hour Pregnancy Test."

CLINICAL AWARDS

First Award: S. A. Goldberg, M.D., Newark, New Jersey; S. N. Blackberg, M.D., Chicago; and P. Stanley, Newark, New Jersey—"The Pathology of Arthritis."

Second Award: Henry K. Taylor, M.D., Goldwater Memorial Hospital, New York—"Bone Infarcts and Aseptic Necrosis."

Honorable Mention: Lee A. Hadley, M.D., Syracuse University, Syracuse—"Cervical Spine Studies."

CONTINUOUS CAUDAL ANESTHESIA IN OBSTETRICS*

Demonstration of Catheter Technic for Administration

FRANCIS R. IRVING, M.D., C. ALBERTSON LIPPINCOTT, M.D., and FRANK C. MEYER, M.D.,
Syracuse, New York

THE idea of injecting anesthetics into the caudal canal originated with Cathelin,¹ the French urologist, and Sicard,² working independently in 1901. Cathelin recommended his method primarily for the relief of bladder incontinence and enuresis in children—not as a method of surgical anesthesia. Since 1901 single injection caudal anesthesia has been extensively used in surgery. Lundy³ reports more than 15,000 cases at the Mayo Clinic. One of the first reports of its use in obstetrics was by Stoeckel,⁴ who reported 141 cases in 1909, using a single injection of novocain. In America it has been used by various investigators, including Meeker and Bonor (1923), Oldham (1925), and Rucker (1930). In 1939 Baptisti⁵ reported the successful use of single caudal anesthesia in 200 cases. Lahmann and Mietus⁶ (1942) reported its use in 400 obstetric cases. Most of these investigators used novocain and found the duration of anesthesia to be from forty minutes to one and one-half hours, depending on the strength and amount of solution used.

In September, 1942, Hingson and Edwards⁷ first reported the use of continuous caudal anesthesia during the early stages of labor and delivery in 33 cases. They used 1½ per cent mety-caine and obtained complete relief of pain and discomfort of active labor within five minutes after administration of the anesthetic. In every case there was immediate and complete relaxation of the cervix and perineum, with no interference with uterine contractions. Moreover, spontaneous respiration of the infant followed delivery immediately. In January, 1943, Hingson and Edwards⁸ reported the successful use of continuous caudal anesthesia in 589 obstetric cases, using a special malleable stainless steel No. 19 gage needle. Earlier they had used a No. 16 gage malleable silver needle but had trouble with breakage.

Lundy and Adams used continuous caudal anesthesia at the Mayo Clinic. However, instead of a malleable needle, since June, 1942, they have used a No. 5 ureteral catheter inserted into the caudal canal through a No. 13 gage Love-Barker spinal needle, thereby obviating the danger of a broken needle, a rather major

complication. Manalan⁹ reported on 46 cases in October, 1942, using a catheter technic for a single caudal injection, inserting the catheter into the caudal canal and allowing it to remain until the patient is ready for delivery and then injecting novocain.

Since October, 1942, we have used continuous caudal anesthesia in over 200 obstetric cases, employing the catheter instead of the malleable needle. There have been no major complications from its use. Since the catheter is flexible, it facilitates moving the patient to the delivery room, and she can move freely during labor, or remain on her back.

When selecting a method of painless childbirth, safety to the mother and the baby are of primary importance, while the relief of pain should be secondary. If the safety of the mother or child is jeopardized, any method should be condemned regardless of the analgesia obtained.

None of the methods heretofore employed can completely fulfill these requirements. If sufficient dosage of morphine, scopolamine, barbiturates, paraldehyde, rectal ether, and the like is used to obtain adequate relief, sleepy babies and increased length of the second stage will ensue. The incidence of operative deliveries is increased and a general anesthetic becomes necessary. As a result, many babies require artificial respiration; there is increased bleeding in the third stage, and the danger of pulmonary complications increases.

The ideal method should cause none of the above complications. Local anesthesia, like presacral or pudendal block, has no deleterious effect on mother or baby but cannot be used to relieve pain in the first stage. Continuous caudal anesthesia is essentially a regional or local anesthetic. It is available in the first stage, which it apparently shortens. It does not cause atony of the uterus. The babies are born wide awake and breathe and cry immediately. The relief of pain is dramatic. The stimulus of the head pressing against the pelvic floor and the desire to bear down are obliterated. There is, therefore, an increase in operative intervention. However, the perineum is so relaxed that the head can be easily delivered by forceps.

Continuous caudal anesthesia cannot be used in every case of childbirth. There are certain contraindications, such as pilonidal cyst, infection near the site of injection, cases of hypoten-

* Preliminary report.

sion, and patients who are known to be sensitive to the drug. We believe that placenta praevia, ablatio placenta, and disproportion contraindicate its use. Although in our study we have used it more or less on unselected cases, we did not transgress to the extent of forgetting the mother's safety.

Since the cervix dilates rapidly in the majority of cases soon after the administration of the drug, especially if uterine contractions are frequent and well established, it is reasonable to assume that in central or partial placenta praevia the placenta would be rapidly detached from the lower uterine segment and severe hemorrhage follow, yet we have used it in one case of marginal placenta praevia in a multipara who went through delivery without any increase in bleeding. Since we have encountered cases in which there was a marked drop in blood pressure, sustained over a variable period, we feel that continuous caudal anesthesia is contraindicated when there is active hemorrhage from any source, or when hemorrhage is anticipated.

In 5 cases of inlet disproportion, in "border-line" pelvis, and 3 outlet contractions, continuous caudal was used successfully, the patients being finally delivered vaginally after a prolonged but comfortable labor. Version can be accomplished but the anesthetic is not ideal since the uterus is not relaxed.

Cardiac cases apparently do exceptionally well. We have used it in several instances of mitral stenosis, with excellent results. It is here that the method stands out; the patient is comfortable; the cervix dilates rapidly, and the desire to strain is absent. As a result, the heart is not called upon for extra effort as in ordinary labor.

Aside from the contraindications mentioned, it must be remembered that the method is time-consuming. A busy obstetrician cannot conduct a continuous caudal anesthesia in two hospitals at the same time. It is extremely necessary to observe and check the blood pressure, the fetal heart, and the height of anesthesia frequently. These rules must be followed; and the conduct of a case of this kind should not be left to a nurse.

Continuous caudal analgesia is simply a type of epidural anesthesia. The caudal canal lies between the lower end of the dura at S_2 and the end of the spinal canal at S_4 (the hiatus sacralis). It is usually at least an inch long and is filled with semiliquid fat, connective areolar tissue, and a venous plexus. It affords ready access to the epidural space. Since this space is closed at the lower end by a fibrous membrane (Cathelin's membrane), fluid deposited therein in excess of the volume of the canal flows up the spinal canal into the epidural space, where it "is likely . . . (it) . . . diffuses along the perineural lymphatics

to leave the epidural space at the intervertebral foramina and block the spinal nerves outside of the spinal canal" (Goodman and Gilman). The third, fourth, and fifth sacral nerves traverse the caudal canal for several centimeters and are exposed to the injected solution throughout that length; hence they are more thoroughly affected than the nerves in the higher epidural space. This anatomic arrangement, together with the fact that sensory nerves are more sensitive to local anesthetics than the motor nerves, makes it possible to anesthetize the higher levels of the birth canal by caudal injection, while at the same time we produce anesthesia and relaxation of the parts supplied by the lower sacral nerves.

Cleland,¹⁰ using Head's zones, demonstrated that pain sensation from the uterus (cervix) was carried to the eleventh and twelfth thoracic segments, and clinical observation indicates that if we block the nerves of this area epidurally we can block the pain of uterine contractions. Thus, by caudal injection of a local anesthetic we can produce analgesia for labor, and anesthesia and relaxation for delivery at the same time.

To produce continuous analgesia-anesthesia most advantageously a malleable needle or fine catheter is left in the caudal canal, through which an injection is made at various intervals. We have used the catheter technic. In the majority of our cases we employed a guide needle to locate the canal and a No. 13 gage needle through which to pass the No. 5 ureteral catheter, as was suggested by Adams, of the Mayo Clinic. Inasmuch as it is necessary to pass 2 needles through the sacral hiatus, this technic is more difficult than the use of the malleable needle, which required the placement of but one No. 19 gage needle. Recently we have revised this method by devising a No. 15 gage sleeve which will pass directly over a guide needle. This eliminates the difficulty in placing the larger needle as well as any chance of missing the hiatus with the second needle and catheter.

It requires sterile preparation of:

- Luer-Lok syringe
- Hypodermic needle
- Cup for local anesthetic
- Spinal needle, 20 gage
- Love-Barker spinal needle, 13 gage
- Ureteral catheter, No. 5
- Blunted 20-22 gage adapting needle, to fit bore of catheter, and rubber tubing with suitable connections, valves, reservoir, and injection apparatus

When the canal has been located with the No. 20 gage spinal needle and the initial injection completed, the No. 13 gage Love-Barker needle is placed in one of two ways. Either the No. 20 gage needle must be removed and the larger one put in at the same angle and place; or the larger

FIG. 1. The sleeve has been slipped over the hubless needle into the caudal canal and the guide needle removed.

needle may be introduced directly beneath the smaller, which serves to guide it into the sacral hiatus. The small needle is withdrawn and the insertion of the Love-Barker needle into the caudal canal is completed. The latter method is definitely easier and surer and has not, in more than 170 cases, resulted in damage to the smaller needle.

For our present method, we employ a 5-inch, No. 18 gage needle without hub, and a $2\frac{1}{2}$ -inch, No. 15 gage needle which has been reamed out so that it will pass over the No. 18 gage needle readily and also permit the introduction of a No. 4 ureteral catheter. The No. 15 gage needle has no point, but its tip is sharpened throughout its circumference and bevelled at 45 degrees.

To derive the full benefit of continuous caudal analgesia, we feel that it should be withheld until uterine contractions are well established and the cervix is at least 2 fingerbreadths dilated—preferably $2\frac{1}{2}$ to 3. If the time of induction is well chosen, the cervical dilatation usually increases 1 to 2 fingerbreadths as soon as analgesia is established—about ten to fifteen minutes.

Since the field of operation is extremely prone to contamination during labor and the puerperium, meticulous care in asepsis is essential. The skin over the sacrum, the lower back, and the buttocks is thoroughly scrubbed with green soap and water and painted with a suitable skin antiseptic. Then the patient is put in the left lateral or knee-elbow position and is draped with a sterile sheet that has a perforation 4 by 6 inches.

As in the technic described by Lundy, when the tip of the coccyx is palpated with the middle finger of the left hand, the thumb falls into the

V-shaped depression formed by the sacral cornua, between which lies the sacral hiatus. This is usually within an inch of the sacrococcygeal joint.

After preliminary infiltration of the skin, subcutaneous tissue, and Cathelin's membrane, a short interval is allowed for observing sensitivity to the drug. The short-bevelled, No. 18 gage hubless needle is then introduced at about 45 degrees so that the bevel parallels the skin and surface of the sacrum. With the bevel thus held, when the needle perforates the membrane and reaches the bone, it will then slide into the caudal canal as the outer end is depressed and the needle is advanced. Owing to the curvature of the sacrum, the point of the needle will strike the roof of the canal. By 180-degree rotation the bevel is brought parallel to the roof of the canal, and it will again advance with gentle pressure. If it is not in the caudal canal, it meets considerable resistance in the tough ligaments and tissue over the sacrum. This rotation and advancement is, in our hands, the most reliable sign that the needle is properly placed. The Luer-Lok syringe is now attached by a rubber catheter adapter and careful aspiration is performed for spinal fluid or blood. A small injection of anesthetic solution (0.1 to 0.2 cc.) is then made and aspiration is repeated. Blood is not infrequently encountered, in which case the position of the needle is changed slightly and gentle pressure is employed in the first injection.

In our series we have never encountered spinal fluid, but the danger is not to be minimized since, in the rare case, it is known that the dura may extend as far down as the fourth sacral segment.

FIG. 2. The catheter has been inserted into the caudal canal through the sleeve, which has been withdrawn.

If the dura were perforated, it would be best to discard the method in that particular case.

We make our first injection of 10 cc. of anesthetic immediately through the needle. The amount of pressure required to inject the drug is a valuable sign whether or not the needle is properly placed. If it is in the canal, the solution flows freely. Then, while we wait eight to ten minutes to observe signs of intraspinal or intravenous injection, we pass the 15-gage sleeve over the guide needle, then withdraw the latter, leaving the sleeve in the caudal canal (Fig. 1). The catheter is then inserted through the sleeve, which is withdrawn (Fig. 2). The catheter should be so adjusted that 8 to 10 cm., depending upon the thickness of the subcutaneous tissue, lies beneath the skin. If no untoward signs develop, the remainder of the initial dose of 25 to 30 cc. is injected through the catheter. If this is not in place, palpation over the sacrum may reveal an injection tumor. If properly placed, the patient, in a majority of cases, complains of cramping in one leg or both. In a few cases, she may complain of fullness over the sacrum or pain up the back, and, rarely, of a headache. The earliest signs that anesthesia is becoming effective are increased warmth of the soles of the feet and a shortening of the subjective pain.

In the individual patient the height of anesthesia is proportional to the amount of solution injected and the volume of caudal canal. We have not been able to correlate the height of anesthesia from the first dose with the size of the patient in all cases. It is, however, our policy to give a smaller dose—that is, 25 cc.—to small women. We have also found that if the patient gets a crampy sensation in the thigh after the first 10 cc., a total of 25 cc. is sufficient. In our experience, skin anesthesia has been observed as high as the second rib and as low as the clitoris, following the initial injection of 30 cc.

The skin opening about the catheter is sealed with collodion and padded with cotton. Dislodgment of the catheter is prevented by strapping with adhesive tape across the buttocks to the flank. The injection apparatus is then connected to the catheter by means of a blunted needle which fits snugly into the bore. The patient is now at liberty to roll on her back or on either side as desired. This greatly facilitates observation of the blood pressure or fetal heart and affords opportunity for rectal examination.

For continuous caudal anesthesia, we endeavor to maintain skin anesthesia to pinprick between the umbilicus and a point midway to the symphysis. The usual volume of subsequent injections is 20 cc. The time interval varies with the size of the caudal canal, the stage of labor, and the intensity of the "pains" and the drug employed. With metycaine, reinjection is usually necessary every thirty to forty minutes, with outside limits of twenty and sixty minutes. With pontocaine, the usual interval is sixty minutes, with limits of thirty and one hundred and fifty.

In analyzing our first 100 cases, we found that we had 10 failures, 7 of which were due to technical errors of the operator, who had had no previous experience with caudal injections. The remaining 3 were attributable to the procedure itself. Of the latter, 2 were cases in which caudal anesthesia was induced too late in labor to be effective. The third occurred early in our series and remains unexplained. Of the 7 technical errors, 4 occurred because analgesia wore off following the first injection, which had been made through the spinal needle and could not be renewed because the catheter had been incorrectly placed. In one case no sacral hiatus was found. The 2 remaining failures probably should not be so considered inasmuch as the analgesia was intentionally allowed to wear off. In one, cesarean section was decided upon for cephalopelvic disproportion. The other was one of our first cases, in which the analgesia was induced too early. Another case should be mentioned at this time. Immediately following the first injection we were unable to obtain pulse, blood pressure, or precordial heart sounds. Respirations were stertorous, and the patient was completely unresponsive; her color, however, remained good. Glucose, adrenalin, and coramine were administered and after forty minutes her condition gradually improved. She was delivered without further anesthesia. The apparent explanation is that at least part of the injection was intravenous.

A review of the series disclosed 17 cases in which the fetal heart rate fell below 100 and did not recover between the uterine contractions; and one case in which, immediately upon turning

Fig. 3. Chart of a typical case illustrating the system of following the factors pertinent to the conduct of a continuous caudal anesthesia.

the patient on her back, following the first injection, the fetal heart could not be heard: it had been heard thirty minutes before.

Seventeen per cent fetal distress was alarming and required explanation. We considered several possible causes. At first, we thought that placing the patient in the knee-elbow position might predispose to pressure on the cord. Second, the drug employed might, after absorption, pass the placenta in sufficient concentration to have some direct effect on the fetus. Third, the fact that dilatation of the cervix took place so rapidly suggested the possibility that uterine tone and contractions might be greatly increased. And fourth, the observation of an almost bloodless uterus at cesarean section in a patient whose condition resembled shock suggested fetal anoxemia from ischemia of the uterus as a cause of fetal distress. This might be due either to maternal hypotension or to direct action of the anesthetic on the arteriolar bed in the uterus.

Before starting observation of the second 100 cases, we established definite rules and had a chart printed, so that the observations could be recorded immediately (Fig. 3). Blood pressure and fetal heart were taken and recorded before and after each injection, and at least every half-hour during the progress of the case. If warranted, these recordings were made every five to ten minutes. We have now compiled and present this preliminary analysis of 118 additional cases, in which we have tried to determine which factors

are significant in the causation of this unusually high percentage of fetal distress.

Our first step was to put the patients in the knee-elbow position for ten minutes at approximately the stage of labor where caudal block is usually started. This was done in 16 patients, and in no case was fetal distress observed. At the same time, we began our inductions in the lateral position, to see if the incidence in the two positions was comparable. We found that the ratios were not significantly different.

We attempted to study the toxicity of the anesthetic agent, but found that we were unable, with the tests available, to determine the concentrations in maternal and fetal blood. We then approached the problem by employing three other local anesthetics. Novocain, while not adequately studied, was found to produce satisfactory but brief analgesia in a 2 per cent solution. We ran 14 cases with monocain and found that with a 1 per cent solution complications of blood pressure and fetal heart were rare, but analgesia was not altogether satisfactory. In 1.25 per cent and 1.5 per cent solutions analgesia was excellent, but the incidence of sustained fall in blood pressure and fetal distress rose. Pontocaine was then tried. In a 0.2 per cent solution complications were rare, but again the analgesia was inadequate. In a 0.23 per cent solution analgesia was better. With a 0.25 per cent solution analgesia was satisfactory, though not as intense as with 1.5 per cent metycaine, but the complications were not

FIGURE NO. 4
INCIDENCE OF FOETAL DISTRESS

FIG. 4. Fetal distress in relation to the drug employed.

so distressingly frequent. All solutions are made with physiologic saline (Figs. 4 and 5). Up to the present time 0.25 per cent pontocaine has given us the most satisfactory results.

At this time we are unable to present any evidence that increased tonicity of the uterus or prolonged contractions exist or play any role in the production of fetal distress. Tocographic recordings, however, are being made. Clinical observation has failed to show that fetal distress was associated with partial tetany of the uterus, with the exception of one case which we have temporarily classified as probably unrelated to caudal anesthesia.

That anoxemia of the fetus is a factor in the mechanism of production of fetal distress in certain of our cases of continuous caudal analgesia seems fairly well founded by the observation that the administration of oxygen to the mother has uniformly resulted in prompt recovery of the fetal heart rate. Consideration of the pale uterus observed at cesarean section suggests ischemia of that organ as an intermediary factor. There are at least two possible explanations. Cannon and Rosenblueth¹¹ have shown that cocaine produces at the sympathetic myoneural junction a potentiation of sensitivity to adrenalin which we would expect to result in vasoconstriction and ischemia of the organ supplied. For this to be pertinent we must assume that there is adequate absorption of the drug into the blood stream.

In 8 cases we administered 1 cc. of adrenalin, 1:2,600 per 100 cc. of anesthetic solution, and observed fetal distress in 3. However, if vasoconstriction were a factor, we can see no reason for its being localized to the uterus and would expect that increased peripheral resistance would produce an elevation of the maternal blood pressure. This is not borne out by our clinical observation. We have found that, including the above 3, 9 of 12 of our cases of fetal distress in the last 118 were associated with a sustained fall in blood pressure. By a sustained fall we mean a

FIGURE NO. 5
INCIDENCE OF SUSTAINED FALL IN BLOOD PRESSURE

FIG. 5. Sustained fall in blood pressure in relation to the drug employed.

systolic pressure of less than 90 which remained so for at least one hour. We feel that the correlation between the sustained low blood pressure and fetal distress is significant (see Fig. 6). This is borne out by two observations: (1) the blood pressure and fetal heart rate recover together when anesthesia is allowed to wear off; and (2) the greater the blood pressure fall, the more frequent the fetal distress (Fig. 7).

Upon analysis, these patients with a sustained fall in blood pressure showed several uniform characteristics. (1) The drop in pressure was progressive. (2) A relatively high diastolic pressure was maintained; thus the pulse pressure suffered most. (3) The pulse rate rarely rose over 110 and occasionally fell to 50 or 60. (4) The patients were pale, showed varying degrees of apprehension, or apathy, but never displayed "cold sweats." (5) In some cases, the level of skin anesthesia was high, although in others it never rose above the umbilicus, while there were several cases of high anesthesia without serious fall in blood pressure.

If the patient exercised her leg and abdominal muscles while bearing down during the uterine contractions, the systolic and pulse pressures improved. In one case, in which the blood pressure was 44/38, elevation of the legs and massage of the thigh and calf muscles raised the blood pressure to 84/50 in four minutes. This rise, however, was attained in lessening degree as the maneuver was repeated.

These features are strikingly similar to those of so-called "spinal shock." Anatomically, subarachnoid and epidural anesthetics involve identical nerve paths. The blocks occur in slightly different locations, so comparison of "caudal shock" and "spinal shock" may not be justifiable. However, there is enough similarity to suggest that the same mechanisms are operative in both.

There remains to be explained only the great disparity in the frequency of "caudal shock" with the different drugs. A possible explanation is suggested by our experience in altering the strength of solution. We found that when we

FIG 6 Nine out of 12 cases of fetal distress were in patients simultaneously manifesting a sustained low blood pressure. For each of the remaining 3, there was a clear obstetric explanation.

increased the concentrations of monocaïne and pontocaïne the incidence of blood pressure and fetal heart complications increased as well. We plan to use metycaine in lower concentrations to see whether, at the same time, we can lower the incidence of these complications.

In this series of 218 cases, we have had no maternal mortalities, there were 2 stillbirths, and 3 neonatal deaths. One of the stillbirths was a case in which a prolapsed cord and fetal death occurred twelve hours before caudal anesthesia was given. The other is the case discussed above, in which the fetal heart disappeared during the administration of the caudal. The neonatal deaths were all in very small babies, one weighed 2 pounds 13 ounces, the other two were 2-pound twins.

Our greatest dosage with metycaine was 9,900 mg., with monocaïne, 2,250 mg.; and with pontocaïne, 572 mg. The longest that we had the catheter in position was twenty-nine hours.

Several patients have complained of pain over the sacrum the day following delivery, and in 5 cases we have had superficial skin infections, but no abscesses.

We have had no apparent increase in postpartum morbidities, although we have found the second stage to be definitely prolonged and our figures show a significant increase in operative deliveries.

Reviewing 1,425 consecutive noncaudal deliveries and 218 caudal deliveries, we found the percentage increase as follows:

	High-Mid	Mid	Low	Prophy-lactic	Scan-zoni	Total
Noncaudal	0	2	9	57	4	74
Caudal	1	4	3	7	7	84

Summary

In summary, we have presented 218 cases of labor and delivery conducted under continuous caudal analgesia.

1. In 218 cases, we observed 29 cases of fetal distress, or 13.3 per cent.

FIG 7. In the cases showing low systolic pressures, the percentage of fetal distress was proportionately greater at the lower pressure levels. Most of the cases of fetal distress represented at levels above 80 had obvious obstetric causes.

2. In 118 cases, we found a sustained fall in blood pressure in 22, or 18.6 per cent.

3. Of the 12 cases of fetal distress in the last 118 cases, 9, or 75 per cent, occurred in patients manifesting a sustained low blood pressure. In each of the remaining 3 cases there was a clear obstetric explanation for the fetal distress.

4. One stillbirth is presented for which there is no apparent obstetric reason, and which was probably a result of the caudal anesthesia.

5. We have set forth four possible explanations for the unusually high incidence of fetal distress and our observations which seem to have some bearing on this problem.

Comment

Continuous caudal anesthesia in obstetrics offers much in the way of painless childbirth. There is still a paucity of experience with its use. It is not yet entirely free of danger to mother or child. Much more experience will be needed before it can be offered to the public as a panacea. Until such time, its use should be restricted to well-staffed obstetric services.

THE ROLE OF CORONARY ARTERIOSCLEROSIS IN CARDIAC HYPERTROPHY

HARRY GROSS, M.D., and JAMES R. LISA, M.D., New York City

THE question of whether or not coronary arteriosclerosis alone is an adequate cause of cardiac hypertrophy is still a disputed one. Numerous observers¹⁻⁵ found no causal relation of coronary artery disease to cardiac hypertrophy. Miller and Weiss⁶ reported extensive coronary artery disease with small hearts. Nemet and Gross⁵ observed severe coronary arteriosclerosis and myocardial damage in both large and small hearts but chronic congestive failure only in hypertrophied and dilated hearts. Hypertrophy, in the absence of other causes, was attributed to hypertension, either present or antecedent. Sutton and Davis,⁷ in experimental coronary occlusion, found that acute coronary closure and myocardial damage did not cause hypertrophy. However, animals exercised shortly after the onset of the acute lesion developed ventricular aneurysms due to local muscular weakness.

On the other hand, there are many proponents of the view that obstructive coronary artery disease with resulting impaired nutrition of the heart is a cause of cardiac hypertrophy.⁸⁻¹³ Blumgart¹² stated that the degree of such hypertrophy was definitely related to the severity of the coronary arteriosclerosis. Smith¹⁴ found cardiac hypertrophy in dogs after coronary artery ligation. Recently Katz and his co-workers¹⁵ approached the problem experimentally by producing cholesterol arteriosclerosis of the coronary arteries in rabbits. They concluded that a causal relationship existed between the two conditions.

It may be reasoned that severe coronary artery disease produces impairment of nutrition of the heart. Anemia from impairment of nutrition as a cause of hypertrophy was established by Goldstein and Boas¹⁶ and Nemet and Gross.¹⁷ Lewis and Drury¹⁸ also attributed to anemia cardiac hypertrophy in arteriovenous fistulas. Bland, White, and Garland¹⁹ showed that impairment of nutrition can lead to cardiac hypertrophy in anomalous origin of coronary arteries from the pulmonary artery in congenital heart disease.

In order to answer from clinical grounds the question whether coronary artery disease can cause cardiac hypertrophy, it is necessary to study cases of uncomplicated coronary disease. However, uncomplicated coronary arteriosclero-

sis is seen relatively infrequently in hospital practice and at necropsy, since this condition in hospital practice is associated in 90 per cent of the cases with hypertension. Moreover, in the presence of coronary artery disease, it is difficult to exclude hypertension since the blood pressure may fall after development of the disease. To conclude that the sclerosis caused cardiac hypertrophy, it would be necessary to show, over a long period of time, that starting with a normal-sized heart, progressive coronary artery disease caused progressive increase in heart size in the absence of failure. One would also have to show that during the time that the heart increased in size, there was no intervening period of hypertension. Data on such cases are necessarily few.

In order to obtain further data that would confirm or refute either of the two opposing views held in reference to the causal relationship between coronary arteriosclerosis and cardiac hypertrophy, the necropsies performed at City Hospital, Welfare Island, New York City, were studied. The cases were chosen on the bases of (1) heart weight of 400 Gm. or more, for a normal body build; (2) grossly evident coronary arteriosclerosis of moderate or marked degree; (3) absence of valvular lesions compatible with cardiac hypertrophy; (4) normal blood pressure findings while the patient was under observation in the hospital; (5) no known history of hypertension. Hypertrophy of the myocardium was confirmed by the histologic appearance of the myocardial fibers, generalized in distribution and not localized to areas of acute or chronic damage. Cases with acute coronary thrombosis were eliminated, since low blood pressures were not considered a correct index. Using these criteria, we found only 18 cases among 3,520 autopsies performed between January 1, 1928, and December 31, 1941.

The ages ranged from 58 to 88 years. There was only one patient below 60 years of age. In the seventh decade there were 7; in the eighth, 4; in the ninth, 6. Seventeen were men; there was only one woman, 84 years old.

Eight hearts weighed between 400 and 490 Gm.; half had moderate and half had severe coronary sclerosis. Four hearts weighed between 500 and 599 Gm. All had severe sclerosis. In the next group, weighing from 600 to 699 Gm., 3 had moderate and 2 had marked coronary sclerosis. The single heart of more than 700 Gm. had severe obstructive changes. It is evident that

From the Second Medical Division, Service of Dr. W. L. Whittemore, and the Pathological Laboratory, City Hospital, Welfare Island, Department of Hospitals, New York City.

TABLE I

No.	Sex	Age	Heart Weight (Gm.)		Cause of Death
1	M	76	625	Severe sclerosis, old bilateral occlusion; acute endocarditis	Chronic congestive heart failure
2	M	85	625	Moderate sclerosis; old infarct; chronic adhesive pericarditis	Chronic congestive heart failure
3	M	69	450	Severe sclerosis, old occlusion	Chronic congestive heart failure
4	M	67	850	Severe sclerosis, old infarct	Chronic congestive heart failure
5	M	68	475	Moderate sclerosis	Chronic congestive heart failure
6	M	83	600	Moderate sclerosis, old infarct	Chronic congestive heart failure
7	M	81	500	Severe sclerosis, old occlusion; acute endocarditis	Ruptured duodenal ulcer
8	M	88	450	Moderate sclerosis	Acute lobar pneumonia
9	M	58	600	Moderate sclerosis	Extensive cerebral thrombosis
10	F	84	490	Severe sclerosis	Extensive cerebral thrombosis
11	M	65	550	Severe sclerosis	Uremia
12	M	71	460	Moderate sclerosis	Carcinoma of bladder; pyelonephritis
13	M	62	690	Moderate sclerosis	Pylephlebitis
14	M	75	450	Moderate sclerosis	Acute empyema and peritonitis
15	M	64	425	Severe sclerosis	Carcinoma of esophagus
16	M	83	450	Severe sclerosis	Carcinoma of gallbladder
17	M	70	500	Severe sclerosis, old occlusion	Multiple cerebral hemorrhages
18	M	68	500	Severe sclerosis, aneurysm of ventricle	Cirrhosis of liver

the degree of coronary arteriosclerosis bore no relationship to the degree of cardiac hypertrophy (Table I).

When the cases were divided into those with and those without congestive failure, significant differences appeared. Six of the patients (Cases 1 through 6) were hospitalized for congestive failure; the others (Cases 7 through 18) were not. Two patients (Cases 7 and 8), although they were suffering from failure, were hospitalized for ruptured duodenal ulcer and for lobar pneumonia. The average heart weight of the eight cases in failure was 572 Gm.; in the 10 cases not in failure, the average weight was 511 Gm. Failure in this group, as reported by others, occurred with the greatly enlarged hearts. The former group also had the severe degrees of arteriosclerosis with marked narrowing or occlusion and healed infarcts. The occlusive features were less marked in the latter group although there was one instance of ventricular aneurysm.

The histologic examination of the kidneys revealed one noteworthy finding. Arteriolar sclerosis was present in each of the 18 cases. Although a few observers^{20,21,22} have reported instances of hypertension with normal kidneys, such cases are uncommon. The majority of studies^{23,24,25,1} indicate that renal arteriosclerosis is commonly associated with long-standing hypertension. The significance of the presence of this lesion in every one of the cases in the present series will be discussed later.

From a purely physiologic angle it seems plausible that chronic coronary artery disease with marked or progressive impairment of nutrition should lead to myocardial hypertrophy. As noted above, other conditions associated with chronically impaired nutrition are believed to cause it. The mechanism probably

is that impaired nutrition leads to increased diastolic length, which, if continued over a sufficient period of time, eventually may lead to hypertrophy.²⁶ While this concept appears reasonable in explaining the association of coronary arteriosclerosis and cardiac hypertrophy as one of cause and effect, nevertheless the findings fail to support this view both in the present series and also in clinical experience. Moreover, it is not justifiable to say that hypertrophy is due to coronary artery disease, unless one knows the size of the heart and the blood pressure figures before and after coronary closure and has followed the size of the heart for years after coronary closure. We are not acquainted with a single proved case in which, with an enlarged heart, some factor other than coronary disease was not present to explain the hypertrophy. It has also been our experience that inquiry of institutions where a patient has been previously hospitalized yields a surprisingly large number of answers confirming hypertension.

While our findings suggest that coronary artery disease does not cause cardiac hypertrophy, the association of the two conditions is well known. It is admitted that hypertension causes the hypertrophy, and it is believed that it also hastens the tempo of the development of sclerosis. In hospital practice coronary disease in patients with hypertrophied and dilated hearts is common. However, proof that coronary arteriosclerosis is not consistently found with hypertrophy is afforded by the fact that it occurs in as severe a degree in small hearts as it does in large hearts. Furthermore, hypertrophy is also frequently found in hearts with perfectly normal arteries. Moreover, in the present series there was no parallel between the degree of sclerosis

THE ROLE OF CORONARY ARTERIOSCLEROSIS IN CARDIAC HYPERTROPHY

HARRY GROSS, M.D., and JAMES R. LISA, M.D., New York City

THE question of whether or not coronary arteriosclerosis alone is an adequate cause of cardiac hypertrophy is still a disputed one. Numerous observers¹⁻⁵ found no causal relation of coronary artery disease to cardiac hypertrophy. Miller and Weiss⁶ reported extensive coronary artery disease with small hearts. Nemet and Gross⁵ observed severe coronary arteriosclerosis and myocardial damage in both large and small hearts but chronic congestive failure only in hypertrophied and dilated hearts. Hypertrophy, in the absence of other causes, was attributed to hypertension, either present or antecedent. Sutton and Davis,⁷ in experimental coronary occlusion, found that acute coronary closure and myocardial damage did not cause hypertrophy. However, animals exercised shortly after the onset of the acute lesion developed ventricular aneurysms due to local muscular weakness.

On the other hand, there are many proponents of the view that obstructive coronary artery disease with resulting impaired nutrition of the heart is a cause of cardiac hypertrophy.⁸⁻¹³ Blumgart¹² stated that the degree of such hypertrophy was definitely related to the severity of the coronary arteriosclerosis. Smith¹⁴ found cardiac hypertrophy in dogs after coronary artery ligation. Recently Katz and his co-workers¹⁵ approached the problem experimentally by producing cholesterol arteriosclerosis of the coronary arteries in rabbits. They concluded that a causal relationship existed between the two conditions.

It may be reasoned that severe coronary artery disease produces impairment of nutrition of the heart. Anemia from impairment of nutrition as a cause of hypertrophy was established by Goldstein and Boas¹⁶ and Nemet and Gross.¹⁷ Lewis and Drury¹⁸ also attributed to anemia cardiac hypertrophy in arteriovenous fistulas. Bland, White, and Garland¹⁹ showed that impairment of nutrition can lead to cardiac hypertrophy in anomalous origin of coronary arteries from the pulmonary artery in congenital heart disease.

In order to answer from clinical grounds the question whether coronary artery disease can cause cardiac hypertrophy, it is necessary to study cases of uncomplicated coronary disease. However, uncomplicated coronary arteriosclero-

sis is seen relatively infrequently in hospital practice and at necropsy, since this condition in hospital practice is associated in 90 per cent of the cases with hypertension. Moreover, in the presence of coronary artery disease, it is difficult to exclude hypertension since the blood pressure may fall after development of the disease. To conclude that the sclerosis caused cardiac hypertrophy, it would be necessary to show, over a long period of time, that starting with a normal-sized heart, progressive coronary artery disease caused progressive increase in heart size in the absence of failure. One would also have to show that during the time that the heart increased in size, there was no intervening period of hypertension. Data on such cases are necessarily few.

ACTIVITY AS A THERAPEUTIC MEASURE IN THE PARKINSONIAN SYNDROMES

A. M. RABINER, M.D., and MORTON H. HAND, M.D., Brooklyn

NOWHERE in medicine has therapy been a greater disappointment than in the management of paralysis agitans. Sir James Parkinson called attention to the "shaking palsy" in 1817, and his description of the clinical picture can scarcely be improved upon today. Patients so affected are insidiously disabled by a progressive disorder of the central nervous system that produces two main symptoms. These are rigidity and tremor. It is the rigidity that accounts for the mask-like facial expression, the monotonous speech, the infrequency of winking, the statuesque gait with loss of associated arm movements, the festination, the lateral pulsion, and the slowing up of all motor activities. After remaining seated for a time these patients experience great difficulty in standing up, and after standing for a prolonged period they have the same difficulty in stepping away from the original position. The rigidity of the buccal musculature results in the drooling of saliva. The tremor occurs, in the main, when the affected muscles are at rest. Initiation of any voluntary act causes the tremor to cease. The tremor itself, therefore, is not of great importance in the production of any disability. The approximation of the thumb and index fingers, rhythmically, at rest, results in the so-called pill-rolling type of tremor.

The true form of paralysis agitans occurs as a rule in middle-aged individuals. The treatment has consisted of the administration of drugs belonging to the atropine-belladonna group. Reports from time to time have indicated that hyoscyne, stramonium, atropine, or belladonna have yielded good results. It may be stated with little fear of contradiction, however, that all drug therapy has been of little, if any, value when administered over a long period of time. When the use of medicinal preparations results in some benefit to the patient, increasing doses of the same drug must be given after a time, until eventually there is no continued alleviation of the symptoms. These patients become increasingly rigid, and the tremor becomes more marked. They seem to prefer to remain seated or to lie in bed until the rigidity is so extreme that if they are able to walk at all their appearance is that of a moving statue.

Some of the earlier clinicians advised exercise, massage, and activity. These recommendations were seldom heeded, and most physicians, having acquiesced to the patient's wish to retire from his occupation, have even prescribed rest. This only results in inactivity. Not infrequently such advice was necessary because many of these patients, being advanced in years, also presented evidences of hypertension and cardiovascular renal diseases.

A century after Sir James Parkinson described the clinical picture of paralysis agitans, the world pandemic of influenza occurred, followed by the epidemic of clinical syndromes that were grouped under the caption of "lethargic encephalitis." In the wake of this epidemic there ensued the chronicity of this insidious disease, producing, in young people as well as old, a train of symptoms very much resembling those of paralysis agitans. Like all imitations, these did not duplicate in their entirety the symptoms of the true disease. These patients developed the typical and disturbing rigidity and tremors, but they also had additional symptoms resulting from involvement of the midbrain region and the basal ganglia. Thus, they have varying degrees of ocular palsies, disturbances in conjugate ocular movements, oculogyric spasms, and bizarre movements of many muscle groups creating dyskinesiae like chorea, athetosis, and dystonia. A greasy appearance of the skin is a commonly associated symptom in the postencephalitic Parkinsonian syndrome.

The treatment of these postencephalitic patients followed in the path of that utilized for one hundred years or more for the bona fide paralysis agitans cases. In addition, various types of vaccines have been administered. Some recent reports have been made of the benefits derived from the use of vitamin therapy.

Many of the postencephalitic Parkinsonian patients are young people—even children. The fact that young people in the prime of life or at almost the commencement of life are stricken with this disease and permitted to become disabled and helpless invalids has prompted this attempt to direct attention to a regimen of therapy which, when adhered to, retards the unfavorable progress of the disease and at times restores the patient to some degree of usefulness, even though it does not effect a cure.

Muscle rigidity may be likened to frozen water. On a cold day water freezes. It is less apt to

Read at the Annual Meeting of the Medical Society of the State of New York, New York City, April 29, 1942.

From the Neurological Service, Jewish Sanitarium and Hospital for Chronic Diseases, Brooklyn.

and the degree of hypertrophy. The weights of the hearts ranged from 450 to 690 Gm with moderate sclerotic changes, and from 425 to 850 Gm. with severe changes.

The lack of an exact relationship between coronary disease and cardiac hypertrophy was further supported by a comparison of the two groups. Regardless of the severity of the coronary disease, the average heart weight was greater in those with failure than in those without failure. It is well known, however, that in hypertensive disease the failing hearts are heavier than those without failure. Our figures correspond with those generally reported in the literature. It appears to us, therefore, that the coronary artery disease is a coincidental finding only and has no causal relationship.

Renal arteriosclerosis was found in every case. This observation, we believe, is significant and important. Moritz and Oldt²⁵ found a correlation between hypertension and arteriosclerosis in 97 per cent of their cases. Among nonhypertensive patients they found that more than a very mild degree of arterial sclerosis of the kidneys was extremely rare. Bell and Clawson¹ likewise pointed out that this condition was seldom found in cases in which hypertension could be definitely excluded. Our experience has been similar and has led us to conclude that the histologic changes of the cortical arterial vessels are a more reliable criterion than manometric readings. The absence of a positive history does not exclude previous hypertension. It is known that manometric readings may fluctuate greatly and may return to normal levels after a period of elevation. Furthermore, in the present series, some of the patients were observed for only a short time. Others were suffering from severe acute illnesses which were adequate cause for a fall of blood pressure. We believe it necessary to assume antecedent hypertension in the presence of renal arteriosclerosis, even if neither hypertensive readings nor historical data were obtained. One other observation gave added weight to our assumption. The histologic examination of the hearts revealed the presence of myocardial hypertrophy, another feature commonly found in hypertension.

From this study we concluded that chronic coronary artery disease does not cause cardiac hypertrophy. If this be true, this observation has prognostic importance. It is now generally accepted that the cardinal feature of chronic

congestive failure of all types is cardiac hypertrophy. Any case of coronary disease may terminate suddenly. Barring such an eventuality, however, one may say that patients with chronic coronary artery disease do not commonly suffer from chronic congestive heart failure unless there is an associated hypertension or other cause of cardiac hypertrophy.

Summary and Conclusions

1 Eighteen cases of hypertrophied hearts with moderate to severe coronary artery disease are presented. In none were there raised blood pressure readings or a history of hypertension. The presence of renal arteriosclerosis in each case suggests that antecedent hypertension caused the cardiac hypertrophy.

2 No relationship could be demonstrated between the severity of coronary artery disease and the degree of cardiac hypertrophy. The association of coronary artery disease with cardiac hypertrophy is considered coincidental and to have no causal relation to the hypertrophy.

*Give me health and a day and I will make the
pomp of emperors ridiculous*

—Ralph Waldo Emerson

FROM CIVILIAN PRACTICE TO NAVY MEDICINE

HAROLD J. HARRIS, Lt. Comdr. (MC), USNR

THERE probably is little that is new in the short discussion I have prepared. The change from civilian practice is much what one would expect it to be—a confusing experience requiring adjustment and self-discipline.

Active duty, in my instance, began in May, 1941, with assignment to the Brooklyn Naval Hospital, previous experience having consisted of two weeks of voluntary training duty in June, 1940. The purely medical duties were such as anyone capable of practicing medicine could readily perform. Mine consisted in taking charge of the acute medical wards as Ward Medical Officer, with a variable number of assistant medical officers who came to duty, became familiar with the work, and were sent elsewhere.

There would be nothing at all to relate if duties in the Navy were restricted to those of a physician. There is much more than that. The routine paper work seemed overwhelming to the newer reserve officers. Forms by the score deluged us, and, I confess, seemed superfluous in nature and multiplicity. Gradually it became evident that all these forms and procedures had their proper place in the scheme of the Navy, and that none could efficiently be dispensed with.

The Navy keeps a health record of every man who joins the service. The record contains every bit of information that has any bearing on the health of that man and therefore on his usefulness to the Navy—a record of his physical examination on enlistment, a very complete dental record (which may serve as the only means of identification in the event of death by fire or drowning), and a list of illnesses, injuries, and defects existing prior to enlistment. That record accompanies or follows the man wherever he goes and is always available, within a short period of time, for examination and for the addition of data such as routine inoculations, periodic physical examinations, and illnesses and injuries occurring subsequent to enlistment. It gives, in a small space, as complete a picture of the man as possible. That record alone justifies the seemingly endless forms and records, of which it is a summary, that one at first thinks of as mere red tape.

Of all the confusing and responsible duties that are encountered, the greatest are those concerned with the duties as Officer-of-the-Day in Navy

hospitals. That duty is usually assigned in rotation to all medical officers of the rank of lieutenant-commander and below. It entails the assumption of full responsibility for and full charge of the hospital, its personnel, and its patients for twenty-four-hour periods. Through the working day the Commanding Officer (who in naval hospitals is a physician), the Executive Officer (also a physician), and the regular staff of medical officers are also on duty; after 4:00 p.m., however, until the next morning at 10:00 a.m., the Senior Officer-of-the-Day is on his own—and God help him if his own is not good enough! He is the Commanding Officer, the Executive Officer, the department heads, and the staff officers all rolled into one. It takes weeks or months of such duty to arrive at a state approaching equanimity.

Probably I had the rudest shock that can be given to a sense of dignity when I was informed that, in addition to being a member of the Courts Martial Board, Nurses' Examining Board, and one or more other Boards, I was to be senior member of the Ship's Service Store Inventory Board. Ship's service stores sell to Navy personnel everything from shoe laces to trunks at prices just above cost, the profits being used for amusements, such as cinemas, for the personnel. It seemed incredible that a medical officer must drop his professional duties, go to the store, and actually count every shoe-lace, every candy bar, and every package of matches and gum. It became evident, however, that such was the case, that it had been for many years past, and that presumably it will continue to be.

Medicine in a naval hospital is interesting and is as varied as it is in any large civilian hospital, especially in one in which the dependents of officers and men are treated. If the newly enrolled reserve medical officer is an internist in civilian life, he is usually assigned to medical wards. Sometimes the exigencies of the work make it necessary to assign, temporarily, a surgeon to medical wards or an x-ray man to psychiatric wards, but in general one does the work he is best fitted for—or he may learn to adapt himself to specialties in which he has not practiced before entering the Navy.

Occasionally it may be difficult to understand the necessity for changing a pet method of treatment to conform to the available drugs or equipment. One's own prejudices in favor of one sulfonamide over another, for example, may lead to unhappiness, but, in general, everything that

freeze when moving. Calm water freezes quickly. These patients prefer to remain seated or to lie in bed. This creates a vicious cycle, for the inactivity permits them to become more rigid. Then, later, when they try to get up, after having been seated for a time, they appear to be glued to the seat and can rise only after a number of attempts. Sometimes they cannot arise from a seated position and must be helped up. If such patients lie in bed for a time, muscle rigidity results in actual muscular pains, of which they complain bitterly.

A bootblack stated that when he was employed shining shoes he felt well and had less tremor. On his day off he was rigid, and his tremor was worse. A young man, by continuing active games like handball and tennis, even though he had all the symptoms of the postencephalitic form of paralysis agitans, was able to carry on with his studies, was graduated as an accountant, and later practiced his profession. Another young man who had had acute encephalitis as a youth married and continued with his vocation for many years until he lost his job. When he brooded and became depressed, he developed such marked rigidity that he sought medical attention. During the years preceding his depression, he and his wife had been very active, riding horseback, and participating in other sports which thus retarded the development of muscle rigidity. A nurse has had a tremor for six years but by carrying on in her profession has never become disabled.

In 1924 Abrahamson and Rabiner* reported on a series of patients in an article entitled "Phasic and Permanent Mutations in Certain Encephalitic Syndromes." One of the patients, A. P., 11 years old, was so rigid that she was confined to bed, for she could not walk. The rigidity included not only the trunk, but also her face, and her speech was consequently slow and monotonous. She ate with difficulty, and her mother visited the institution daily to feed her. So she was all day, but at night she would get out of bed, wander around the ward, eat greedily, and laugh and chatter with the other patients.

A young girl, E. O., aged 20, was rigid and immobile and could not feed herself during the day. At night she became entirely relaxed, walked about with ease, and sometimes danced. S. S., a 17-year-old boy, was so rigid that in attempting to walk he toppled and crashed down like a statue falling from a pedestal. Yet, at times when visitors came and the phonograph was played, he would doff the rigidity that encased

his body like armor and would entertain his friends with Russian dances that called for great agility, rapidity of movement, and suppleness. We could describe in detail many other instances similar to these, for they are by now well known to all clinicians who have studied these syndromes.

At the time, these observations led one of us (R.) to introduce physical exercises to groups of these patients. Later an attempt was made to interest the city hospital administration in setting aside a building in which study and treatment of this postencephalitic syndrome could be properly continued. Unfortunately, this request was never granted.

In the years that have elapsed, persistent efforts have been made to stimulate interest in the importance of activity for these patients. It is interesting to note that in discussions of the value of the so-called Bulgarian treatment, which consists of the administration of a vinous decoction of *Atropa belladonna*, it has been emphasized that the best results are obtained when exercises are given to augment the medicinal preparation.

For a number of years now, at the Jewish Sanitarium and Hospital for Chronic Diseases in Brooklyn, routine exercises have been instituted for groups of these patients. These are given under the direction of an instructor, and the patients are advised to keep as active as possible.

Those patients who do not cooperate do not benefit from this regimen, but others are definitely improved. Following the exercises they move about more freely, walk better, are definitely happier, and instead of being helpless invalids requiring the aid of others in the performance of necessary functions, they even encourage and help other patients, force them to accompany them in walking, and become a part of the moral influence that has built up a spirit of hope to people who had been previously regarded as incurable.

We do not believe that activity offers a cure for Parkinsonism. We feel that these patients should not be advised to rest. They should be told to carry on in their vocation as long as possible and to resist the temptation to "stay put" in a sitting or lying position, which so many of them want to do.

It is obvious that this regimen is contraindicated in cases in which pathology of other organs would be aggravated by activity. Young people with a postencephalitic Parkinsonian syndrome should have routine exercises in addition to any of the several forms of medication previously described. Drugs without activity are of little, if any, value.

FROM CIVILIAN PRACTICE TO NAVY MEDICINE

HAROLD J. HARRIS, Lt. Comdr. (MC), USNR

THERE probably is little that is new in the short discussion I have prepared. The change from civilian practice is much what one would expect it to be—a confusing experience requiring adjustment and self-discipline.

Active duty, in my instance, began in May, 1941, with assignment to the Brooklyn Naval Hospital, previous experience having consisted of two weeks of voluntary training duty in June, 1940. The purely medical duties were such as anyone capable of practicing medicine could readily perform. Mine consisted in taking charge of the acute medical wards as Ward Medical Officer, with a variable number of assistant medical officers who came to duty, became familiar with the work, and were sent elsewhere.

There would be nothing at all to relate if duties in the Navy were restricted to those of a physician. There is much more than that. The routine paper work seemed overwhelming to the newer reserve officers. Forms by the score deluged us, and, I confess, seemed superfluous in nature and multiplicity. Gradually it became evident that all these forms and procedures had their proper place in the scheme of the Navy, and that none could efficiently be dispensed with.

The Navy keeps a health record of every man who joins the service. The record contains every bit of information that has any bearing on the health of that man and therefore on his usefulness to the Navy—a record of his physical examination on enlistment, a very complete dental record (which may serve as the only means of identification in the event of death by fire or drowning), and a list of illnesses, injuries, and defects existing prior to enlistment. That record accompanies or follows the man wherever he goes and is always available, within a short period of time, for examination and for the addition of data such as routine inoculations, periodic physical examinations, and illnesses and injuries occurring subsequent to enlistment. It gives, in a small space, as complete a picture of the man as possible. That record alone justifies the seemingly endless forms and records, of which it is a summary, that one at first thinks of as mere red tape.

Of all the confusing and responsible duties that are encountered, the greatest are those concerned with the duties as Officer-of-the-Day in Navy

Read at the Annual Meeting of the Medical Society of the State of New York, New York City, April 29, 1942.

Approved for publication by the Bureau of Medicine and Surgery, U.S. Navy.

hospitals. That duty is usually assigned in rotation to all medical officers of the rank of lieutenant-commander and below. It entails the assumption of full responsibility for and full charge of the hospital, its personnel, and its patients for twenty-four-hour periods. Through the working day the Commanding Officer (who in naval hospitals is a physician), the Executive Officer (also a physician), and the regular staff of medical officers are also on duty; after 4:00 p.m., however, until the next morning at 10:00 a.m., the Senior Officer-of-the-Day is on his own—and God help him if his own is not good enough! He is the Commanding Officer, the Executive Officer, the department heads, and the staff officers all rolled into one. It takes weeks or months of such duty to arrive at a state approaching equanimity.

Probably I had the rudest shock that can be given to a sense of dignity when I was informed that, in addition to being a member of the Courts Martial Board, Nurses' Examining Board, and one or more other Boards, I was to be senior member of the Ship's Service Store Inventory Board. Ship's service stores sell to Navy personnel everything from shoe laces to trunks at prices just above cost, the profits being used for amusements, such as cinemas, for the personnel. It seemed incredible that a medical officer must drop his professional duties, go to the store, and actually count every shoe-lace, every candy bar, and every package of matches and gum. It became evident, however, that such was the case, that it had been for many years past, and that presumably it will continue to be.

Medicine in a naval hospital is interesting and is as varied as it is in any large civilian hospital, especially in one in which the dependents of officers and men are treated. If the newly enrolled reserve medical officer is an internist in civilian life, he is usually assigned to medical wards. Sometimes the exigencies of the work make it necessary to assign, temporarily, a surgeon to medical wards or an x-ray man to psychiatric wards, but in general one does the work he is best fitted for—or he may learn to adapt himself to specialties in which he has not practiced before entering the Navy.

Occasionally it may be difficult to understand the necessity for changing a pet method of treatment to conform to the available drugs or equipment. One's own prejudices in favor of one sulfonamide over another, for example, may lead to unhappiness, but, in general, everything that

is essential is available, and patients receive treatment as good as it is humanly possible to give.

There are some very boring duties in various branches of the Navy Medical Department—examining recruits, conducting medical surveys, giving routine inoculations (and counting Hershey bars)—but, in the main, it is extremely interesting work and is likely to add much to one's knowledge of medicine. By way of illustration, rheumatic fever is of unusual occurrence in northern New York State; yet in about four months of Navy service I saw as many cases of rheumatic fever as I had seen in twenty years of civilian practice. Malaria is unknown in northern New York, but the British presented us with some very severe cases of the malignant tertian form from the west coast of Africa that one would have to travel far to see at first hand. Most important of all, to physicians and personnel and the country at large, Navy medicine is excellent medicine.

It is only in naval hospitals that medical officers are actually in full command. In all other establishments of the Navy—yards, barracks, receiving ships, training stations, air stations, and on ships of all types—line officers are in command. In these facilities, medical officers are heads or assistants in the medical departments, but they are responsible to the commanding officers. There is surprisingly little conflict here, however, for line officers usually entertain a wholesome respect for the opinions and decisions of medical officers and rarely go counter to them. However, many years ago, one commanding officer did, I am told by one of the survivors. His ship was put under quarantine restrictions by the medical officer attached to one of our gun boats lying off a South American port because of an epidemic of yellow fever in that port. Every officer and man was forbidden by the medical officer to go ashore. The commanding officer vacated that order, he and other officers and men went ashore, brought back yellow fever to the ship, and half of them, including the commanding officer, died. There is an even healthier respect for Navy doctors on the part of line officers since that time.

Physical therapy has had some of its greatest advances contributed by Navy medical officers. It is common now to find even small ships' sick bays equipped with at least short wave diathermy and infrared and ultraviolet generators, and manned by hospital corpsmen who are well trained in their use. Naval hospitals have very well equipped and staffed departments of physical therapy for this essential branch of medicine.

Nothing concerning sea duty will be discussed here, for as yet I have not been to sea. Before I

finish this discussion, orders for such duty may arrive. In one instance a lieutenant commander, medical corps, was given two hours to be detached from the hospital, to report to district headquarters, and to be on board a transport. In another, one of my assistant medical officers was given three hours to go through a similar procedure and report on board a cruiser. Most of us want sea duty—and most of us will get it before there is a victorious end to this war.

(EDITOR'S NOTE: After the above was written Dr. Harris was transferred from the naval hospital for duty at a receiving barracks and later to a ship. The remaining paragraphs deal with his subsequent experiences.)

Duty at a receiving barracks, receiving station, or receiving ship consists of general medical care, examinations, and inoculations of transient personnel and of the "ship's company." ("Ship's company" consists of personnel regularly on duty at the facility, now being largely replaced by civil service employees and WAVES to make the men available for sea duty.) Men are sent to such facilities to await new assignments—assignment to their first duty following training, or reassignment if they have missed their ships for one or another reason, such as hospitalization. Some are crews of ships which are being overhauled or repaired after damage in action. Others are men assigned to special duties such as radio school. In general, they are a husky lot and, therefore, present lesser and different problems than are encountered in hospital duty.

The medical officer and his assistants hold sick call at least twice daily for any who may need to be seen. Those with minor injuries, non-infectious and not serious illnesses are treated at once or put to bed in the sick bay. Those requiring much care are despatched to the nearest naval hospital. Equipment is adequate for all ordinary needs and includes basic laboratory and physical therapeutic procedures. Inspection of food and food handlers and of all sanitary facilities is carried out rigidly.

It was my good fortune to be ordered to serve as Senior Medical Officer aboard a combat troop ship with the amphibious force which participated in the African invasion. The ship was in process of conversion for its special mission when I was ordered to her, so the novel experience of supervising the construction and equipping of the hospital facilities fell to my lot. An adequate number of assistant medical officers for any eventuality was assigned, there was a period of training, and we took our place in that great undertaking which is now apparently approaching a successful climax.

Shipboard duties are very much the same as duties at shore stations except for those connected with expected or actual casualties. Provisions for first aid in all parts of the ship, particularly in the engine room and at gun stations, and preparations for the care of major injuries in two or more designated spaces, known as battle dressing stations, must be made. Boats and rafts must be equipped with at least elementary medical needs. Officers and men must be instructed in first aid, general health measures, venereal disease prevention, and the like. Food inspection and sanitary inspection of the ship is even more important than inspection at shore stations, for the food supply is not readily replaceable, nor can illness among personnel be countenanced if it is possibly preventable. Inoculation and reinoculation of the men must be done periodically. Here again the health record is the one positive source of information as to what the man has had and what he still must have. Obviously, the types of inoculations to be given depend to some degree on the territory that the ship is to enter.

The medical officer must have a knowledge of the ship that will allow an understanding of the needs and hazards of the men at their various tasks. Salt tablets for engine-room crew, dark adaptation provisions for the eyes of the crews assigned to deck, look-out, and gun duty, cotton for the ears of gun crews, and provisions for hoisting injured men from boats, from holds, and through narrow hatches, are among the many varied responsibilities of the ship's medical officer.

The usual sick-call is carried out two or three

times daily. All ships carrying medical officers have sick bays and operating rooms where adequate medical and surgical care may be given. When the ship is in port, patients requiring extensive diagnostic or treatment procedures, as well as patients with any communicable diseases, are ordinarily transferred to naval hospitals. At sea, all emergencies must be cared for at once—and most of them are cared for remarkably successfully.

Hospital corpsmen deserve all the credit that is given them in stories of this war—and more. They perform all the tasks essential to the running of the medical department, including rendering first aid, the upkeep of the hospital spaces, the keeping of records, and the nursing of the sick and injured. In addition they are sometimes used to supplement overworked gun crews and look-outs. Their willingness and efficiency can hardly be overpraised.

On one mission the Army officer in command of the troops on board particularly stressed the excellent cooperation the hospital corpsmen had given to the Army medical officers in caring for the soldiers. With a desire to let them know that their work was appreciated, I addressed them one morning at quarters, complimenting them on their work and mentioning the words of commendation. One young and extremely naive lad among them said: "Sir, I think that is just what we should do for the Army—after all, they are our allies, just like the Chinese."*

BLOOD CHANGES MAY SHOW RELATIONS OF NORTHERN RACES

"The Monthly Science News," of London, reports that the Blood Transfusion Service of Great Britain may add to our knowledge of relations and origins of northern races.

Similarities have been observed between the people of northern Britain and the people of the Scandinavian countries, evidence that strengthens the assumption that the Scandinavian people at one time had settlements in the British Isles.

Now the blood donor service has been responsible

for the collection of enough data to demonstrate the proportionate frequencies of the four blood groups, A, B, AB, and O. A and O change as one passes from south to north in Britain, for A becomes rarer and O becomes more common. Proportions of the types in southern England are most like those in neighboring continental countries. In Scandinavia the proportion of A is much higher than it is in southern England or the continent adjacent to England.—*N.Y. Herald Tribune*

DEVICE FOR DETECTING ABNORMAL BRAIN CONDITIONS

Invented by two scientists at the University of Edinburgh, Drs. R. Furth and E. A. Bevers, a new device has been perfected that will simplify the diagnosis of abnormal conditions of the brain.

The instrument, called an "encephalophone," operates on the principle of a submarine detector, with abnormalities of the brain changing the pitch of a constantly sounded note.

THE MODERN SPA, THE PHYSICIAN, AND THE PATIENT

WASHINGTON MERSCHER, M.D., Watkins Glen, New York

WITH the present upheaval in Europe, it seems that the American people are less likely to go abroad for their spa treatments for years to come. It is a well-recognized fact that the people of the Continent are much more conscious of the value of these resort cures than we are here in America. They believe that by frequent visits to these resorts they will maintain their present health standards and prevent future illnesses. We in America have been slow to realize the value of this procedure. We have also been prone to ignore health maintenance, disregarding early danger signals. Of all people in the world today, Americans—with their driving force and energy, their increasing mortality from heart disease, the startling increase of their angina and coronary thrombosis groups—are probably more in need of these modern spa methods than any other nationality group.

This should be a particularly apt time to present briefly and concisely what the American spa is capable of doing. There will be no attempt at a scientific interpretation of why certain results are obtained, for there have been numbers of papers presented on this and kindred subjects. The modern works on hydrotherapy cover this subject completely.

The type of people in the United States today who are taking advantage of spa treatments may be roughly divided into several groups. First, there are those who return annually or semi-annually. This group consists almost entirely of the advanced age group—those who realize the value of a few weeks of regulated hydrotherapy, diet control, and rest. This group should include today those who need it most, the group just entering their fifties and beyond. These people, having gone through the depression and the recession, are mentally and physically worn down. No one can dispute the effect of worry and the group of coronary disturbances that follow it. Members of this age group should today be made to realize the value of health and health maintenance. They are not hospital cases, but they cannot be left alone to work out their own schedules. Here is where the well-regulated spas can do their best work.

The second group who patronize spas are those who enter them sporadically to overcome the toxic or debilitating aftermath of acute illnesses, rheumatic flare-ups, anginal attacks, post-operative conditions, etc.

A third group is found in the overweight. A group comprises a fair number.

There is still another group, which fortunately is few in number. These people go from one place to another, comparing this with that. Their purpose is not a health motive. It may almost be classified as an unusual form of an escape mechanism—an attempt to avoid the realities of life. This is the group that does not add to the prestige of spas.

The question naturally arises as to the type of patients treated. The type of patients treated include those suffering from cardiac and neuro-circulatory ailments, arthritis, neuritis, sciatica, postmenopause, and metabolic conditions (obesity, glandular cases, diabetes, certain types of nephritis, convalescent, and rest cases)—all constituting a good cross section of general medicine.

The equipment of an institution handling this type of patient must be ample. Laboratory facilities are important. Facilities for x-ray and fluoroscopic examinations, cardiographic studies, and basal metabolism should be available. Such accessory methods for treatment as short wave, infrared and ultraviolet rays, and colonic irrigations are definite adjuncts. In the hydrotherapy and allied treatment group Nauheim baths, sinusoidal baths, packs, whirlpool baths, foam baths, showers, Scotch douche, mud packs, cabinets, ionophoresis, and massage are all important. For this last group there must be two sets of equipment because of the attendance of both men and women in treatment groups.

In addition to the above facilities, a well-planned Zander room, combining the mechanical exercises so necessary in cardiac cases with the extra physical work-out as an adjunct in the treatment of obesity, is of undoubted value. So are the graduated walks, as in the Oertel walking exercise. Last, but by no means least in importance, is the well-trained dietitian.

The admission of a patient to an institution of this type is usually by reference from the attending physician, with a complete history of findings and recommendations. On admission, there is usually a brief interview by one of the staff physicians, and an appointment is made for a complete physical examination. At this time arrangements are made for any special examinations that may be deemed necessary or that have been requested by the referring physician. For cardiac cases particularly, it is helpful here to get a heart diagram and a cardiograph for future comparisons. For arthritis patients, blood chemistry and sedimentation should be taken, and for

diet control cases a basal metabolism test is necessary.

A word of explanation here might be justifiable. Twenty-five years ago complete laboratory and special examinations were well within the scope of the spa, but today practically all this background work has been thoroughly gone into by the patient's home physician. Duplication of this work is an unnecessary expense to the patient and a source of resentment to both the patient and his physician. Upon completion of the examination and the compilation of the data obtained a letter containing a tabulation of the findings is written to the referring physician.

It is always to be remembered in an institution of this type that success or failure is entirely dependent upon the cooperation between the referring physician, the medical staff, and the patient. It must also be remembered that the institution and its medical group are not the controlling factors with the patient. The home physician remains in absolute control of his patient. But frequent communications between the two medical men on the case during the time of the patient's stay are to be encouraged. Upon the patient's leaving, a résumé of the findings and the treatment progress should be sent to the staff physician, with possibly a personal note to be given to the patient for presentation to his own physician, whom he is instructed to see on his arrival at home. In all ways, the contact between the referring physician, the patient, and the staff physician should be developed and encouraged.

After the examination and a perusal of findings and data from the referring physician, an outline of treatment is ordered for the patient. In effect the treatment usually calls for a morning and afternoon treatment, with the further obligation of one hour's rest following each treatment. Whenever possible, the staff physician should make frequent visits to treatment rooms in order to have first-hand information concerning reactions of the patient during and after treatment, particularly in cardiac cases. Care should always be taken not to alarm a patient unduly by over-attention.

Operators of spas have frequently been asked what line of treatment is followed, whether it is the same for all patients, etc. In answering these questions, it may be best to summarize the treatment of certain common conditions.

First, and probably most common, is the hypertensive cardiovascular group, and of these it is to be remembered that the moderately sclerotic and early coronary cases get the best results. Arteriosclerosis of the first part of the aorta is the least benefited. Exercise and rest

comprise the background of the treatment. Massage is begun moderately and gradually increased, and is followed by one hour of rest. The Nauheim baths are given from three to four times a week, with gradual increase in carbonation, a corresponding decrease in temperature, and, probably toward the end of the series, an increase in brine strength. The total number of baths in the series varies from 20 to 30. The Nauheim is a vasatonic treatment bath, with an hour's rest following.

Hot packs or abdominal fomentations will reduce a moderate degree of hypertension from 10 to 20 points. Electric cabinet, followed by spray and Scotch douche, is to be used with caution and only on those patients who have been carefully studied for circulatory balance and cardiac reserve.

Schott's resisting exercise, Zanders' passive mechanical exercise, and, later, short easy Oertal graded walks constitute an average course of treatment for the hypertensive and cardiac patients in general, with modification for specific cases. A factor to remember is the sodium chloride elimination in sweating. Also to be kept in mind is the fact that vigorous sweating is a definite depletion to the patient and to his heart and should be employed only when general conditions warrant it.

It is unfortunate that the sceptics among physicians—and they are numerous—cannot follow a case of this kind daily during a three or four weeks' stay at a spa. The symptomatic improvement of these patients is often startling, with the blood pressure picture definitely improved and the cardiac reserve increased.

For arthritics in general, a program is followed that includes dietary control, the use of cabinets for elimination, fomentations, mud packs, massage or baking, and massage of the involved joints. The mud pack is an antiphlogistic and is used either alone or in the same treatment schedule with fomentations. Variation of the response of patients to either procedure determines which is to be given preference. The mud pack is applied at an average temperature of 106 to 110 F. for a period of from twenty to forty minutes. In arthritics special emphasis is to be paid to rest and heat, and this is where the short wave comes to the fore. Of particular value is the preliminary use of the infrared ray followed by the short wave. Also splendid results in arthritics can be obtained with histamine, in the form of imadyl unguentum. This may be used either in the form of massage or by ionophoresis. There is usually lessening of pain and an increased amount of motion. Not to be forgotten is the great value of the supplemental use of vitamins.

THE MODERN SPA, THE PHYSICIAN, AND THE PATIENT

WASHINGTON MERSCHER, M.D., Watkins Glen, New York

WITH the present upheaval in Europe, it seems that the American people are less likely to go abroad for their spa treatments for years to come. In effect the treatment usually calls for a morning and afternoon treatment, with the further obligation of one hour's rest following each treatment. Whenever possible, the staff physician should make frequent visits to treatment rooms in order to have first-hand information concerning reactions of the patient during and after treatment, particularly in cardiac cases. Care should always be taken not to alarm a patient unduly by over-attention.

Operators of spas have frequently been asked what line of treatment is followed, whether it is the same for all patients, etc. In answering these questions, it may be best to summarize the treatment of certain common conditions.

First, and probably most common, is the hypertensive cardiovascular group, and of these it is to be remembered that the moderately sclerotic and early coronary cases get the best results. Arteriosclerosis of the first part of the aorta is the least benefited. Exercise and rest

comprise the background of the treatment. Massage is begun moderately and gradually increased, and is followed by one hour of rest. The Nauheim baths are given from three to four times a week, with gradual increase in carbonation, a corresponding decrease in temperature, and, probably toward the end of the series, an increase in brine strength. The total number of baths in the series varies from 20 to 30. The Nauheim is a vasatonic treatment bath, with an hour's rest following.

Hot packs or abdominal fomentations will reduce a moderate degree of hypertension from 10 to 20 points. Electric cabinet, followed by spray and Scotch douche, is to be used with caution and only on those patients who have been carefully studied for circulatory balance and cardiac reserve.

Schott's resisting exercise, Zanders' passive mechanical exercise, and, later, short easy Oertal graded walks constitute an average course of treatment for the hypertensive and cardiac patients in general, with modification for specific cases. A factor to remember is the sodium chloride elimination in sweating. Also to be kept in mind is the fact that vigorous sweating is a definite depletion to the patient and to his heart and should be employed only when general conditions warrant it.

It is unfortunate that the sceptics among physicians—and they are numerous—cannot follow a case of this kind daily during a three or four weeks' stay at a spa. The symptomatic improvement of these patients is often startling, with the blood pressure picture definitely improved and the cardiac reserve increased.

For arthritics in general, a program is followed that includes dietary control, the use of cabinets for elimination, fomentations, mud packs, massage or baking, and massage of the involved joints. The mud pack is an antiphlogistic and is used either alone or in the same treatment schedule with fomentations. Variation of the response of patients to either procedure determines which is to be given preference. The mud pack is applied at an average temperature of 106 to 110 F. for a period of from twenty to forty minutes. In arthritics special emphasis is to be paid to rest and heat, and this is where the short wave comes to the fore. Of particular value is the preliminary use of the infrared ray followed by the short wave. Also splendid results in arthritics can be obtained with histamine, in the form of *imadyl unguentum*. This may be used either in the form of massage or by ionophoresis. There is usually lessening of pain and an increased amount of motion. Not to be forgotten is the great value of the supplemental use of vitamins.

In treating obesity it is possible to obtain splendid results, providing one has the complete cooperation of the patient. A diet background of 900 calories is a good maintenance one if attention is paid to the question of high protein, high mineral, and an adequate vitamin intake. Fluid intake must be carefully watched. The use of hot brine baths, the bubble bath, cabinets, massage, Zanders' exercises, and outdoor walks all help in the increased elimination that is so important in this condition. Here again, if the basal metabolism has been taken, the adjunct use of some of the thyroid or thyroid pituitary combinations has proved their value. Weight loss is not rapid and should not be because of the possible disturbance in general health.

The vagotonic upsets incidental to the post-menopausal period can be well taken care of in the modern spa. The regularity of life and the freedom from incidental worries and cares constitute the first gain. A comprehensive neuro-circulatory training regimen, hot air cabinets, spray showers, Scotch douche, salt rubs, massage, and physical exercise form a valuable group of aids. Again not to be neglected is the supplemental use of endocrine preparations.

As a conclusion, it might be fitting to give a brief summary of the Nauheim bath, its indications, methods of use, and results obtained. Natural carbon dioxide baths have been in use at various health resorts for many years, the most famous of these being the Spa Nauheim in Germany. The Nauheim baths are indicated in various forms of heart disease, hypertensive cardiovascular ailments, valvular heart disease, providing decompensation is not overwhelming, and in the various degrees of myocarditis. Again the bath may be used for its general circulatory effect during the convalescent period of the acute infections in which heart damage is actual or potential, as after scarlet fever, pneumonia, influenza, anginal attacks, and in coronary disease.

It is also useful for the vagotonic group in which the autonomic nervous system is constantly at war. The results include strengthening of the heart muscle, equalizing the circula-

tion, and producing a general sedative effect on the central nervous system.

The number, frequency, and strength of the baths, both as to saline content and carbon dioxide strength, are dependent entirely upon the patient and his response. At the Glen Springs the brine is a 12 per cent solution of sodium chloride, 4.12 per cent calcium chloride, with approximately 68 Mache units of radium activity, a natural brine derived from a spring on the grounds. This brine is stronger than that of the spring at Nauheim, and must be diluted with fresh water. It is artificially carbonated. The temperature of the Nauheim bath water is nearer the neutral point—approximately 96 F.—with weaker carbonation. The temperature during the series of baths is decreased, while the carbon dioxide saturation is increased. The increase in carbonation offsets any feeling of chilliness incidental to the decrease in the temperature of the water. The duration of the bath varies from a starting period of six or eight minutes up to a duration of from twelve to fifteen minutes by the end of the series, which constitutes an average of from 3 to 4 baths a week for a full course of from 20 to 30.

This presentation of treatment background naturally covers many phases not particularly familiar to the physician in general practice, for very few general hospitals except those of unusual scope are equipped with complete physiotherapy departments. The cost of installation and maintenance and the salaries of the attendants make it prohibitive to most. General hospital treatment and environment and those of the modern spa are very different. One cannot replace the other in their respective functions, yet each is to a certain extent dependent upon the other. Essentially, spa therapy is really a continuation treatment for acutely ill patients and a preventative and conservation treatment for those who do not need actual hospital care. In a spa, the treatment schedules can be carried out in quiet surroundings, with close dietary supervision and control of physical effort, with none of the hospital atmosphere that the ambulatory patient resents so keenly.

PUBLIC HEALTH CONFERENCE

The Executive Board of the American Public Health Association announces that the Association will sponsor a three-day Wartime Public Health Conference in New York City, October 12, 13, and 14. The seventy-second annual business meeting of the Association will be held in connection with it.

The Conference program will be devoted ex-

clusively to wartime emergency problems as they affect public health and the public health profession. New York City was selected because more than 40 per cent of the membership is concentrated in and immediately around it. The radio will be used as extensively as possible to bring the benefits of the Conference to health workers in distant states.

Therapeutics

CONFERENCES ON THERAPY

THESE are stenographic reports, slightly edited, of conferences by the members of the Departments of Pharmacology and of Medicine of Cornell University Medical College and the New York Hospital, with collaboration of other departments and institutions. The questions and discussions involve participation by members of the staff of the college and hospital, students, and visitors. The next report will appear in the July 1 issue and will concern "Treatment of Asthma and Hay Fever."

The Modern Treatment of Cirrhosis of the Liver and Hepatic Insufficiency

DR. DAVID P. BARR: From the standpoint of therapy, one of the most hopeless of diseases has been cirrhosis of the liver with hepatic insufficiency. Recently, however, some significant advances have been made.

This morning we plan to discuss the rationale of the therapy of cirrhosis of the liver. I have asked Dr. Deitrick to review the older literature on this subject and to tell us what might have been regarded as correct management a few years ago.

DR. JOHN E. DEITRICK: Until about 1900 or 1910 the diets as outlined in most textbooks and articles on cirrhosis of the liver were generally low in practically all constituents. Doctors were afraid of giving too much carbohydrate because it was thought that the consequent intestinal fermentation would be bad for cirrhotic patients. They were afraid to give protein because they believed that the badly damaged liver might have difficulty in handling protein. The intake of fats was not described in detail. So the diet which was used for years was composed chiefly of milk. The patient was given from 3 to 4 quarts of milk a day as soon as the diagnosis of cirrhosis of the liver was made and was kept on this milk diet usually for two, three, or four weeks. Then the diet was gradually increased by the addition of cereals, vegetable protein, and occasionally fish. The rationale for the dietary restrictions was based on the fact that all food substances had to pass through the liver, which was known to be badly damaged and presumably was unable to accomplish the necessary breakdown of protein, carbohydrate, and fat.

Then in the 1920's, experiments showed that high carbohydrate diets would protect the liver against certain poisons. These observations marked the first great change in the treatment of cirrhosis. A diet relatively low in protein was still advised, but instead of a low caloric diet, which had formerly been given, it was now proposed to increase the carbohydrate content so that the patient had a relatively normal or high caloric intake.

Innumerable other methods and therapeutic agents have been used in the past. Liver was used as early as 1900 or earlier. Crude liver was ground up and fed to these patients without any spectacular results. The old remedies included potassium iodide and calomel, although there seems to have been no definite rationale for them. Alcohol has always been taboo, for obvious reasons, and spicy foods have also been prohibited. Practically every therapeutic regimen for cirrhosis advised a laxative like Vichy water or a saline cathartic, usually magnesium sulfate. Decholin (dehydrocholic acid) was used as a cholagogue for a time; it is a bile salt known to stimulate the secretion of bile.

When the mercurial diuretics came into practical usage, they represented an advance in the handling of the patient with cirrhosis. They were not aimed so much at the treatment of the disease itself as they were at its complications, chiefly the ascites.

Surgery, as well as medicine, developed new techniques for the treatment of cirrhosis. The theory was that some unknown toxic agent was carried by the portal vein to the liver, causing progressive liver damage, so that various operations intended to shunt the portal blood into the greater circulation were performed. The Eck fistula was performed on human beings several times. Talma's operation or omentopexy was also attempted, with the object of promoting collateral circulation—that is, short-circuiting the liver. In this operation the peritoneal surfaces of the liver and the peritoneum were roughened and the omentum was sutured to the abdominal wall in the hope that adhesions would form and new blood vessels would grow through the adhesions to carry the blood around the liver to the superior vena cava. In some series improvement was reported in about 30 per cent of the cases. Whether the improvement applied only to the ascites or to the general nutrition of the patient is hard to determine.

Obviously, such operations were not done on a sound rational basis. It was purely a supposition

that toxic substances were carried in the portal circulation. Furthermore, we know that all the portal blood cannot be short-circuited through the greater circulation without serious complications.

Study of these therapeutic regimens reveals that they were based upon no clear understanding of the cause of cirrhosis. The outlook was hopeless and these measures were regarded as merely palliative.

DR. BARR: I have asked Dr. Charles L. Hoagland of the Rockefeller Hospital to present some of the newer ideas concerning the treatment of cirrhosis, and particularly to tell us of some of his own results in connection with the treatment of this disease.

DR. CHARLES L. HOAGLAND: Attention was first directed to the role of faulty nutrition in the production of human cirrhosis of the liver by the studies of Rao, who, in 1933, showed that a high incidence of cirrhosis occurred among members of the population of Southern India, where alcoholism is all but unknown. In these areas nutritional deficiencies in protein, fat, and vitamins, especially in vitamins A, C, and D, have occurred among members of the population for many years. In 1934, surveys made in Syria, where the incidence of cirrhosis is as high as it is in any part of the world and where chronic alcoholism does not exist, showed that the diets of most members of a congested population were extremely low in protein. In Italy, in those regions where pellagra is endemic, the incidence of cirrhosis has always been high, as it has been in the southern part of the United States, where pellagra has been a national problem since 1905. These facts, together with a growing awareness in this country, where half our cases of cirrhosis occur among chronic alcoholics, of the relation between chronic alcoholism and vitamin deficiencies, have served to focus our attention on a possible nutritional basis for hepatic cirrhosis. This realization, together with a rapidly growing background in the production of experimental cirrhosis in animals on diets low in protective catalysts, has, within the past five years, re-oriented completely our therapeutic approach to the management of this distressing disease.

Dr. Barr has asked me to speak briefly on the rationale of the present management of cirrhosis, a request which is some evidence in itself of a break on the part of therapeutists with the empiricism of the past, and a willingness to accept any ideas that the experimental laboratory has to offer toward the treatment of this disorder.

If we can demonstrate any progress whatever in regard to the therapy of cirrhosis based on results of the experimental laboratory, we can congratulate ourselves, for from the time of the

ancient physicians, medical writers have given this disease a fatal prognosis once ascites had appeared. I might say that therapy of the past decade, which concerned itself with glucose infusions, mercurial diuretics, saline purges, radical surgical procedures directed toward establishment of new vascular anastomoses, and various other means of supportive treatment, did not alter our fatalistic ideas concerning this disease during the time in which these modes of therapy were in vogue. I hope, however, that in recounting the failures of past therapy I am not encouraging the belief that present methods of management of cirrhosis are all that may be desired. We are far from the therapeutic ideal, but a certain amount of progress has been made, and the hope is very bright that further progress in our understanding and eventual successful management of this condition will be made as the complex nutritional background of this disease is further worked out.

To justify in detail the rationale of the modern management of hepatic cirrhosis would require not one but a series of discussions together with a comprehensive review of the greater part of the fields of experimental nutrition and biochemistry. Perhaps the best plan, therefore, would be to present the history of a typical case of advanced cirrhosis, with a résumé of the pertinent findings in the history and physical examination, and a detailed account of the therapeutic regimen. We shall later attempt to justify each item in the program of therapy on the basis of results obtained from the experimental laboratory.

A 48-year-old Puerto Rican woman presented herself at the Rockefeller Institute Hospital Clinic with massive ascites, pretibial and ankle edema, and pain in the abdomen. Two months before she had developed jaundice and ascites and had required the performance of one paracentesis. Physical examination showed a woman appearing old for her years, breathing rapidly, and in obvious distress. Her hair was sparse gray, and dry. Her skin was dry and jaundiced and her sclerae deeply icteric. There was symmetric scaling of hands and arms. There were several spider angiomas on the face, neck, and lower extremities. The veins on her neck and the upper portion of her chest were prominent. There was a marked *caput medusae* on the abdomen, extending into the flanks. The heart was displaced to the left, but returned to normal position after paracentesis and the removal of 6,000 cc. of clear, straw-colored fluid. Other positive findings included a taut, protuberant abdomen with eversion of the umbilicus, and a fluid wave. The liver margin, palpable after paracentesis, was about 4 finger breadths below the costal margin and appeared hard and

CLINICAL COURSE OF PATIENT M. C.

Date, 1941	Weight, Kg.	Average Daily Urine Output, Cc.	Paracentesis, Cc.	Daily Fluid Intake, Cc.	Remarks

10	52.3	1,300	"	Appetite good
20	54	1,150	"	Discharged
June 1	53	1,200	"	Clinic visit; improved

leathery. The spleen was not palpable. The patient's social history revealed a low economic status during her twenty years' residence in Puerto Rico and only a slightly improved status during her five years in the United States. There was a history of prolonged addiction to wine, rum, and whiskey, over a period of at least twenty years.

In preparation for base line studies, the patient was placed on a diet of approximately 350 Gm. of carbohydrate, 130 Gm. of protein, and 60 Gm. of fat. She was given daily, 25,000 units of vitamin A, 5,000 units of vitamin D, 100 mg. of ascorbic acid, 5 mg. of thiamine, 2 mg. of riboflavin, 1 mg. of pyridoxine, 50 mg. of nicotinic acid, 1 mg. of pantothenic acid, and sufficient soy bean lecithin to provide about 3 Gm. of choline daily.* The chart entitled "Clinical Course of Patient M. C." describes the clinical course of the patient during her period of hospitalization.

For several weeks after admission the urinary output was very low, and the patient continued to gain weight from the accumulation of ascitic fluid.

A second paracentesis was performed sixteen days after admission, with the removal of 6,500 cc. of fluid. Fifteen days later, a third paracentesis was performed, with the removal of 8,000 cc. of fluid. At this time the patient was started on 5 cc. of crude liver extract daily, administered intramuscularly, for one week, at which time dosage was reduced to 5 cc. three times weekly. The patient's improvement was dramatic from this point on, although I am not prepared to say that it is wholly due to the liver extract, since improvement in subsequent cases has not occurred so rapidly. No further paracenteses were required. The patient's urinary output became greater each day, with a corresponding loss in weight. From October 15, 1941, to January 15, 1942, the patient continued to improve, with no further ascites or demonstrable edema. She was discharged from the

hospital at this time and has returned twice a week to our outpatient clinic to receive intramuscular liver extract. The quantity has now been cut to two weekly doses of 5 cc. each. In the meantime she has remained for the most part on the initial diet, with continued supplements of vitamins A, D, and B complex. The lecithin has been discontinued.

The laboratory data afford additional objective evidence of improvement. On admission the erythrocyte count was 2.0 million; three months later it was 3.1 million. The hemoglobin in the meantime rose from 40 per cent to 65 per cent. An original blood serum albumin value of 0.9 Gm. had reached 2.8 Gm. per 100 cc. when the patient was discharged. The fibrinogen rose from a trace, too small to be determined accurately, to 0.1 Gm. per 100 cc. The plasma vitamin A rose from an initial level of 15 I.U. per 100 cc. to 70 I.U. The carotene level of 0.05 mg. per 100 cc. of plasma remained unchanged. A bromsulfalein liver function test showed 40 per cent retention in the blood after five minutes and 15 per cent after thirty minutes, which was a slight improvement. The hippuric acid excretion test was 50 per cent of normal on admission and not appreciably changed on discharge. An initial icterus index of 18 fell to 8 on discharge. This improvement was confirmed by the disappearance, clinically, of the icterus. Rationale for a high protein diet in the treatment of cirrhosis of the liver is best discussed along with the rationale for the inclusion of choline, and this, in turn, with the exclusion of fats, in so far as possible, since sharp delineation of the effects of each regimen is impossible at the moment.

In 1933 it was pointed out by a number of workers that a high incidence of cirrhosis was almost invariably associated with a previously low intake of protein over a period of years. Even more direct evidence for the protective effect of protein on hepatic processes has been obtained in the experimental animal. The importance of protein in liver protection was shown by Goldschmidt and his coworkers in

* Obtained gratis from the American Lecithin Company.

that toxic substances were carried in the portal circulation. Furthermore, we know that all the portal blood cannot be short-circuited through the greater circulation without serious complications.

Study of these therapeutic regimens reveals that they were based upon no clear understanding of the cause of cirrhosis. The outlook was hopeless and these measures were regarded as merely palliative.

DR. BARR: I have asked Dr. Charles L. Hoagland of the Rockefeller Hospital to present some of the newer ideas concerning the treatment of cirrhosis, and particularly to tell us of some of his own results in connection with the treatment of this disease.

DR. CHARLES L. HOAGLAND: Attention was first directed to the role of faulty nutrition in the production of human cirrhosis of the liver by the studies of Rao, who, in 1933, showed that a high incidence of cirrhosis occurred among members of the population of Southern India, where alcoholism is all but unknown. In these areas nutritional deficiencies in protein, fat, and vitamins, especially in vitamins A, C, and D, have occurred among members of the population for many years. In Italy, in those regions where pellagra is endemic, the incidence of cirrhosis has always been high, as it has been in the southern part of the United States, where pellagra has been a national problem since 1905. These facts, together with a growing awareness in this country, where half our cases of cirrhosis occur among chronic alcoholics, of the relation between chronic alcoholism and vitamin deficiencies, have served to focus our attention on a possible nutritional basis for hepatic cirrhosis. This realization, together with a rapidly growing background in the production of experimental cirrhosis in animals on diets low in protective catalysts, has, within the past five years, re-oriented completely our therapeutic approach to the management of this distressing disease.

Dr. Barr has asked me to speak briefly on the rationale of the present management of cirrhosis, a request which is some evidence in itself of a break on the part of therapists with the empiricism of the past, and a willingness to accept any ideas that the experimental laboratory has to offer toward the treatment of this disorder.

If we can demonstrate any progress whatever in regard to the therapy of cirrhosis based on results of the experimental laboratory, we can congratulate ourselves, for from the time of the

ancient physicians, medical writers have given this disease a fatal prognosis once ascites had appeared. I might say that therapy of the past decade, which concerned itself with glucose infusions, mercurial diuretics, saline purges, radical surgical procedures directed toward establishment of new vascular anastomoses, and various other means of supportive treatment, did not alter our fatalistic ideas concerning this disease during the time in which these modes of therapy were in vogue. I hope, however, that in recounting the failures of past therapy I am not encouraging the belief that present methods of management of cirrhosis are all that may be desired. We are far from the therapeutic ideal, but a certain amount of progress has been made, and the hope is very bright that further progress in our understanding and eventual successful management of this condition will be made as the complex nutritional background of this disease is further worked out.

To justify in detail the rationale of the modern management of hepatic cirrhosis would require not one but a series of discussions together with a comprehensive review of the greater part of the fields of experimental nutrition and biochemistry. Perhaps the best plan, therefore, would be to present the history of a typical case of advanced cirrhosis, with a résumé of the pertinent findings in the history and physical examination, and a detailed account of the therapeutic regimen. We shall later attempt to justify each item in the program of therapy on the basis of results obtained from the experimental laboratory.

A 48-year-old Puerto Rican woman presented herself at the Rockefeller Institute Hospital Clinic with massive ascites, pretibial and ankle edema, and pain in the abdomen. Two months before she had developed jaundice and ascites and had required the performance of one paracentesis. Physical examination showed a woman appearing old for her years, breathing rapidly, and in obvious distress. Her hair was sparse gray, and dry. Her skin was dry and jaundiced and her sclerae deeply icteric. There was symmetric scaling of hands and arms. There were several spider angiomas on the face, neck, and lower extremities. The veins on her neck and the upper portion of her chest were prominent. There was a marked *caput medusae* on the abdomen, extending into the flanks. The heart was displaced to the left, but returned to normal position after paracentesis and the removal of 6,000 cc. of clear, straw-colored fluid. Other positive findings included a taut, protuberant abdomen with eversion of the umbilicus, and a fluid wave. The liver margin, palpable after paracentesis, was about 4 finger breadths below the costal margin and appeared hard and

liver extract. So far as I am aware, the French workers were the first to advance the idea that liver extract may be indicated on the basis of a replacement adjuvant. This aspect of the problem of the therapy of hepatic cirrhosis has interested me most, and we believe we have unequivocal evidence of its usefulness in those cases in which all the known requirements of the B-complex are met in excess. When all things have been done which seem to be indicated in the rational therapy of cirrhosis—such as high protein, high carbohydrate, low fat diet, choline, vitamin B complex, and vitamins A, D, and C—additional benefit may be obtained by the administration of relatively large quantities of liver extract parenterally, two to three times weekly. The evidence for the efficacy of liver extract in the patient whose case was described is not better than in several cases for whom we have been permitted to have longer base lines on controlled diet, choline, and B-complex administration before beginning liver extract therapy. We regret that exigencies of the war and the need for space in our hospital for patients from the United States Navy have for the time being interrupted this phase of our research. At the moment we are studying a number of cases with Dr. Elaine P. Ralli, on the Third Medical Division at Bellevue, where we are able to secure the objective biochemical tests on the number of patients required to prove this point. Obviously many cases, carefully studied, together with a series of alternate control cases, will be required before this matter can be settled unequivocally.

DR. BARR: The subject is now open for general discussion or questions.

DR. C. H. WHEELER: Dr. Hoagland, is there any evidence that this treatment produces actual regeneration of liver tissue, or does it simply arrest the changes which are under way?

DR. HOAGLAND: That is an interesting aspect of the problem.

For some time we have been seeking a test that would tell us when this process is arrested, and Dr. Hanger feels that such a test is embodied in the cephalin flocculation test, the results of which are believed to give some notion of the extent of the active process. If such a test is valid, it might enable us to get at just that problem. It is possible that we are providing an elaborate replacement regimen without reversing the hepatic process in the least.

In the case just presented the liver on palpation still appears as leathery as ever and leaves no doubt that cirrhosis remains.

DR. WHEELER: Do animal experiments throw any light on that point?

DR. HOAGLAND: Sebrell and others maintain that there is extensive regeneration, or hyperplasia, resulting from the administration of choline and methionine in their animals with experimental cirrhosis. Of course, the identity of liver cirrhosis in the rat with that of the human being is questionable, but the pathologists seem willing to say that the cirrhotic process in experimental animals resembles very much the pathologic process in human cirrhosis.

DR. McKEEN CATTELL: Do these cirrhotic livers regenerate after surgical operation?

DR. DEITRICK: I think it is fairly well accepted that regeneration may occur. The pathologists argue as to whether the biliary ducts themselves produce the new liver cells, and apparently some believe that they do.

DR. BARR: I think that it is a natural consequence of the destruction of portions of the liver to have a subsequent regeneration of uninvolved portions when the damaging process is no longer active. One explanation of the cause of cirrhosis of the liver has been either that certain factors prevented this natural regeneration or that the absence of certain factors was responsible for an absence of regeneration.

It is interesting that Mann found very active regeneration after partial removal of the liver, and he found also that in animals that were fed high protein diets, the regeneration was diminished or almost completely inhibited. So there came from the Mayo Clinic and elsewhere a prohibition against a high protein diet, which now is apparently completely reversed by the work which Dr. Whipple started and which is being continued in many other laboratories.

DR. HOAGLAND: Dr. Snell's cases were on a protein intake even higher than that in the case under discussion.

DR. BARR: Snell has recently expressed himself as being strongly in favor of a high protein diet.

DR. HARRY GOLD: After the active process of liver destruction has stopped, there still remains the problem of regeneration. May not a high protein intake continue to interfere with regeneration? If the liver is given too big a job to do in other directions, may not its growth slow down?

DR. HOAGLAND: Perhaps the stimulus to growth is removed by diets too high in replacement substances.

DR. EPHRAIM SHORR: Is there any evidence, Dr. Hoagland, of a related defect in renal function in these patients?

DR. HOAGLAND: I cannot quote anyone on this point, but I am distinctly under the impression that pathologists often find renal pathology associated with cirrhosis.

1939, as a result of their dietary studies on rats, when it was concluded that a diet high in protein, if given before the production of anesthesia with chloroform, reduced the incidence of hepatic cellular necrosis, even in livers with high lipid content. Whipple and his associates have confirmed this work and have shown that the effects of high protein intake in protecting the liver from chloroform injury can be duplicated by the addition of methionine and, to a lesser extent, of cystine to a diet low in protein. Moreover, Sebrell and his associates have demonstrated that in rats with liver cirrhosis produced on a low choline, low casein diet, improvement in the gross appearance of the liver and hyperplastic regeneration of liver cells occurred following treatment with choline and a high casein diet. Similar results have been obtained in protecting the liver of dogs from arsphenamine injury by the use of these substances. At the moment, many of the effects of high protein diets seem to be explained on the basis of their high content of methionine, which we now know can donate methyl groups for the formation of choline.

The lipotropic effects of choline are, of course, well known. The fact that cystine is also helpful in preventing dietary cirrhosis in rats is interesting, since it enters only indirectly into the transmethylation scheme, and also in view of the fact that Gyorgy and his associates have shown that the protective effects of choline and methionine against dietary cirrhosis can be reversed by large amounts of cystine in much the same manner that they can be reversed by fat supplements.

Optimism with respect to therapy of advanced cirrhosis of the liver is nearly always met with the statement that much of the defect appears to be a mechanical one brought about by fibrosis and liver shrinkage, and therefore that attempts to reverse the pathologic process are hopeless. In the past, the ascites, which is often the most troublesome feature of this disease, was explained on the basis of portal hypertension and consequent resistance to the flow of blood through the portal system. It is true that a portal hypertension may exist in many of these cases. It has even been measured directly by Thompson, Whipple, and others, and indirectly by post-mortem perfusion experiments. But Patek and Post have shown quite clearly, I think, that ascites is more definitely related to a marked deficit in plasma albumin, and that when, in spite of portal hypertension, a critical concentration of approximately 3.2 Gm. per 100 cc. of plasma albumin is reached, the ascites disappears rapidly, although no demonstrable change in portal hypertension has occurred.

Moreover, there are many instances when portal hypertension is marked, even though ascites is not noted. In these cases, the concentration of plasma albumin appears to be adequate.

The rationale for a low fat diet in cirrhosis has been argued for many years—first because it was realized that in the presence of interference with bile metabolism fats are not digested as effectively as they are in the normal person. Furthermore, since the work of Connor, it has generally been accepted that the appearance of fatty infiltration of the liver precedes the cirrhotic state and that effects of choline and methionine in reversing this process in animals can be prevented entirely by increasing the fat intake.

Rationale for the administration of large amounts of B-complex rests on a more empirical basis—that is, on the assumption that faulty metabolism of these substances may occur in the diseased liver, and, of course, on the recent observation of McCollum, Gyorgy, and others, that some protection against experimental cirrhosis is afforded by increasing the B-complex intake in animals. We have sought for more direct evidence of this faulty utilization in cirrhosis and have some evidence that the amount of nicotinic acid required to elevate blood coenzyme—the active, physiologic form of nicotinic acid—is greater than that required by the normal patient.

Evidence of an enhanced need for vitamin A in patients with cirrhosis of the liver is more convincing. Ninety-five per cent of the vitamin A stores are in the liver, and analyses on cirrhotic livers for vitamin A reveal in many instances a concentration of less than 10 per cent of this amount. Patek and others have shown that defects in adaptation to darkness may occur in patients with cirrhosis of long standing. Added to this may be a defect in the ability of the cirrhotic liver to convert carotene and carotenoid pigments into vitamin A. So far as we know, the liver is the only important site of the mechanism required for this conversion.

Evidence of vitamin K deficiency in prolonged cirrhosis is also strong. This deficiency arises in part as a result of deranged absorption due to altered bile pigment metabolism in the intestine and in part, perhaps, because of faulty utilization by the liver. When enough liver function remains in cirrhosis, vitamin K administered parenterally may enhance the prothrombin value.

The rationale for liver extract therapy is much harder to assess. Patek and others have given 5 cc. or more of crude liver extract weekly to their cirrhotic patients, as a source of vitamin B complex and of other required factors not yet defined, but which may be contained in crude

DR. BARR: And you believe that when you give all these supplements without the liver extract you are approximating the beneficial effects of the liver extract?

DR. HOAGLAND: In my opinion the liver extract is just one more part of the mosaic required for complete therapy.

DR. BARR: On the other hand, would you say that the converse is true—namely, that you could use liver extract alone without these other additions?

DR. HOAGLAND: We have a smaller series going in that direction, but I do not think the improvement is as marked as the other way around. Of course, the liver extract contains many of the other components so that it is very difficult to evaluate.

DR. BARR: What crude liver extract do you use?

DR. HOAGLAND: We make the crude liver extract in our own laboratory from Armour's liver powder, which is defatted with acetone. A continuous re-extraction of this material with hot water and treatment of the water extract with permutit removes any chill-producing substances. It is then bottled, and autoclaved, and subsequently tested for sterility and toxicity. It is still extremely crude compared to most liver extracts.

DR. BARR: Have you any experience with the crude liver extracts on the market, such as Valentine's crude liver extract? Do you know whether in practice one could use that with any degree of equivalence?

DR. HOAGLAND: I rather think that you might, because the procedure for making it is much the same. We have undertaken to assay the Valentine's and our own extracts for these various components with microbiologic methods, and they assay very closely in riboflavin, nicotinic, pantothenic, and biotin content. However, there is a great deal of variation in the choline content.

DR. REID R. HEFFNER: I gather from your remarks that the type of protein you use makes no difference. Patek, I believe, originally recommended that protein be derived from dairy products, particularly milk and eggs, and Snell recently recommended the same thing. Do you agree with that?

DR. HOAGLAND: I prefer the animal proteins because I think in general they are much higher in methionine and also in some of the other essential amino acids.

DR. WALTER MODELL: Is it practical to feed such patients large amounts of soy bean products? Before it is defatted, the soy bean has high protein and lecithin contents as well as a substantial amount of most vitamins.

DR. HOAGLAND: Not if it is refined too much. DR. MODELL: It is a complete food, and very cheap—about ten cents a pound.

DR. HOAGLAND: I know that choline is about one-twentieth as expensive in the form of soy bean lecithin as in the form of egg lecithin.

DR. WHEELER: Where do you obtain the lecithin?

DR. HOAGLAND: The soy bean lecithin can be obtained from the American Lecithin Company. It is put up in cookies, which some patients like very much.

STUDENT: You mentioned stabilization. Do these patients lose their ascites completely?

DR. HOAGLAND: The patient just described has lost her ascites entirely, and there is now no demonstrable pretibial edema. The ascites did not disappear, however, until the albumin content of the plasma rose appreciably.

STUDENT: Have you considered the possible return of the ascitic fluid to the patient?

DR. HOAGLAND: That would necessitate some rather involved biochemistry. We have considered the possibility.

DR. BARR: I know that has been tried but without brilliant results. I have no data on it myself.

DR. HOAGLAND: We have been interested in whether the protein make-up of the ascitic fluid is different from that of blood plasma. There is some evidence that it does differ.

DR. BARR: Thank you very much, Dr. Hoagland, for coming here today.

Summary

DR. JANET TRAVELL: Recent clinical studies yield evidence that cirrhosis of the liver is the result of a nutritional deficiency, and, furthermore, that the pathologic changes occurring in this condition can be reversed—or at least arrested—by replacement therapy. Thus, even in the patient with advanced cirrhosis and massive ascites, the outlook is no longer hopeless. Disappearance of ascites, pretibial edema, and jaundice, and the restoration of various objective findings to normal, or to approximately normal values, have been observed in such patients when they are placed on a suitable dietary regimen. Under these conditions, the blood serum albumin rises to about 3 Gm. per 100 cc.; the blood vitamin A and fibrinogen, the number of red blood cells, and the concentration of hemoglobin increase appreciably; the icteric index falls; and liver function tests may show some improvement.

The modern therapeutic regimen includes a high caloric, low fat, high protein, and high carbohydrate diet, supplements of vitamins A, C, D, and members of the B-complex, choline

Dr. SHORR: I wonder whether there are any studies of amino acid metabolism by which one could determine the ability of the liver to handle amino acids, since that is our present concept of deamination.

Dr. HOAGLAND: We know that there is no appreciable inability of the cirrhotic liver to convert glycocyamine to creatine by transmethylation from methionine.

Nitrogen balances indicate that many of these patients are often very near a negative balance.

Dr. SHORR: In fact, negative nitrogen balances, or precarious nitrogen balances, suggest that the influence of both estrogens and androgens might be utilized as adjuvants because of their sparing effect on nitrogen metabolism. Using physiologic doses of these substances, it is possible to increase retention to as much as 3.5 to 4 Gm. of nitrogen a day within a period of a week or two.

Dr. HOAGLAND: I am interested in your comment on the androgens and estrogens because it is thought that some of the gynecomastia and testicular degenerations that occur in these cases may be explained on the inability of the liver to detoxify estrogens.

Dr. SHORR: One occasionally gets evidence of very definite improvement with androgens, in cases not so carefully studied as this. Finally, in the acute case, after paracentesis has been performed and the plasma albumin has been found to be very low, would plasma transfusions provide a temporary stopgap until the patient's own regeneration permitted an endogenous elaboration?

Dr. HOAGLAND: A most dramatic relief from ascites has been observed in just such a case as you have mentioned. So far this has been tried in only one case.

Dr. SHORR: Does the lowering of the plasma protein have any effect on bone?

Dr. HOAGLAND: Yes, almost without exception these cases show marked decalcification of the bony skeleton. For that reason we felt that inclusion of vitamin D was important. The need for vitamin D is also evidenced in the precarious phosphorus balance which these patients show.

Dr. SHORR: Dr. Bowers has been studying one case in which enormous quantities of vitamin D were employed by mouth without effect and which brought up the possibility that there may at times be some defect in the gastrointestinal tract with respect to its absorption. I wonder whether the effect of intramuscular as compared with oral administration of vitamin A or D has been investigated in your cases.

Dr. HOAGLAND: We have attempted to get around this difficulty by giving vitamin A

parenterally. A much higher level of vitamin A is obtained by its intramuscular administration than when it is given by mouth.

Dr. GOLD: I should like to ask whether any benefit is derived from calcium administration in cirrhosis of the liver at any stage, and whether the chologogues play any part in the changes which occur.

Dr. HOAGLAND: One of the things I did not mention in the long list of therapeutic agents was the fact that we give our patients large amounts of bile salts. This patient received bile salts. I have not found any way to fit that into the research scheme, but I think it is rational.

Dr. GOLD: On the basis of promoting absorption from the gastrointestinal tract?

Dr. HOAGLAND: And perhaps to supply certain of those things that may be insufficient.

Dr. GOLD: And calcium?

Dr. HOAGLAND: I have no information about calcium. The calcium intake is materially increased, however, by the administration of the high protein diet.

Dr. SHORR: The presence of decalcification might persuade one to administer calcium along with large amounts of vitamin D.

Dr. WHEELER: Could you say a word, Dr. Hoagland, about the availability of these substances, such as choline and lecithin, to smaller hospitals and practicing physicians?

Dr. HOAGLAND: The lecithin choline is very cheap at the moment because it is a by-product in the manufacture of soy bean products, but I think that methionine is prohibitively expensive. It is about \$1.50 a gram, so that the best way to give it is by means of casein supplements or other proteins high in methionine—that is, the whole group of proteins of animal origin.

As for the vitamins, we have used the crystalline members of the B-complex because we wanted to control the ratios as nearly as possible. These are not prohibitively expensive, as you know, and they can even be purchased in mixtures about as cheaply as the B-complex from natural sources.

Dr. BARR: According to your chart, Dr. Hoagland, it would appear that this patient did not improve until the crude liver extract was given. Is that inference correct? Was there any demonstrable improvement before its administration?

Dr. HOAGLAND: There was no demonstrable improvement, but at the same time she was so critically ill that we were afraid to extend the base line any longer.

We have three other cases in which there was marked improvement on the regimen that I have outlined, without the liver extract.

Case Report

PNEUMOCOCCIC MENINGITIS

ROBERT C. SCHWARTZ, M.D., Syracuse, New York

THE mortality rate of pneumococcic meningitis¹ has always been very high in infants and children stricken with the disease. There has been only one previous report of a patient under 6 months of age who has recovered from this disease.² Therefore, another case report with complete recovery is of interest.

In this case, type specific pneumococcus rabbit serum and sulfapyridine were given, the pneumococcus serum having been obtained from the State Laboratories at Albany, New York. The organisms were identified and typed by Dr. O. D. Chapman at the City Laboratories at Syracuse, New York. The spinal fluid, as well as the blood culture, was both positive for type 33 *Pneumococcus* organisms. The serum was used intravenously and intramuscularly and the chemical, intravenously and orally.

Case Report

The patient was a well-developed and well-nourished infant girl, age 4½ months, weight 13 pounds 11 ounces. She was born May 31, 1941, the second child of healthy parents, neither of whom had recently had any colds or influenza. She was admitted to the Crouse Irving Hospital on October 17, 1941. She had been well previously and on an adequate diet. Her delivery had been normal, with no cyanosis, convulsion, vomiting, or other disturbances during the neonatal period. On October 12, 1941, five days before admission, she was taken with a low fever. Two days later both ears were apparently bulging, and bilateral paracentesis was done.* The fever, however, continued, and on the date of admission to the hospital her temperature went up to 105.6 F. She had a convulsive seizure followed by twitchings of the head, face, and right side of body. The pulse rate was 188, respiration rate, 48. She was irritable and resented interference. She had no head retraction or rigidity. She had bilateral positive Kernig's sign, and all reflexes were hyperactive. The ocular fundi were normal. The ear drums had recently been lanced and both had a purulent drainage. There was slight general redness of the throat; the lungs were clear, the heart sounds were rapid but normal, and the abdomen was distended and apparently tender but not rigid. Acute meningitis was the diagnosis, and lumbar puncture produced turbid cerebrospinal fluid under increased pressure. The fluid contained 2,680 cells per cu. mm., 75 of which were polymorphonuclears. There were 78 mg. of sugar and a slight increase in globulin. The blood count showed a hemoglobin of 65 per cent; red blood count, 3,800,000; white blood count, 2,900, with 84 per cent polymorphonuclears.

Sodium sulfapyridine in normal saline was started

at once, and by the end of twenty-four hours 3 Gm. of the chemical in 400 cc. of solution and 100 cc. of whole blood had been given intravenously. No change in the condition of the patient was noted until two hours after the specific antipneumococcus serum was given. The serum was started twelve hours after admission, and after test and intramuscular doses, 10 cc. were injected by vein. No reaction was noted.

The next day the temperature was down to 100.8 F., and the infant appeared much improved. Spinal fluid showed 250 cells, sugar 77 mg., and a slight increase in globulin. Sulfapyridine concentration in spinal fluid was 2.9 mg.; in blood, 4 mg. One-quarter gram of sulfapyridine every four hours was started orally and continued for the next ten days. Ten cubic centimeters of the serum were given intravenously for the next two days, with 10 cc. being given intramuscularly.

The temperature remained below 100.8 F. for the next twelve days. On the seventh day the blood sulfapyridine was 5.2 mg., and the spinal fluid showed only 15 lymphocytes, 43 mg. of sugar, no increase in globulin, and no growth in culture. The white blood count was 14,400 with 28 per cent polymorphonuclears.

X-ray studies of the mastoid area showed undeveloped mastoids. There was a decrease in the density in the left mastoid, which could have been the result of inflammation. X-ray studies of the chest showed the heart and lungs to be normal.†

On the twelfth day the temperature rose to 102 F. The spinal fluid showed 32 cells, 50 per cent polymorphonuclears and 50 per cent lymphocytes, with slightly increased globulin. The blood sulfapyridine concentration was 5.7; white blood count, 20,700, 70 per cent polymorphonuclears. A blood transfusion of 100 cc. was given and 20 cc. of antipneumococcus serum administered. Although the rise in temperature may have been due to a serum reaction, the serum was nevertheless readministered because of the return of irritability and a slight nuchal rigidity. The next day the child seemed much improved, and her temperature returned to normal. The spinal fluid showed 10 white blood cells, sugar 55 mg., and the white blood count was 8,800 with 53 polymorphonuclears.

From that date on, the child ate well, had a normal temperature, and had no return of symptoms. Spinal fluid examination on the thirtieth day showed 4 lymphocytes, 45 mg. of sugar, a white blood count of 10,000 with 40 per cent polymorphonuclears, hemoglobin 62 per cent, and a red blood count of 3,300,000.

During the thirty days of illness, the patient had 36 Gm. of sulfapyridine with no evidence of granulopenia or toxic symptoms from the drug. She received a total of 110 cc. of antipneumococcus serum (rabbit), type 33, supplied by the Division of Laboratories and Research, New York State Department of Health. Forty cc. were given intravenously and 70 cc. intramuscularly.

* Paracentesis was done by Dr. S. Stewart and Lt. Comm. N. Livshin, M.C., U.S.N.

† X-ray studies were done by Dr. C. Potter.

(as soy bean lecithin), and the parenteral administration of a crude liver extract. The injection of the liver extract apparently accelerates recovery, although it is not clear precisely what role it plays.

Many of the effects of the high protein diet are explainable on the basis of the increased intake of methionine which makes methyl groups available for the formation of choline. Animal experiments indicate that both methionine and choline exert a protective action on the liver which may be antagonized by fat supplements.

Many problems as to the effects of the various factors included in this dietary regimen still remain unsolved. For instance, a prohibition against a high protein diet in cirrhosis existed for many years because animal experiments showed that such a diet markedly inhibits regeneration of the liver after partial hepatectomy.

It remains an open question whether, after the active process of liver destruction is arrested, the high protein diet may not still continue to interfere with its regeneration.

PLANS FOR THE WAR BLINDED

Among the casualties of war few merit more immediate consideration than those who become sightless as a result of their national defense. In World War I, figures available, 243 American soldiers became blind. Thus far the number of British soldiers who have become sightless, including the men from Great Britain and the colonies, is somewhat less than a few hundred. Planning bodies, therefore, estimate that the number of Americans in the armed forces who become totally blind will not exceed a few hundred.

For the past six months representatives of the Surgeons General of the Army, the Navy, the Public Health Service, the administrator of the Veterans Administration, the Federal Board of Hospitalization, and the ophthalmologic committee of the Division of Medical Sciences of the National Research Council have been engaged in a study of the problem. An elaborate program has been developed to rehabilitate socially and economically those who become sightless. Sufficient funds have been provided by the Congress to meet every possible need. The plans contemplate utilization of existing agencies which deal with the blind.

However, public fund-raising campaigns are unnecessary since the over-all need is hardly sufficient to demand special expansion for this purpose in the services of unofficial agencies. In accordance with the executive order of the President, the social rehabilitation of the blind becomes a function of the Veterans Administration and is to be handled by the Division of Educational Rehabilitation and not the Medical Division. Through the cooperative effort now in process of development the rehabilitation will begin just as soon as the diagnosis is made and will continue from the time of reception of the invalid by the armed forces until the man can be discharged from the Veterans Administration physically, mentally, and socially rehabilitated.—J.A.M.A.

SWINE INFLUENZA VIRUS

Richard E. Shope, in an article in the February issue of the *Journal of Experimental Medicine*, shows that his work on the swine lungworm as a reservoir and intermediate host for the virus of swine influenza adds significantly to research on viruses.

He reports 98 experiments with transmission, using 216 swine and involving a three-year study of the lungworm as an intermediate host for the virus of swine influenza. Fifty of the experiments gave negative results. In the remaining forty-eight, transmission of virus by way of the lungworm was demonstrated in one or more animals used in each experiment. Irregularities in the results, Shope explains, would appear to be due not so much to lack of transmission of the masked virus by the lungworms as to failure to evoke its pathogenic capabilities.

During the summer months, May to August, inclusive, swine prepared by the injection of lungworms carrying virus were absolutely refractory to the provocation of influenza. They were also relatively refractory in September and October. Activation of the masked virus occurred most readily during the first four months of the year. In one experiment it was possible to demonstrate by direct means the presence of virus in the neighborhood of lungworms at the base of the lung at a time when the virus could not be demonstrated anywhere else in the respiratory tract. Masked virus of swine influenza was found to be present in lungworm ova obtained either from the respiratory tracts or from the feces of infected swine. In several instances masked virus persisted for over a year in lungworm larvae within the earthworm intermediate host, and in one of these its presence was demonstrated after thirty-two months. Finally it was found that lungworm ova obtained from convalescent swine which no longer carry swine influenza virus in infectious form in their respiratory tracts, contain a masked virus.—J.A.M.A.

AID FOR ADULT POLIOMYELITIS CASES

An appropriation of \$20,000 has been made in the state budget for the coming fiscal year to provide state aid for such remedial care of adult poliomyelitis cases as may be authorized by local boards of health and health officers, and approved by the

State Commissioner of Health, in accordance with the provisions of Section 19½, Article II-B, of the Public Health Law. Inquiries regarding procedures for making application for care should be directed to the district health officer.—*Health News*

Case Report

CONTACT DERMATITIS CAUSED BY DYES IN WEARING APPAREL*

E. L. KADISCH, M.D., New York City

THE study of allergic reactions to simple chemical compounds owes its recent great advances in particular to observations in cases of contact-type eczematous dermatitis. The following cases are reported as additional examples of this form of dermatitis because they illustrate certain phenomena of great practical and theoretic interest.

Case Reports

Case 1.—S. L., a man aged 67, was a tailor who had lived in New York City for thirty-two years. In 1923 he developed a cutaneous eruption which began on the left foot. The condition spread to the left wrist, the left buttock, and the left side of the scrotum, but cleared after a period of six months. In 1929 he had a recurrence on the hands, on the region about the eyes, and on the buttocks. At that time a diagnosis of dermatitis venenata was made at the Brooklyn Jewish Hospital. In 1934 he had an eruption over his entire body which lasted nine weeks and which in June, 1937, recurred, starting on the foot in the form of a vesicular eruption. A diagnosis of allergic dermatitis was made at that time at the New York Post-Graduate Hospital. In July, 1937, the patient was admitted to the City Hospital under the diagnosis of mastitis and a mastectomy was performed. In November, 1938, the patient was admitted to Montefiore Hospital.

When the patient entered Montefiore Hospital the diagnosis was uncertain; in January, 1939, the patient was presented by Dr. M. B. Sulzberger at the Bronx Dermatological Society as a case for diagnosis.¹ At that time the patient presented the following clinical picture: generalized thickening, lichenification, and hyperpigmentation of the skin with a well-healed scar at the site of the breast amputation. There was a leukoderma at the site of a healed burn on the right arm. A general lymphadenopathy was present. The hyperpigmentation affected also the buccal mucosa. A marked longitudinal ridging and a yellowish opacity of the nailbeds was noted. The laboratory findings were essentially negative. A sternal marrow puncture revealed an increase in eosinophilic myelocytes and eosinophilic polymorphonuclear leukocytes. No leukemia was evident.

A biopsy of an axillary node showed chronic proliferative lymphadenitis. The biopsy of the skin showed a thinned epidermis with several areas of cellular infiltration beneath it. This infiltration consisted of lymphocytes, fibroblasts, and an occasional eosinophilic leukocyte, and a few plasma cells.

Under bland local treatment—perhaps also under the influence of hospitalization—the skin improved sufficiently during the ensuing weeks to permit the performance of patch and scratch tests.

Scratch tests performed with 82 foods and inhalant protein extracts were entirely negative.

* Work done under the Jennie and Siegfried Peierls Fellowship at Montefiore Hospital for Chronic Diseases, New York. Dermatologic Service of Dr. Fred Wise.

¹ Sulzberger, M. B.: Arch. Dermat. & Syph. 40: 337 (1939).

Thirty-five patch tests performed with various allergens to which the patient had been exposed at home or at his occupation revealed the following positive findings (Fig. 1):

Suit lining.....	++
Suit clothes.....	++++
New suit material.....	++++
One pair of socks.....	++++
Shoes, tongue lining.....	++++
Tongue outside.....	++++
Leather lining.....	++++
Lining of another pair of shoes.....	++++

It may be mentioned that the lining of the new suit and the leather of the soles of the shoes were negative.

When the patient had greatly improved, owing to hospitalization and treatment as well as to the avoidance of all articles which had been found to cause reactions when used in patch tests, he was discharged and returned to his home under the following precautions: A special suit and special shoes were made to order after all materials, including the threads and buttons, had been tested. In other words, his new wearing apparel was made from materials which failed to produce patch test reactions on his skin. Since the patient's discharge more than two years ago, he has had no recurrences. There is no itching and even the pronounced brownish generalized discoloration has become considerably less intensive. The patient is now occupied in a type of work which entails exposure to only undyed materials. It is now easy to account for the recurrences which regularly followed all dismissals (or releases) from the various hospitals: Each time the patient left the hospital where his skin had improved, he had been given his garments and shoes, precipitating an immediate recurrence of his dermatitis.

Case 2.—S. G., a man aged 58, a motion picture theater manager, gave a family and individual history that was negative for allergic diseases, yet he had had frequent attacks of bronchitis and one of lobar pneumonia many years before. His cutaneous eruption started in the interdigital spaces of the feet in October, 1938, and subsequently spread over the entire body. He had many recurrences, the cause of which could not be found. The relapses often occurred immediately after leaving the hospital or after returning to his home. At the time of his hospitalization at the Post-Graduate Hospital the eruption was characterized by pruritus, erythema, and particularly by groups of follicular papules. The back and the extensor surfaces of the arms presented the most severe changes. Between the toes there was scaliness, erythema, and maceration. The physical examination, routine blood and urine examinations, the basal metabolic rate, and the electrocardiogram were all entirely negative.

Discussion

Before antipneumococcus serum and the sulfonamide compounds were introduced, the mortality rate of pneumococcal meningitis was very high. According to W. T. Cooke,³ the fatality rate in the first year of life is extremely high, but between the ages of 5 and 40 the prospects of cure are good unless there is an associated severe infection such as pansinusitis, ulcerative endocarditis, or sinus thrombosis. The death rate is high for patients under 3 years and over 50 years of age. Case reports with recovery in the high mortality age groups are few, but they should encourage the

clinician as to prognosis with proper treatment.

Summary

1. A case of pneumococcal meningitis, with recovery, in a child of 4½ months is reported.
2. Sulfapyridine and specific antipneumococcus rabbit serum were used.
3. This is the second case of complete recovery to be reported in an infant under 6 months of age.

TO COMBAT DEAFNESS

Washington County, Maryland, is inaugurating a program for the prevention of deafness, to be conducted as a function of Services for Crippled Children. The need of such a program may be gleaned from a previous survey, which has shown that about 2.5 per cent of school children in the county have impaired hearing. The program will augment the limited facilities for otolaryngology in the community and will provide for radon therapy for adenoid tissue.

The following immediate steps are projected: (1) Education of parents in the necessity for proper medical care for children with acute otitis media. This is to be accomplished through Parent-Teacher Association meetings, distribution of pamphlets, newspapers, preschool and school medical conferences and home nursing visits, especially for school children with earaches. (2) Testing of hearing in public and parochial schools. Each child will be tested approximately three times during his school life. The screening test will be performed by a trained technician from the Frederick School for the Deaf. (3) Establishment of an ear, nose, and throat clinic to be conducted by a trained specialist. Provisions will be made by arrangement with the local hospital and the local ear, nose, and throat profession for special treatment, such as tonsil and adenoid operations and mastoid operations.

The project is to be a cooperative study by the health agencies, the medical societies, and the state board of education. The private physician is to be brought into active participation in this program. —J.A.M.A.

DOCTORS ON THE HOME FRONT

A page from the physician's diary: "Doctors left in private practice are very much like the private automobiles: they must be carefully preserved for the duration, must not be used for 'pleasure driving,' the production of new models is sharply curtailed, old models must be renovated and brought back into service, and retirement of obsolete and antiquated ones must be reduced to a minimum. With most of the young, efficient, energetic, and patriotic doctors responding to the great need of our armed forces for medical aid, it is necessary that those old and physically disqualified be kept in proper physical condition to carry on without danger to themselves or to the workers on the home front.

"It would appear that doctors on the home front must abandon their individualistic medical isolationism and take upon themselves the herculean task of community health problems. They must teach their patients the importance of proper nutrition, the principles of mental and physical hygiene, how to obtain the maximum results from preventive medical measures, and to a large extent they must assume a more active and aggressive participation in public health matters. For decades we have idealized the 'family counselor' role of the doctor and now is the time to emphasize this ideal. Physicians on the home front have a tremendous responsibility and one that is not likely to increase their longevity, but they will be happy in the knowledge of their indispensability, and their ability to lighten some of the cruel and heart-rending blows—inevitable to a war-weary people!" —Texas State J. Med.

ARMY MEDICAL CENTER CUTTING DEATH RATE

According to official news releases, the Army's vast medical center in Washington, D.C., is cutting the war death rate by thousands and returning the wounded to health as rapidly as modern techniques can make it possible. The emergency capacity of the hospital is 3,225, and officers and enlisted men from all theaters of war are brought there for treatment.

Among the especially successful departments is the division of plastic surgery, which has been treating soldiers who have suffered head wounds and burns. A relatively new technique is being used

with the Padgett dermatome for skin grafting. The dermatome was developed by Dr. Earl C. Padgett, of Kansas City, Missouri.

The encephalograph, recently invented instrument for the detection of brain tumors and other disorders, is also in use at the center.

The center is equipped with a dental laboratory that regularly stocks 70,000 false teeth, of which approximately 16,000 are used monthly. There is also a complete shop for the manufacture of artificial limbs and braces, although sulfa drugs have materially reduced amputations.

FIG. 2. Back of the patient. The rash is not present at those places which were better protected against contact with the allergen.

One patient who reacted to the lining of one of his suits was so highly sensitive that he even reacted to the water in which this lining was washed.

Although the allergen may be present originally in the material of a single suit, it may "contaminate"

shirts and underwear and thus be indirectly brought in contact with the skin.

1165 Park Avenue
New York City

CANCER AND THE WAR

Today there are many urgent activities and causes linked with the struggle against our enemies which clamor for our attention and time. How does cancer control fit into today's war pattern?

The answer should be obvious. In upstate New York there are thirty thousand men, women, and children who have some form of cancer. Thousands of them are working in war industries or in other useful occupations; thousands of others are fulfilling equally important work in maintaining households. Almost half of them are under the age of 60. As for those who are older—well, any plant manager can tell you that some of his best workers are over 60. Whatever we do to help the cancer patient get treatment early and increase his years of useful life unquestionably and directly aids the war effort.

But the war has done more than give practical

importance to the lives of those who have or who may develop cancer. It has set in the path of cancer control new obstacles which call for new approaches and more intense activity. We must face the fact that with fewer physicians in civilian life has come an even greater tendency than before to put off consulting a doctor for the early symptoms which may mean early cancer. And yet the doctor still wants to be consulted about these early symptoms.

He still wants to see the woman who has discovered a small lump in the breast; he wants to see her the following day, not two months later. He wants this for the selfish reason that it takes less of his time and energy to cure an early case of cancer than to care for an advanced case Morton L. Levin, M.D., in "News Letter," *Women's Field Army Against Cancer*

FIG. 1. Patch test reactions of the patient to the material of his socks and to the lining and leather of the tongue of his shoes.

The patient was transferred to the Montefiore Hospital, where the skin cleared up within six weeks after admission, under local application of various bland remedies. The rapid improvement was sometimes interrupted by a sudden standstill or even a slight recurrence while he was under treatment. He complained particularly of itching, which usually occurred simultaneously with or slightly preceding erythematous follicular eruptions, which were mainly on the upper part of the back, the clavicular region, and the radial aspect of the forearms.

This persisted for a period of four or five days.

On this patient an interesting observation could be made pertaining to the protective effect of a lotion containing zinc oxide 96 Gm., talcum 96 Gm., glycerine 72 Gm., and alcohol 72 Gm. in 400 cc. of water. It was repeatedly found that certain areas on the patient's back which had been painted with two or more layers of this lotion were less affected during the recurrences of the patient's dermatosis than other areas which happened to be covered with only one layer of the lotion (Fig. 2). This finding could be best understood on the basis of the theory that the two or more layers of the lotion protect more effectively against an unknown contact allergen than a single layer does. Patch tests with numerous materials contained in the patient's clothing were therefore made. These proved the patient to be extremely sensitive to the brown lining of a coat and vest. A patch test performed with 2 per cent paraphenyldiamine in vaseline, as well as a test performed with this brown lining, caused a strong reaction which was not healed after three weeks, and even after three months the site of these first tests could be detected and a slight elevation could be felt.

When the patient was considerably improved, he was asked to wear his suit. This resulted in severe itching approximately one-half hour afterward. This itching became progressively more severe, and although the suit was removed immediately after the onset of the itching, this clinical test was followed by the typical generalized eruption similar to the one which he had presented upon admission. The erythema appeared first on the upper part of the back and over the shoulders, in those areas where the dyed materials had the most intimate contact with the skin. The arrangement of the lesions on the arms showed similar characteristics, the rash being symmetrically distributed and the borders following the anatomic configuration.

A similar clinical test, executed with material which had elicited negative patch test reactions on the patient's skin, did not result in any subjective or objective evidence of a recurrence of the patient's dermatosis.

Subsequent patch tests performed with a number of other materials from this patient's clothing produced positive reactions to the material of two shirts and the outer material of a tie. However, even these weak reactions were proved to be of great clinical importance. When the patient wore one of these shirts, it produced a definite, although not very severe, relapse.

Five grams of the lining of the above-mentioned brown suit were taken, and the material was immersed in 10 cc. of water for ten minutes. After this piece of lining had been wrung carefully, it was placed in another 10 cc. of water in which it was permitted to soak again for ten minutes. This procedure was repeated for a total of twelve times, and the resulting wash waters were then applied under patch tests on the arm of the patient. These wash waters, which did not cause any reactions on several control individuals, elicited vesicular reactions so strong that approximately three weeks were required for their healing.

It seems theoretically possible that a shirt worn underneath a brown vest may absorb a sufficient amount of the allergenic dye to "contaminate" the wash water in which other perfectly harmless materials of underwear are washed at the same time, so that these originally harmless materials may in turn subsequently elicit an allergic reaction on the patient's skin. Since there are variations in the affinity of dyes to various types of clothing materials, one material may not be so "contaminated" as another material which tends to hold and accumulate the dye.

Summary

Two cases of contact dermatitis are presented. They improved during hospitalizations but relapsed immediately upon leaving the hospital or during visits at home. This should always direct the attention to allergens in the patient's home or in his clothes.

Careful observation of the outlines of these eruptions may give useful suggestions as to the cause of the eczematous dermatitis.

Fig. 1

Fig. 2

fibronchoscopic examination was made on August 12. Most of the tracheobronchial tree was covered by a thin, grayish membrane, and a detached, thick, fibrinous coagulum was seen which almost filled the lumen of each main bronchus. The material was removed with the bronchial aspirator and a gauze swab. The patient experienced much relief following the removal of these casts, and for the first time in weeks he was able to lie down. Potassium iodide was given by mouth to aid expectoration, and because of the presence of staphylococci, sulfathiazole was also given. The temperature ranged between 102.4 F. and 100.2 F. for seven days, when it returned to normal and remained so. Although there was marked clinical improvement, the patient still continued to have a harsh cough, productive of similar fibrinous bronchial casts.

On September 23 the bronchoscopic examination was repeated. The mucosa of the trachea and right main bronchus, except for slight injection, appeared almost normal. The left main bronchus still contained a thick, easily removable, fibrinous deposit. Two days after this examination, the patient was discharged as improved and advised to return in two weeks for further examination. He came to the outpatient clinic on October 6 and reported a continued slight productive cough with occasional nocturnal dyspnea and wheeze. On bronchoscopic examination the only abnormality noted was a moderate degree of hyperemia of the mucosa of the left main bronchus. A roentgenogram (Fig. 2) taken at this time and compared with other serial films showed additional clearing of the abnormal shadows to nearly normal appearance.

Laboratory Data.—No tubercle bacilli were seen on three concentrate examinations of the sputum. Gram-positive cocci in pairs, small clusters, and short chains, as well as eosinophils, were seen. Urine was normal. Blood examination showed: hemoglobin, 118 per cent; red blood cells, 5,010,000;

white blood cells 22,400; polymorphonuclears, 63; lymphocytes, 13.5; mononuclears, 12.25; eosinophils, 8.75; basophils, 2.5; stabs, 4 per cent; and sedimentation rate, 87 (Westergren method).

Biopsy of the bronchial casts obtained at the first bronchoscopy showed a mass of purulent material with considerable necrosis of cells. There were many polymorphonuclear leukocytes and large mononuclear cells present. Epithelial cells were not identified. There was no evidence of tuberculosis nor was any elastic tissue present.

On October 13, approximately three months after the onset of the present illness, the patient returned to work. He experienced occasional wheezing, slight dyspnea, and a moderate cough productive of about one drachm of creamy, yellow sputum daily. On December 12, while working on a wiring job in a building under construction, the patient again inhaled sulfur dioxide in the fumes of coke which was being used to aid in the drying of cement. He was suddenly seized with a severe headache, chills, perspiration, nausea, vomiting, and a sense of constriction in the chest, followed by unconsciousness. The patient rested at home for a week and upon returning to work he developed another acute infection of the upper respiratory tract. This so aggravated his symptoms that he was obliged to return to the hospital on Christmas Day.

On examination, the chest appeared symmetric and expansion was equal on both sides. Tactile fremitus was increased over both bases and percussion was resonant and unimpaired. The breath sounds were bronchovesicular to vesicular over both lungs and inspiratory and expiratory squeaks were heard throughout. Palpable and audible rhonchi were noted, particularly over the left lung, and were more marked when the patient was lying on the left side. The remainder of the physical examination was within normal limits. The roentgenogram showed no striking abnormality and, except for a moderate leukocytosis, the laboratory examination

Case Report

ACUTE TRACHEOBRONCHITIS COMPLICATED BY BRONCHIAL STENOSIS FOLLOWING THE INHALATION OF SULFUR DIOXIDE

JOSEPH GORDON, M.D., Ray Brook, New York

HAGGARD¹ has pointed out that all respiratory irritants have the same toxicologic action. The difference in symptomatology is related to the location of their action and is dependent upon the relative solubility of the irritating gases. A gas that is very soluble in water is readily taken out of the inspired air by contact with the first moist tissue it reaches. Hence, the upper respiratory tract bears the brunt of action. A gas that has a low solubility in water is slower to liberate its irritant principle, and the main damage occurs deeper in the respiratory tract.

Winternitz² observed, from pathologic studies, that the action of irritating gases produces an inflammatory edema followed by a cellular exudate. Later, if death does not occur, there is organization of the exudate within the alveoli and bronchioles. Chronic suppurative lesions, such as bronchiectasis, result.

Sulfur dioxide is a highly irritating, irrespirable gas. Sulfurous acid is produced by contact of this gas with the moisture of the respiratory tract, and it rapidly oxidizes to sulfuric acid. As stated by von Oettinger,³ the main effect of sulfur dioxide is an irritation of the upper respiratory tract, but it may also cause lesions of the bronchi and lungs. Thompson⁴ reported that persons exposed to mild degrees of the gas complained of headache, anorexia, spasmodic cough, bronchitis, constriction of the chest, and gastrointestinal disorders. Asphyxia from acute catarrhal bronchitis, pulmonary edema, and even death may occur. As is the case with other poisonous, irrespirable gases, the lethal effects may be delayed. Death may ensue some days after what has been regarded as a trivial exposure.

TABLE 1.—PHYSIOLOGIC RESPONSE TO VARIOUS CONCENTRATIONS OF SULFUR DIOXIDE (Henderson and Haggard⁵)

	Parts of SO ₂ per million parts of air
Least detectable odor	3 to 5
Least amount causing immediate irritation to eyes	20
Least amount causing immediate irritation to throat	8 to 12
Least amount causing coughing	20
Maximum concentration allowable for prolonged exposure	10
Maximum concentration allowable for short exposures (1/2 to 1 hour)	50 to 100
Dangerous for even short exposures	400 to 500

McCord,⁶ in 1930, pointed out that sulfur dioxide

Read at a meeting of the Saranac Lake Medical Society, January 14, 1942.

From New York State Hospital, Ray Brook, New York.

was the most suitable refrigerant but that it was on top of the list as a respiratory irritant. However, he stated that no lasting harm following exposure was known to exist. Hamilton,⁷ on the other hand, mentions that the gas causes deleterious effects, both in human beings and in animals. Norris and Landis⁸ refer to one case in which death followed two weeks after an apparently slight exposure to this gas. Conditions such as asthma (Romanoff,⁹ Cooke,¹⁰ Dowling¹¹), bronchitis (Kehoe¹² *et al.*), and bronchiectasis (Smith and Needles¹³) have been attributed to sulfur dioxide poisoning.

Case Report

H. L., an electrical repairman, aged 44 and married, was admitted to the hospital on August 17, 1941, in acute respiratory distress. There was no history of any significant illness in the past. About five weeks before admission, the patient developed a mild infection of the upper respiratory tract which did not necessitate his stopping work. Before he had fully recovered, he uncoupled a joint in a pipe line leading to an old refrigerator furnished with sulfur dioxide gas. Some of the escaping gas was inhaled for several minutes before the proper connection was made. There followed immediately momentary mild irritation of the nose and throat. The incident was reported to his employer on the same day, July 12. Five days after this exposure, the patient was suddenly seized with a paroxysm of coughing associated with severe dyspnea. The expectoration of a small amount of tenacious, stringy sputum partially relieved the attack. The symptoms were not ameliorated by the administration of adrenalin. The paroxysmal attacks continued for days, with periods of relief following the expectoration of large "plugs" of heavy sputum. The severity of the symptoms suggested the presence of partial occlusion of the upper respiratory tract, and the patient was admitted to the hospital.

A short-statured, well-developed, and well-nourished white man, he was in urgent dyspnea, orthopneic, with a paroxysmal, productive cough. All the accessory muscles were active in the respiratory effort, but there was no cyanosis. The chest appeared symmetric, vocal fremitus was normal, and the percussion note was unimpaired. The breath sounds were moderately suppressed anteriorly and posteriorly over the upper third of both lungs and were compensatory below this level. Persistent subcrepitant rales were heard in the lower right axillary region and occasional sonorous rhonchi were heard at both bases posteriorly. The blood pressure was 130/90, and the remainder of the physical examination revealed no abnormalities.

The roentgenographic film (Fig. 1) showed radiating strands of increased density in the upper third of the right lung field and irregular, mottled shadows in the lower portion of this same field. There was slight peritruncal thickening in the left lung field.

When the patient's condition remained unchanged,

was normal. A bronchoscopic examination was done on January 5, 1912. The trachea and right main bronchus appeared normal. There was slight hyperemia of the mucosa of the left main bronchus. The lumen was reduced to three-fourths its normal size and was somewhat triangular in outline. The stenosis was moderately elastic as the 7-mm. bronchoscope could just be passed through it with gentle pressure. The upper and lower lobe orifices thus visualized appeared normal. Under conservative therapy the patient's symptoms abated, and he was discharged, improved, on January 11.

Johnstone¹⁴ mentions sulfur dioxide as an industrial hazard in coke oven workers. The Bureau of Mines¹⁵ states that the fumes from burning coke under conditions of complete combustion are carbon dioxide and some sulfur dioxide (usually 0.6 to 0.8 per cent sulfur dioxide); with incomplete combustion carbon monoxide is produced.

Summary

The illness of the patient began with a mild infection of the upper respiratory tract, followed by exposure to sulfur dioxide gas, resulting in acute tracheobronchitis. Clinical improvement was obtained during the first admission with broncho-

scopic aid. Some months later, the patient again inhaled sulfur dioxide in the fumes of coke and the acute attack of tracheobronchitis that followed this exposure terminated in a partial stenosis of the left main bronchus.

THE MICROBE'S SERENADE

A love-lorn microbe met by chance
At a swagger bacteroidal dance,
A proud bacillian belle, and she
Was first of the animalculeae.
Of organisms saccharine,
She was the protoplasmic queen;
The microscopical pride and pet
Of the biological smartest set.
And so this infinitesimal swain
Evolved a pleading low refrain:

"O, lovely metamorphic germ!
What futile scientific term
Can well describe your many charms?
Come to these embryonic arms!
Then hie away to my cellular home
And be my little diatom!"

His epithelium burned with love;
He swore by molecules above,
She'd be his own gregarious mate,
Or else he would disintegrate.
This amorous mite of a parasite
Pursued the germ, both day and night,
And 'neath her window often played
This Darwin-Huxley serenade—
He'd warble to her, ev'ry day,
This rhizopodial roundelay:

"O, most primordial type of spore!
I never met your like before;
And, though a microbe has no heart,
From you, sweet germ, I'll never part!
We'll sit beneath some fungus growth
'Till dissolution claims us both."

—*J. Med. Soc., Cape May Co., N. J.*

IF LATIN IS GREEK TO YOU

A surgeon is a busy man
Who never his job will shirk;
But an otolaryngologist
Is up to your neck in work.
A pediatrician treats the child;
His work seems awfully small;
While a physical therapist makes you work;
Which doesn't seem right at all.

The ophthalmologists work on eyes,
The windows of the soul;
So their job isn't pane-less;
Quite pane-ful, on the whole.
Psychiatrists are fond of nuts,
The human kind; and Freud.
The allergists tell what food and things
And people to avoid.

On obstetricians you depend
For they have to deliver.
The gastroenterologists
Will cure that stomach quiver;
And any cardiologist,
When effort makes you pant,
Can remedy the heartaches which
Our Beatrice Fairfax can't.

A phthysiologist works on lungs;
He surely knows the bellows.
The orthopaedists get the breaks.
Quite bracing are these fellows.
Each man must have his specialty
And of his prowess sing;
But the general practitioners
Must know the whole damn thing.

STUDY OF ANCIENT SOILS

A new science has just made its bow to the world of research. Its name is paleopedology, and it is a member of the family of geological sciences. Its sponsor is Prof. C. C. Nikiforoff, soil specialist in the U.S. Department of Agriculture.

Translated out of its rather formidable-looking Greek, paleopedology means simply the study of ancient soils. It is thus an extension into the past of the already established subject of pedology, or soil science.

Fossil soils, Professor Nikiforoff states, are even harder to find than fossil animals and plants. Although many rocks, like sandstones, limestones, slates, and shales, were formed by the solidification of what were originally loose-grained materials, very few of these could be called soils. For the most part they were laid down as underwater sands and silts, results of the decay and ruin of older rocks and soils. But sometimes deposits are found that were once actual soils in which plants grew. They

were covered up as they stood, by such things as showers of volcanic ash, or lava flows, or glacial deposits, or deep layers of wind-blown loess.

Seldom are these buried deposits whole soils any longer. As a rule, only the mineral particles, ranging in size from coarse gravel to sand, are all that remain. These have been likened to the skeleton of the soil; they are more or less analogous to the fossilized bones that are usually the only remains we find of extinct animals. Missing is the "flesh" of the old soils—the finer clay particles and the organic humus that form the soil colloids. Missing also is the soil solution—the "blood" of the soil.

Yet despite the skeletonized condition of these fragments of ancient soils, it is possible to make some kind of legitimate inferences regarding the forest floors trodden by the dinosaurs, and the plains where the offspring of little Eohippus grew up into horses.—*Science News Letter*

TO EXCHANGE MEDICAL SERVICE

A reciprocal agreement for medical treatment of members of the Canadian and United States armed forces has been completed by the two governments, the War Department announced recently. Under the agreement, United States service men in Canada

who cannot obtain medical or dental treatment from United States sources will receive free treatment from the Canadian medical and dental services. Similar treatment will be accorded Canadians here.

Postgraduate Medical Education

Programs arranged by the Council Committee on Public Health and Education of the Medical Society of the State of New York are published in this section of the JOURNAL. The members of the committee are Oliver W. H. Mitchell, M.D., chairman (428 Greenwood Place, Syracuse); George Baehr, M.D.; and Charles D. Post, M.D.

Plasma Therapy and Whole Blood Transfusion

PLASMA Therapy and Whole Blood Transfusion" will be the subject of a lecture to be presented on June 8 for the Delaware County Medical Society. The speaker will be George M. Mackenzie, M.D., associate professor of medicine, Albany Medical College, and physician-in-chief, Mary Imogene Bassett Hospital in Cooperstown, New York. The meeting, which is sponsored by the Medical Society of the State of New York, and the New York State Department of Health in cooperation with the Medical Division of the Office of Civilian Defense and the Health Preparedness Commission of the State of New York, will be held at 6:30 P.M. in the Elm Tree Restaurant in Delhi, New York.

Plasma therapy was also discussed at a meeting of the Albany County Medical Society held on May

26 and presented by the same group of sponsors. Dr. Mackenzie was also the speaker for the Albany society. The meeting took place at 8:30 P.M. in the Auditorium of the Albany Pharmacy College.

Members of the Columbia County Medical Society heard a lecture on the subject of Plasma Therapy and Whole Blood Transfusion at a meeting on May 20. The speaker was Samuel Standard, M.D., assistant professor of surgery, New York University College of Medicine.

The meeting, which was held at 9:00 P.M. in the Hudson City Hospital in Hudson, was sponsored by the State Medical Society and the New York State Department of Health in cooperation with the Medical Division of the Office of Civilian Defense and the Health Preparedness Commission of the State War Council.

Cancer Teaching Day

A CANCER Teaching Day will be held in Utica on June 17 through the cooperation of the Oneida County Medical Society, the Utica Academy of Medicine, the Fifth District Branch of the Medical Society of the State of New York, the State Medical Society, and the New York State Department of Health, Division of Cancer Control. The instruction will take place at the Hotel Utica.

The meeting will be called to order at 4:00 P.M., when the following program will be heard:

4:00 P.M. "The Management of the Patient with Advanced Cancer" Norman Treves, M.D., associate surgeon, Memorial Hospital, New York City, and consultant, neoplastic diseases, Meadowbrook Hospital, Hempstead, New York, "Cancer of the Larynx, Bronchi, and Esophagus" (illustrated with motion

pictures and lantern slides) Chevalier L. Jackson, M.D., professor of bronchoesophagology, Temple University School of Medicine and Hospital, Philadelphia

6:15 P.M. Dinner

8:00 P.M. "Cancer of the Colon and Rectum" George E. Binkley, M.D., attending surgeon, Memorial Hospital, New York City
"The Significance of Enlarged Lymph Nodes" Lloyd F. Craver, M.D., attending physician, Memorial Hospital, New York City

Chairman of the meeting will be Ross D. Helmer, M.D., president of the Utica Academy of Medicine.

Dinner will be served at the Hotel Utica, and the committee requests that advance reservations be made.

Treatment of Leg Fractures in War Surgery

THROUGH the cooperation of the Medical Society of the State of New York and the New York State Department of Health, a lecture was arranged for the Suffolk County Medical Society on the subject, "Treatment of Fractures of the Leg in Relation to War Surgery." The speaker was David Gold-

blatt, M.D., assistant clinical professor of surgery, New York Post-Graduate Medical School, Columbia University.

The meeting of the society, which was held at 2:00 P.M. on April 28, took place in Friede's Inn, Smithtown, Long Island.

BOARD OF COUNCIL ON ALCOHOL PROBLEMS TO MEET

The Board of Directors of the Research Council on Problems of Alcohol will hold its quarterly meeting on June 8 at the Hotel Commodore in New York City.

who cannot obtain medical or dental treatment from United States sources will receive free treatment from the Canadian medical and dental services. Similar treatment will be accorded Canadians here.

Ainsworth Road

Named for Major General Fred Crayton Ainsworth (1852-1943), of Vermont, the medical officer who devised the Army's system of personnel records and who became adjutant general of the Army.

Eustis Road

Named for Surgeon William Eustis (1753-1825), of Massachusetts, who served as a medical officer during the Revolution and became Secretary of War in President Jefferson's cabinet; member of Congress; Governor of Massachusetts.

McHenry Road

Named for Surgeon James McHenry (1753-1816), of Pennsylvania, who served as a medical officer during the Revolution and became Secretary of War in President Washington's and President Adams' cabinets; Member of Con-

gress; member of the convention which framed the Constitution of the United States.

Myer Road

Named for Brigadier General Albert James Myer (1828-1880) of New York, distinguished field surgeon and student of military communication systems; founder of the Signal Corps and first Chief Signal Officer of the Army; father of the Weather Bureau.

Winter General Hospital itself is named for the late Brigadier General Francis Anderson Winter, who was Surgeon of the Lines of Communication in France early in the first World War and later became senior American medical officer in Great Britain.

Physiotherapists Needed in Army Hospitals

WITH an average of almost 400 physiotherapy patients a day at Walter Reed General Hospital, the Army has found an urgent need for qualified physiotherapists. The present staff is composed of only 7 graduates, 9 apprentices, and 26 students. The Army will accept as students of physiotherapy women who hold college degrees in physical education and who possess the added qualities of patience, imagination, optimism, faith, and ingenuity.

Their work with war veterans is considered an

important aspect of the restoration of nerve functions, and since nerve injuries are more prevalent in this war than they were in the last, the demand for physiotherapists is naturally increased. By prescribing a course of skillfully graduated exercises, the physiotherapist teaches and encourages the patient to use what physical and intellectual powers are left to him.

Massage, exercise, and heat are the three essentials in the physiotherapist's treatment of war injuries.

Organize Emergency Medical Units

EMERGENCY units of physicians to aid in the care of civilian casualties and other patients who may be transferred from urban hospitals in critical defense areas to base hospitals in safe areas are being organized at the request of the Office of Civilian Defense and the U.S. Public Health Service.

The work of organization is being handled by selected hospitals and medical schools. These emergency units—which will be known as Affiliated

Hospital Units—may also be called upon to assist the Army in the event of military necessity.

Physicians selected will receive inactive commissions as reserve officers in the U.S. Public Health Service. Eligible physicians will be restricted to doctors who are 45 or over, women physicians, physicians of any age who are disqualified for Army duty, and physicians who have been classed as essential for civilian needs.

Improvements

The \$1,500,000 outpatient building at Kings County Hospital, dedicated in October, 1941, by Mayor LaGuardia, was opened for use on May 4.

Facilities in the new building are double those in the crowded clinic quarters on the first floor of the main hospital building. The clinic has been moved to the new building, according to Dr. Israel Magelner, medical superintendent, and accommodations for clinic patients are much better.*

Syracuse General Hospital, newly enlarged and improved, was formally dedicated on May 1.

Mayor Thomas E. Kennedy accepted the presentation of the hospital on behalf of the city. The board of trustees, the women's guild staff doctors, and executive members of the nursing staff attended the ceremonies, which were broadcast by Station WFBL. Delegations from other Syracuse hospitals crowded the small auditorium.

In praising members of the hospital staff who operated at full capacity during the period of construction, James D. Taylor, Jr., announced that the work had been done exclusively by Syracuse labor and in every possible instance, city-manufactured materials had been used.*

On May 3 Albany Hospital and the Junior League opened a nursery school for children of nurses, hospital employees, and men and women hospital volunteers at the Albany Home for Children. Miss Marion Case, director of the Child Care Center at School 6, is director of the new school.*

Jamestown General Hospital is to have new x-ray equipment, as the result of action taken by the Health and Hospital Board on April 29.

A control unit for venereal disease is to be established in the Pathological Dormitory Building of Bellevue Hospital in New York City, it was disclosed with the filing of plans for building alterations to accommodate the new center.

The control unit is part of the recently announced Federal-local cooperation in combating venereal infection and spread under wartime conditions.*

With a modernization program estimated to take three years to finish, the central buildings of Veter-

Hospital News

Employees Honored on Hospital Service Anniversary

ONE hundred employees who have been with the Associated Hospital Service of New York for five years or more were honored at a dinner given on May 7, the eighth anniversary of the founding of the hospital service plan. The dinner, at which AHS officers were hosts, was held at the Cafe Loyale. Louis H. Pink, president, presided.

Honored, in addition to the employees, were one executive officer and six members of the board of directors who have served at least five years. The officer was Frank Van Dyk, vice-president in charge of enrollment, who has been with the organization since April 15, 1935, and was the first executive director.

The board members were William C. Breed, Jr., attorney; the Rev. Joseph F. Brophy, director of the Health Division of Catholic Charities, Diocese of Brooklyn; Stanley Resor, president of J. Walter Thompson Co.; John F. Bush, executive director of Presbyterian Hospital; David H. McAlpin Pyle, attorney who for a number of years was president of the United Hospital Fund; and George E. Warren, vice-president of the Chase National Bank. The first three were among the incorporators of the non-profit hospital service plan.

The employees who were honored represent one-sixth of the present personnel. It was decided to

form a Five-Year Club, of which they became charter members and to which other employees will be admitted as they attain five years of service.

Twenty-one other employees are eligible for the Five-Year Club but could not be present at the dinner because they are serving with the armed forces.

They include Miss Gertrude Leff, a WAAC, and Capt. Joseph Dreyfuss, of the U.S. Army, who was one of the original employees. All are on leave from Associated Hospital Service.

Reminiscences brought out that the 5 employees with the longest service were Frank Hughes, who came to the organization as assistant to the director on April 29, 1935, and is now division bureau chief; Mrs. Berte Potassin Eckstein, who began with the addressograph department on May 6, 1935, and is now head of that department; Miss Jeannette Bevan, who started with the enrollment department on May 13, 1935, and is now supervisor of enrollment correspondence; Miss Rose Credendino, who was employed as a secretary May 20, 1935, and is now office manager of the Westchester branch at Mt. Vernon, and Miss Eleanor McIntyre, who was employed for general office work on May 27, 1935, and is now secretary to one of the executives.

Distinguished Medical Officers Honored at Winter General Hospital

WINTER General Hospital, U. S. Army hospital in Topeka, Kansas, has adopted the interesting plan of naming its important clinics, buildings, and streets for distinguished deceased medical officers of the Army who so far have never been honored by having their names given to buildings, general hospitals, or other entities of the Medical Department, U. S. Army.

The names are selected as appropriate for the particular clinic or building. The names of the streets are those of medical officers who have become the heads of other branches of the Army.

The following are the names so far selected:

The Waterhouse Medical Clinic

Named for Surgeon Benjamin Waterhouse (1754-1846), of Massachusetts, who introduced vaccination in America; first professor of medicine at Harvard.

The John Jones Surgical Clinic

Named for Surgeon John Jones (1729-1791), of New York, who wrote the first American medical book, founded the New York Hospital; first professor of Surgery at King's College, now Columbia University.

The Northington Roentgenological Clinic

Named for Colonel Eugene Garland Northington (1880-1933), of Alabama, pioneer student of military roentgenology; lost both arms and finally his life from malignancy due to exposure to the rays before their danger was known to science.

The Rodriguez Dental Clinic

Named for Major Fernando Emilio Rodriguez (1888-1932), of Puerto Rico, who made the first studies of the bacteriology of dental caries.

The Keen Neurosurgical Clinic

Named for Major William Williams Keen (1837-1932), of Pennsylvania, pioneer student—with his colleagues, Acting Assistant Surgeons Silas Weir Mitchell and George Reed Morehouse—of gunshot wounds of nerves; one of the

few medical officers who served in both the Civil War and the first World War.

The Rush Neuropsychiatric Clinic

Named for Surgeon General Benjamin Rush (1745-1813), of Pennsylvania, author of the first American book on insanity, the only systematic American treatise on the subject before 1833; signer of the Declaration of Independence; founder of the University of Pennsylvania.

The Shippen Clinic for Women

Named for Director General William Shippen, Jr. (1736-1808), of Pennsylvania, first teacher of obstetrics in America; first professor of surgery in America; founder of the University of Pennsylvania.

The Woodward Laboratory

Named for Lieutenant-Colonel Joseph Janvier Woodward (1833-1884), of Pennsylvania, pioneer in photomicrography; eminent anthropologist; president of the American Medical Association.

The Fletcher Medical Library

Named for Colonel Robert Fletcher (1823-1912), of the District of Columbia, first editor of the *Index Medicus*; eminent bibliographer and anthropologist.

The William Brown Pharmacy

Named for Physician General William Brown (1748-1792), of Virginia, author of the first American *Pharmacopeia*.

McGee Hall (Nurses Quarters)

Named for Contract Surgeon Anita Newcomb McGee, M.D., R.N. (1864-1940), of the District of Columbia, organizer of the Army Nurse Corps and leader in advancing the profession of nursing in America.

Boschen Hall (Enlisted Men's Recreation Building)

Named for Major General Frederick Wegener Boschen (1876-1942), of New York, hospital steward who became Chief of Finance of the United States Army.

Leonard Wood Road

Named for Major General Leonard Wood (1860-1927), of New Hampshire, who won the Medal of Honor for extreme gallantry as a medical officer, and who became Chief of Staff of the Army.

cian, and Dr. James L. Wilson to Associate Visiting Surgeon.

Goldwater Memorial Hospital has promoted Drs. Sidney Cohen and Shepard Shapiro to the rank of Associate Visiting Physician.

Dr. Albert H. Garvin was unanimously elected president of the Buffalo and Erie County Tuberculosis Association on May 5.*

Dr. Walter E. Lawrence has been appointed assistant physician to Dr. James M. Blake at Glenridge Sanitarium, in Schenectady. He succeeds Dr. Edmond A. Suss, recently appointed physician in charge of Homestead Sanitarium, Middle Grove.*

Mrs. Amelia C. Richards, of Sleepy Hollow Manor, former superintendent of Tarrytown Hospital, has been appointed superintendent of Ossining Hospital.

Mrs. Richards succeeds Mrs. Grace Woods, who left in April to fill a mission for the American Red Cross.*

Dr. John E. Free, of Ogdensburg, has been appointed chief operating surgeon at the A. Barton Hepburn Hospital in Ogdensburg.

Dr. Free succeeds Dr. Grant C. Madill, also of Ogdensburg, who died on March 20. He has been practicing in the city since 1920 and has performed many operations at the Hepburn Hospital.*

Newsy Notes

Impelled by the interest of their wives and daughters in hospital work, increasing numbers of public-spirited men are following suit and volunteering their services. "If the women can do it, why can't we?" is an argument with which no hospital administrator will take issue; instead, he will proceed to find logical places for such willing hands.

A recent check-up reveals training programs for amateur orderlies, comprising ten or fifteen hours during which the registrant is instructed in moving patients to and from the operating room and in certain simple procedures in bedside care, including the setting up of Balkan frames. In addition, public-spirited citizens are running elevators, driving ambulances, performing clerical and other administrative duties, and even acting as watchmen. One institution boasts an architect, a lawyer, and a banker among its most loyal workers, and a community interest so great that several industrial concerns are granting time off during the day to younger executives who are willing to give their services.

What greater assurance can the harassed hospital administrator have than the knowledge that the public recognizes the urgency of the situation and is ready to roll up its sleeves to help! It makes even the problems of volunteer training and management seem small in comparison.—*The Modern Hospital*

Pianos are needed in New York City hospitals for work in musical therapy, according to Harriet Ayer Seymour, director of the National Foundation of Musical Therapy.*

Many hospital services in Brooklyn would have to be discontinued if it were not for the help of the Red Cross Nurses' Aide Corps, according to Dr. John J. Gainey, president of the Medical Society of the County of Kings. Dr. Gainey, in a recent statement, called the service "invaluable." He said: "The hospitals of Brooklyn have found that the Nurses' Aides are rendering an invaluable service. We find that these volunteers, when properly trained, are of great assistance to both the nurses and the doctors in the wards and clinics of the hospitals."

Mrs. Carroll J. Dickson, Brooklyn chairman of Red Cross Nurses' Aides, said Nurses' Aides make beds, bathe patients, assist in the supply room and utility room, prepare trays, feed patients, and do a great many things for their comfort which it would be impossible for the trained nurses to do.

Qualified women citizens over 18 years of age with a high-school education or its equivalent may register for this work.*

The medical board of Morrisania City Hospital and numerous friends held a testimonial dinner and dance at the Concourse Plaza Hotel on May 15 in honor of Dr. Julius Lewis Amster, in recognition of his services as president of the medical board and visiting surgeon and to mark his recent elevation to the position of honorary consulting surgeon. The proceeds of the dinner are to be used as an endowment of the J. Lewis Amster Library of the Morrisania Hospital.

New York Hospital, the first hospital established in New York and the second in America, has issued an appeal for men volunteers to serve as orderlies for three hours two nights a week. After training, the volunteers would perform for male patients tasks comparable with those of the women nurses' aides.

At present, New York Hospital has 10 men attending classes and serving as orderlies two nights a week and 5 other volunteers, 2 in the pharmacy department, 2 in the x-ray department, and one in the personnel department.

The appeal is addressed to business and professional men who have been deferred in the draft because of age, dependency, or physical disability. The men serving at present report to the hospital at 6:00 P.M. on Mondays and Wednesdays, attend a class conducted by the head orderly for the first hour, and then go on duty from 7:00 P.M. to 9:00 P.M. under the supervision of a professional orderly.*

A central school of nursing for Staten Island, directed and operated by Wagner College, with the

ans Hospital in Castle Point will undergo a complete transformation. The governmental appropriation has been received and work has already been started on this extensive project, the largest since the hospital was completed in 1924.

There will be two separate and distinct construction programs. One of these consists of the waterproofing and refinishing of the outside of the buildings, roofs, and other exposed portions of the structures, as well as the plastering and painting of the buildings and other work.

The second program, an extensive project in itself, will include the modernization of the two large, main buildings. The work will consist of interior reconstruction of the buildings and a re-allocation of space, with an approximate increase of 122 beds. The present official capacity of the hospital is 479, and the emergency capacity is 517 patients. On the basis of the normal capacity, an increase of 122 beds would be practically an increase of 25 per cent, making a total capacity, when the improvements are finished, of about 600 beds.

When the changes in the wards are completed, there will be many more private rooms and less ward space. More semiprivate rooms will be provided.*

. . .

The surgical equipment and medical equipment of the late Dr. Grant C. Madill, Ogdensburg physician and surgeon, have been left to the A. Barton Hepburn Hospital in Ogdensburg, where he practiced for over a half century.*

At the Helm

Joseph Freeman, for many years actively identified with Brooklyn philanthropies, has been re-elected for a second term as president of the Jewish Sanitarium and Hospital for Chronic Diseases.

Prior to his election last year as president of the institution, Mr. Freeman served as chairman of both the executive board and the medical lay committee.

Other officers re-elected were Abraham S. Singer, honorary president; Isaac Albert Jacob Ponemone, Mrs. Max Blumberg, Max Finkelson, David Serota, and Murray Rosenbloom, vice-presidents; Andrew N. Miller, treasurer; Ethel Nagel, secretary; Henrietta Klein, recording secretary; Bernard Lebovitz, executive director; Lt. Morrell Goldberg, on leave with the Army, superintendent; Mrs. Minnie Tulipan, director of social service; and Harry Meyerowitz, chairman of the board.*

. . .

E. Roland Harriman has been named permanent chairman of the Red Cross Greater New York Camp and Hospital Council, which will unify Red Cross units serving camps and hospitals within the area.

The purpose of such councils is to seek, through cooperation of the Red Cross units in the vicinity, to give the maximum service to soldiers and sailors in camps and hospitals. The new one is the twenty-fourth in the North Atlantic area, and brings to 136 the number of such councils in the country.

The chapters of the Red Cross embraced within the council of the New York area are those of New York, Brooklyn, the Central Chapter of Queens, North Shore, and Staten Island. At council meetings each chapter will be represented by two delegates and an alternate.

. . .

Work has been started on a two-story and basement annex to Memorial Hospital in Niagara Falls, which will provide accommodations for beds for 100 additional patients and bring the hospital's capacity to 262 beds. The Federal Works Agency granted \$296,753 for the full cost of the addition.

The annex will be of brick exterior, with wood floors and roof.

FWA Regional Director John M. Gallagher said that the building will be leased to the Memorial Hospital Association for the duration of the war and a short time thereafter.

The project was certified as to need by the U.S. Public Health Service because of increased industrial population in the Niagara Falls area.*

. . .

The A.W.V.S. has given a completely furnished ambulance to Mother Cabrini Hospital in New York City.*

. . .

Plans have been drawn by hospital officials for a new fireproof wing to increase considerably the capacity of St. Jerome's Hospital in Batavia. A campaign will be conducted early next fall for funds with which to build.*

. . .

Dr. G. O. Gardner has been elected medical director of Utica Memorial Hospital to succeed Dr. Harold C. Lyman, who recently resigned because of ill health after serving about ten years in that position.

Dr. Ina C. Hall, of Richmond, Virginia, succeeded Miss Katherine Jones as superintendent of the Brooks Hospital in Dunkirk on April 15. Miss Jones recently announced her intention to retire after seventeen years' service as superintendent.

The new superintendent is a graduate of the Wheeling Hospital school for nurses at Wheeling, West Virginia. She received her bachelor of science degree in nursing at West Virginia University and won her doctor of medicine degree at the Medical College of Virginia in 1938. She then took her Master of Arts degree in hospital administration at the University of Chicago and served her administrative internship at Wisconsin General Hospital at the University of Wisconsin.

Dr. Hall served as instructor in anatomy and histology at West Virginia University Medical School and for three years was assistant director of the Medical College of Virginia, hospital division.

Dr. Hall is a member of Alpha Epsilon Iota Medical Society.*

. . .

Dr. John H. Sheldon was elected president of the Glens Falls Hospital staff at the annual meeting in the hospital on May 4. Other officers elected are Dr. B. C. Tillotson, vice-president, and Dr. W. W. Bowen, secretary-treasurer.

. . .

Harlem Hospital has announced the promotion of Dr. Cyril H. Dolly to Associate Visiting Physi-

President's Address*

Annual Meeting—Medical Society of the State of New York

G. W. CORTIS, M.D., Jamestown, New York

IT SPEAKS well for our profession that at a time when every doctor is overworked so many are willing to take time to attend this meeting in order to keep informed. We can well be proud of our part in the war effort. I feel safe in saying that there are few men in this audience not in uniform who are not barred from military service by reason of age, physical handicaps, or indispensability. In spite of the fact that our armed forces require the services of practically all physically fit doctors of military age, no draft has been necessary to fill our quota.

Our people are told in newspapers and over the radio of Americans fighting on land and sea, but they are seldom reminded that Army or Navy doctors are under fire wherever our troops fight—in the jungles of Guadalcanal, the mountains and deserts of Africa, and on every warship that is sent to the bottom of the sea. Yes, and on ambulance planes in the air. It is necessary that we kill the enemy, but it is also necessary that we save the lives of our own wounded men. That requires more than courage. It requires coolness, devotion, and skill. At Pearl Harbor, in spite of frightful burns and the shattering wounds of high explosives, 96 per cent of the wounded were saved. Of 4,000 wounded in the southwest Pacific, the Navy reported that only 7 died.

These things need to be said. They give us faith in ourselves and in our ideals. In the years just ahead we shall need all of that faith, not only because we are in a war for survival, not because that war will be long and hard, but because of what will happen after the war is ended.

Nobody can forecast the duration of the war, but the statesmen of all the Allied Nations are already planning for the postwar reconstruction. Hundreds of committees in this country are preparing plans. Medical care is at or near the top of the agenda of every conference dealing with postwar problems.

It is not the war alone that makes this necessary. The past decade has been one of great social upheaval. All the peoples of the world have been moving toward a new way of life. Society as we have known it is already a thing of the past. It will be replaced by what is in the making today. Call it what you will—the New Order, the Wave of the Future, or the New Deal. The name means nothing; the fact means everything.

As a profession we are interested in all programs dealing with public health and medical care. Our interest is selfish in so far as it is concerned with the defense of our independence of action and the maintenance of our ideals of service. But transcending all selfish thoughts is our sense of duty. Knowledge brings more than power; it imposes responsibility. If we shirk that responsibility and do not contribute the full measure of our understanding to the solution of the great problem of health, we shall have no

reason to complain if a new system of medical care is imposed upon us from without.

In my annual report I recommended to the House of Delegates that a permanent committee be set up to study all questions concerning the relation of medicine to society and to prepare our own blueprints for the future. Even before that report had been published such a resolution was prepared and ready for submission to the House of Delegates. Its passage by the House yesterday is proof that the Medical Society of the State of New York is prepared to accept the challenge of the times. It has taken the first step. Now I would like to suggest what I believe should come next.

A few weeks ago I talked with a wise man who for years has been studying at first hand the medical situation in practically every country on the globe. He approved of our setting up a committee to prepare plans for the future, but he said, "Your view is too limited. You think in terms of organized medicine, forgetting that it is only one of many organs involved in maintaining the health of the social body. Like the liver, it is the largest and has the greatest number of cells. By comparison the parathyroids and the pituitary in size and in the number of cells are relatively insignificant; but they also are essential to health."

He was right. In our thinking we have been isolationists, blind to the importance of other agencies which operate in the broad field of health. I know that some men are already thinking of a super-council which would bring together the knowledge and experience of all the important agencies having to do with our problems. The National Research Council might serve as a model.

In such a council men could fit together the parts of the jigsaw puzzle of medical care. To the puzzle each would bring the pieces which represent his special field. But to form a complete picture, with no piece missing, every important agency dealing with matters of health must be represented. Each of them has an interest in the great problem that we are too likely to consider exclusively our own. Each has something important to contribute and each would benefit by the knowledge and experience of the others. In no other way could conflicting interests be so well reconciled, and in no other way can an all-inclusive plan be made.

What agencies should be represented on such a council? Opinions will probably differ, but in order to emphasize the diversity of interests involved I would tentatively propose the following:

1. The American Medical Association. I place it first not only because it is the largest, but because its activities overlap those of most of the others. It is like a huge ganglion cell whose dendrites reach out and make contact with those of all the others.

2. The American College of Surgeons. The work done by the College in raising the standards of surgical practice and of our hospitals would certainly entitle it to representation.

3. The American Hospital Association. The hospitals of this country have had a phenomenal growth not only in numbers and in patient capacity, but in the complexity

* Delivered at the 137th Annual Meeting of the Medical Society of the State of New York, Buffalo, May 4, 1943

cooperation of Staten Island Hospital and Richmond Memorial Hospital, two private voluntary hospitals of Richmond Borough, has been approved by the directors of all three institutions. First classes will open July 1, according to an announcement by Dr. Clarence C. Stoughton, president of the college.

Students will not only train to receive their license from the state as professional nurses, but also opportunity is provided by which they may return to the college campus for a fourth year and earn a bachelor of science degree.

The program represents a sharp change in nursing education. Stimulated both by federal and state authorities, it marks a departure from the program of having such education centered in hospitals. All of the purely theoretic training in the sciences and nursing arts will be given on the Wagner campus. The practical work will be carried on in the hospitals' wards, under the direction of the college, and student nurses will be sent to all participating hospitals, instead of to just one.

Under the new program, as outlined for the Wagner College, school students will spend their first eight or nine months on the college campus and the next two years in the hospitals. At the end of this time they will take their state examinations and, if successful, be given their certificates as registered professional nurses. If they then elect to do so, they may return to the college for a fourth year and receive their bachelor of science degree also.

The new college-centered school has the approval of the State Department of Nursing and the New York State Nursing Council for War Service.

Two other such community schools have been established under state approval: one at Adelphi College in Garden City and one at Keuka College, near Penn Yan.—*Better Times*

• • •

Lydenham Hospital in New York City celebrated its fifty-first anniversary in April. More than

\$15,000 was raised for the institution at a dinner-dance held at the Waldorf-Astoria Hotel.

• • •

Guaranteeing their patients an ample supply of food for the summer and fall, two more hospitals have made plans for extensive victory gardens. The Long Beach Hospital, in Long Beach, will use all its available space for a garden and will provide a means of canning and preserving the surplus for the winter.

The Westchester Division of the New York Hospital, in White Plains, has had 40 acres plowed up and has added a new team of horses for farm work. Allowing 20 acres for potatoes, 10 for corn, and 10 for assorted vegetables, directors of the institution hope to raise enough produce for summer, fall, and part of the winter.

An extra 10 acres will be set aside for garden plots for hospital employees.

• • •

The adjustment of the tuberculous patient under wartime conditions, from the standpoint of rehabilitation, nutrition, education, family dislocations, and the like, was the subject of discussion at the meeting of the Nursing and Social Service Section of the Tuberculosis Sanatorium Conference of Metropolitan New York held Monday, May 24, at 8:15 P.M. in the Einhorn Auditorium of Lenox Hill Hospital. Miss Bosse B. Randle, R.N., director, Division of Public Health Nursing, Nassau County Department of Health, presided.

Dr. I. D. Bobrowitz, Medical Superintendent of the Municipal Sanatorium, Otisville, was moderator. Other participants in the discussion were: Miss Muriel E. Anness, R.N., county nurse, Nassau County Department of Health; Mr. Kenneth W. Hamilton, supervisor, New York State Bureau of Vocational Rehabilitation; Miss Martha Howard, R.N., induction nurse, 113th Infantry Armory, Newark, New Jersey; and Miss Marie V. Krause, director, nutrition clinic, New York Hospital.

TUBERCULOSIS COMMITTEE TO MEET

"Wartime Citizen Service for Public Health" is the theme of the Annual Meeting of the State Committee on Tuberculosis and Public Health, which will be held on June 2 and 3 at the Commodore Hotel in New York City.

The meeting will open on June 2 with a presentation of wartime citizen services by city and county tuberculosis and health associations in three simultaneous round-table meetings, made up according to population of their areas. This program will be continued in the afternoon, ending in a joint session of the three groups.

The schedule for June 3 includes a symposium on the influences of war emergency, favorable or unfavorable, on the eradication of tuberculosis. The annual business meeting of the State Committee will be held that afternoon.

MEDICAL SLANG

There is not sufficient distinction in the medical mind between the spoken and the written word. Certain medical slang is highly descriptive and emotionally and intellectually suited to the purpose of professional discussion; when, however, such idiom is transferred to print it produces a different effect. There are too many examples of words and phrases incorporated and accepted into the medical press which offend against rules of style and grammar. Textbooks on "the acute abdomen" are numerous: disease may be acute, but an abdomen, never. Exactness and dignity are the two essential qualities of good medical expression. The surgeon who "laparotomises" his patient and the physician who diagnoses "P.T.B." achieve neither.—*The Decay of Medical Language*, editorial in the *New Zealand M. J.*

Medicine and the Changing Order

A COMMITTEE to Study Medicine and the Changing Order has been organized by the New York Academy of Medicine. The objectives of this committee are defined as follows:

"To be informed on the nature, quality, and direction of the economic and social changes that are taking place now and that are clearly forecast for the immediate future; to define in particular how these changes are likely to affect medicine in its various aspects; to determine how the best elements in the science of medicine and its services to the public may be preserved and embodied in whatever changed social order may ultimately develop."

The Committee plans to survey the changes that are currently taking place in our economic and social organization and to consider also any changes which are likely to take place during the next decade. In this survey the Committee will solicit information and opinion from a wide variety of groups, including sociologists, economists, representatives of organized labor, industrialists, bankers, and politicians.

Every shade of political and economic thought is to be represented.

Also, in this connection, the Committee will solicit the cooperation of all those intimately connected with medicine, for the work will be devoted primarily to the study of how, within the changing social order, the best qualities in medical service, in medical education, and in medical research can be preserved and developed. It is expected that the study will continue until such time as sufficient evidence has been accumulated to make possible a considered report.

Members of the Committee are: Dr. Malcolm Goodridge, *Chairman*; Dr. Arthur F. Chace, Dr. James Alexander Miller, Dr. Alan Gregg, Dr. George Baehr, Dr. Harry Aranow, Dr. I. Ogden Woodruff, Dr. Paul Reznikoff, Dr. Henry W. Cave, Dr. Tracy J. Putnam, Dr. Wilson G. Smillie, Dr. Jean A. Curran, Dr. Herbert B. Wilcox, Dr. Howard Craig, Dr. E. Tolstoi, Dr. E. H. Pool, Dr. Robert Pound, and Dr. Iago Galdston, *Secretary*. Committee associates are Mr. John W. Davis and Mr. W. S. Gifford.

County News

Albany County

Albany celebrated Mother's Day proudly this year, with its remarkable record of only one maternal death in 1942 when 3,560 babies were born in the city.

This was achieved in a year when the birth rate increased approximately 600 over the 1941 total, when enrollment of physicians for military service left only seven obstetricians in the city, and when hospital facilities were curtailed sharply by a war-time shortage of nurses and maintenance employees. There were 12 maternal deaths in 1941.

The drop in the maternal mortality rate is the outcome of a decade of missionary work, begun by the Maternal Welfare Committee of the Albany County Medical Society, to educate the public on the importance of adequate prenatal and postpartum care.*

Bronx County

Adolph J. Chesley, Bronx Rationing Administrator, announced, following a conference with an advisory council of the Bronx Medical Society, that Bronx physicians will assist in working out a schedule to be used in connection with special rationing cases in which diabetics and other sick persons may require special consideration.

Patients will be granted special allotments on presentation of applications accompanied by a physician's statement which will give the reason why certain foods are needed and the amount needed.

The advisory physicians are Dr. Frederick Williams, Dr. Edward C. Podvin, Dr. Philip Eichler, Dr. Samuel Gitlow, and Dr. William A. Roberts.*

On April 7 Dr. Henry Roth celebrated his fiftieth year in the practice of medicine. Over 300 colleagues and friends attended a dinner given in his honor at the Concourse Plaza Hotel.

Broome County

The May meeting of the county society was held in Binghamton State Hospital on May 11.

Dr. Ulysses Schutzer spoke on "Electroshock Therapy in Mental Illness—Demonstration of Technic."

A Doctor's Emergency Fund has been established, and voluntary contributions will be accepted by the treasurer or at the office of the county society in the Medical Library at City Hospital in Binghamton.

A program to provide persons who are ill with additional food or special foods to meet medical and dietary requirements has been developed by the Eastern Broome County War Price and Rationing Board and the Broome County Medical Society.*

Chautauqua County

The Jamestown Medical Society held its monthly meeting at the Hotel Jamestown on April 22. Following a dinner, the regular business meeting was held, Dr. Hilding A. Nelson, presiding. Dr. Clayton W. Greene, of Buffalo, read a paper on "Differential Diagnosis of Kidney Lesions."*

A nine-point program through which medical service to patients in Jamestown and vicinity can be facilitated has been outlined by a committee of the Jamestown Medical Society in a letter to the *Jamestown Post-Journal*. Need for cooperation is indicated by the statement that "One-half of the most active doctors in Jamestown are now in the Army or Navy."

The Medical Society appointed its committee to study the problem after a communication from the Central Labor Council called attention to difficulty in certain cases of securing a doctor at night.

Here is the reply of the medical society committee:

Editor, Post-Journal
Jamestown, New York

Dear Sir:

A recent communication from the Central Labor Council to the Hospital Board called attention to the difficulty which

* Asterisk indicates item is from local newspaper.

of their functions. In the education of nurses and the training of interns they are a vital part of medical education. Cancer clinics, social service, laboratories, and dispensary service are of great value to the community. Among their many problems are the hospitalization of the families of men in service, workmen's compensation cases, and the charge that they are practicing medicine, especially in connection with hospital insurance. They are the medical centers of all communities.

4. The United States Public Health Service is pre-eminent in the fields of epidemiology, sanitation, nutrition, and venereal diseases. In the framing of any national health program, the experience of this group would obviously be indispensable.

5. The American Public Health Association would bring firsthand knowledge of conditions and needs in the states and territories in relation to the local administration of public health.

6. The medical services of the Army and Navy and the Veteran's Administration will, after the war, represent a very large proportion of the medical profession, and they will be responsible for the medical care of a vast number of veterans and their dependents. If the vote-getting policy of Congress since the last war is any criterion, the number of persons to be served by the Veteran's Administration will be increasing for at least one generation. Representation of these three organizations cannot be omitted.

7. Medical Schools. Whether we flatter ourselves that the A.M.A. is the liver or the brain of our medico-social organism, the medical schools are the gonads since upon them we depend for the perpetuation of medical science. Their curricula must conform to the demands of the new order. They would bring to the conference the viewpoint of educators and they would take away information vital to their own success. Even the pre-medical schools might well be represented because they lay the foundations upon which the medical schools must build.

8. State and National Boards of Licensure. We are too likely to overlook the importance of these bodies. Medical licensure is an outstanding example of the Balkanization of our country. There is no uniformity and little reciprocity between the states. Some accept the certificate of the National Board of Medical Examiners, some do not. The standards run the gamut from very high to very low. The varying requirements are proving

a serious obstacle to the placement of foreign physicians who are now concentrated in our own state. They will in like manner interfere with the dispersement of medical officers after postwar demobilization. So far as I know, no state legislation protects the public against unqualified specialists. Under the new order it is to be hoped that this shameful condition will be corrected by the requirement of licensure over and above that required for general practice.

9. Foundations. We owe a great debt to the many foundations that have financed medical research. It would seem wise to have at least one member of the council to represent these great humanitarian agencies. In spite of their contributions to scientific medicine, some of them are regarded with suspicion as being proponents of socialized medicine. If the suspicion is justified, the best corrective would be contact with the other members of the council. They could bring much of value to us and they could take away much of value to themselves.

Some of these groups have interests and knowledge more or less foreign to those of practicing physicians and yet they constitute an important part of the environment in which we live. Life has been defined as adaptation to one's external relations. To adjust ourselves to this environment we must understand it. Failure of any free organism to adapt itself to the medium in which it lives leads to one of two alternatives: death or parasitism. Medicine will not die, but it could become a parasite of government. That is one reason for our participation in the work of the proposed Council on Health.

There is another argument for the consultative union of the agencies which I have mentioned. Each of them has authority in its own field. Their combined power and influence, if they agreed on a national program, would be great enough to counteract any attempt on the part of a government bureaucracy to seize control. It would be the surest safeguard against the danger of the kind of state medicine that we oppose. I believe that it is worthy of your consideration.

International College of Surgeons to Meet June 14-16

AT THE fourth International Assembly of the International College of Surgeons to be held at the Waldorf-Astoria Hotel in New York City on June 14, 15, and 16 dealing with the subjects of "Rehabilitation" and "War Surgery," the tentative program arrangements will be as follows: (1) papers will be read by eminent authorities in the Grand Ballroom during both morning and afternoon sessions, and (2) continuous roundtable discussions on rehabilitation, war surgery, care of veterans, and allied subjects have been scheduled to run for the duration of the Assembly.

The many distinguished visitors who are expected will include: Admiral Percy Noble, British Admiralty Delegation; Surgeon General R. T. McIntire, Rear Admiral, Medical Corps, U.S. Navy; and Surgeon General Thomas J. Magee, Medical Corps, U.S. Army, who will all be present if their appointments permit.

Visitors to the Assembly are urged to see the many exhibits which will be set up to demonstrate activities in military medical affairs and rehabilitation. Among these will be a visual demonstration on the work of the State of New Jersey Rehabilita-

tion Commission, John J. Toohey, Jr., Director, presenting its Curative Workshop under the personal direction of Mr. J. C. Kupper.

The Veterans Administration, Washington, D.C., of which Charles M. Griffith is Medical Director, will furnish charts showing pictures and descriptions of the routine and special measures in bibliotherapy, occupational therapy, and physical therapy used to aid in the treatment of patients in Veterans Administration Hospitals.

The Medical Detachment of the 17th Regiment, New York State Guard, of which Major Donald R. Beck is Regimental Surgeon, will set up a regimental aid station. The personnel will consist of members of the medical detachment who will be in daily attendance.

There will also be an exhibit by the New York State Department of Social Welfare, Bureau of Services for the Blind, with Ruth B. McCoy in charge.

A large number of motion pictures in color will be shown on craniocerebral surgery, bone and joint surgery, plastic surgery, and war surgery. The medical profession is cordially invited to attend.

Medicine and the Changing Order

A COMMITTEE to Study Medicine and the Changing Order has been organized by the New York Academy of Medicine. The objectives of this committee are defined as follows:

"To be informed on the nature, quality, and direction of the economic and social changes that are taking place now and that are clearly forecast for the immediate future; to define in particular how these changes are likely to affect medicine in its various aspects; to determine how the best elements in the science of medicine and its services to the public may be preserved and embodied in whatever changed social order may ultimately develop."

The Committee plans to survey the changes that are currently taking place in our economic and social organization and to consider also any changes which are likely to take place during the next decade. In this survey the Committee will solicit information and opinion from a wide variety of groups, including sociologists, economists, representatives of organized labor, industrialists, bankers, and politicians.

Every shade of political and economic thought is to be represented.

Also, in this connection, the Committee will solicit the cooperation of all those intimately connected with medicine, for the work will be devoted primarily to the study of how, within the changing social order, the best qualities in medical service, in medical education, and in medical research can be preserved and developed. It is expected that the study will continue until such time as sufficient evidence has been accumulated to make possible a considered report.

Members of the Committee are: Dr. Malcolm Goodridge, *Chairman*; Dr. Arthur F. Chace, Dr. James Alexander Miller, Dr. Alan Gregg, Dr. George Baehr, Dr. Harry Aranow, Dr. I. Ogden Woodruff, Dr. Paul Reznikoff, Dr. Henry W. Cave, Dr. Tracy J. Putnam, Dr. Wilson G. Smillie, Dr. Jean A. Curran, Dr. Herbert B. Wilcox, Dr. Howard Craig, Dr. E. Tolstoi, Dr. E. H. Pool, Dr. Robert Pound, and Dr. Iago Galdston, *Secretary*. Committee associates are Mr. John W. Davis and Mr. W. S. Gifford.

County News

Albany County

Albany celebrated Mother's Day proudly this year, with its remarkable record of only one maternal death in 1942 when 3,560 babies were born in the city.

This was achieved in a year when the birth rate increased approximately 600 over the 1941 total, when enrollment of physicians for military service left only seven obstetricians in the city, and when hospital facilities were curtailed sharply by a wartime shortage of nurses and maintenance employees. There were 12 maternal deaths in 1941.

The drop in the maternal mortality rate is the outcome of a decade of missionary work, begun by the Maternal Welfare Committee of the Albany County Medical Society, to educate the public on the importance of adequate prenatal and postpartum care.*

Bronx County

Adolph J. Chesley, Bronx Rationing Administrator, announced, following a conference with an advisory council of the Bronx Medical Society, that Bronx physicians will assist in working out a schedule to be used in connection with special rationing cases in which diabetics and other sick persons may require special consideration.

Patients will be granted special allotments on presentation of applications accompanied by a physician's statement which will give the reason why certain foods are needed and the amount needed.

The advisory physicians are Dr. Frederick Williams, Dr. Edward C. Podvin, Dr. Philip Eichler, Dr. Samuel Gitlow, and Dr. William A. Roberts.*

On April 7 Dr. Henry Roth celebrated his fiftieth year in the practice of medicine. Over 300 colleagues and friends attended a dinner given in his honor at the Concourse Plaza Hotel.

Broome County

The May meeting of the county society was held in Binghamton State Hospital on May 11.

* Asterisk indicates item is from local newspaper.

Dr. Ulysses Schutzer spoke on "Electroshock Therapy in Mental Illness—Demonstration of Technic."

. . .

A Doctor's Emergency Fund has been established, and voluntary contributions will be accepted by the treasurer or at the office of the county society in the Medical Library at City Hospital in Binghamton.

. . .

A program to provide persons who are ill with additional food or special foods to meet medical and dietary requirements has been developed by the Eastern Broome County War Price and Rationing Board and the Broome County Medical Society.*

Chautauqua County

The Jamestown Medical Society held its monthly meeting at the Hotel Jamestown on April 22. Following a dinner, the regular business meeting was held, Dr. Hilding A. Nelson, presiding. Dr. Clayton W. Greene, of Buffalo, read a paper on "Differential Diagnosis of Kidney Lesions."*

. . .

A nine-point program through which medical service to patients in Jamestown and vicinity can be facilitated has been outlined by a committee of the Jamestown Medical Society in a letter to the *Jamestown Post-Journal*. Need for cooperation is indicated by the statement that "One-half of the most active doctors in Jamestown are now in the Army or Navy."

The Medical Society appointed its committee to study the problem after a communication from the Central Labor Council called attention to difficulty in certain cases of securing a doctor at night.

Here is the reply of the medical society committee:

Editor, *Post-Journal*
Jamestown, New York

Dear Sir:

A recent communication from the Central Labor Council to the Hospital Board called attention to the difficulty which

some people have had in securing a doctor at night. At the regular monthly meeting of the Jamestown Medical Society on March 25 a committee was appointed to study this problem and advise the public.

It is important that the people in this vicinity be aware of the difficulties in order that they shall be willing to cooperate in the matter. Before making specific recommendations the committee believes it wise to clarify the situation.

One-half of the most active doctors in Jamestown are now in the Army or Navy. Of those remaining two are full-time health officers, two are x-ray specialists, one is a pathologist, and six are specialists whose practice does not include general medicine or surgery. Furthermore, of the twenty-eight men who do general practice in medicine or surgery, eight are between the ages of sixty and seventy-one.

In addition to rendering service to the people of Jamestown, Falconer, Colon, Lakewood, and the adjacent territory these men give much time without compensation to the examination of draftees, Civilian Defense work, and free clinics. Practically all of our doctors are working from twelve to sixteen hours a day including Sundays and holidays and they have no regular hours for sleep. We cite these facts not in any spirit of self pity but in order to impress the public with the necessity for cooperation in our effort to render necessary service.

In time of war your doctor must ration his time among the patients in his community. Your consideration in the use of his services is earnestly requested. The Office of War Information says: "Luxury medicine, to which some Americans have become accustomed, is out for the duration." You can help very greatly by keeping in mind the following advice:

1. Whenever possible come to the doctor's office instead of calling him to your home.
2. Call for an appointment early in the morning so that he may schedule his calls more efficiently.
3. Do not ask for a night call unless it is absolutely necessary. In case of children, parents naturally become alarmed during the night. If a child becomes ill during the day, do not neglect to consult your physician early. Telephone advice will often make a house call unnecessary.
4. Use the classified directory in the back of your telephone book. The new directory will contain the names of all physicians remaining on May 1. Do not leave a call for more than one physician. It is unfair to have a physician hurry to your home only to find that some other doctor is already there.
5. Be sure that you call the residence and not the office during the night.
6. It is advisable to have a family doctor upon whom you can depend in case of need.
7. If you are unable to secure the doctor of your choice, do not call the Police Station. Call one of the hospitals and explain the nature of the illness or accident. The night superintendent will then be better able to secure a doctor who will best meet the requirements of your particular case. If you will first try to call a physician and if unable to find one, will call the hospital, we believe that the difficulty will be alleviated so far as it is humanly possible to do so.
8. Have an examination at the first sign of sickness rather than risk a serious illness.
9. Keep your family and yourself in good health and be immunized against all possible contagious diseases.

We wish to emphasize that in general the cooperation of the public has been most gratifying and this spirit is becoming more prevalent all the time. Those who are unreasonable in their demands on the profession are a very small minority and we trust that this communication may result in the elimination of these few exceptions.

Yours very truly,

G. W. CORTIS, M.D.
C. O. LINDBECK, M.D.
E. J. KELLEY, JR., M.D.
Committee of Jamestown Medical Society*

Monroe County

The Civic Medal, awarded annually by the Rochester Museum Association, was presented on May 13 to Dr. George H. Whipple, dean of the University of Rochester School of Medicine and Dentistry. In 1934 Dr. Whipple was cowinner with

Drs. George R. Minot and William P. Murphy, of Boston, of the Nobel Prize in Medicine.

Dr. Arthur M. Johnson, city health officer, was awarded the Albert David Kaiser medal by the Rochester Academy of Medicine at the annual meeting on May 11.

Dr. Johnson was selected by the board of trustees of the Academy, it was reported, because of his ability as health officer and as coordinator of medical defense activities.

To qualify for the medal, which was established in 1939, the recipient must be a member of the Academy who has made an outstanding contribution to scientific research, to the medical profession, or of service to the entire community.

Dr. Johnson has been health officer for eleven years and is now chief of the local Emergency Medical Service of the Office of Civilian Defense. The citation was presented by Dr. Stearns S. Bullen, chairman of the committee on awards.

Previous medalists have been Dr. Kaiser, Dr. David B. Jewett, and Dr. John R. Williams.*

New York County

More than 500 families of moderate means have come to The Consultation Center for advice and help during its first year of operation, according to the first annual report made public on May 8 by Ira M. Younker, chairman of The Consultation Center and a trustee of the Jewish Social Service Association, one of the agencies of the Federation for the Support of Jewish Philanthropic Societies.

These 500 families represented 3,000 separate consultations on complex personal and family problems.

A unique project in the field of family welfare, The Consultation Center has attracted national interest. The purpose of The Center is to make available to those of moderate income a professional service which will help them solve their personal and family difficulties, which today are intensified by war conditions. A minimum fee has made it easier and more comfortable for this group to apply for help, according to the report.

Dr. Joseph Jordan Eller lectured with lantern slide demonstrations to the Army Medical and Dental Corps at the Morrison Field Hospital, West Palm Beach, Florida, on May 7. His subject was "The Diagnosis and Treatment of Benign and Malignant Tumors of the Skin."

At the regular meeting of the Clinical Society of the New York Polyclinic Medical School and Hospital held on Monday, May 3, at 8:30 P.M., the following program was presented: "The Sulfonamides," by James P. Croce, M.D.; "Blood Pressure and the Total Individual," by John Carroll, M.D.; "The Treatment of Paroxysmal Tachycardia and Auricular Fibrillation," by Harold E. B. Pardee, M.D.; "The Management of Lung Abscess," by George G. Ornstein, M.D.; "Apocrine Breast Cancer" (Colored Motion Picture), by Herbert C. Chase, M.D.; "Evaluation of Excretion Urography as Compared with Instrumental Urography," by Joseph F. McCarthy, M.D.; "Gastroduodenal Ulcer; Its Surgical Approach," by Robert E. Brennan, M.D.; "The Hypertonic Infant," by Sidney V. Haas, M.D.; "Premature Babies," by

W. Morgan Hartshorn, M.D.; "Endometrial Implant Occurring in Abdominal Scar Following Cesarean Section," by Edward H. Dennen, M.D.; "The Treatment of Empyema as a Postoperative Complication," by Henry I. Goodman, M.D.; "Three Simple Tests for Bedside and Office Diagnosis of Liver Diseases," by Samuel Weiss, M.D.; and "The Status of Gastroenterology in Medicine," by G. Randolph Manning, M.D.

A report on a two-year experiment in providing family doctors for a group of low-income families on New York City's East Side at a charge of 25 cents a month a person has been made public by the Corlears Hook Medical Association, conductors of the experiment, with the recommendation that its program be placed on a large-scale basis through the help of city funds.

A copy of the report was sent to Mayor F. H. LaGuardia, who appointed a committee to work out a medical insurance plan for moderate-income families of the city. Dr. J. Stanley Kenney, president of the Medical Society of the County of New York, a member of the committee, said last night that the two-year experiment was one of the bases from which the committee hoped to form "a broader plan applicable to low-income groups."

Vladeck House, an experimental housing project, was chosen for the experiment because its 1,771 families were of the low-income group, the average annual income being \$1,050 a family.

By May, 1942, the association had 695 families on its rolls, each person paying 25 cents a month, with a limit of \$1 a family. The fee entitled him to unlimited house or office treatments from any doctor on the association's panel, the patient having the right to choose his own physician and change doctors whenever he wished.

A panel of 58 doctors volunteered their services on this basis two years ago and, although the panel has since shrunk to about half that number, adequate care is maintained for all families in the plan, Dr. Morris A. Brand, medical director of the association, said. The administrative expenses of the association are paid by the New York Foundation, and the monthly fees go entirely to the doctors. The average remuneration received by the doctors has been 90 cents a visit.*

The Army's first woman physician, Dr. Margaret D. Craighill, is a fellow of the New York Academy of Medicine, the American College of Surgeons, and the American Medical Association, and a diplomate of the American Board of Obstetrics and Gynecology.*

Dr. John J. McGowan was toastmaster at a testimonial dinner tendered Dr. J. Stanley Kenney, president of the Medical Society of the County of New York, at the Hotel Biltmore, Wednesday, May 19. The dinner committee, composed of over 30 physicians, was headed by Dr. Alfred Gilbert Forman, chairman.

Conrad Berens, M.D., has been appointed to the National Committee of the American Medical Association on Conservation of Vision.

Dr. H. van Zile Hyde, regional medical officer for the Second Civilian Defense Region, has been transferred to Washington. Dr. John J. Bourke, deputy state chief of Emergency Medical Service for New York, is now acting regional medical officer for the Second Region.

Joseph B. Altruda, M.D., has been appointed associate surgeon in charge of plastic surgery at Mother Cabrini Memorial Hospital.

The Medical and Surgical Relief Committee of America, 420 Lexington Avenue, New York City, has issued an urgent appeal for drugs and instruments to enable it to continue its work of providing emergency medical kits to Coast Guard patrol boats and Navy sub-chasers.

Among the items sorely needed to equip the emergency kits are artery clamps, splinter forceps, scalpels, probes, grooved directors, sulfadiazine tablets, sulfadiazine ointment (5 per cent), sulfathiazole tablets, and sterile shaker envelopes of crystalline sulfanilamide. Any other spare medicines or surgical instruments are, of course, also welcome

New York University has received approval from the council on medical education and hospitals of the American Medical Association for its program to train occupational therapists.

The University's training program, offered in the School of Education, is one of seven in the country which has been approved by the American Medical Association for housing, equipment, curriculum, teaching staff, facilities for practice training in hospitals and financial stability, the announcement stated. Graduates will be eligible after one year of successful practice for listing in the directory of registered occupational therapists maintained by the American Occupational Therapy Association.

A minimum of nine months' training in co-operating hospitals of varied specialties, in addition to four years of college training in biologic and social sciences, clinical subjects, and the arts and crafts, is included in the program. Nearly a score of hospitals in general, psychiatric tuberculosis, children's, and orthopaedic fields cooperate with the university in offering this training.*

Being medical adviser to the Iranian government is a big job, according to Dr. A. A. Neuwirth, former New York City physician and resident of Floral Park, Long Island, and now a lieutenant colonel in the U.S. Army, on loan to Iran. Among his duties are acting as adviser and consultant at the Pasteur Institute in Teheran; advising the American Lend-Lease mission on medical supplies needed in Iran; serving as medical liaison officer with the American Mission to the Iranian army; and working with the Ministry of Health's commission on typhus, smallpox, and typhoid fever.

In his spare time Lt. Col. Neuwirth makes plans for a potable water supply throughout the country, consults with other physicians on difficult cases, and systematizes the medical department of the Iranian army.

Lt. Col. Neuwirth has been in the Army Medical Corps since 1939 and has been in Iran since Feb-

ruary, 1942, when he stopped there with a Lend-Lease mission to aid in the Iranian fight against typhus. He was subsequently chosen medical adviser to the government.

Dr. Charles Frederick Bolduan, retiring director of the Bureau of Health Education of the New York City Department of Health, was the guest of honor at a testimonial dinner held at the Fifth Avenue Hotel, New York City, on Thursday, May 20, at 7:00 P.M. The dinner was sponsored by employees of the Health Department of New York City.

Health Commissioner Ernest L. Stebbins presided, and the speakers included: Dr. James Alexander Miller, former president of the Academy of Medicine, and now chairman of the Academy's Committee on Public Health Relations; Dr. Haven Emerson, former Commissioner of Health and now a member of the Board of Health; Dr. E. H. Lewinski-Corwin, executive secretary of the Committee on Public Health Relations of the Academy of Medicine; and three members of the staff of the New York City Department of Health—Dr. Gustav I. Steffen, an assistant director of the Bureau of Laboratories; Dr. Samuel Frant, director, Bureau of Preventable Diseases; and Mr. Will F. Clarke, assistant in the Bureau of Health Education.

Dr. Bolduan's long career in public health began in 1904 when he joined the Department of Health staff as a bacteriologist. Three years later he was promoted to the position of assistant to Dr. Hermann M. Biggs, general medical officer of the Health Department. In 1914 Dr. Bolduan organized and became the first director of the Department's Bureau of Health Education, in which capacity he remained until 1918. From 1918 until 1928 he was with the United States Public Health Service, first as chief of the section on health education and later as a surgeon in the U.S. Consular Service in Europe. In 1928 he returned to the New York City Department of Health as director of the Bureau of Health Education. His retirement on June 1, 1943, completes 39 years of continuous service in the public health field.

Dr. Bolduan is perhaps best known to public health workers as a teacher, lecturer, and writer. From 1905 to 1908 he was professor of bacteriology and hygiene at Fordham University and from 1929 to 1941 was a lecturer in preventive medicine and hygiene at the same institution. From 1916 to 1921 he was a lecturer in preventive medicine and hygiene at Columbia University. He is the author of several books, including two standard textbooks: *Applied Bacteriology and Immunology for Nurses*, now in its eighth edition, and *Public Health and Hygiene; a Student's Manual* which is in its third edition. Innumerable scientific papers by him have appeared in the publications and reprint series of the Department of Health and in the leading medical journals of the country. He was the editor of the *Quarterly Bulletin*, published by the Department.

Oneida County

Dr. Ira F. Thompson, who was special administrative assistant in the Syracuse Health Department during the Milbank health demonstration, has been named by Gov. Walter S. Goodland, of Wisconsin, as a member of the State Board of Health.

Dr. Thompson is widely known for his work in the public health field. Before coming to Syracuse he was deputy health commissioner in Milwaukee,

and since leaving Syracuse in 1932 he has been the health officer in Racine, Wisconsin. As chairman of municipal administrative practice of the American Public Health Association, Dr. Thompson drafted the record forms now used in nearly all city health departments.*

Dr. George Block has arrived in New York Mills to take over the practice of Dr. Moritz Elias, who entered the service recently.*

The following editorial appeared in the *Utica Press* of April 23:

"Characteristic of the late Dr. Andrew Sloan was the fact that he was a charter member and first president of the Utica Academy of Medicine and for more than twenty years the chief of staff of St. Luke's Hospital. He devoted himself to his profession, and for some forty years was one of Utica's most respected physicians.

"But his interests were not limited by the requirements of his profession. As a native Utican and a member of one of its older families, he took a useful part in many community enterprises. Dr. Sloan was a man of unusual personality, who had a great gift for friendship. That fact, together with his service to the people of Utica, accounts for the keen regret which his death occasioned."

Ontario County

The second quarterly meeting of the county society was held in Clifton Springs on April 13. The program consisted of a business meeting at 5:00 P.M., a dinner at 6:00 P.M., and a scientific session following the dinner. The surgical staff of the Clifton Springs Sanitarium and Clinic gave a "Clinic on Fractures of the Hip."

Dr. C. M. Lee, recently of Wu Shih, China, has joined the Surgical Staff of the Clifton Springs Sanitarium and Clinic.

Dr. T. R. Nichols, of Clifton Springs, will leave early in May to establish practice in Morgantown, North Carolina.

Orange County

Dr. Theodore W. Neumann, of Central Valley, has succeeded Dr. R. L. Schmitt, of Middletown, president of the Orange County Health Association.*

Otsego County

Dr. Cornelius F. Ryan, an assistant physician at Homer Folks Hospital since 1940, has resigned to open his own practice in Oneonta.

A native of Schenectady, Dr. Ryan was graduated from Albany Medical College in 1935.*

Queens County

The county medical society has announced the appointment of a committee to advise the Queens War Price and Rationing Boards on matters pertaining to the medical profession.

This committee, headed by Dr. Francis G. Riley, of Jamaica; includes Dr. Thomas D'Angelo, of Jackson Heights; Dr. Henry C. Eichacker, of Ridgewood; Dr. Charles M. Levin, of Richmond

Hill; Dr. Joseph S. Thomas, of Flushing; and Dr. Abraham W. Victor, of Far Rockaway.

These doctors, appointed by Dr. Jacob Werne, of Jamaica, president of the society, will give particular consideration to the gas rationing problems of the medical profession.

Dr. Levin will head a subcommittee to advise the Queens boards on food problems as they relate to sick persons who need special diets.

This subcommittee supersedes an unofficial medical panel that advised the Jamaica Rationing Board on diet ration problems and which was headed by Dr. Michael Schultz, of Hollis.*

. . .

Dr. Edward R. Richardson, of Flushing, has gone to Boston City Hospital to take up his new duties as an intern assistant to professors of Harvard University.

Dr. Richardson was graduated from Dartmouth College in 1939 and served as a student intern at the Schenectady Home, the Troy Hospital, and the Albany Hospital.

At present he holds the rank of lieutenant in the Army Reserve.*

. . .

Dr. Paul E. Rekers, has issued cards announcing that he will practice medicine in the former offices of Dr. Lief Y. Jacobsen in Douglaston.

A graduate of the School of Medicine in the University of Rochester, Dr. Rekers subsequently took four years of surgical training in Yale University and later did three years of research work at Memorial Hospital in Manhattan. He is at present a member of the staff of Memorial Hospital.*

Rensselaer County

Dr. Benjamin J. Slater, medical director of the Kodak Park Division, Eastman Kodak Company, Rochester, was the principal speaker at the annual meeting of the Rensselaer County Tuberculosis and Public Health Association at the Hendrick Hudson Hotel on May 6.

Dr. Slater, who is vice-president of the Monroe County Tuberculosis and Health Association, spoke on "A Planned Health Program."*

. . .

Dr. Leo Freyberg, of Troy, has been appointed a qualified examiner of the Department of Mental Hygiene for service in Rensselaer County by County Judge Harry E. Clinton.*

Richmond County

A resolution paying tribute to the memory of Dr. H. Lynn Halbert, president of the Richmond County Medical Society, who died recently, was adopted by the society at a meeting held in the Richmond Health Center, St. George, on April 14. A copy will be sent to the doctor's family.

Dr. Allen G. Robinson, assistant professor of radiology at New York Medical College and a lieutenant commander in the U.S. Naval Reserve, spoke on "Radiation Therapy in Civil and Military Practice."

Several medical officers of Halloran General Hospital were guests at the meeting. Dr. D. V. Catalano presided.*

Schenectady County

The public has been urged to become "cancer conscious" by Dr. Ellis Kellert, of Schenectady, chairman of the cancer control committee, in a paper he has prepared in connection with the annual campaign of the Women's Field Army to control cancer, which is now being conducted.

"The cancer committee of the Medical Society of the County of Schenectady urges the public at this time," said Dr. Kellert, "to become cancer conscious; to be alert to the well-recognized danger signals which should not be neglected under the stress of present-day conditions."*

. . .

In cooperation with the war council program to provide adequate care and protection for preschool age children of mothers employed in war industries, the personnel and facilities of the Department's Division of Maternity, Infancy, and Child Hygiene have been utilized in dental health education and correction of dental defects of 65 children enrolled in the nursery classes of the Pleasant Valley, Hamilton, and Van Corlaer schools in Schenectady. When the program is in full swing, it is expected that the enrollment will reach about 300.

The division dental hygienist examined the children and gave them oral prophylaxis. She also assisted the classroom teacher and volunteer aides in presenting the dental health education aspects of the program to the parents of these children. Sixty-one families were represented, including 44 in which mothers were employed and 8 in which the fathers worked nights and slept during the day. Nine families were either in the low-income brackets or had many children and insufficient help at home.

The senior dentist, operating in the division dental trailer, examined and x-rayed the teeth of 62 of the children. Three hundred carious teeth were found in 51, 5.8 per child; 20 in 6 of the 10 two-year-olds, 3.3 per child; 46 in 7 of the 8 three-year-olds, 6.5 per child; 194 in 32 of the 37 four-year-olds, 6.0 per child; and 40 in 6 of the 6 five-year-olds, 6.6 per child. Among the entire group, there were 21 teeth which had been either previously extracted or indicated for extraction; 11 teeth in these categories were in the mouth of one four-year-old child.

Forty-four of the 51 children requiring corrections received complete treatment (86 per cent). The program was carried on during the severest part of the winter between February 10 and March 15, when there were many absences from school. Otherwise, services to a higher percentage of the children would probably have been completed.

Following corrective treatment, the division hygienist again visited the parents and explained the importance of the services rendered, the importance of good daily home care and of periodic inspection and care by the dentist.—David B. Ast, D.D.S., in *Health News*.

. . .

Dr. Bruno C. Mazurowski, of Schenectady, has been appointed to membership on the Schenectady County alcoholic beverage control board to succeed the late Dr. Henry G. Hughes. Announcement of Dr. Mazurowski's selection was made by Chairman James P. Kalteux of the board of supervisors.*

ruary, 1942, when he stopped there with a Lend-Lease mission to aid in the Iranian fight against typhus. He was subsequently chosen medical adviser to the government.

and since leaving Syracuse in 1932 he has been the health officer in Racine, Wisconsin. As chairman of municipal administrative practice of the American Public Health Association, Dr. Thompson drafted the record forms now used in nearly all city health departments.*

. . .

Dr. George Block has arrived in New York Mills to take over the practice of Dr. Moritz Elias, who entered the service recently.*

. . .

The following editorial appeared in the *Utica Press* of April 23:

"Characteristic of the late Dr. Andrew Sloan was the fact that he was a charter member and first president of the Utica Academy of Medicine and for more than twenty years the chief of staff of St. Luke's Hospital. He devoted himself to his profession, and for some forty years was one of Utica's most respected physicians.

"But his interests were not limited by the requirements of his profession. As a native Utican and a member of one of its older families, he took a useful part in many community enterprises. Dr. Sloan was a man of unusual personality, who had a great gift for friendship. That fact, together with his service to the people of Utica, accounts for the keen regret which his death occasioned."

Ontario County

The second quarterly meeting of the county society was held in Clifton Springs on April 13. The program consisted of a business meeting at 5:00 P.M., a dinner at 6:00 P.M., and a scientific session following the dinner. The surgical staff of the Clifton Springs Sanitarium and Clinic gave a "Clinic on Fractures of the Hip."

. . .

Dr. C. M. Lee, recently of Wu Shih, China, has joined the Surgical Staff of the Clifton Springs Sanitarium and Clinic.

. . .

Dr. T. R. Nichols, of Clifton Springs, will leave early in May to establish practice in Morgantown, North Carolina.

Orange County

Dr. Theodore W. Neumann, of Central Valley, has succeeded Dr. R. L. Schmitt, of Middletown, president of the Orange County Health Association.*

Otsego County

Dr. Cornelius F. Ryan, an assistant physician at Homer Folks Hospital since 1940, has resigned to open his own practice in Oneonta.

A native of Schenectady, Dr. Ryan was graduated from Albany Medical College in 1935.*

Queens County

The county medical society has announced the appointment of a committee to advise the Queens War Price and Rationing Boards on matters pertaining to the medical profession.

This committee, headed by Dr. Francis G. Riley, of Jamaica; includes Dr. Thomas D'Angelo, of Jackson Heights; Dr. Henry C. Eichacker, of Ridgewood; Dr. Charles M. Levin, of Richmond

For Safe Effective Antisepsis Without Pulmonary Complications

The fact that ARGYROL has been used repeatedly and with good effect in the bronchoscopic irrigation of the lungs is striking evidence of its freedom from any tendency towards pulmonary complications.

But this is only one of ARGYROL'S many unique advantages. For ARGYROL is *not* just another "germ-killer." It is peculiarly adapted to the treatment of mucous membrane infections. It not only attacks the infectious organisms directly but many writers have observed that it appears to aid and abet the natural defensive mechanisms of the tissues. It promotes a decongestion and circulatory stimulation without resort to powerful vasoconstriction. It stimulates the mucous

glands so as to effect "a physiologic washing of the membrane." It produces no ciliary injury. It is detergent and inflammation-dispelling. And above all, it remains bland and non-irritating in all concentrations from 1% to 50%. Some explanation of ARGYROL'S superiority in these respects is likely to be found in its controlled pH and pAg, its fine colloidal dispersion, its more active Brownian movement.

This is why ARGYROL, in over 40 years of world-wide use, has established an unparalleled record of clinical efficiency and safety. Specify genuine "ARGYROL Barnes in Original Package" whenever ordering, prescribing, or recommending.

ANTISEPTIC EFFICIENCY PLUS

- SOOTHING AND INFLAMMATION-DISPELLING PROPERTIES
- NO CILIARY INJURY—NO TISSUE IRRITATION
- NO SYSTEMIC TOXICITY
- NO PULMONARY COMPLICATIONS
- DECONGESTION WITHOUT VASOCONSTRICTION

Suffolk County

Dr. William Lathrop Love, State Senator for ten years from Brooklyn, and for that period a member of the Health Committee of the Senate, has taken up his permanent residence in East Hampton, where he will practice his profession. He will continue to be a member of the consulting medical staff of the Cumberland Hospital and of the Brooklyn Nursery and Infants Hospital.*

Washington County

Dr. Roy E. Borrowman, of Fort Edward, has been appointed supervisor of Washington County.*

Westchester County

On April 6, Dr. Erich H. Restin, of Mount Vernon, resigned his post as Chief of Emergency Medical Service for the Westchester County War Council. On the same day the Hon. Herbert C. Gerlach, county executive and Director of Civilian Protection for Westchester County, announced the appointment of Dr. E. Leslie Burwell, of New Rochelle, as the new director of Emergency Medical Service, succeeding Dr. Restin. Simultaneously, Dr. George C. Adie, president of the county medical society, announced the appointment of Dr. Burwell as chairman of the county society's War Participa-

tion Committee, a post relinquished by Dr. Restin at the same time that he resigned the directorship of Emergency Medical Service. On April 15, Dr. Burwell announced the appointment of Mr. James E. Bryan, executive secretary of the county medical society, as deputy director of emergency medical service for the county. The director's desk at the district Warning Center in White Plains is regularly staffed by Dr. William A. Holla, county health commissioner, and Mr. Bryan, both of whom reside in White Plains.—*Westchester Med. Bull.*

. . .

Dr. George J. Hogben, of Rye, Dr. John Cannon, of Scarsdale, and Dr. Horace E. Robinson, of Pleasantville, are among the new members of the board of directors of the Westchester Tuberculosis and Public Health Association, elected at the Association's Annual Meeting on April 14. Mr. Alf L. Carroll, of Scarsdale, was re-elected president of the Association.

Case-finding reports were presented by Dr. John H. Korn, director of the tuberculosis division of the county health department; Dr. Joseph J. Arminio, school physician, of Ossining; Dr. Ebba Dederer, school physician, of Mount Vernon; Dr. William G. Childress, director of tuberculosis at Grasslands Hospital; and others.

THE BURDEN OF *Reconstruction*

After the invading infection has been overcome and the temperature has returned to normal, the speed of further recovery depends largely on the patient's nutritional state. Thus adequate food intake is the primary requisite during convalescence.

The burden of reconstruction can be greatly eased and recovery hastened, when New Improved Ovaltine becomes a part of the dietary. This delicious food drink,

with its wealth of proteins, minerals, vitamins, and readily available caloric energy, aids measurably in satisfying the increased metabolic demand for these nutritional essentials, and is always well tolerated.

Ovaltine is advantageously prescribed for all convalescent patients, both medical and surgical, regardless of age. The Wander Company, 360 North Michigan Avenue, Chicago, Illinois.

Creatine and Creatinine Metabolism. By Howard H. Beard, Ph.D. Octavo of 376 pages, illustrated. Brooklyn, N.Y., Chemical Publishing Company, Inc., 1943. Cloth, \$1.00.

Principles and Practice of Obstetrics. By Joseph B. DeLee, M.D., and J. P. Greenhill, M.D. Eighth edition. Quarto of 1,101 pages, illustrated. Philadelphia, W. B. Saunders Company, 1943. Cloth, \$10.

Clinical Diagnosis by Laboratory Methods. By James C. Todd, M.D., and Arthur H. Sanford, M.D. Tenth edition. Octavo of 911 pages, illustrated. Philadelphia, W. B. Saunders Company, 1943. Cloth, \$6.00.

Burns, Shock Wound Healing and Vascular Injuries. [Military Surgical Manuals, Vol. V]. Prepared under the Auspices of the Committee on Surgery of the Division of Medical Sciences of the National Research Council. Octavo of 272 pages, illustrated. Philadelphia, W. B. Saunders Company, 1943. Cloth, \$2.50.

Manual of Veterinary Bacteriology. By Raymond A. Kelser, D.V.M., and Harry W. Schoening, V.M.D. Fourth edition. Octavo of 719 pages, illustrated. Baltimore, The Williams & Wilkins Company, 1943. Cloth, \$6.50.

Therapeutics of Infancy and Childhood. Edited by Harry R. Litchfield, M.D., and Leon H. Dembo, M.D. 4 vols. and desk index. Octavo of 3,831 pages, profusely illustrated. Philadelphia, F. A. Davis Company, 1942. Cloth, \$32.

Therapeutics of Infancy and Childhood, according to the editors, Drs. Litchfield and Dembo, "was conceived in the interest of pediatricians, general practitioners, and those intimately concerned with the welfare of the infant and child." They planned "a work in which the treatment of diseases of the infant and child, no matter how insignificant or minor it might seem, would be included; a reference so complete in detail that when consulted it would make immediately available all desired information." Whether the authors have realized this laudable ambition the reader himself must decide. The limited scope of this review makes a detailed evaluation impossible.

The editors have had the cooperation of at least 115 contributors, including some of the outstanding names in contemporary pediatrics. Every phase of therapy, including psychotherapy, drug therapy, and pediatric surgery, is discussed. With such a large field to be covered and with so many contributors participating, unevenness in the quality of the articles must be expected. Some of the authors have drawn upon their wealth of clinical experience, while others have leaned heavily upon the literature.

Most of the articles are written in good, readable English. There are numerous illustrations, many in colors. In some of the articles the English is poor, the sentence structure is clumsy, and the meaning is ambiguous. Occasionally one finds expressions like the following (Volume I, page 780): "The course is usually short, fast, stormy, and exitus from a few days to a few weeks."

Obstetrical Practice. By Alfred C. Beck, M.D. Third edition. Quarto of 938 pages, illustrated. Baltimore, The Williams & Wilkins Company, 1942. Cloth, \$7.00.

Essentials of Proctology. By Harry E. Bacon, M.D. Duodecimo of 345 pages, illustrated. Philadelphia, J. B. Lippincott Company, 1943. Cloth, \$3.50.

Diseases of the Nose, Throat and Ear. By William Lincoln Ballenger, M.D., and Howard Charles Ballenger, M.D. Eighth edition. Octavo of 975 pages, illustrated. Philadelphia, Lea & Febiger, 1943. Cloth, \$12.

Man in Structure and Function. By Fritz Kahn, M.D., Translated from the German and edited by George Rosen, M.D. Volumes I and II. Octavo of 742 pages, illustrated. New York, Alfred A. Knopf, Inc., 1943. Cloth, \$10.

Standard Nursing Procedures of the Department of Hospitals, City of New York. Prepared by the Committee on Nursing Standards, Division of Nursing, Department of Hospitals, Mary Ellen Manley, R.N., M.A., Director. Octavo of 436 pages, illustrated. New York, The Macmillan Company, 1943. Cloth, \$3.25.

Medical Leaves: A Review of the Jewish Medical World and Medical History. Vol. V. Dr. Hershel Meyer (Ed.). Quarto of 190 pages, illustrated. Chicago, Medical Leaves, Inc., 1943.

REVIEWED

There is no doubt that, in spite of their defects, both the general practitioner and the pediatric specialist will find these volumes useful. The material, for the most part, is up to date, but with the rapid advances in therapy, revision will no doubt be necessary to keep pace. There is a separate volume devoted to a subject index. Unfortunately there is no author's index.

BENJAMIN KRAMER

Vascular Sclerosis with Special Reference to Arteriosclerosis. Pathology, Pathogenesis, Etiology, Diagnosis, Prognosis, Treatment. By Eli Mocshowitz, M.D. Octavo of 178 pages, illustrated. New York, Oxford University Press, 1942. Cloth, \$3.75.

This small volume presents the author's views on arteriosclerosis and similar sclerosis of other parts of the cardiovascular system. He believes that the dominant factor in the production of sclerosis is intravascular pressure. He reviews critically the work of others in the field of vascular sclerosis.

Some points which could have been discussed are not mentioned. However, the author's views are fairly presented, and the book is very stimulating. The illustrations and printing are excellent. The book is easy to read. Everyone interested in this field should find it worth while.

J. HAMILTON CRAWFORD

A Textbook of Gynecology. By Arthur H. Curtis, M.D. Fourth edition. Octavo of 723 pages, illustrated. Philadelphia, W. B. Saunders Company, 1942. Cloth, \$8.00.

The fourth edition of this well-known book is even better than its predecessors. The discussion of chronic pelvic inflammatory disease and also the

[Continued on page 1078]

Therapy with Estrogens

STRIKING THERAPEUTIC RESULTS have been obtained with estrogenic substances, whether natural or synthetic, in alleviating the vasomotor symptoms of the menopause, and in conditions related to deficiency of estrogen. Other reported uses may be considered experimental, except the oral use of synthetic estrogen to relieve or prevent painful engorgement of the breasts—a condition not practical to treat with natural estrogens.

Both Amniotin (natural estrogenic substance) and Diethylstilbestrol Squibb (synthetic) are available in dosage forms for oral, hypodermic, and intravaginal administration. Diethylstilbestrol is lower in cost and, in contrast to natural estrogens, is only slightly less effective orally than intramuscularly. It should be noted however that the high potency of Diethylstilbestrol demands that caution be exercised in its use and that it may, in some instances, be better to build up the estrogenic level with Amniotin by injections and then maintain it with small oral doses of Diethylstilbestrol.

SQUIBB ESTROGENIC SUBSTANCES

Amniotin . . . A highly purified, non-crystalline preparation of naturally occurring estrogenic substances derived from pregnant equine urine. Its estrogenic activity is expressed in terms of the equivalent of international units of estrone. Available in capsules for oral administration, solution for intramuscular injection, and vaginal suppositories.

Diethylstilbestrol . . . A low-cost synthetic estrogen possessing the physiologic properties of estrogenic substances derived from natural sources. Highly effective orally. Available in tablets for oral administration, solution for intramuscular injection, and vaginal suppositories.

[Continued from page 1076]

recent ideas on the pathology of myomata are excellent. The new investigations into pelvic anatomy recently made by Curtis are well stated and beautifully illustrated.

Although very complete in most of its coverage, the work is, however, sketchy in spots. It is nevertheless an excellent book for the medical student or the general practitioner and is highly recommended for their purposes.

CHARLES A. GORDON

The Anatomy of the Nervous System. By Stephen W. Ranson, M.D. Seventh edition. Octavo of 520 pages, illustrated. Philadelphia, W. B. Saunders Company, 1943. Cloth, \$6.50.

This is the seventh edition of a work that has assumed a prominent position in anatomy as well as in neurology. This revision, published shortly before Dr. Ranson's death, represents his latest thoughts on the subject.

There has been a complete revision of the chapter on "The Sympathetic Nervous System," and there has been extensive revision of the sections on the rest of the brain. At the suggestions of various colleagues, there has been rearrangement of the numerous illustrations. The extrapyramidal motor pathways have received considerable attention.

The book has always received a cordial welcome from those who teach neurology, and the present revision should be similarly received. This book is highly recommended for students as well as for those who are interested in neurology and in neuroanatomy.

IRVING J. SANDS

The Principles of Anatomy as Seen in the Hand. By Frederic W. Jones. Second edition. Octavo of 418 pages, illustrated. Baltimore, Williams & Wilkins Company, 1942. Cloth, \$7.50.

For those who are interested in the hand as a hobby, this volume contains many interesting by-paths of quaint information, and numerous diverting references to the observations of old authors. But those who want a textbook on the hand will find such reading too time-consuming and too minutely philosophical for practical use. In times like these, why compare the number of hairs to a square centimeter of skin in man, the orang, the gibbon, the chimpanzee, and the macaque monkey? And why remind us that "There is no need to dilate upon the myriad functions discharged by the mobile human digits?"

Throughout, the author stresses comparative anatomy—which is important, but not pat for the wartime surgeon. Not until the writer discusses the dissection of the hand and forearm does the practical reader begin to find what he wants, and then only concealed in long, leisurely sentences. Indeed, one must admire the man who, as he informs us, is able to write such sentences "during the intervals between routine duties and air-raid signals."

The line drawings are relatively few, and are, for the most part, diagrammatic. Those representing dissections lack depth, roundness, and contrast.

Although not of immediate value to the surgeon, nor yet to the rushed medical student of today, the volume will be of interest to the leisurely armchair anatomist.

CARLETON CAMPBELL

Fractures of the Jaws and Other Facial Bones. By Glenn Major, M.D. Octavo of 446 pages, illustrated. St. Louis, C. V. Mosby Company, 1943. Cloth, \$7.50.

Write for Literature

This is a well-written, comprehensive, readable volume, obviously the work of an experienced maxillofacial surgeon. Nothing of value pertaining to the subject of maxillary, mandibular, and zygomatic fractures has been omitted.

The chapter on general types of fixation in fractures of the maxilla and mandible is of great practical value; unfortunately, neither the author nor anyone else has hit upon the ideal treatment of fractures of the mandible posterior to the third molar. This will come soon, we hope.

The subject of bone grafts of the jaw is handled in an admirable manner, and the surgeon who treats fractures of the jaws would do well to read with care the Chapter on "Radiographic Technique" by Dr. Freedman. The book can be wholeheartedly recommended.

WALTER A. COAKLEY

Indigestion: Its Diagnosis and Management. By Martin E. Rehfuess, M. D. Octavo of 556 pages, illustrated. Philadelphia, W. B. Saunders Company, 1943. Cloth, \$7 00.

This work from the pen of a master could well be called "from a symptom to a textbook." Truly the author has done just that, difficult as it might seem at first thought. Yet indigestion as a symptom can be caused by so many different conditions that it could very well be made an outstanding subject in a textbook discussing any system or organ of the body. This book could be read with profit by any physician interested in knowing the newest facts in gastrointestinal disease or digestive disturbances in general.

BENJAMIN M. BERNSTEIN

The Antigonadotropic Factor. By Bernhard Zondek and Felix Sulman. Octavo of 185 pages. Baltimore, Williams & Wilkins Company, 1942. Cloth, \$3.00.

The premise of this book deals with the antigonadotropic factor. Discussion of the several phases are detailed under conveniently divided headings, in each of several chapters. A historic review, and the antihormone theory of Collip bring the reader up to the substance of this book.

The author's personal opinions are enhanced by laboratory investigations, which are noted in tables and in references to previous publications. A comprehensive bibliography is appended.

This volume will prove invaluable to the research worker as well as to the clinical endocrinologist.

JACOB S. BEILLY

Bronchiectasis. By James R. Lisa, M.D., and Milton B. Rosenblatt, M.D. Octavo of 190 pages, illustrated. New York, Oxford University Press, 1943. Cloth, \$4.00.

This book presents an exhaustive study of the subject of bronchiectasis, based on a thorough review of the literature and conditioned by the personal experiences of the authors. A complete study of the anatomy and the physiology of the bronchi is followed by chapters on theories of pathogenesis, pathology, bacteriology, and clinical aspects of the disease. Then follows a fair presentation of modern concepts of the treatment, the gist of which is the early application of surgical measures. A very good book for students and practitioners—we recommend it without reservation.

[Continued from page 1076]

recent ideas on the pathology of myomata are excellent. The new investigations into pelvic anatomy recently made by Curtis are well stated and beautifully illustrated.

Although very complete in most of its coverage, the work is, however, sketchy in spots. It is nevertheless an excellent book for the medical student or the general practitioner and is highly recommended for their purposes.

CHARLES A. GORDON

The Anatomy of the Nervous System. By Stephen W. Ranson, M.D. Seventh edition. Octavo of 520 pages, illustrated. Philadelphia, W. B. Saunders Company, 1943. Cloth, \$6.50.

This is the seventh edition of a work that has assumed a prominent position in anatomy as well as in neurology. This revision, published shortly before Dr. Ranson's death, represents his latest thoughts on the subject.

There has been a complete revision of the chapter on "The Sympathetic Nervous System," and there has been extensive revision of the sections on the rest of the brain. At the suggestions of various colleagues, there has been rearrangement of the numerous illustrations. The extrapyramidal motor pathways have received considerable attention.

The book has always received a cordial welcome from those who teach neurology, and the present revision should be similarly received. This book is highly recommended for students as well as for those who are interested in neurology and in neuro-anatomy.

IRVING J. SANDS

The Principles of Anatomy as Seen in the Hand. By Frederic W. Jones. Second edition. Octavo of 418 pages, illustrated. Baltimore, Williams & Wilkins Company, 1942. Cloth, \$7.50.

For those who are interested in the hand as a hobby, this volume contains many interesting by-paths of quaint information, and numerous diverting references to the observations of old authors. But those who want a textbook on the hand will find such reading too time-consuming and too minutely philosophical for practical use. In times like these, why compare the number of hairs to a square centimeter of skin in man, the orang, the gibbon, the chimpanzee, and the macaque monkey? And why remind us that "There is no need to dilate upon the myriad functions discharged by the mobile human digits?"

Throughout, the author stresses comparative anatomy—which is important, but not pat for the wartime surgeon. Not until the writer discusses the dissection of the hand and forearm does the practical reader begin to find what he wants, and then only concealed in long, leisurely sentences. Indeed, one must admire the man who, as he informs us, is able to write such sentences "during the intervals between routine duties and air-raid signals."

The line drawings are relatively few, and are, for the most part, diagrammatic. Those representing dissections lack depth, roundness, and contrast.

Although not of immediate value to the surgeon, nor yet to the rushed medical student of today, the volume will be of interest to the leisurely armchair anatomist.

A PROFESSIONAL GOAL

Getting people back on their feet—and keeping them on their feet—is the ultimate goal in medicine. Today, as never before, it is important to help everyone stand on their own so they may the better serve to achieve the 100 per cent efficiency aimed at in our war efforts. In our profession, the goal is closely allied to yours—by helping you to provide proper footwear we feel that our job is an important one, too. If experience and determination to be first in things that count in footwear is important to you, we suggest you let your patient try Pediforme shoes.

HARRY F. WANVIG*Authorized Indemnity Representative*

of

The Medical Society of the State of New York

70 PINE STREET

NEW YORK CITY

TELEPHONE: DIGBY 4-7117

[Continued from page 1079]

678 pages. Philadelphia, W. B. Saunders Company, 1943. Cloth, \$8.00.

This book, the result of collaboration between an internist and a psychiatrist, is an excellent and much-needed work. It covers the various specialty fields with particular emphasis on the clinical applications of psychopathology to general medical problems. It stresses the importance of knowing the patient not only from the clinical and pathologic view, but also from the emotional and psychologic aspects. Everyone who reads it will have a much clearer idea of the close tie-up existing between general medical and psychiatric problems.

The text is devoted chiefly to practical discussions of the various diseases under a particular specialty and contains 70 case histories which are illustrative and helpful to the reader in seeking a better orientation. The cases are presented in an interesting manner, and as the reader peruses them he will clearly see the mechanisms that produce the patient's disability.

There is a chapter on military medicine which is particularly appropriate now. This shows how the combined efforts of the clinician and the psychiatrist can do much to reduce the number of psychiatric casualties seen in the last war. The authors state: "It is estimated by army officials that one-half the beds in military hospitals are occupied by patients with psychiatric disorders."

The book is recommended as a practical and worth-while addition to the library of every physician. The bibliography offered is complete and up to date.

JOHN M. MURPHY

The Hormones in Human Reproduction. By George W. Corner, M.D. Octavo of 265 pages, illustrated. Princeton, N.J., Princeton University Press, 1942. Cloth, \$2.75.

This book on the processes of sex and reproduction is written primarily for the laity and assumes no familiarity on the part of the reader with biology or other premedical sciences. The author has accomplished the task of describing the most intricate and elaborate mechanisms of the body in a simple and frequently in a most entertaining manner. Before the more complicated mechanisms that occur in the human being are presented, reproduction in lower forms is described, with special emphasis on the role of the hormones. Although emphasis is placed on the hormones, the book is principally concerned with reproduction in the higher mammals in all its phases and represents one of the most complete descriptions of this subject that can be understandable to the laity. The general practitioner, and indeed even the specialist, will find much in the book that will be new to him. The author is an embryologist of world-wide reputation and since 1940 has replaced Dr. Streeter as director of the Department of Embryology at the Carnegie Institution of Washington and Baltimore, and as professor of embryology at Johns Hopkins Medical School. He has done much original work on the anatomy and physiology of human reproduction and is responsible in large part for clarifying the function of the corpus luteum and for isolating progesterin.

This most unusual book represents the best description of the complicated processes of reproduction, including the role of the hormones, written in recent years and is highly recommended to the medical profession as well as to the laity.

ALEXANDER H. ROSENTHAL

PROTECT *Skilled* HANDS

The importance of keeping all skilled hands in condition to work at full capacity, particularly during our war time emergency, cannot be over-emphasized. Every pair of hands plays a major role in the victory effort.

Acidolate* skin cleanser is offered to the physician as an aid in the management of those dermatoses which may be irritated by soap. By a process of emulsification, Acidolate destroys the adherent nature of cutaneous soil, and facilitates its removal with water. This same property makes it useful in removing residual ointments, grease, or oils from the hair or skin.

Acidolate is supplied in 8 ounce dispenser bottles and in gallons. It is available through better drug stores everywhere.

Literature and samples will be sent to physicians on request.

[Continued from page 1083]

A Handbook on Diseases of Children Including Dietetics and the Common Fevers. By Bruce Williamson, M.D. Third edition. Duodecimo of 364 pages, illustrated. Baltimore, Williams & Wilkins Company, 1942. Cloth, \$4.50.

This is the third edition of Dr. Williamson's book, and in it the text has been thoroughly revised. It may be recommended as a handbook replete with information and containing descriptions of the diseases which are incident to childhood, as well as discussions of infant welfare, dietetics, and infant feeding. The descriptions are necessarily brief but contain, in general, a proper emphasis on the cardinal features of symptomatology, diagnosis, and treatment. The therapy recommended is quite in accord with modern opinion.

There are certain unique features, particularly the chapters on disorders of the heart and circulatory system and that on nutrition and metabolism. The author has an unusual ability to express very well in concise terms the important features of disease entities. In a number of instances he adds further to the value of the book by making many statements which have the merit that comes from original observation.

JOSEPH C. REGAN

Roentgen Treatment of Diseases of the Nervous System. By Cornelius G. Dyke, M.D., and Leo M. Davidoff, M.D. Octavo of 198 pages, illustrated. Philadelphia, Lea & Febiger, 1942. Cloth, \$3.25.

This book is, as the authors state in their preface, a "summary in English of the literature on the subject and the reports of the experiences of the radiologists interested in this branch of radiotherapy."

The work includes: (1) a summary of experimental effect of radiation on normal nervous tissues; (2) a résumé of the technic used in the treatment of brain tumors in a number of neurosurgical clinics; (3) results obtained from the literature and in detail from the authors' large experience, including case reports; (4) the effect of radiation on pathological processes affecting the nervous system, which not only includes primary tumors but also metastases, infections, and miscellaneous disease conditions.

That great progress has been made in radiation therapy of brain tumors is attested to by the facts that: (1) In the authors' opinion, a pituitary adenoma should no longer be considered for surgery until radiation therapy has been given and found unsuccessful. (2) Other malignant tumors, such as the medulloblastoma, spongioblastoma multiform, astroblastoma, and protoplasmic astrocytoma respond to irradiation even though they are not curable. (3) Postoperative treatment of benign gliomas is recommended, for certain ones have a tendency to become malignant following operative interference.

The bibliography will be helpful to all students of the subject. The reviewer would like to add to this Dr. Merrill Sosman's short summary on the subject to be found in *Radiology*, Volume 36, page 594 (1941).

PAID BY THE BANK OF THE AXIS

To wake up American workers who absent themselves from important war work for no valid reason, several firms in Middle West are using checks drawn on the "Bank of the Axis" to pay for absenteeism.

Where the idea originated, employees were surprised recently to find two checks in their pay envelopes—one for days worked and the other for time absent from their jobs making war materials. The check for not working was drawn on the "Bank of the Axis," signed by Adolph Hitler and counterstamped by Benito Mussolini. Across its face was stamped in red letters: "Negotiable in Human Lives."

The idea is to make out the check in the exact amount of money the worker lost by being away from the job. Some firms include a note explaining that the Axis partners would gladly pay them to stay home and thereby slow down production.

As a result of these checks, one company reported a 27 per cent reduction in absenteeism immediately after the first "checks" were issued. Others have reported similar reductions.

The check was developed by R. S. Robinson, public relation director of Columbian Steel Tank Company of Kansas City, Mo., and the form is produced and copyrighted by R. M. Rigby Printing Company of the same city.

NOW BANDAGE BANKS

A bandage bank—a reserve for use in defense emergencies—has been created for a New England hospital by a woman interested in community welfare.

The material is supplied by the hospital and the job of preparing several thousand bandages of various types is being accomplished through the voluntary services of groups of women.

This activity does not duplicate other work done for the hospital and it suggests a worth-while service that might be considered for other hospitals by women's auxiliaries.

SECRET WEAPONS?

Maybe we had a "Pearl Harbor" before December 7, 1941. According to a report by R. V. Stone, *Journ. Lab. & Clin. Med.*, 1941 (Clin. Abstracts), as repeated in the April, 1943, issue of *The Journal of the Medical Society of New Jersey*, anthrax was discovered in imported shaving brushes.

Breaking open the handles of bristle or hair brushes, removal of the handle binder from the hairs, and subsection of this portion of the hair to cultural and animal procedures for the demonstration of anthrax, yielded a positive result in one of nine used shaving brushes of Japanese manufacture

DON'T FORGET THE SOLDIER'S MAIL

When the troops are busy training,
And perhaps it has been raining,
When discomfort seems the order of the day;
Then a parcel or a letter
Makes a soldier somewhat better,
For he knows he's not forgotten, though away.

It's a joyful, glad some feeling
O'er his senses quickly stealing
As he'll recognize the old familiar hand;
Like a miser with his treasure,
He'll gloat o'er it at his leisure,
With a simple joy not hard to understand.

This link never should be broken,
For to him it's just a token
Of a loving friend who's ever in his mind;
And he'll do his duty gaily
For his heart's uplifted daily
By the thoughtfulness of those he's left behind
—A Canadian Exchange

WAR EDUCATION PROGRAM PROVIDES FOR MEDICAL TRAINING

The wartime educational program for youths in the armed services, announced jointly by the Army and Navy, provides for a continuation of medical education. Enlisted reserve medical students will be called to active duty at the end of next semester but will then be detailed to continue their medical training. Medical students who have been commissioned in the Medical Administrative Corps may resign and resume their studies as students in the enlisted reserve.

Premedical students will also be called to active duty at the end of next semester. Those selected for further medical training will then be assigned to suitable schools.

During their attendance at school under these circumstances, students will wear uniforms and receive regular pay of the lowest enlisted grade. Quarters, food, and medical service will be provided them, as well as instruction. The colleges must accept all men assigned to them for training—*J. Med. Soc. Co. N. Y.*

A WAR WORKER'S LUNCH

The typical "stenographers' lunch" of cake and "cola" seems to have been carried over to war workers in heavy industry. A recent survey of luncheon trays in four leading war plants in the Chicago area revealed that only eight per cent of the employees ate sanely. Twenty-one per cent made a choice of food close to the borderline of malnutrition, while 71 per cent purchased totally inadequate meals.

Lack of money was not the cause of the choice nor was lack of good foods, but rather a lack of appreciation of essential foods, for instead of meat or cheese sandwich doughnuts were ordered, instead of a salad sweets were the choice, and instead of milk the anemic food was washed down with pop soda.

BRIGHAM HALL HOSPITAL AT CANANDAIGUA, N. Y.

FOR MENTAL AND NERVOUS PATIENTS. An un-institutional atmosphere. Treatment modern, scientific, individual. Moderate rates. Licensed by dept. of Mental Hygiene. (See also our advertisement in the Medical Directory of N. Y., N. J. and Conn.) Address inquiries to MARGARET TAYLOR ROSS, M.D., *Physician-in-Charge.*

A "FEARICIDE"

Since the first humans sinned in the Garden of Eden, fear has filled more of our sanitariums and hospitals than some of our worst diseases combined. John Dollard, of the Institute of Human Relations at Yale University, analyzes the causes of this common ailment in his book, "*Victory over Fear*," and suggests some treatments that can be helpful.

The popular remedy for a person in a fear conflict, states the writer, is the recommendation to "forget it." If restless and under pressure, friends advise a vacation or change of diet—or getting tight, having a love affair or some equally inane cure. But science, according to Dollard, tells us to "remember it. Think about it, calculate the chances for good or ill, and act."

This advice is not easy to follow for the usual reaction to fear is flight, mental flight, and thinking against fear is always difficult. Says the author, "There are three invisible barriers which stop the constructive mind at its work. They are: ignorance, laziness, and fear. If we are not the persons we might be it is largely due to these demons of the mind. They make us stupid, frightened, and ineffectual, leaving the tasks undone and the words unsaid which might add much to our happiness and that of others. . . .

"Most people do not begin self-study because they do not know that it is possible and useful. We do not train our children to be able to state

their motives clearly, and often we punish them when they make attempts to do so. Even after years of academic study, a man may have had no more, or even less, practice in knowing his own mind than a person who has had no formal education at all. Instead of being trained to know our wishes and fears most of us are trained to forget them. We remain ignorant, therefore, of the first steps in the art of mastering fear."

The author points out that there are shadow fears and ghosts of fear which have become domiciled in the human mind in childhood. Unreal fear is often distinguished from real fear by calling it "anxiety," and this fear is the painful apprehension left over after we have really been punished for some act. This is the fear that arouses the escape complex, and the desire to stop what is being done and to do something else—it consists of being afraid when there is nothing to be afraid of.

To free the mind, bound and gagged by fear, the author recommends self-study—the recognition and labeling of the unconscious forces at work. He says, "The truth is that self-study brings each person up against his own unsolved problems."

People should learn to ask themselves in the first place, "What am I afraid of in this situation?" What do I really want?" "Can the other person afford to meet my demands?" etc. For, it is only by confronting fear that it can be mastered.

WHOOPING COUGH

ELIXIR BROMAURATE IS A UNIQUE REMEDY OF UNIQUE MERIT

Cuts short the period of the illness, relieves the distressing cough and gives the child rest and sleep. Also valuable in other PERSISTENT COUGHS and in BRONCHITIS and BRONCHIAL ASTHMA. In four-ounce original bottles. A teaspoonful every 3 or 4 hours.

“A tooth in a silver leaf”...

In ancient Islam, it was believed that if a woman carried a tooth in a silver leaf, she would not conceive.*

• Superstition has been displaced in our enlightened world. Medical contraceptive practice today requires the selection of methods and materials that have been established on a scientific basis through technical and clinical research. The effectiveness of Ortho-Gynol can be attributed to the high degree of uniformity in the desirable physical and chemical properties. This is supported by satisfactory results obtained in extensive clinical studies. *Himes—Medical History of Contraception

Drug of Choice for Meningococcic Meningitis . . .

SULFADIAZINE

Lederle

RECENTLY a marked increase in the number of meningococcal meningitis cases throughout the country has occurred.

The value of sulfonamides in the treatment of meningococcic meningitis has been universally recognized^{1, 2, 3, 4}. Among the sulfonamides, Sulfadiazine is now coming to the fore in the treatment of all bacterial meningitides^{5, 6} and particularly for meningococcal meningitis^{5, 7, 8, 9, 10, 11}.

The prognosis in these cases has been greatly improved by the availability of Sulfadiazine⁴.

PACKAGES: Bottles of 50, 100 and 1,000 tablets, 0.5 gram (7.7 grains) each.

A BETTER PROGNOSIS IN BURNS WITH

FOILLE

In the crucible of clinical experience, this easily applied water-in-oil emulsion has displayed the following desirable features in modern burn therapy:

Effective Emergency Treatment—Quickly controls pain, helps mitigate shock, reduces need for opiates. May be employed before or even without debridement.

Effective Later Treatment—The soft coagulum produced permits free movement of joints and extremities—thus lessening the danger of contracting scars.

Foille is easily and quickly applied—by sponge, brush or sprayed on. Foille saves the nurse's time—frequent changing of dressings is unnecessary.

Foille saves the patient's time—aids toward quicker, complete recovery.

Supplied in 2-oz., 4-oz., pints, quarts, gallons, 5-gallon bottles.

Distributed through Surgical Supply Houses, Wholesale Druggists, Pharmacists and First Aid Suppliers

THERAPEUTIC EFFECTIVENESS PLUS PALATABILITY

The therapeutic effectiveness of ALUMINOID, chemically non-reactive colloidal alumina has been demonstrated by ample clinical use.

Administered in capsule form, it provides the patient with convenient acceptable medication, and overcomes the objection to taste frequently exhibited against other forms of aluminum hydroxide. Samples and literature to physicians on request.

"... a cod-liver oil ointment and ointments containing vitamins A and D from other fish-liver oils caused a much more rapid rate of healing than was observed in control lesions or burns treated with tannic acid."
 Abramowitz, E. W.: *Indus. Med.*,
 10:481-486 (Nov.) 1941

WHITE'S VITAMIN A and D OINTMENT

brings to the treatment of burns, wounds, ulcers and various skin affections the vitamins A and D of fish liver oils, in the same ratio as found in cod liver oil—incorporated in a lanolin-petrolatum base.

White's Vitamin A and D Ointment has a pleasant odor, is free from excessive oiliness. At ordinary temperature, will keep indefinitely without becoming rancid.

Topical application of vitamins A and D has shown many advantages:

1. Promotes healthy granulation and rapid epithelization
2. Reduces infection
3. Applicable to burns and wounds of any area—face, hands, perineum, axillae, groin
4. Minimizes the need for skin grafting

Four convenient sizes: 1.5 oz. tubes, 8 oz. and 16 oz. jars, 5 lb. containers.

Deep electrical burn caused by 11,000 volt shock. Appearance at 3 weeks shows typical deep destructive process. Extensor tendon has sloughed out, distal interphalangeal joint is fully exposed, amputation appears necessary.

Appearance after 4½ weeks. Treatment consisted of dressings—infrequently changed—with White's Vitamin A and D Ointment and use of finger splint. Sloughing quickly cleared up, granulations filled in the extensive defect, with complete healing.

Ethically promoted—not advertised to the laity. White Laboratories, Inc., Newark, N. J.

THE ORIGINAL DEOXYCHOLIC ACID

for fat digestion and the absorption of fat-soluble vitamins

Degalol represents deoxycholic acid, the bile acid which is chiefly responsible for emulsification of food fat and the formation of the water soluble cholic acid compounds.

Degalol is valuable in biliary fistula, assuring fat digestion even with diversion of bile to the outside. Degalol enhances absorption of the fat-soluble vita-

mins A, D, E, and K. In complete biliary obstruction with poor or absent fat digestion, Degalol makes possible utilization of food fat, and insures absorption of orally administered vitamin K.

Degalol consists solely of chemically pure deoxycholic acid. It is supplied in boxes of 100 1½ gr. tablets.

Pharmaceutical Chemists Since 1852 Massachusetts

SAFE . . . CONVENIENT when mother and baby must travel

The mother has only to measure out and place in dry, sterile feeding bottles, the prescribed amount of Similac powder for each individual feeding. The bottles containing the measured Similac powder are then capped, and can be conveniently carried, along with a thermos bottle of boiled water cooled to about blood heat. At feeding time it is necessary only to pour into one of the bottles containing the measured Similac powder, the prescribed amount of water, then shake until the Similac is dissolved, place a nipple on the bottle, and feed.

A powdered, modified milk product especially prepared for infant feeding, made from tuberculin tested cow's milk (casein modified) from which part of the butter fat is removed and to which has been added lactose, olive oil, cocoanut oil, corn oil and cod liver oil concentrate

SIMILAC

Similar to breast milk

A Sign of Strength . . . *to endure through changing times*

Consider the situation: Millions of women engaged in the heavier work of industrial jobs. Domestic help growing scarce so that even housewives work harder, longer. More maternity patients than in any time during the last two decades.

Result: More and more physicians are recommending Camp Scientific Supports according to the needs of the particular condition.

Easy to see why the symbol of Camp service is today more important than ever.

It assures doctors that every prescription for a Camp support will be filled exactly as ordered . . . by an expert, specially trained by the Camp organization.

It means that patients will find the prescribed garment available for immediate use, and at moderate prices.

Today, this responsible Camp service is a bulwark for physicians. For in an increasingly unstable field, it is filling a growing need unflinchingly.

WHEN YOU NEED A GOOD SUPPORT FOR REDUCIBLE HERNIA

— may we suggest the advantages of "custom-made" Protection, designed to meet the described needs of each particular case? Physicians, who know from experience, can tell you that Rice "custom-made" Supports for reducible HERNIA are truly different and that our methods are dependable. With dozens of different styles, shapes and types of pads at our disposal and with a full realization of our responsibility to those who put their faith in us—we respectfully offer our services for your approval. Descriptive literature and measurement charts on request.

pH carefully adjusted

The pH of "Ramses"* Vaginal Jelly is adjusted with acetic acid, and buffered to maintain a pH of 4 in the vaginal tract.

"Ramses" Vaginal Jelly is especially effective because:

1. It is prepared with a vegetable gum base to provide effective barrier action.
2. Its low surface tension permits diffusion into the vaginal rugae.
3. It provides adequate sperm-immotilizing power.
4. It is non-staining, with an agreeable odor.
5. It is non-irritating, non-toxic, will not liquefy at body temperature — therefore, suitable for continuous use.

Available to physicians and their patients through retail pharmacies only. Never advertised to the laity.

*The word "Ramses" is the registered trademark of Julius Schmid, Inc.

A PROFESSIONAL GOAL

Getting people back on their feet—and keeping them on their feet—is the ultimate goal in medicine. Today, as never before, it is important to help everyone stand on their own so they may the better serve to achieve the 100 per cent efficiency aimed at in our war efforts. In our profession, the goal is closely allied to yours—by helping you to provide proper footwear we feel that our job is an important one, too. If experience and determination to be first in things that count in footwear is important to you, we suggest you let your patient try Pediforme shoes.

BELBARB

AN

Excellent

SEDATIVE and HYPNOTIC

The potentiation of the central action of phenobarbital by the belladonna alkaloids (Friedberg, Arch. f. exp. P. & P. CLX, 276) renders possible attainment of desired effects with relatively small doses, thus avoiding "hang over" and other unpleasant side-actions. In contrast to galenical preparations of belladonna, such as the tincture, Belbarb has always the same proportion of the alkaloids.

Indications: Neuroses, migraine, functional digestive and circulatory disturbances, vomiting of pregnancy, menopausal disturbances, hypertension, etc.

Formula: Each tablet contains $\frac{1}{4}$ grain phenobarbital and the three chief alkaloids, equivalent approximately to 9 minims of tincture of belladonna.

Belbarb No. 2 has the same alkaloidal content but $\frac{1}{2}$ grain phenobarbital per tablet.

Hypo for an Embryo

ONE of the scourges of war was in retreat before a shot was fired in World War II . . . Vaccine to protect against typhus could be prepared in quantity sufficient for all. In the Lilly Laboratories farsighted planning had provided extensive experience with typhus Rickettsiae, and the yolk sac culture method was a workaday procedure. Within a few short days after war began, vaccine production was increased a thousandfold. No order has been refused and no fighting man denied typhus protection because of inadequate knowledge or lack of facilities for vaccine preparation.

NEW YORK STATE JOURNAL OF MEDICINE

Copyright 1943 by the Medical Society of the State of New York

VOLUME 43

JUNE 15, 1943

NUMBER 12

Editorial

What Are the Facts?

The *Journal of the American Medical Association* in its issue of March 27, 1943, carried an editorial to the effect that "young available physicians in the large cities of the country, particularly those of the eastern seaboard," seemed unpatriotic and reluctant to volunteer for military service. The *Journal* said further, ". . . New York, Brooklyn, Boston, and some of the larger communities in the states of Connecticut, New Jersey, Pennsylvania, and California have failed even to approximate their quotas." We quoted parts of this editorial, with comment, in the April 15, 1943, issue of this JOURNAL, on the assumption that the J.A.M.A., and the national office of the Procurement and Assignment Service were reasonably accurate in their information. In our comment we called to the attention of our readers that "there are now in service from Brooklyn about 36 per cent of all of its physicians."

In the Supplementary Report of the Council, Part VIII, the Chairman of the War Participation Committee of the Medical Society of the State of New York under date of April 30, 1943, wrote:

"The latest information obtainable from the State Procurement and Assignment Committee is as follows:

Number of physicians from New York in Service on February 1, 1943.....	9,000
Additional listed since February 1	800 to 900
Total.....	9,800 to 9,900

New York quota for 1942.....	8,600
New York quota for 1943.....	2,100

Total..... 10,700

"It is evident, therefore, that New York has not only met its 1942 quota but is on the way to meeting its 1943 quota.

"P & A reports that practically all counties outside of New York City are stripped of every possible available physician. . . . In Kings County, there are 2,024 in service. Three hundred more are still being processed. Only 39 men under 37 were declared essential and there are only 63 men still available. . . . Richmond has been stripped to the last available man. . . . New York and the Bronx are fast approaching the same state, so very few more men can be obtained from New York State.

"At the start, in New York, 15,700 men were under 45 years of age. Of these, 9,800 to 9,900 are in service; 2,185 have been physically disqualified. The remainder includes the younger men essential in the full-time faculties in the nine medical schools, all the alien physicians, women physicians, physicians essential in hospitals, physicians essential in industry and in the mental hospitals, and it must in addition furnish the balance required for the armed services.

"With 43,000 physicians in the armed services, it will be seen that New York has furnished between 20 and 25 per cent of the total.

"It is believed that these figures definitely prove that New York is not the laggard state it has been accused of being, and that this State can be relied upon to furnish every available man who can possibly be spared for military service."

It does not seem probable that statistics available on March 27 and April 30 of the same year relative to conditions in the State of New York could differ so greatly. On March 27, "New York, Brooklyn, Boston . . . have failed even to approximate their quotas." On April 30, 9,800 to 9,900 New

York physicians were in service to meet a combined 1942-1943 quota of 10,700 medical officers, roughly 20 to 25 per cent of the national total of 43,000 physicians for the armed forces.

In this issue there appear (page 1112) statements from the Surgeons General of the U.S. Army, the U.S. Navy, the U.S. Public Health Service, and the National Procurement and Assignment Service, which the JOURNAL is glad to publish in aid of further recruitment of physicians. The statement from the Procurement and Assignment Service should be read in the light of our question of accuracy of figures. The opening paragraph states, "Four states—

New York, Connecticut, Massachusetts, and Nevada— were below 90 per cent of their quotas." This does not seem consistent with the figures we have just quoted as to New York State.

The patriotism and the performance of many young physicians of the State of New York have been publicly and apparently unfairly impugned. The indictment is a grave one and is not supported by the facts as set forth by the Chairman of the War Participation Committee of this Society in his official report. An error of this magnitude calls for rectification by the J.A.M.A. and the National Chairman of Procurement and Assignment.

The American Ferment

Speaking at a dinner to Dr. J. Stanley Kenney, president of New York County Medical Society, on May 19, Dr. Nathan Van Etten, past-president of the A.M.A., said, in part:

"The great melting pot of civilization, which is the United States of America, has often been overheated during the years of Dr. Kenney's experience.

"Modern medicine and the revelations of science have upset empiric traditions, so that he is now engaged in studying new therapies—new methods for restoring the sick to functional usefulness and new ideas to enlist community support in the prevention of disease.

"New social forces have risen to disturb medical evolution by violent explosions which are impatient of normal adjustment. Elements unfriendly to the medical profession have been in power for ten years, upsetting the peaceful progress of a great nation by erecting powerful bureaus, which rule by fascist decree; which do not serve the people, but who command the people to serve them.

"Although the medical profession has voluntarily enlisted fifty thousand of its young doctors in the service of the war emergency, it is reviled for lack of support of the whims of idealists who claim to be interested in new distributions of medical service.

"Mr. McNutt shakes his fist at the physicians of the country in June at Atlantic City, Frances Perkins calls them obstructionists on January 20, and Mrs. Roosevelt gnashes her teeth and tells doctors on the third of May that if they do not voluntarily conform to the wishes of autocracy that they will be compelled to do so.

"No longer are our elected representatives, whose wages are paid by the taxpayer—no longer

are they our servants, but they are our masters. No longer does the State serve us, but we slavishly serve the State.

"Let us not forget that this unfortunate situation is the result of fermentation by agitators who have long been working at every social level, and that widening cracks are appearing in the surface and in the foundations of our economic, religious, and social systems which may engulf us.

"Civilization is sick! It needs good doctors. Shall we be equal to the task of doing our part toward preventing complete destruction of what we have been proud to call American Democracy?

"The answer to this question is YES if we shall wake up and work."

The President of the Medical Society of the State of New York also said, in part:

"It was the medical profession in the first place, not only here but with the other doctors throughout the United States, that proposed and inspired and helped erect *every* hospital, every dispensary, and every clinic in this country in order that those of little or no means should receive good medical care. For the maintenance of these institutions *and* for the benefit of the patients the doctors then and through these 108 years gave their entirely free services. I often wonder, when I read, so carefully recorded in the annual reports of hospitals in this city, of the monetary offerings of trustees and other benefactors just how much the monetary appraisal would be at even minimum rates, of the free services rendered by the profession in the 26 institutions of this municipality as well as in the voluntary hospitals.

"In the prevention of the spread of contagious diseases, in the resistance to the entrance to this city from other shores of such plagues as cholera and yellow fever and typhus; in the response to the calls of the several wars affecting this country,

organized medicine here always gave a full response. . . .

"It is sad to admit that the important role of medicine in inaugurating and supporting so many measures for the health of the people has been forgotten or overlooked and the control assumed by bureaus of government and civilian groups.

"Already are there agencies to make premarital examinations of prospective men and wives; to render obstetric care, including prenatal and postpartum; to care for the infant, sick and well; to follow him through school age with general and special examination. They have dental service, nutrition, and transportation furnished by the government; we have government care for poliomyelitis, for tuberculosis, for mental diseases, for cancer and heart diseases. We have hospitals of cities, counties, states, and central governments.

"Only during the past decade or two has the doctor, absorbed in the welfare of his patient, buried in his books, or walking the hospital wards or the clinic, realized that developing nonmedical groups were attempting to control all phases of his life work. The incorporated bodies of great wealth, the professional social organizations, political divisions of our government found in the care of the sick opportunities for their well-intentioned, though so frequently harmful, efforts. Many of their proposals have been introduced in quiet insidious ways, even using such pretenses as special surveys or war needs. The federalization of our medical schools covering four years of tuition, one year of internship and an agreement by the student to remain in government service for "the duration," for six months after cessation of hostilities or for the pleasure of the President is a long stride toward government control of doctors. To that may so easily be added the control of existing hospitals, all these new hospitals, erected by the government and the future free care, *whenever* needed, of veterans and their families.

"There is no measure, no matter by whom proposed, that would really, permanently or temporarily improve the health of the people, that will not receive—as it always has—the support of the medical profession regardless of its effects on the individual physician. Sufficient experience, however, has already accumulated to show the weaknesses in so many of these plans, their dangerous effects in lowering the quality of medical care, and the retardation of the normal progress of science.

"Doctors, as a class, are but slowly realizing these present conditions. They have not given the time or the study to these vital ancillary branches of medicine, or the many increased duties imposed on the profession in its organized groups.

"For these studies, medicine today needs men of special aptitude, as leaders; men of ability in scientific medicine and possessed of knowledge of social and economic conditions; men of experience and distinction in hospital work and who

from private practice in the homes of the people have never lost 'the common touch. . . .'"

The *New York Times*.¹ sometime advocate of "sweeping changes" in the practice of medicine, said editorially in discussing recent proposals made to the House of Delegates:

"For its willingness to recognize the need of reform in medical practice the Medical Society of the State of New York deserves praise. Out of its promised deliberations some good will undoubtedly flow, even though some of the addresses delivered before its House of Delegates raise doubts. 'The tendency of hospitals to get into the practice of medicine' was criticized by one speaker, though it has been pointed out for years that the hospitals are admirably qualified to deal with the sick. There was also a demand that 'medical matters must be decided by medical men.' Certainly no one will quarrel with this demand if scientific procedures alone are meant; but the economic plans of industry, labor, welfare organizations, hospitals, and the public ought not to be ignored.

"The matter of medical reform will sooner or later become a political issue. It is far better that it should be attacked by organized medicine instead of by State Legislatures and Congress. . . ."

It appears from a report "Wartime Facts and Post-War Problems" made public recently by the Twentieth Century Fund, that two general objectives are sought by the American people for the postwar period, economic stability and national prosperity within a workable system of collective security and revived international trade. A pleasant prospect, surely, if it can be accomplished. How does the profession of medicine fit into it? What should be its function and practices in such a postwar world?

"The medical profession," said Dr. Louis Bauer, Speaker of the House of Delegates, in a preamble to a resolution establishing a Planning Committee for Medical Policies,²

"has been accused of being obstructionist. This is an unjust accusation, but we must admit we have been slow in planning for the future. We have been too content to sit back and wait until we are faced with definite problems and then endeavor to solve them, rather than try to anticipate them. . . . the danger we have to face in New York is not complete socialized medicine, but an extension of phases already in effect, under the aegis of lay control. . . . There are many

¹ May 5, 1943.

² Buffalo, May 3, 1943.

agencies using the war effort as a cloak to foster their pet schemes for further socialization of medicine, and what are we doing about it?

"Let us inform the public in no uncertain terms that we are in favor of good medical care for all with freedom of choice of physician; that methods will be found to bring that good care to all; that whatever changes are necessary to accomplish

this will be made, but that those changes will be carried out under the guidance of the medical profession and not by governmental or lay agencies; and that we have a program which will meet the situation and at the same time will protect those high standards of medical care which have made the United States the healthiest country in the world."

Intramedullary Infusions

Transfusions, intravenous therapy, and tests are among the pillars of modern medicine. Yet there are times when it is impossible to enter a vein. In small infants, in cases with extensive burns, and in conditions of extreme shock, urgent intravenous therapy often cannot be performed. Any method that serves the same purpose and performs the same function is a most welcome accessory adjuvant when a vein is not accessible.

Substances injected into the bone marrow cavity are rapidly taken up by the circulation in unaltered form.¹ Blood administered by this method restores blood volume as efficiently as transfusion does, and drugs act as quickly and effectively by this route as they do when they are administered intravenously. Furthermore, diodrast injected into the bone marrow outlines the renal pelvis as clearly as it does by the intravenous route. When saccharine is employed, the circulation time by the intramedullary route is the same as when the saccharine is injected directly into a vein.² Previous radiopacity and injection studies have demonstrated the prompt entrance of injected materials from the bone marrow into the large tributary veins.¹

The technic of intramedullary infusion has been fully described.³ In adults and older children the sternum is the site of choice. In

children under 3 years of age the sternal marrow cavity is too small for this purpose, but the upper tibia and lower end of the femur are adequate substitutes. Care must be taken that no air enters the bone marrow, especially in children. It is best not to give substances such as emulsions, which may be potential embolic particles, by the intramedullary method. Contraindications are cases of bacteremia, septicemia, and osteomyelitis. In the series thus far studied there have been no untoward local or systemic reactions.

A valuable method is offered whereby the benefits of intravenous therapy can be obtained when, for whatever reason, there is no available vein. With proper technic there seems to be no risk. Not only have we another valuable method of parenteral therapy but also a technic of performing important intravenous functional tests when a vein for this purpose is lacking. Intramedullary infusions give promise of being used on an extensive scale when knowledge of the technic becomes more widely disseminated.

War Participation

The following four statements from the Surgeons General of the U.S. Army, the U.S. Navy, the U.S. Public Health Service, and the National Procurement and Assignment Service are published at the request of the National Procurement and Assignment Service. This is in effort to aid in the recruitment of physicians.—
Editor

Statement of the Surgeon General of the United States Army

The Army is increasing in size; more medical officers are required. New units are being formed and many new general hospitals are under construction at many points in the United States. Some basic training must be given to medical officers before they are assigned to purely medico-military duties.

For this reason, they are needed one or two months prior to actual assignment. For the protection of the health of the civilian population, the quotas for physicians must be fairly distributed throughout the country. Certain states are far behind; they will, it is hoped, do everything possible to furnish their quotas at once.

Statement of the Surgeon General of the United States Navy

In order to plan intelligently I have reviewed the personnel situation in the Medical Department of the Navy. There is a deficit of approximately 900 medical officers for the next six months, based on minimal requirements. The Bureau of Medicine and Surgery calls medical officers to active duty when billets are available, does not build up too large a reserve at any time. Consequently, procurement must go on in an orderly fashion, if we are to meet the demands that will be placed upon us as the offensive fighting develops. We cannot afford to have the deficit increase beyond its present level; if it does we will not be able to give first-class medical service to our wounded.

The Medical Department of the Navy is charged with maintaining the health of all the personnel of the Navy and the Marine Corps; in addition it must care for the dependents of the officers and men. We look to the medical profession of our nation to come forward with the available doctors that can be spared from civil life to aid in our military

necessity. In the main, the profession has responded nobly. There are some localities where this is not so. In those localities the medical profession should cause the pressure of public opinion to bear on all eligible doctors and thereby bring to their attention the seriousness of failing to do their patriotic duty.

The medical profession is faced with a challenge of furnishing medical service to the armed forces and to the civil population during the active state of war and in the postwar period, which we hope is not too far distant. Should the profession fail in either regard, many forces may develop that will destroy the practice of medicine as we know it. This would be disastrous and it is something that we cannot afford to allow to come about. In all seriousness, the doctors of medicine in the United States should take stock carefully of their own immediate situations and should give every assistance in planning to see that medicine plays its responsible part in this and coming years.

Statement of the Surgeon General of the U.S. Public Health Service

During the next twelve months, the Public Health Service will require approximately 600 medical officers for full-time active duty in the reserve commissioned corps. These physicians will be recruited on an average of 50 a month—25 for service in the U.S. Coast Guard, and 25 for general service.

In addition to the medical officers assigned to the Coast Guard, physicians are needed for duty in the marine hospitals and the medical program of the War Shipping Administration, as well as for detail to general public health work in state and local health departments, and for such specialized war programs of the Public Health Service as tuberculosis control, venereal disease control, industrial hygiene, and community medical services.

The Service also expects this year to commission some 5,000 physicians in the inactive reserve. These doctors will be available for active duty in the event of acute emergency in their own or nearby communities. They will not be called for active duty unless an acute emergency exists, and will be retained only for the duration of such an emergency. This recruitment of inactive officers is undertaken as a part of the cooperative program of the Public Health Service and the Office of Civilian Defense.

The needs of state and local health departments for physicians have increased greatly during the past year. In January, 1942, it was estimated that State and local health departments would need 600 physicians. As of January, 1943, the exact needs have not been determined, but the Public Health Service has, at the present time, requests from the States for 185 medical officers to be assigned to duty in war areas alone.

According to reports from State Procurement and Assignment chairmen, as of March 23, 1943, 286 additional doctors for civilian practice are needed in 176 counties located in 38 states. Another 22 counties in the same states report a shortage of physicians but do not specify the number needed. In the remaining 10 states, no needs were reported.

These 198 counties reporting immediate needs represent only 7 per cent of the 2,654 counties in the 38 states, and only 6 per cent of all counties in

the country. Nevertheless, it is apparent that civilian communities are feeling the pinch of the physician shortage increasingly, since experience has shown that local needs become acute before they are expressed in formal reports. In the joint studies made in 42 areas by the Public Health Service and the Procurement and Assignment Service, it has been determined that 59 physicians and 5 dentists, or 64 medical and dental personnel, are needed in these areas—an average of 1.5 per study. The Public Health Service has been requested to supply 13 of these physicians and dentists, or 23 per cent of the determined need.

On the basis of these 42 studies, it is estimated that 500 physicians and dentists will be needed in 332 areas to be surveyed in the coming fourteen months, or by June 1, 1944. It is anticipated that 80 per cent of these, or 400, will be supplied by voluntary relocation through the regular channels of Procurement and Assignment, and that the Public Health Service will be requested to assist in meeting the needs for the remaining 20 per cent, or 100 physicians and dentists. This may be done either through financial assistance to physicians desiring to relocate in areas requiring their services, or through assignment of Public Health Service personnel upon request of the proper authorities.

Although it is impossible to project with accuracy the 1943 needs of civilian communities, we must face the fact that the shortage undoubtedly will increase during and after the filling of the 1943 military quotas; and that the chances of meeting civilian needs, as well as replacing physicians who die or withdraw from practice because of disability, will correspondingly decrease. Furthermore, we cannot predict at this time the possible needs of certain rural areas, which now may be adequately supplied but which will require additional public health and medical services during 1943, should the government move a large number of farm families into these areas for the food production drive. It is believed that joint action of the Public Health Service and the Procurement and Assignment Service will serve to meet urgent needs in civilian communities.

Statement of Chairman, Directing Board, Procurement and Assignment Service for Physicians, Dentists, and Veterinarians

Figures are now complete on the 1942 quotas for supplying physicians of the various states. Forty states have exceeded the 100 per cent figure of their quotas. Five States were above 90 per cent of their quotas. Four states—New York, Connecticut, Massachusetts, and Nevada—were below 90 per cent of their quotas.

Nevada is the lowest state, but has a total quota of but 35 doctors. It has provided 23 and deserves special consideration because its population is thinly scattered over wide areas.

This statement would not imply any reflection on the patriotism of those members of the medical profession who have been marked available by the Procurement and Assignment Service in these three states and who have not sought a commission. I would only present the facts and let each one draw from these facts whatever deductions he individually chooses.

Certain unavoidable considerations must be faced in these figures. Four states failed to provide 90 per cent of their 1942 quotas of doctors for the services. Three of these states—New York, Connecticut, and Massachusetts—are Eastern Seaboard States and among the most populous ones in the Union. These populous States have large cities in them which now have more doctors per thousand persons than most other parts of the country. Largely because those doctors marked available by the Procurement and Assignment Service have not sought commissions, these states are below their quotas.

Unless more of the doctors found available for military service by the Procurement and Assignment Service in these cities apply for commissions in the armed forces with reasonable promptness, still more doctors must come from rural communities. This will greatly complicate the problem for those communities in their own and other states, since many rural communities are already none too well supplied with doctors. Such inequalities in medical service as now exist are in a considerable measure the result of the conditions herein stated and cause occasional problems of rural medical care which become practically insurmountable for the Procurement and Assignment Service with its present limited authority. With all these facts in mind, with the responsibility of medicine to the country and to itself such as it is, the quota figures particularly in New York, Connecticut, and Massachusetts should be brought up to par by an intensive effort of the state medical societies through their executive bodies, preferably by an organized state medical society campaign.

The provision of doctors for the armed forces is not only the special obligation of medicine but a responsibility which it acknowledges and accepts as its part in the war effort. Each state that has not met its 1942 quota will be kept informed of its position in relation to its quota and its position in relation to other states. Otherwise, a state is denied the pardonable pride of satisfaction in meeting its quota or pampered against facing a distasteful position in relation to other states.

Diagnosis

CLINICOPATHOLOGIC CONFERENCES

FOURTH MEDICAL DIVISION OF BELLEVUE HOSPITAL

Date: May 20, 1943

Conducted by: Dr. Arnold Koffler

DR. CHARLOTTE T. PEIRCE: This was the fourth Bellevue admission of a 60-year-old white woman. In 1928 the patient had a radical mastectomy at another hospital for carcinoma and cyst of the left breast.

She was admitted to Bellevue Hospital in 1939 with a history of a painless lump in the right breast. At operation the frozen section was reported to show malignancy and a radical mastectomy was performed. The final pathologic diagnosis, however, was chronic interstitial mastitis.

The patient was readmitted to this hospital in July, 1942, with a history of severe precordial pain and dyspnea of one day's duration. Physical signs, laboratory findings, and serial electrocardiograms showed evidence of an acute myocardial infarction of the posterior wall. The course of her illness was uneventful and the patient was discharged to the Clinic after two months' bed rest. She felt well until four weeks before the final admission, when she noted dyspnea and mild precordial pain on exertion. Two weeks later the precordial pain became more severe and she developed a cough that was productive of small amounts of mucoid sputum which became blood-tinged two or three days prior to admission. There was no history of orthopnea, nocturnal dyspnea, or edema of the extremities. She had never taken digitalis. Review of systems was otherwise negative. The past history included, in addition to the above facts, one admission for erythema multiforme following a sore throat in 1939. The family history was noncontributory.

On admission, the patient's temperature was 100 F.; pulse, 66; respirations, 32; and the blood pressure, 98/68. Physical examination revealed an obese, pale, apprehensive white woman, moderately dyspneic and orthopneic, with a frequent dry cough. The head, eyes, ears, nose, and throat were essentially negative. The neck was supple; the trachea was in the midline. There was no palpable adenopathy, but there was slight venous distention with a positive Mackenzie. There were bilateral radical mastectomy scars with no palpable axillary nodes. Examination of the right lung disclosed

impaired percussion at the base with harsh breath sounds and a few moist rales. The left lung was hyper-resonant throughout and a few medium moist rales were heard in the left axilla. The heart was enlarged to the left, with regular sinus rhythm; the P.M.I. was not felt. The heart sounds were distant and of poor quality. No murmurs were heard. On examination of the abdomen there was noted slight tenderness in the right upper quadrant; no organs or masses were palpable. The pelvic and rectal examinations were negative. The extremities showed one plus edema and bilateral varicose veins. The reflexes were equal and active.

Laboratory Findings on Admission.—The white blood count was 15,750 with 64 per cent polymorphonuclears, 5 per cent transitionals, 24 per cent lymphocytes, 7 per cent monocytes, and 1 per cent basophils. The hemoglobin was 11.3 Gm., with a red blood count of 4,200,000. The urine was clear, with specific gravity of 1.027, alkaline reaction, a faint trace of albumin, and no sugar; microscopic examination showed an occasional white blood cell. The blood non-protein nitrogen was 43 and the blood Wassermann was negative. A roentgenogram of the chest revealed the heart to be enlarged in all diameters, with widening of the supracardiac aorta and marked congestive changes in both lungs.

Course.—The patient ran a febrile course throughout her hospital stay, with her temperature ranging from 98.6 F. to 102 F. The pulse rose to 106 the day after admission, and the patient was digitalized and put on regular cardiac routine. At the same time the temperature rose to 102 F. and because bronchopneumonia was suspected, she was given sulfadiazine for five days, receiving a total of 26 Gm. The patient did not improve because the temperature and white blood count remained elevated and the drug was cut. Urinalyses remained negative except for a trace to a 1 plus reaction for albumin. Two weeks after admission the patient developed pain over the left chest and precordium which was nonradiating. The heart sounds remained of poor quality, but a gallop rhythm was noted. The blood pressure was 94/70; the white blood count was 14,250 with 65 per cent polymorphonuclears; the tempera-

ture was 100 F., and the pulse, 84. The liver was palpable two fingerbreadths below the costal margin. The erythrocyte sedimentation rate was 9 mm. per hour. The electrocardiogram showed active myocardial changes of Q23, T23 type.

On March 30, the patient developed acute parotitis on the right side, a condition which was treated with radium packs and which subsided completely within five days. One week later discrete and confluent purpuric spots appeared over the sacrum and dependent surfaces of both arms and legs. The platelets numbered 160,000; tourniquet tests were negative, and the bleeding and clotting times were normal. At the same time the patient developed acute thrombophlebitis of the right leg. She had no further precordial pain. The course was progressively downhill. The patient became more dyspneic; signs of fluid appeared in the right chest and thoracentesis on April 10 yielded 200 cc. of grossly blood fluid with specific gravity of 1.015; culture was negative. Thoracentesis was repeated on April 13, yielding 1,200 cc. of serosanguineous fluid with specific gravity of 1.015, 1,250,000 red blood cells, and 6,000 white blood cells with 70 per cent polymorphonuclears. There was no improvement; the dyspnea increased and on April 15 the patient developed acute pulmonary edema. She died on April 16, the thirty-eighth hospital day.

Discussion

DR. ARNOLD KOFFLER: The case today presents superficially a very simple cardiac problem—namely, one of acute right coronary thrombosis and infarction of the posterior basilar type with septal involvement and subsequent congestive failure. Underlying this problem, however, are a number of complicating factors not satisfactorily explained on such a simple basis. Although on the previous admission, the diagnosis of an acute infarction was substantiated by the electrocardiograms, there was a three weeks' febrile period with pulmonary signs suggesting the presence of a bronchopneumonia. The patient, however, made a fair recovery and was discharged.

The patient was readmitted nine months later with a history of gradual onset of congestive failure characterized by exertional dyspnea, cough, and precordial pain. The cough increased and expectoration became blood-streaked. The hospital stay was characterized by a long febrile course with leukocytosis and pulmonary signs which did not respond satisfactorily to the administration of sulfadiazine. It was, therefore, necessary to search for other possibilities to explain the symptoms. The answer may lie in the

fact that in cardiac patients, particularly those with limited activity and signs of congestive failure, the clinical picture of chest pain, cough and bloody expectoration should lead us to suspect the possibility of hemorrhagic pulmonary infarction. This is the condition most commonly mistaken for bronchopneumonia since the co-existence of pulmonary congestion seems to be a necessity in the production of such infarction. It has been noted that in the presence of a good heart and adequate pulmonary circulation, embolization to a medium-sized vessel does not produce infarction. I am, of course, not referring to closure of a main vessel, which produces either sudden death or acute right heart failure with peripheral circulatory collapse.

The origin of embolization in this patient may have been from the right heart, but it is much more likely to have come from the peripheral vessels for the following reasons: (1) it is the commonest cause; (2) myocardial infarction diagnosed on the previous admission and possibly on this admission would produce a mural thrombus in the left ventricle. It would not have embolized to the pulmonary circuit; and (3) varicosities of the lower extremities were present and definite thrombophlebitis was noted during the terminal phase of her illness.

Contributing to the diagnosis of hemorrhagic infarction was the presence of a hemorrhagic pleural effusion. Infarction is probably the commonest cause of such an effusion, with the exception of malignancy. Leukocytosis and fever may accompany this condition.

In mentioning malignancy we must not overlook the history of double mastectomy in this case—the first in 1928, the other in 1939. While we must assume that the first was done for malignancy, the second tumor was definitely proved nonmalignant in spite of the suspicious frozen section taken at the time of operation. I believe we are fairly safe in assuming that metastasis to the lung was not likely so long after the first operation, and if the microscopic picture of the second tumor was correct, there would be no cause to suspect a metastatic lesion from that source.

It is unfortunate that two laboratory procedures were apparently omitted—namely, the taking of blood cultures to rule out blood stream infection and the use of icteric indices to help in the diagnosis of the pulmonary infarction.

Two clinical episodes which occurred during the last two weeks of the patient's illness must not be overlooked. First was the occurrence of an acute parotitis, which always is of grave prognostic significance in the aged except in the epidemic or postoperative form. The second

condition was the presence of a terminal purpura which may well have been conditioned by the application of radium for the treatment of the parotitis—however small the dose.

In conclusion, we may visualize a woman who has sustained the accident of acute cardiac infarction. Following a period of comparative comfort, signs of congestive failure became apparent. This impaired reserve predisposed the patient to peripheral and pulmonary congestion. An ideal situation was therefore created for the production of a thrombus in the lower extremities and embolization to the lungs. This further embarrassed the already exhausted circulation, and death was inevitable.

DR. MAX TRUBEK: I saw this patient throughout her final admission. She came in with symptoms suggesting another episode of cardiac infarction. There was clinical evidence of extensive myocardial damage—obviously severe nutritional disturbance of the myocardium. The apical sounds were of extremely poor quality and there was a persistent gallop. I felt that pulmonary pathology was due to infarction, most likely embolic from the iliac or femoral veins. Confluent petechiae appearing after radium application seemed to be due to some capillary toxic trauma. I do not feel that the question of metastatic malignancy arises in the differential diagnosis. At this late date, fifteen years after the removal of breast carcinoma, other more obvious evidences of metastases would have also been manifest.

DR. CHARLES H. NADLACK: The temptation in this case is to consider the possibility of a pleural carcinoma of the bouton-en-chemise type, but the lapse of time precludes that. We have used radium packs in parotitis on several occasions with good effect and without any unfavorable influence on the blood picture.

Presentation of Pathology

Gross Findings.—DR. SEYMOUR TENZER: Numerous petechial and purpuric hemorrhages were conspicuous in the skin of both legs and over the dorsal aspects of both hands and feet. The mastectomy scars were well healed and contained no signs of recurrence of the original tumors. Moderate edema was present in the lower extremities and dependent portions of the body.

The peritoneal cavity was free of fluid but the right pleural sac contained about two liters of greenish-yellow opalescent fluid. The left pleural sac was free of adhesions or fluid. The lungs overlapped in the midline, and the right lung was bound down by numerous adhesions. Some of the pleural exudate was loculated over the right lower lobe. This lobe was almost completely

collapsed. The visceral pleura of both lungs was the seat of fibrinous deposits, more marked over the right lung. The right middle and lower lobes were the seat of multiple hemorrhagic infarcts of various sizes. The branches of the pulmonary artery supplying these areas contained thrombi of various colors ranging from red to yellow. The right upper lobe was crepitant but the rest of the lung was airless. On section, bloody fluid oozed from the cut surfaces. The left lung was crepitant except for the basal portion of the left lower lobe, where multiple wedge-shaped infarcts were present. Yellowish thrombi or emboli were demonstrated in the pulmonary arterial branches to this area.

The heart was moderately enlarged, weighing 470 Gm.; the increase in size was due to enlargement of the left ventricle. The epicardial surface was smooth and transparent, and the epicardial fat was only slightly increased over the atrioventricular sulcus and over the right ventricle. The right auricular appendage contained small, firmly attached yellowish-red thrombi overlying the pectinate muscles. Visible through the endocardium of the right ventricle, a yellowish, roughly C-shaped area of coagulation necrosis was found in the septum. The overlying endocardium was unaltered. The pulmonary conus was dilated, but no thrombi or emboli were found in the pulmonary artery or its main branches. In the left side of the heart three main areas of infarction were encountered—one apparently healed in the posterior wall behind the posterior leaflet of the mitral valve. This was of indefinite outline and appeared to be composed of multiple confluent areas of fibrous replacement. The second was a well-healed area of fibrous replacement which was located at the apex. Its walls were extremely thin. The whole area was 3 cm. in diameter in its broadest portion. The third area corresponded exactly to the zone of necrosis seen in the right side of the septum. It was quite irregular in outline, varying from 1 to 4 cm. from side to side. Adjacent to it, minute thrombi were attached among the trabeculae carneae. The atrioventricular and pulmonary valves and their leaflets were free of notable changes. The cusps of the aortic valve were moderately sclerotic but freely movable. The coronary vessels had patent ostia, but from their inception they exhibited progressively severe atherosclerosis of concentric and eccentric distribution. The anterior descending branch of the left coronary artery contained a fresh red thrombus, 1½ cm. from its origin. It filled the vessel at a point of great narrowing due to atherosclerotic deposits. The circumflex branch of the left coronary artery and its smaller branches exhibited narrowing due to some sclerosis, but

this was more patchy. The right coronary artery was patent for 4 cm. from its origin but then was occluded by an organized thrombus and large atherosclerotic plaques for a distance of 7 cm. Distal to this point the vessel was collapsed and its posterior branch was very minute although still demonstrably patent. The coronary veins were not remarkable.

The kidneys exhibited a moderate degree of arteriolar nephrosclerosis. The other organs were not remarkable except for chronic passive congestion of the spleen and liver. In the fat of the pancreas, a small area of fat necrosis (1 to 2 mm.) was encountered. In the right external iliac and femoral veins a reddish thrombus was found occluding the lumen. Limitations of the autopsy prevented further determination of its extent into the veins of the right leg.

Microscopic Findings.—DR. IRVING GRAEF: Studies of the sections of the lung disclosed evidence of old as well as recent thrombotic embolic occlusion of the medium-sized branches of the pulmonary artery. Canalized vessels as well as freshly occluded ones were present in multiple blocks. Besides hemorrhagic infarction, microscopic foci of lobular pneumonia were encountered in the sections of the right upper lobe. Sections including the inflamed pleura disclosed evidence of early organization of fibrinopurulent exudate. Sections through the zone of septal infarction of the myocardium revealed a partly organized old infarct and well-attached mural thrombi between the trabeculae carneae. Sections of the coronary vessels confirmed the gross impression of fresh thrombosis of the left coronary artery and old canalized thrombosis of the right.

Comments

DR. IRVING GRAEF: This patient aptly illustrates the vicious circle which coronary occlusion and myocardial infarction may begin, for congestive failure ensued and promoted thrombosis in the veins of the systemic circulation. Right auricular thrombi may also be ascribed to the failing heart, and this together

with the venous thrombosis furnished ample sources for pulmonary embolization and hemorrhagic infarction. Further complicating the picture was the secondary infection of the pleural sac, probably due to secondary development of lobular pneumonia. On its own account, pulmonary embolization may well have contributed to the progressive coronary thrombosis by the physiologic insult leading to shock-like states with reduced cardiac output, lowered systolic blood pressure, and reduced coronary flow. The myocardial ischemia already initiated by the coronary sclerosis in a hypertensive subject thus became critical, leading to necrosis of the muscle. The fresh thrombus in the left coronary may well have been a terminal event, for no fresh areas of myocardial necrosis were encountered.

The purpura observed at death is unexplained. Thrombopenia was not demonstrated and nothing distinctive was disclosed in the hemopoietic organs at necropsy.

Anatomic Diagnoses

Myocardial infarction, recent and old, involving the interventricular septum, the posterior wall of left ventricle, the left ventricular apex, and the tip of the left posterior papillary muscle.

Coronary thrombosis, recent (left) and old (right), with canalization.

Severe atherosclerosis of coronary vessels.

Mural thrombi in right auricular appendage, and endocardium of left ventricle.

Dilation and hypertrophy of the heart, chiefly of left ventricle.

Bilateral multiple pulmonary emboli.

Multiple bilateral hemorrhagic infarcts involving right middle lobe, right lower lobe, and left lower lobe.

Arteriolar nephrosclerosis.

Thrombosis of femoral and external iliac veins (right).

Purpura.

Local fat necrosis of pancreas.

Adentia.

IMPROPER USE OF THE WORD ETIOLOGY

To the Editor:—One of the commonest errors in medical writing is in use of the word "etiology." The precise meaning of this word, derived from the Greek words *aitia* and *logos*, is the science or study of the causation. It is therefore incorrect to say the "etiology of the disease is unknown." Authors who make this common error intend to say that the cause of the disease is unknown and not that the science or study of causation is unknown.

Similar mistakes are often made with other words

ending in "-logy." There is no excuse for the outrageous expression "there was no pathology," as the author who writes in this manner would not dream of saying "there was no ophthalmology" in place of stating that he found no abnormal changes in the eyes. Perhaps the worst example of medical jargon is the expression "the patient has a negative serology." Some writers even speak of "negative serologies."—Howard Fox, M.D., New York City, in J.A.M.A.

Case Report

PERSISTENT TACHYCARDIA IN A SURVIVOR ADRIFT AT SEA FOR EIGHTY-THREE DAYS

ARTHUR J. HORTON, LT. COMDR., MC-V (S), USNR

THE following preliminary case report concerns a survivor who drifted for eighty-three days on an open raft.

Case Report

The patient, B. I., a 20-year-old seaman second class, USNR, was a member of an armed guard crew of a medium-sized Allied passenger ship, which was torpedoed and sunk at the beginning of November, 1942, in tropical waters. He and four others obtained a standard drum-type 9-by-10-foot life raft, equipped with oars; a 9-by-10-foot canvas cover; 10 pounds of hardtack; 9 cans of evaporated milk; 2 pounds of chocolate; 2 small paper cartons of biscuits; and a cask containing 10 gallons of fresh water. This food was carefully rationed, but by the sixteenth day all of their stores had been used.

With their canvas cover, they were able to catch enough water to maintain themselves, for frequent showers occurred during most of their stay on the raft. By means of a slip noose, they caught fish and also birds which alighted upon the raft occasionally, but at one time they were without food for five days. Upon catching a fish or bird, they first ate the liver, heart, muscular tissue, and finally the intestines. Snails clinging to the sides and bottom of the raft were also eaten. Two of the men aboard the raft had great difficulty in eating raw meat. They became nauseated frequently, and during the latter part of December they both developed frequent, loose stools, accompanied by marked tenesmus. These two men became progressively weaker and began to pass bloody stools. One man died on the sixty-sixth day and the other of the seventy-seventh day.

During his entire stay on the raft, the patient had only two bowel movements, both of a thin, oily consistency.

Upon being brought aboard the patrol ship, the patient was treated by the chief pharmacist's mate aboard that vessel. He presented a picture of extreme emaciation, his weight being between 75 and 80 pounds. He had no complaints except that of great hunger. His temperature was normal and his pulse rate 76. It was noted that no bleeding of the gums was present and that his teeth were firm. No evidence of joint hemorrhage existed. Ulcers, crusted and partially healed, were found on the feet and legs. Two pressure sores were present on the buttocks. The abdomen, although not markedly sunken, was rigid. The anal sphincter was completely relaxed.

He was put to bed, given 4 ounces of peach juice, 2 ounces of pineapple juice, and a chocolate bar. The following day he slept most of the morning, being given 4 ounces more of fruit juice. Water was given freely. About noon, he voided 200 cc. of clear urine. The pulse rate varied from 72 to 76, and the respiratory rate was normal. During the afternoon, several bouts of vomiting occurred, producing a thin, bile-colored vomitus. An enema of mineral oil and glycerin was given, with a slightly

bloody return. One hour later, a bowel movement occurred, slightly bloody, with hard round stools about 1 cm. in diameter. A proctoclysis of dextrose, 5 per cent, and sodium bicarbonate, 2 per cent, was begun, 4,000 cc. being absorbed during the next twelve hours. During this time the patient's temperature varied from 99.4 to 100 F., his pulse varying from 86 to 90. During the following day, milk toast, poached eggs, milk, corn flakes, creamed peas, and puréed carrots, all in small quantity, were administered frequently. By the evening of the third day, the patient was retaining food well, and two days later he retained a regular meal, his temperature being normal, with a pulse varying from 80 to 94. He passed several semisolid stools during this time.

Thirteen days after being picked up by the patrol vessel, the patient was brought to this dispensary. The other two survivors, who had practically the same treatment aboard the patrol vessel, were taken to another institution.

Upon admission, the patient's chief complaint was palpitation, coupled with a slight frontal headache. The skin was deeply tanned; the arms, legs, and chest were emaciated, but the abdomen was scaphoid and not remarkably sunken. Scars were present over both feet and legs. The skin of the face showed some crusting and a branny desquamation. The temperature was 99 F. Pupillary reflexes were normal; no bleeding of the gums or gingivitis was present. The mucous membranes of the mouth and throat were pale but otherwise not remarkable. Examination of the tongue showed it to be of normal size, but reddened and roughened, with smooth whitish lesions present on the ventral surface and frenum. The thyroid was not enlarged. Examination of the chest was negative, except for sunken supraclavicular and intercostal spaces. The pectoral muscles showed a good deal of wasting. Cardiovascular findings revealed the apex to be in the sixth left interspace about 9 cm. from the mid-sternal line. A faint apical systolic murmur was present. The rate was 120 per minute with a blood pressure of 124 mm. systolic and 80 mm. diastolic. Abdominal findings were not remarkable; the liver and spleen were not palpable. The abdominal reflexes were normal. Aside from the scarring previously described and emaciation of the muscles, the extremities showed nothing of note. The knee jerks were active; no Babinski reflex or ankle clonus was present.

The hemoglobin was 82 per cent (H); the red blood cells 2.9 million per cu. mm. Leukocytes numbered 6,150, with 46 per cent polymorphonuclears, 48 per cent lymphocytes, 2 per cent basophils, 1 per cent eosinophils, and 3 per cent mononuclears. The urine was cloudy, light amber color, with a specific gravity of 1.020, the pH being 7.5. Albumin and glucose were not present; microscopic examination, with the exception of numerous motile bacilli, was negative. The patient was placed on a full diet, with the addition of 12 ounces of fresh orange juice, 1 Gm. of ferrous sulfate, 30

mg. of thiamin chloride, as well as multiple vitamin capsules containing small quantities of vitamins A and D, thiamin chloride, riboflavin, ascorbic acid, and nicotinic acid amide.

During the next three days, the tachycardia persisted; the rate varying from 100 to 120. It was believed that a vitamin B complex deficiency may have caused this, but excessive smoking could also have been a factor. The patient's bowel movements were regular, and he had no other complaints. He continued to run a fever, with the temperature varying from 98.2 F. in the morning to 100 F. during the late afternoon. On the morning of the seventh day following admission, the patient complained of a sore throat and generalized malaise. The throat was reddened and injected, no exudate being present. The lesions described on the under surface of the tongue and frenum had disappeared. Examination of the chest was negative. The following day the throat symptoms subsided, but the tachycardia still persisted. At times the patient complained of a feeling of constriction in his throat. No thyroid enlargement was noted. His blood pressure was 124/70, with an apical rate of 118 per minute. The murmur previously described had by now disappeared. Phenobarbital, $\frac{1}{2}$ grain, was given after each meal.

The hemoglobin was 84 per cent (H); the red blood cells 3.8 million per cu. mm.; the white blood cells 4,400, with 60 per cent polymorphonuclears, lymphocytes 39 per cent, and monocytes 1 per cent. The Kahn reaction was negative. The body weight, which had been approximately 100 pounds on admission, had increased by the fifth day to 116 pounds. Two days later the patient weighed 118 pounds.

During the next five days, the patient's temperature remained at from 98.4 F. to 99.2 F., with the apical rate varying from 100 to 120. The rhythm remained constantly regular. No signs of rheumatic infection appeared. His smoking had been cut down to a marked degree, only 5 cigarettes daily being permitted. Because he had been on a diet of uncooked fish and birds prior to being rescued, stool examinations were made frequently in an effort to detect intestinal parasites. None was ever found, however. Urine analysis was repeatedly negative.

The patient's appetite was excellent. By the nineteenth day of his stay here his hemoglobin was 94 per cent, the red blood count was 4.85 million; the white blood count 9,550, with 66 per cent polymorphonuclears, 31 per cent lymphocytes, 1 per cent basophils. Phenobarbital was discontinued at this time, for it evidently had no effect on the tachycardia. His weight had reached 122 pounds by this time. A chest x-ray was negative, and the cardiac shadow was of normal size and configuration.

On his twenty-third day the patient was transferred via air transport to the National Naval Medical Center for further disposition.

Comment

This patient was in excellent physical condition prior to being cast adrift. It appears almost incredible that a human being could survive for this length of time, especially upon the food that the survivors were able to obtain. The fact that no clinical signs of scurvy or of any marked vitamin deficiency existed is important. There are several points in explanation of this. To begin with, the crew were in tropical waters in a season when frequent rain squalls occurred, and so they were able to obtain sufficient water for their needs. The mean temperature was fairly constant; and to some extent they were able to protect themselves from the sun by their canvas cover. The course of their drift led them through waters where many tropical fish and birds are found, and by eating these uncooked they probably obtained some vitamin content, especially from the livers. No severe storms occurred during their period of drift.

I am unable to explain the low-grade fever and tachycardia which this patient exhibited. One factor may have been an increased metabolic rate because of the ingestion of a full diet after a long period of semistarvation. The author had an opportunity to examine the other two survivors about two weeks after their arrival at this port, and in both instances a tachycardia of from 110 to 130 was present with a normal blood pressure. Physical examination of both was otherwise negative.

The fact that none of these men developed signs of "immersion foot" during their stay on the raft seems to indicate that in tropical or semitropical waters this complication, which has had such serious effects in North Atlantic waters, is not a grave danger. The peripheral circulation in all three cases was excellent when they were examined after arriving at this port.

It is believed that small frequent feedings, with measures to combat dehydration, is the best early treatment for advanced malnutrition of this type. Metabolism determinations after two weeks of a full diet would have been interesting, but unfortunately no apparatus was available either for this or for blood chemistry determinations.

The author wishes to commend Chief Pharmacist's Mate Raymond Clifton Buckley, USN, of the escort vessel which sighted the raft, for his prompt and effective care of these patients when they were picked up and for his aid in the preparation of this paper.*

INFLUENZA STUDY PROGRESSING

Dr. Norman Plummer, of Cornell Medical College, announced recently that the first step in the search for vaccines to prevent influenza has been completed.

Under the direction of the Army influenza com-

mission, 3,000 vaccinations have been made, and specimens for the immunity test have been obtained from more than 500 individuals.

Records will be kept of every respiratory infection that occurs in any of the vaccinated men.

Case Report

THROMBOPHLEBITIS MIGRANS DISSEMINATA: REPORT OF A CASE IN WHICH GANGRENE OF A BREAST OCCURRED*

Observations on the Therapeutic Use of Dicumarol (3, 3' Methylenebis (4-Hydroxycoumarin))

EDWARD P. FLOOD, M.D., MILTON H. REDISH, M.D., STANLEY J. BOCIEK, M.D., and
SHEPARD SHAPIRO, M.D., New York City

THROMBOPHLEBITIS migrans usually occurs locally, the process remaining confined to one or both of the lower extremities. Less frequently, it extends to other veins. In rare instances it becomes widespread, involving distant venous channels, including those of the viscera. The clinical picture, consequently, is determined by the site and the extent of the lesions, superficial veins revealing the usual picture of thrombophlebitis while more generalized spread gives rise to variable toxemia and symptoms referable to the respective tissues affected.¹⁻⁴

The cause of the disease is often obscure although certain features stand out to characterize the entity. The phlebitic process, especially of the superficial vessels, unpredictably arises in different areas irregularly and frequently undergoes periods of exacerbation and remission. Although of relative benignity with respect to life, it is nevertheless generally responsible for periods of incapacitation of months' duration.

We have studied a case of thrombophlebitis with migratory and disseminate lesions, in which the clinical picture and response to anticoagulant therapy were of sufficient interest to warrant a separate report.

The *in vivo* anticoagulant Dicumarol (3,3'-methylenebis (4-hydroxycoumarin)) was used. It induces a state of prothrombinopenia, which is measurable by the prothrombin clotting time.⁷

The method used for prothrombin assay has been previously described.⁸ It includes estimation of the prothrombin clotting time of whole (100 per cent) and diluted (12.5 per cent) plasma. The rationale and clinical interpretations have been set forth in the earlier communication.⁸

Case Report

A 49-year-old white housewife was admitted to St. Francis Hospital on April 21, 1942, complaining of severe pain in the right chest of one day's duration. She had had several attacks of "phlebitis"

From the Medical Service of St. Francis Hospital, New York City.

* This is the third paper of the series "Studies on Thrombolization." The first paper is reference 9, the second, reference 21.

ACKNOWLEDGMENTS: The authors gratefully acknowledge the assistance of Dr. Roy S. Nelson in the preparation of the pathologic tissues. The Dicumarol was supplied through the kindness of Dr. K. K. Chen of Eli Lilly & Co., Indianapolis, Indiana. Miss Frances Kaufman gave technical assistance in the prothrombin estimations.

in her legs during the past fourteen years. In 1936, following the birth of her youngest child, she was confined to bed for thirteen weeks because of an attack of a similar condition. For about two months prior to the present admission she had had frequent pains in the lower extremities, especially in the right leg and thigh, where gradually increasing swelling was also noted. The day preceding her admission to the hospital, she was seized with sudden, severe sharp pain in the right side of the chest. This was not accompanied by cough or hemoptysis.

On examination the patient was found to be moderately obese. Her breathing was rapid and shallow; her face was flushed and portrayed great anxiety.

Expansion of the right side of the chest was limited. Over the base there were elicited dullness, distant bronchovesicular breath sounds, large and small moist rales, and a pleuritic friction rub. The left side of the chest was clear throughout.

Examination of the abdomen revealed diffuse tenderness on deep pressure over the lower quadrants.

Both feet and legs were cold to the touch. The superficial veins appeared prominent and those on the right side were thickened, tender, and surrounded by an area of redness, especially throughout the greater part of the saphenous tract. The limb was severely edematous throughout its entire length. Dorsalis pedis pulsations were palpable on both sides. The temperature was 101.6 F.

The diagnosis on admission was thrombophlebitis of the right saphenous vein with extension to the right iliac vein; infarction of the right lung was also included in the diagnosis.

The friction rub was heard only on the day of admission, although the other physical signs continued. Sulfadiazine was administered, and within three days the temperature fell to normal. Because of signs of intolerance—erythematous eruption, nausea, vomiting, and rise in temperature to 101.6 F.—the drug was withdrawn on the tenth hospital day. The abnormal physical signs in the chest persisted.

On May 9 the Dicumarol therapy was started (Fig. 1). Within three days the leg became softer, and during the succeeding two days the edema of the entire limb diminished markedly. The temperature remained below 100 F., in the interval between May 11 and 20. The physical signs in the right side of the chest altered slightly. On May 22 Dicumarol was discontinued, following which the prothrombin time gradually decreased. One week later these values approximated normal (Fig. 1).

On May 24 the temperature rose to 104 F., and on the next day there were elicited over the base of

mg. of thiamin chloride, as well as multiple vitamin capsules containing small quantities of vitamins A and D, thiamin chloride, riboflavin, ascorbic acid, and nicotinic acid amide.

During the next three days, the tachycardia persisted; the rate varying from 100 to 120. It was believed that a vitamin B complex deficiency may have caused this, but excessive smoking could also have been a factor. The patient's bowel movements were regular, and he had no other complaints. He continued to run a fever, with the temperature varying from 98.2 F. in the morning to 100 F. during the late afternoon. On the morning of the seventh day following admission, the patient complained of a sore throat and generalized malaise. The throat was reddened and injected, no exudate being present. The lesions described on the under surface of the tongue and frenum had disappeared. Examination of the chest was negative. The following day the throat symptoms subsided, but the tachycardia still persisted. At times the patient complained of a feeling of constriction in his throat. No thyroid enlargement was noted. His blood pressure was 124/70, with an apical rate of 118 per minute. The murmur previously described had by now disappeared. Phenobarbital, $\frac{1}{2}$ grain, was given after each meal.

The hemoglobin was 84 per cent (H); the red blood cells 3.8 million per cu. mm.; the white blood cells 4,400, with 60 per cent polymorphonuclears, lymphocytes 39 per cent, and monocytes 1 per cent. The Kahn reaction was negative. The body weight, which had been approximately 100 pounds on admission, had increased by the fifth day to 116 pounds. Two days later the patient weighed 118 pounds.

During the next five days, the patient's temperature remained at from 98.4 F. to 99.2 F., with the apical rate varying from 100 to 120. The rhythm remained constantly regular. No signs of rheumatic infection appeared. His smoking had been cut down to a marked degree, only 5 cigarettes daily being permitted. Because he had been on a diet of uncooked fish and birds prior to being rescued, stool examinations were made frequently in an effort to detect intestinal parasites. None was ever found, however. Urine analysis was repeatedly negative.

The patient's appetite was excellent. By the nineteenth day of his stay here his hemoglobin was 94 per cent, the red blood count was 4.85 million; the white blood count 9,550, with 66 per cent polymorphonuclears, 31 per cent lymphocytes, 1 per cent basophils. Phenobarbital was discontinued at this time, for it evidently had no effect on the tachycardia. His weight had reached 122 pounds by this time. A chest x-ray was negative, and the cardiac shadow was of normal size and configuration.

On his twenty-third day the patient was transferred via air transport to the National Naval Medical Center for further disposition.

Comment

This patient was in excellent physical condition prior to being cast adrift. It appears almost incredible that a human being could survive for this length of time, especially upon the food that the survivors were able to obtain. The fact that no clinical signs of scurvy or of any marked vitamin deficiency existed is important. There are several points in explanation of this. To begin with, the crew were in tropical waters in a season when frequent rain squalls occurred, and so they were able to obtain sufficient water for their needs. The mean temperature was fairly constant; and to some extent they were able to protect themselves from the sun by their canvas cover. The course of their drift led them through waters where many tropical fish and birds are found, and by eating these uncooked they probably obtained some vitamin content, especially from the livers. No severe storms occurred during their period of drift.

I am unable to explain the low-grade fever and tachycardia which this patient exhibited. One factor may have been an increased metabolic rate because of the ingestion of a full diet after a long period of semistarvation. The author had an opportunity to examine the other two survivors about two weeks after their arrival at this port, and in both instances a tachycardia of from 110 to 130 was present with a normal blood pressure. Physical examination of both was otherwise negative.

The fact that none of these men developed signs of "immersion foot" during their stay on the raft seems to indicate that in tropical or semitropical waters this complication, which has had such serious effects in North Atlantic waters, is not a grave danger. The peripheral circulation in all three cases was excellent when they were examined after arriving at this port.

It is believed that small frequent feedings, with measures to combat dehydration, is the best early treatment for advanced malnutrition of this type. Metabolism determinations after two weeks of a full diet would have been interesting, but unfortunately no apparatus was available either for this or for blood chemistry determinations.

The author wishes to commend Chief Pharmacist's Mate Raymond Clifton Buckley, USN, of the escort vessel which sighted the raft, for his prompt and effective care of these patients when they were picked up and for his aid in the preparation of this paper.*

INFLUENZA STUDY PROGRESSING

Dr. Norman Plummer, of Cornell Medical College, announced recently that the first step in the search for vaccines to prevent influenza has been completed.

Under the direction of the Army influenza com-

mission, 3,000 vaccinations have been made, and specimens for the immunity test have been obtained from more than 500 individuals.

Records will be kept of every respiratory infection that occurs in any of the vaccinated men.

Fig. 3. Photomicrograph of breast, showing venous thrombosis and hyalinization. The interstitial hemorrhage is prominent. The artery is unaltered.

The arterial supply of this gland arises from three sources; hence, it is difficult to visualize the cause as being solely of arterial (ischemic) origin. The microscopic sections showed organizing venous thrombosis with intact arterioles. In addition there was interstitial hemorrhage. It is not clear how these phenomena singularly or collectively could have induced the gangrenous process. The mechanism believed to be responsible for gangrene in association with other forms of thrombophlebitis does not appear to apply in this case^{11,12,13} although we feel that there must have been some relationship because of their common denominator, the phlebitis.

Gangrene has not been observed in animals or man after the administration of Dicumarol, including those instances in which hemorrhage was induced.¹⁴⁻²⁰ The unique aspect of the lesion is to be emphasized. No previously reported instance of it in association with thrombophlebitis could be found in the literature.

The effects of the anticoagulant on the course of the disease are of considerable significance. The striking and rapid recession of the symptoms of the thrombophlebitis following the administration of Dicumarol further establishes the therapeutic value of the drug in phlebotic processes and confirms previously reported observations.²¹ It is especially noteworthy that the same response was observed twice under almost identical conditions. It was evident from the clinical picture that during the intervals of prothrombinopenia that propagation of the thrombotic process ceased only to resume its activity when the Dicumarol action abated. This is in accord with the experimental findings of Richards and Cortell²² and of Dale and Jaques.²³

Certain observations concerning Dicumarol action are well exemplified here. The same dose (400 mg.) administered the second time within a fortnight after the prothrombin time was restored to normal was followed by a much greater degree of prothrombinopenia than it was on the earlier occasion. It is known that there is no hypersensitivity or immunity acquired after prior ingestion of the anticoagulant. Two of us have shown this in

Fig. 4. Biopsy after recovery. No abnormalities are visible.

previous work.²⁴ The reason for the more pronounced response is to be found in the change in the nutritional state of the patient consequent to such severe illness. This experience serves to emphasize the absolute necessity for frequent estimation of the prothrombin time during Dicumarol therapy. The use of diluted (12.5 per cent) plasma for prothrombin assay is urged because of its greater sensitivity and reliability and because of the additional data thereby obtainable.^{8,25}

The occurrence of confusional and maniacal states is an interesting variation in the symptomatology of the disease. These are due, it appears, to dissemination of the phlebotic process to the intracranial system of veins.^{5,6}

The microscopic sections of the mammary gland revealed mural alterations of the veins, venous thrombosis, and hyalinization of the thrombi and the intima. The picture indicates that the condition was of greater duration than the symptoms indicated. Hence, in addition to local spread of existing lesions, the disease attacks various vulnerable vessels widely distributed throughout the body, either simultaneously or at different intervals. An appellation such as "thrombophlebitis migrans disseminata" is proposed to designate the features of the disease and to distinguish it from the local variety.

The biopsy specimen obtained from the right leg after the clinical evidences of activity had abated revealed no significant residual pathology. That the disease may be of reversible nature is demonstrated thereby.

Summary

A case of phlebitis with migratory and disseminate lesions is described. A unique complication, gangrene of a mammary gland, arose during the course of the disease. The mechanism by which this was induced is undecided. That the disease may be reversible is illustrated by the biopsy findings. To describe the widely distributed lesions it is suggested that the entity be designated as "thrombophlebitis migrans disseminata."

The striking improvement following the administration of Dicumarol is described. Observations on the use of this anticoagulant are noted. The absolute necessity for frequent prothrombin assay during the time that the drug is being used is em-

phasized. The advantages of the estimation of diluted (12.5 per cent) plasma prothrombin time are pointed out, and its use is recommended.

Addendum

Since this paper was written, one of us (S. S.) has treated a case (referred by Dr. M. Rashbaum) of recurrent thrombophlebitis involving a lower extremity and in which gangrene of the intestine (requiring resection of the bowel) had occurred following mesenteric thrombophlebitis.

The reader is referred to a report of another case in which mesenteric thrombophlebitis occurred by Birnberg, V. J., and Hansen, A. E., *J. Pediat.*, 21: 775-786 (December) 1942.

\$1,000 BACTERIOLOGY PRIZE

The \$1,000 prize and gold medal given annually by the Society of American Bacteriologists to an American bacteriologist under 36 years of age who has made an outstanding contribution to knowledge of the subject during the year were awarded to Dr. Harlan G. Wood, research assistant professor of bacteriology at Iowa State College.

Work tending to show that carbon dioxide acts

as a vitamin-like substance necessary in the life of plants and animals won the award for Dr. Wood.

The award is presented at the annual meeting of the Society of American Bacteriologists, but as this was canceled this year, the award was presented to Dr. Wood at a joint meeting at Iowa State College of local chapters of the Society and of Sigma Xi.—*Science News Letter*

HEPVISC IN HYPERTENSION

LOWERS HIGH BLOOD PRESSURE

Relieves Hypertensive Symptoms • Prolongs Hypotensive Action

Each tablet contains a synergistic combination of 20 mg. Viscum album, 60 mg. desiccated hepatic substance and 60 mg. desiccated insulin-free pancreatic substance.

Dosage 1-2 tablets t.i.d.

Sample on request

Available in bottles of 50, 500 and 1,000 tablets.

House of Delegates

Minutes of the Annual Meeting

May 3 and 4, 1943

THE 137th Annual Meeting of the House of Delegates of the Medical Society of the State of New York was held at the Hotel Statler, Buffalo, New York, on Monday, May 3, 1943, at 10.10 A.M.: Dr. Louis H. Bauer, *Speaker*; Dr. William Hale, *Vice-Speaker*; Dr. Peter Irving, *Secretary*; Dr. Edward C. Podvin, *Assistant Secretary*.

SPEAKER BAUER: The House will be in order.
Ladies and Gentlemen, The National Anthem!

... The delegates sang "The Star-Spangled Banner"

Section 1. (See 42)

Report of the Reference Committee on Credentials

SPEAKER BAUER: The chair recognizes Dr. Peter Irving, chairman of the Reference Committee on Credentials.

SECRETARY IRVING: Mr. Speaker, there are no disputed delegations, and all on our rolls are entitled to vote.

SPEAKER BAUER: I declare the 137th Session of the House of Delegates of the Medical Society of the State of New York open for the transaction of business.

Mr. Secretary, how many delegates are registered?

SECRETARY IRVING: I cannot give you that number just yet, sir, but there is a quorum present.

SPEAKER BAUER: There is a quorum present, and the number of delegates will be reported later

Section 2

Approval of the Minutes of the 1942 Session

SPEAKER BAUER: The first order of business is the approval and adoption of the minutes of the 1942 Session of the House.

SECRETARY IRVING: I move you, sir, that the reading of the minutes of the 1942 Session of the House be dispensed with, and that they be approved and adopted as published in the June 15 and July 1, 1942, issues of the NEW YORK STATE JOURNAL OF MEDICINE.

Dr. ROBERT BRITAIN, *Delaware*: I second that motion.

... There being no discussion, the motion was put to a vote, and was unanimously carried

SPEAKER BAUER: Mr. Secretary, will you read the Reference Committee appointments?

Ladies and Gentlemen, please pay particular attention to the reading as there are several changes from the printed list.

Section 3

Reference Committees

SECRETARY IRVING: The Reference Committees of the 1943 House of Delegates are as follows:

REFERENCE COMMITTEE ON CREDENTIALS

Peter Irving, *chairman*, New York County
John F. Burden, Oswego County
Charles F. McCarty, Kings County
Edward C. Podvin, Bronx County
Seymour L. Homrighouse, Montgomery County

REFERENCE COMMITTEE ON REPORT OF PRESIDENT:

David W. Beard, *chairman*, Schoharie County
J. Stanley Kenney, New York County
Philip I. Nash, Kings County
Charles A. Prudhon, Jefferson County
John E. Wattenberg, Cortland County

REFERENCE COMMITTEE ON REPORT OF COUNCIL—PART I.

Postgraduate Education

Albert F. R. Andresen, *chairman*, Kings County
Conrad Berens, New York County
William J. Tracy, Steuben County
Lyman C. Lewis, Allegany County
Leo E. Reimann, Cattaraugus County

REFERENCE COMMITTEE ON REPORT OF COUNCIL—PART II.

Public Health Matters

G. Scott Towne, *chairman*, Saratoga County
Albert A. Cinelli, New York County
Edward P. Flood, Bronx County
Morris Maslon, Warren County
Herbert E. Wells, Erie County

REFERENCE COMMITTEE ON REPORT OF COUNCIL—PART III.

School Health Program

W. Guernsey Frey, Jr., *chairman*, Queens County
Joseph H. Cornell, Schenectady County
Ralph I. Lloyd, Kings County
Walter G. Hayward, Chautauqua County
Ralph Sheldon, Wayne County

REFERENCE COMMITTEE ON REPORT OF COUNCIL—PART IV.

Publications and Medical Publicity

Andrew A. Eggston, *chairman*, Westchester County
Charles A. Anderson, Kings County
Albert A. Gartner, Erie County
Alfred M. Hellman, New York County
Joseph P. Henry, Monroe County

REFERENCE COMMITTEE ON REPORT OF COUNCIL—PART V

Medical Expense Indemnity Insurance

Harry S. Bull, *chairman*, Cayuga County
Robert F. Barber, Kings County
Ada Chree Reid, New York County
A. H. Noehren, Erie County
Nelson W. Strohm, Erie County

REFERENCE COMMITTEE ON REPORT OF COUNCIL—PART VI

Medical Relief

William B. Rawls, *chairman*, New York County
Edgar O. Boggs, Lewis County
Joseph A. Geis, Essex County
Abraham Koplowitz, Kings County
Guy S. Philbrick, Niagara County

cians; requirements for licensure; the tendency for hospitals to get into the practice of medicine; the effect of 11,000,000 men returning to civil life with their demands on a paternalistic government; relationships to government agencies and commercial organizations that have any relations with medicine; the increased costs of medical care and the various propositions which have been suggested for reducing those costs, such as voluntary indemnity insurance and the means of making the latter more widespread and inclusive; the status of nursing.

The Council has many committees, and they are doing effective work, but they are largely concerned with the problems of immediate importance, and each committee with only one phase of one problem. We should have a committee concerned with the broad general principles of a long-range program, a committee which can bring to us a policy of our own which we can set up not only in opposition to ill-advised and often crackpot theories but in advance of many of them. We must be constructive leaders. Such a committee, to my mind, would not complete its work in one year or two years. It would evolve a program gradually, and such a program might be changed from time to time as conditions changed, but it would be a program which would, at least, be abreast of the times and possibly ahead of them. Then whenever some outside agency called attention to a problem not only would our answer be ready but we might perhaps already have solved the problem.

We are not soothsayers, and we shall not be able to foresee everything, but we do know the trends and many of the situations that we shall have to face. Medical matters must be decided by medical men, and changes must, in medicine, be led by physicians, or there will be chaos and regression rather than smooth functioning and progress. Our plan must be constructive, and we must offer it soon or others will offer plans which will be destructive.

Let us inform the public in no uncertain terms that we are in favor of good medical care for all with freedom of choice of physician; that methods will be found to bring that good care to all; that whatever changes are necessary to accomplish this will be made, but that those changes will be carried out under the guidance of the medical profession and not by governmental or lay agencies; and that we have a program that will meet the situation and at the same time will protect those high standards of medical care which have made the United States the healthiest country in the world.

To accomplish this I suggest that the House establish a committee on long-range medical policies. While the House can establish this committee for but one year, succeeding Houses can extend its tenure.

You have read the Presidential Report of Dr. Cottis. He recommends the same thing. To make this suggestion more concrete I have drawn up a resolution, which if adopted will, I believe, be the most progressive step this Society has taken in many years and will make this Society the leader in any changes which the practice of medicine may undergo:

"WHEREAS, there are various influences and trends in the world which directly affect the practice of medicine; and

"WHEREAS, there are many government agencies actively engaged in all phases of medicine; and

"WHEREAS, these agencies are not coordinated or integrated with each other for the most part; and

"WHEREAS, there is bound to be a period of adjustment and readjustment in the postwar period, as already evidenced in various war programs; and

"WHEREAS, The Medical Society of the State of New York is directly concerned with possible changes in the practice of medicine, and in this State should lead and direct such changes; and

"WHEREAS, there has been a tendency for the Medical Society to wait until changes are proposed by others and then endeavor to meet those changes, rather than propose a constructive program of its own; and

"WHEREAS, the Council and Council Committees of the State Society are concerned with matters of immediate importance rather than long-range policies; and

"WHEREAS, the Council Committees are of yearly tenure and the preparation of a long-range program may take more than one year; therefore, be it

"Resolved by the House of Delegates of the Medical Society of the State of New York, in its Annual Session in May, 1943, that, in accordance with Section 1 of Chapter XII of the By-Laws, a special committee of the House of Delegates is hereby established. This committee is to be known as the Planning Committee for Medical Policies; and be it further

"Resolved, that this Committee shall consist of eleven members who are members of the Medical Society of the State of New York. Six of these members shall be appointed by the Speaker. The President, the President-Elect, the Secretary, the Speaker, and the Chairman of the Board of Trustees or a member of the Board designated by him shall constitute the other five members. The Committee shall elect its own Chairman and Recorder; and be it further

"Resolved, that the Committee, in studying and in developing a policy for the status of medicine and the physician in relation to the public in the postwar period, shall consider the following:

1. The distribution of physicians.
2. Educational requirements for licensure.
3. Voluntary insurance plans and other plans for decreasing the costs of medical care.
4. Socializing influences.
5. Relationships of the medical profession with government agencies, commercial laboratories, and vendors concerned with any phase of medicine.
6. The relationship of hospitals and the practice of medicine.
7. Relationships with and the status of the nursing profession.
8. Such other matters as the committee deems important from the standpoint of protecting the public and the medical profession from attempts to bring about inadequate medical care and unwarranted interference by outside agencies with the practice of medicine; and be it further

"Resolved, that all Council Committees concerned with any phase of this program shall give such advice and assistance as called for by this Special Committee; and be it further

"Resolved, that this Special Committee shall report to the House of Delegates at its next

 Harvey B. Matthews, Kings County

Mr Speaker, I move that the reports that have already been published and distributed to the members of the House through the STATE JOURNAL be referred to the respective committees without reading.

SPEAKER BAUER: You have heard the motion of the Secretary that the printed reports that have already been printed and distributed be referred to the respective reference committees without reading. Is there any objection to that being done?

... There was no dissent. ...

SPEAKER BAUER: There being none, it is so ordered.

Section 4. (See 61)

Address of the Speaker Recommending Special Committee of House called "Planning Committee for Medical Policies"

VICE-SPEAKER HALE: The chair recognizes Dr. Louis H. Bauer.

SPEAKER BAUER: Mr. Vice-Speaker, it is not the custom in this House of Delegates for the Speaker to deliver an address, for which I am duly thankful and for which I imagine the House is likewise thankful; however, these are extraordinary times. The country is in the midst of war and the medical profession is beset with many problems. Without desiring to establish any precedent, I make bold to take a little of your time to express my opinion upon and to present to you a problem which I believe is the most outstanding one confronting us.

The medical profession has been accused of being obstructionist. This is an unjust accusation, but we must admit that we have been slow in planning for the future. We have been too content to sit back and wait until we are faced with definite problems and then endeavor to solve them, rather than try to anticipate them.

The world is changing, much as we regret it. Unless we are alive to this fact, and unless we try to direct those changes, in so far as they affect the practice of medicine, we shall be left at the proverbial hitching-post, and instead of leading we shall be led.

I wonder how many members of this House realize the number of inroads on the private practice of medicine already made by government agencies? If you have not already done so, I suggest that you look at the imposing list published in the JOURNAL for April 1. It is astounding, yet most of these socialized phases were proposed by the medical profession itself. Many of them, however, have slipped out of our grasp, and we no longer control them. In my opinion, the danger we have to face in New York is not complete socialized medicine, but an extension of phases already in effect, under the aegis of lay control.

We hear much these days of "Beveridge Plans," of social security from the cradle to the grave, or, as Dr. Fishbein and others have aptly described it, "from the womb to the tomb." There are many agencies using the war effort as a cloak to foster their pet schemes for further socialization of medicine, and what are we doing about it?

It is not a case of rushing in where angels fear to tread, for while the proponents of some of the schemes are sincere, though ill-advised, many of them, I fear, are equipped with horns and a forked tail rather than with wings.

The medical profession must evolve a plan of its own and work and fight for its adoption. We must look ahead and take into consideration the fact that these trends have already made headway. We must harness those trends and drive them, or they will drive us.

We must consider many factors in evolving a policy—factors such as the distribution of physi-

Advisory Boards. They are serving under the Office of Civilian Defense in the organization of medical resources and training of civilians for emergencies of peace as well as of war.

In the armed forces on April 1, 1943, were enrolled more than 9,100 of our doctors from New York, who with other doctors have shown a devotion to duty and a heroism under fire that have merited highest praise. As early as August, 1942, Surgeon-General McIntire broadcast his account of the work of the doctors at Pearl Harbor, at Guadalcanal, in American field hospitals, and on our aircraft carriers, such as the torpedoed "Lexington"—"doctors," he said, "who operated in their hospitals under continuous fire and who risked their lives in safeguarding the wounded. Many of the medical officers have been commended by their commanding officers and recommended for decorations because of their devotion to duty under the most hazardous circumstances." Too often, now, do we hear of the many doctors who, in the pursuit of military duty, have made the supreme sacrifice. The example of our doctors in the past year will inspire us in the next.

The call for doctors for our rapidly expanding Army is still urgent, and must be met chiefly by New York State and its larger cities. Every "available" man should present himself at once for commission, and every teaching institution, every hospital, and every "essential" physician should use their influence to have our quota completed. Neither hospitals, medical schools, nor communities will be seriously crippled thereby.

Although the duration of the war cannot be foretold, nor the financial and social conditions of the nation at its termination accurately predicted, many groups of people are actively engaged in making provisions for the postwar changes. Their attention is occupied in the fields of economics, of capital and labor, of education, of world politics, in religion, in universal peace and happiness, and in matters of social security and of health. Many of them hold that in a time of revolution many radical changes, at other times impossible, can be successfully effected.

The government, too, as it should, has had committees at work making preparations for the new world. It would seem that we must guarantee the lands, the mode of life, and the political rights of the individual, in addition to freedom from every want, not only for ourselves but for all peoples.

From England has come a proposed security plan which would assure, among other things, complete free medical care for everyone in the Kingdom. Our own government, through a National Committee, has published a similar plan of social security, with compulsory health insurance, the outlines of which are hazy as yet.

The leaders of one of the largest political groups in our State have announced a social security plan that would include compulsory health insurance for all, regardless of their means. It would seem that nothing that has existed longer than the past two years is sound, or right, or valuable. However, it is consoling to recall "that every war we have been through has generated a more or less widespread epidemic of war melancholia, but each time when peace has come the disease has disappeared." The best guide for our future is the history of the past, and the most valuable changes have been evolutionary—not revolutionary—in their nature. In this country within the past twenty-five years that kind of progress in every branch of medicine has given our people better health, more widely avail-

able medical care, and a lower death rate than any other country has had.

In state and county medical societies—the units of organized medicine—will be found the knowledge of the medical needs of their regions and also the records of experience in meeting these needs. Throughout the country many plans to meet local needs are in operation which have been conducted or sponsored by these societies. It is distressing to have the government and industry spend great fortunes in these mushroom towns, with armies of new employees, and make no decent provision for the housing, the sanitation, the food supplies, or the care of the health of the hosts of new residents. Conferences in advance with the local and public health authorities and with the doctors of the counties and states would have averted the threatening dangers. The results of such conferences in places like Portland, Oregon, where more than 100,000 workers on ships flocked to the city, show how good medical services could be arranged. More than 900 doctors, in their patriotism, have voluntarily dislocated themselves from their homes and practices and given their full-time services to the boom towns and to areas with an insufficient number of physicians.

The health of people engaged in industrial occupation should receive from us still greater attention. Despite workmen's accident compensation laws in many states, there has not been the success in the prevention of accidents that the people expected. Insufficient attention has been given to the study of the 1,100 different diseases due to occupation and of the maintenance of good health. Still less effort has been made to find places within the industries for the employees with partial disabilities. Many of our industrial corporations are but slowly realizing the importance to themselves, as well as to the workers, of the preventive measures. The avoidable sick leaves, the turnover in labor, the decrease in production because of ill health, and the large premiums for accident insurance are now receiving more consideration.

It is not the function of industry to care directly for the employee and his family in sickness. That is the duty of the doctor outside the factory: the physician in the community, the physician chosen by the patient, the family doctor; and it is the obligation of county and state medical societies to prevent further invasion by corporations or employers into this practice of medicine. The physician in industry will be well employed in protecting all the employees from disease or accident, in knowing at all times the physical capabilities of the man for his particular job, in finding places in the plant for the employee who because of accident or disease is unable to maintain his former skill, and in striving to retain in the plant every man capable of working, regardless of his chronologic age.

This subject has become more important with the entrance of large numbers of women into new lines of industrial labor. Heretofore, women have been engaged for the most part in branches of labor requiring mental skill, clerical duties, light machine work, and those occupations for which women are by nature better fitted, while to men have been left the jobs which require heavier, muscular efforts and irregular shifts of hours. Many women, young and old, married, single, and widowed, and those having the obligations and responsibilities of homes, of children, and of husbands, have been enticed

regular meeting such progress and recommendations as are possible toward defining a policy for the State Medical Society in providing adequate medical care for all under the leadership of the medical profession; and be it further

"Resolved, that if, in the opinion of the Committee, official sanction of its actions and recommendations is urgently required prior to the next meeting of the House of Delegates, the Committee is authorized to seek such sanction from the Council; and be it further

"Resolved, that the Board of Trustees is requested to appropriate sufficient funds to defray the necessary expenses of this Committee for traveling, stenographic reports of its meetings, and the purchase of publications necessary for its study." (Applause.)

VICE-SPEAKER HALE: You have heard the suggestions from Dr. Bauer and the resolution that accompanies them. This resolution bears very close association with the recommendation of the President. For that reason I should refer it to the Reference Committee which is to consider the Report of the President.

SPEAKER BAUER: I still hope we will get a "mike" here, but apparently it is like the coal strike: it can't be fixed until the last minute. (Laughter.)

I am sorry to say we are going to be a little cramped for space for our reference committees. The hotel is so crowded that we were unable to obtain any rooms for the reference committees to work in as we have had heretofore. Small tables have been placed about this room, and after the meeting adjourns you may move to any of these tables you like and go to work.

The House will be in recess from adjournment this morning, at whatever time we get through, until 3:00 P.M., and there will be no session this evening. Therefore this room will be unoccupied during both of those periods, and the committees can work here. For such committees as will be unable to complete their work in that period—as, for example, the three reference committees on new business—there is space on the eighteenth floor in the rooms of the Erie County Medical Society where they can work; and, of course, the committees may go to the room of one of their members if they prefer that. I know that this arrangement is not particularly convenient, but it is the best we can do, and we will have to get along with it.

There are stenographers at the rear of the room who will type resolutions for you, but the committee reports should be taken to the eighteenth floor, where in the rooms of the Erie County Society, stenographers will be available to make up your reports. There should be four copies of all reports and all resolutions. The room number of the Erie County Society is 1814, and you have to walk upstairs to the eighteenth floor, for there is no elevator. The stairway is a little to your right before you get to the registration desk, near the elevators on the seventeenth floor.

Tickets for the Civilian Defense Dinner on Tuesday night may be secured at the registration desk by those who desire to attend that meeting.

Section 5. (See 7, 61)

Remarks of the President

SPEAKER BAUER: Dr. Johnson, if my memory serves me right—and I think it does—two years ago you nominated the present President of the Medical Society of the State of New York. Such

being the case, I would like to have you act as a committee of one to escort the president of the Medical Society of the State of New York to the platform.

(The delegates arose and applauded as Dr. William D. Johnson, of Batavia, escorted Dr. George W. Cottis to the platform.)

SPEAKER BAUER: I present your President.

PRESIDENT COTTIS: Mr. Speaker and Gentlemen, we have a heavy program. I don't want to take up any of your time, but I want to say in just one minute how delighted I am to have heard the Speaker's masterly presentation of this resolution. When I put that in my annual report I did it because I feared nobody else might think about it. I find that I was 'way behind the procession because Louis Bauer had been planning this thing long before I wrote my message. It is a very gratifying indication that the profession is alert and on its toes. We have suffered most of our grief because we have emulated Lot's wife and turned backward instead of looking forward. It is no wonder that some of us resemble a pillar of salt.

I think that, with the war, we all realize that the best defense is a good offense. This is our first step in the offensive against those agencies which to our mind are detrimental to the public welfare.

I hope that the reference committee will endorse the Speaker's resolution, and I hope that the House will adopt it.

I thank you! (Applause)

SPEAKER BAUER: The remarks of the President are referred to the Reference Committee on the Report of the President, of which Dr. Beard is chairman.

Section 6. (See 61)

Address of the President-Elect

SPEAKER BAUER: Dr. Brennan, would you consider yourself a committee of one to escort the President-Elect of the Medical Society of the State of New York to the platform?

(The delegates arose and applauded as Dr. Thomas M. Brennan, of Kings County, escorted Dr. Thomas A. McGoldrick to the platform.)

SPEAKER BAUER: Dr. McGoldrick, the House will be glad to hear from you at this time.

PRESIDENT-ELECT MCGOLDRICK: Let me make, Mr. Speaker, as the first official act for the coming year of the Medical Society of the State of New York, the renewal of our pledge of loyalty and unrestricted cooperation, with all we possess, to our Commander-in-Chief, the President of the United States. (Applause.)

Let me make a special pledge to our men in arms, on behalf of our doctors who are with them and those who are still in civilian life, that every aid medical science can produce will be available for them and for their families at home.

To our brother doctors in military service let me send the assurance of our knowledge and appreciation of the high quality of their work, of the sacrifices they have made and are making, of the splendid results they are securing in the care of our men, and of the honor they are earning for themselves and their profession.

In addition to the routine work of caring for the health of the people our doctors in civilian life will continue during the year to perform their special duties for the prosecution of the war. With no remuneration, more than 5,000 of the physicians in this State have examined a vast army of selectees, they have served on Appeal Boards, on Medical

At this time I believe it important that a special committee be appointed to study the matter on its merits. I have two reasons for this belief.

First, sixteen states have adopted a basic science law. This is no argument for our adopting it any more than the licensing of chiropractic by 42 states is an argument for our doing so. But an article in the *American Medical Association Bulletin*, prepared by the Bureau of Legal Medicine and Legislation (November, 1936) quotes officials of the state medical societies of 10 states who are enthusiastic about the results of such legislation. Surely a law which has given satisfaction to other state medical societies is worthy of our consideration. The fact that the American Medical Association has prepared a draft of a uniform basic science act as the basis for legislation "to be sponsored by any state medical association" is not without significance.

Second, the State Legislature has passed a resolution to create a committee not only to study legislation in other states but "to prepare and recommend legislation for the regulation and licensing of chiropractors in this State." The wording of that clause is for us the handwriting on the wall.

In all other states the basic science law has been passed after the chiropractors have been licensed. It may be that a study of the results will indicate that we should close the barn door before the horse is stolen. At least we should be informed by an impartial committee, while there is still time to act.

Respectfully,

G. W. CORTIS, M.D., *President*

SPEAKER BAUER: I will refer this supplementary report to the Reference Committee on the Report of the President, of which Dr. Beard is chairman.

Section 8. (See 50)

Supplementary Report of the Council—Part I: Postgraduate Education

April 26, 1943

In addition to the instruction mentioned in the Annual Report submitted March 6, 1943, instruction has been arranged for the following county medical societies:

County	Instruction	No. Lectures
Broome	Plasma Therapy and Whole Blood Transfusion	1
Clinton	Plasma Therapy and Whole Blood Transfusion	1
Cortland	Sulfonamide Therapy	1
Franklin	Plasma Therapy and Whole Blood Transfusion	1
Greene	Plasma Therapy and Whole Blood Transfusion	1
Herkimer	Plasma Therapy and Whole Blood Transfusion	1
Onondaga	Plasma Therapy and Whole Blood Transfusion	1
Rensselaer	Plasma Therapy and Whole Blood Transfusion	1
Richmond	Plasma Therapy and Whole Blood Transfusion	1
Steuben	Plasma Therapy and Whole Blood Transfusion	1
Suffolk	War Medicine and Surgery	1

The Committee arranged for a total of 94 lectures, 72 of which were given jointly by the New York State Department of Health and the Medical Society of the State of New York.

SPEAKER BAUER: I will refer this supplementary report to Reference Committee on Report of the Council—Part I, of which Dr. Andresen is chairman.

Section 9. (See 76)

Supplementary Report of the Council—Part II: Public Health Matters

April 26, 1943

Maternal and Child Welfare.—On April 7, 1943, in New York City a meeting of the Council Committee on Public Health and Education and the Subcommittees on Maternal and Child Welfare was held with representatives of the State Department of Health to discuss "Emergency Maternal and Infant Care."

"The first Federal Deficiency Appropriation Act, 1943, made an appropriation of \$1,200,000 to enable the states to provide so-called 'Emergency Maternity and Infant Care,' obstetric and pediatric (for infants under one) to wives and infants of men in the ARMED FORCES, ARMY, NAVY, MARINE CORPS and COAST GUARD, of fourth, fifth, sixth, and seventh grades. (This excludes wives and infants of master, major, first, technical, staff, and platoon sergeants; and of chief, first, and second class petty officers.)

"Federal grants for the purpose will continue during the war and six months thereafter.

"Such care is available, when supported by identifying data, to wives and infants irrespective of financial status and residence, but will not be given if services are readily available from medical personnel of Army or Navy facilities.

"Authorization for maternity service will start with date of application, and for sick infants can be made retroactive to cover the week immediately preceding the date of application.

"Initial authorization for hospital maternity and infant care—not more than fourteen days.

"The plan also includes purchase of bedside nursing care, when necessary and cannot be adequately supplied through local regular public health nursing service. Special nurses can be engaged for critical periods of serious illness.

"The plan also provides for consultation service, ambulance service, transfusions, and expensive drugs, when necessary and requested by the physician.

"Authorization of more prolonged care may be requested by attending physicians or hospitals where submitted data justifies further care than that initially authorized.

"Hospital care provided will be on a ward cost per patient day of the particular hospital. When the amount of such care rendered to eligible patients amounts to \$500 the hospital must submit to the State Department of Health a statement of operating expenses for the most recent year, covering seventeen specified items entering into the calculation of war cost per patient day, according to a prescribed method of calculation."

Industrial Health.—Dr. Herbert H. Bauckus, chairman, Study Committee on Industrial Health, reports:

"In order to complete this year's report on the activities of the Study Committee for Industrial Health the following should be added to the previously report:

During the week of April 11, Dr. Orlen J. Johnson, from the Council on Industrial Health of the American Medical Association, toured the State of New York. He stopped at Schenectady, Utica, Syracuse, Rochester, and Buffalo, and discussed with the leading repre-

into these plants by the temporary high wages and the thought of contributing to the war. Every physician knows that there is no satisfactory substitute in the home for the mother. To slackened home authority has been attributed the great increase of juvenile delinquency of the war period.

Our Industrial Health Committee will continue to study these and the related subjects, to give information, advice, and help to employees and employers, to individual physicians as well as to the county societies, and will have our encouragement and support in the furtherance of its work.

Our State Society has not been unmindful of the burden placed on many people by the costs of sickness, and has approved and encouraged practical methods to lighten the load. The great costs of hospital care are moderated by the Associated Hospital Plan, while in various parts of the State there are indemnity groups which aid in meeting the costs of professional services. Voluntary plans are under consideration that will provide further advantages to patient and to doctor. The citizen of our nation wants and should have less compulsion, more individual freedom, and his judgment is supported by the retarding effects on general health and on the advance of science in countries where compulsory health insurance exists.

It is with much hope that I look to the acceptance by this House of the resolution offered by our Speaker, Dr. Bauer. The Committee, therein proposed, with wide powers to study all phases of the economic matters affecting the profession and the public, including provisions for the rehabilitation and the reconstruction of individuals now in the community or returning from war services, and to make progress reports during the year, would be most helpful. The formation of such a committee has the approval of our President, Dr. Cottis, who proclaimed its need and its beneficent possibilities in his Presidential Address.

Lack of employment and diminished income are more often the cause of ill health than ill health is the cause of the idleness and poverty. Our own Governor Dewey of New York has this view of the relative importance of these factors in social security plans, and in his inaugural address expressed the hope and aim of his government to maintain the highest possible rate of industrial activity with full employment. He said that if this could be done in wartime it could also be done in time of peace. Doctors, particularly, have long known how deeply rooted in the financial condition is the ill health of their patients, and that while doles and grants and security benefits may prevent extreme want and permit bare subsistence, these are only the treatments of symptoms and are not directed to removing the cause. The author of the widely noted "English Plan" made the statement that unless there is at least 90 per cent of full employment his proposal will fail.

Coincident with our present full employment and with the high percentage of our national income paid in wages in 1942—the greatest amount in our history—has been the decrease in the demands on our hospitals for ward beds and in all health programs, including clinic visits. An analysis of the total inpatient days in 45 urban areas shows a decrease of 12.5 per cent, while in medical services provided by social agencies, in the home, and by doctors' visits it was 29 per cent.

Since our entrance into the war, statesmen on both sides of the Atlantic, including representatives of the Allied Nations, have drawn for themselves a

charter for their future direction. They have expressed, along with other things, their determined purpose to secure and maintain freedom for their countries from all enslaving powers, and for their citizens, freedom from those vices within a nation that would destroy its prosperity, its health, its progress, and its peace.

Medicine, too, has many freedoms that it will ever pursue—will ever safeguard. It demands freedom from political, bureaucratic, or nonmedical domination of every sort in the work of the profession; freedom, as of right, to be fully represented in every organization or council, industrial or governmental, making provisions for medical care of the individual or for the public health; it insists that all features of medical service in any method of medical practice should be under the control of the medical profession; it wants freedom to retain and control a philanthropy which has ever been associated with its name, to select the objects, the persons, and the places of bounty and at the same time, apart from this work of charity, to receive the financial remuneration commensurate with the priceless services it gives and the high costs of its training. Medicine wants freedom to pursue its studies, to continually acquire more knowledge, to attain more wisdom, to discover and to quickly apply new scientific truths. It wants all these, not for the aggrandizement of the profession, or for the selfish gain of any doctor, but that as the trustee of the health of every community and of every person in the community it may render to them its fullest measure of devotion. (Applause)

SPEAKER BAUER: The remarks of the President-Elect will be referred to the Reference Committee on the Report of the President, of which Dr. David W. Beard, of Schoharie, is the chairman. I hope that both Dr. Cottis and Dr. McGoldrick will remain on the platform during the sessions of the House.

Mr. Secretary, are there any supplementary reports?

SECRETARY IRVING: A number, sir: one from the President; others from the Council and from several of its committees as follows: Part I—Postgraduate Education; Part II—Public Health Activities; Part III—School Health Program; Part VII—Legislation; Part VIII—War Participation; Part XII—Miscellaneous; Part XIII—Malpractice Defense and Insurance, Legal Counsel; one from the Special Committee on Publication; one from the Special Committee on Office Administration and Policies.

These, Mr. Speaker, have been distributed. I suggest that they be referred to the appropriate reference committees, with the special committee reports going to the Reference Committee on Council Report—Part IV.

SPEAKER BAUER: These supplementary reports have all been mimeographed and distributed and are before you. Does anyone wish them read?

.... There was no answer.

SPEAKER BAUER: I take it no one does.

Section 7. (See 5, 61)

Supplementary Report of the President

April 16, 1943

For several years a resolution favoring a basic science law has been introduced in the House of Delegates. Every year it has been decisively defeated. Last year it seemed to me that the adverse reaction of the House was more emotional than thoughtful.

At this time I believe it important that a special committee be appointed to study the matter on its merits. I have two reasons for this belief.

First, sixteen states have adopted a basic science law. This is no argument for our adopting it any more than the licensing of chiropractic by 42 states is an argument for our doing so. But an article in the American Medical Association *Bulletin*, prepared by the Bureau of Legal Medicine and Legislation (November, 1936) quotes officials of the state medical societies of 10 states who are enthusiastic about the results of such legislation. Surely a law which has given satisfaction to other state medical societies is worthy of our consideration. The fact that the American Medical Association has prepared a draft of a uniform basic science act as the basis for legislation "to be sponsored by any state medical association" is not without significance.

Second, the State Legislature has passed a resolution to create a committee not only to study legislation in other states but "to prepare and recommend legislation for the regulation and licensing of chiropractors in this State." The wording of that clause is for us the handwriting on the wall.

In all other states the basic science law has been passed after the chiropractors have been licensed. It may be that a study of the results will indicate that we should close the barn door before the horse is stolen. At least we should be informed by an impartial committee, while there is still time to act.

Respectfully,

G. W. COTTIS, M.D., *President*

SPEAKER BAUER: I will refer this supplementary report to the Reference Committee on the Report of the President, of which Dr. Beard is chairman.

Section 8. (See 50)

Supplementary Report of the Council—Part I: Postgraduate Education

April 26, 1943

In addition to the instruction mentioned in the Annual Report submitted March 6, 1943, instruction has been arranged for the following county medical societies:

County	Instruction	No. Lectures
Broome	Plasma Therapy and Whole Blood Transfusion	1
Clinton	Plasma Therapy and Whole Blood Transfusion	1
Cortland	Sulfonamide Therapy	1
Franklin	Plasma Therapy and Whole Blood Transfusion	1
Greene	Plasma Therapy and Whole Blood Transfusion	1
Herkimer	Plasma Therapy and Whole Blood Transfusion	1
Onondaga	Plasma Therapy and Whole Blood Transfusion	1
Rensselaer	Plasma Therapy and Whole Blood Transfusion	1
Richmond	Plasma Therapy and Whole Blood Transfusion	1
Steuben	Plasma Therapy and Whole Blood Transfusion	1
Suffolk	War Medicine and Surgery	1

The Committee arranged for a total of 94 lectures, 72 of which were given jointly by the New York State Department of Health and the Medical Society of the State of New York.

SPEAKER BAUER: I will refer this supplementary report to Reference Committee on Report of the Council—Part I, of which Dr. Andresen is chairman.

Section 9. (See 76)

Supplementary Report of the Council—Part II: Public Health Matters

April 26, 1943

Maternal and Child Welfare.—On April 7, 1943, in New York City a meeting of the Council Committee on Public Health and Education and the Subcommittees on Maternal and Child Welfare was held with representatives of the State Department of Health to discuss "Emergency Maternal and Infant Care."

"The first Federal Deficiency Appropriation Act, 1943, made an appropriation of \$1,200,000 to enable the states to provide so-called 'Emergency Maternity and Infant Care,' obstetric and pediatric (for infants under one) to wives and infants of men in the ARMED FORCES, ARMY, NAVY, MARINE CORPS and COAST GUARD, of fourth, fifth, sixth, and seventh grades. (This excludes wives and infants of master, major, first, technical, staff, and platoon sergeants; and of chief, first, and second class petty officers.)

"Federal grants for the purpose will continue during the war and six months thereafter.

"Such care is available, when supported by identifying data, to wives and infants irrespective of financial status and residence, but will not be given if services are readily available from medical personnel of Army or Navy facilities.

"Authorization for maternity service will start with date of application, and for sick infants can be made retroactive to cover the week immediately preceding the date of application.

"Initial authorization for hospital maternity and infant care—not more than fourteen days.

"The plan also includes purchase of bedside nursing care, when necessary and cannot be adequately supplied through local regular public health nursing service. Special nurses can be engaged for critical periods of serious illness.

"The plan also provides for consultation service, ambulance service, transfusions, and expensive drugs, when necessary and requested by the physician.

"Authorization of more prolonged care may be requested by attending physicians or hospitals where submitted data justifies further care than that initially authorized.

"Hospital care provided will be on a ward cost per patient day of the particular hospital. When the amount of such care rendered to eligible patients amounts to \$500 the hospital must submit to the State Department of Health a statement of operating expenses for the most recent year, covering seventeen specified items entering into the calculation of war cost per patient day, according to a prescribed method of calculation."

Industrial Health.—Dr. Herbert H. Bauckus, chairman, Study Committee on Industrial Health, reports:

"In order to complete this year's report on the activities of the Study Committee for Industrial Health the following should be added to the previously report:

"During the week of April 11, Dr. Orlen J. Johnson, from the Council on Industrial Health of the American Medical Association, toured the State of New York. He stopped at Schenectady, Utica, Syracuse, Rochester, and Buffalo, and discussed with the leading repre-

representatives of the respective county societies the setting up and the programs of future industrial health committees. In Syracuse and Buffalo, where committees have been functioning during the past year, prospective developments were discussed in detail. The decision to make these industrial centers a basis for concentrated industrial health activities for organized medicine had been made at a meeting held in New York by the entire Study Committee for Industrial Health, in February of this year.

In Buffalo Dr. Johnson was able to participate in the first open forum which was held by the Buffalo District Committee on Industrial Health under the chairmanship of Dr. Herbert H. Bauckus. The forum, which was called under the timely title, "Increase Manpower through Industrial Health," was attended by over 250 persons, representing management, labor, and the medical and nursing professions. Dr. Clarence D. Selby, Medical Consultant of the General Motors Corporation, Detroit, was the main speaker, discussing "Industrial Health in the Nation at War." He was followed by a 40-minute panel discussion in which selected members of the local committees highlighted some of the main problems facing industry, labor, and the medical profession today. Actual analysis of 1,000 cases of industrial absenteeism; food as a weapon; home problems of women in industry; industrial nursing; a report on a labor-management health committee; fatigue, rest, recreation, and vacation; and the seven-day week were burning topics which were readily taken up by the audience in a lively discussion lasting until late in the night.

"There were many interesting features revealed in the original panel presentation. The analysis of the absenteeism cases brought out that 54 per cent of absenteeism was caused by illness. A labor representative reported on the harmonious working relations with management in settling critical health problems, and management and labor agreed to a surprising degree on the need for a six-day week, regular rest periods during the work day, and vacations as a necessary stimulus to morale and new energies for greater production.

"The latest accomplishment of this committee, which has been functioning for scarcely four months, is an exhibit at this convention, featuring an efficient First Aid Department for a plant with less than 500 employees. Already it has become manifest that the Buffalo District Committee for Industrial Health is not only rendering an important service to the local community, but is serving as an inspiration to states and counties all over the country in establishing similar committees. Until now the committee has been functioning entirely without an appropriation and all financial outlays have been borne by individual members of the committee interested in its growth. This lack of definite funds is seriously hampering a group which has shown such splendid initiative. Although it is anticipated that some funds will be raised from management and labor, both of which are intensely interested in the progress of the committee, it is hoped that funds can be made available from the Medical Society of the State of New York to aid in the work of

this committee, and as an indication that organized medicine recognizes the overall value of this local enterprise and wishes to support it."

Tuberculosis and Diseases of the Chest.—Dr. Charles D. Post, chairman, Subcommittee on Tuberculosis and Diseases of the Chest, reports as follows:

"Judging by the large number of acceptances received to attend the luncheon to be held in Buffalo at Hotel Statler on Wednesday, May 5, 1943, at 12:00 m., the Committee feels that an excellent opportunity will be had for acquainting the representatives from the county societies with the objectives of our programs. At this meeting we will have those best qualified to present various phases of the problems confronting us. The Committee feels that by having this meeting it will bring together the many agencies in this field for the purpose of establishing a co-ordinated program. The attendance at this luncheon will be over seventy-five. The Committee, at the present time, is also giving attention to an exhibit which will be on display at the Buffalo meeting."

SPEAKER BAUER: I will refer this supplementary report to Reference Committee on Report of the Council—Part II, of which Dr. Towne is chairman

Section 10. (See 51)

Supplementary Report of the Council—Part III School Health

April 26, 1943

On February 10, 1943, in New York City, the Committee on Public Health and Education held a meeting with the Subcommittees on Child Welfare and 4-H Clubs and Youth Health Activities, representatives from the New York State Departments of Health and Education, and the New York State Association of School Physicians to discuss the course content of health education in the high schools. As a result of this meeting it was decided that the Medical Society of the State of New York should designate two or more representatives who would be available in an advisory capacity to the State Department of Education. This recommendation was submitted to the Council on February 11, 1943, and was approved.

Dr. George W. Cottis, President of the Medical Society of the State of New York, has notified Dr. George D. Stoddard, Commissioner, State Education Department, that the following physicians have been appointed as representatives of the Medical Society of the State of New York:

Paul W. Beaven, M.D., Vice-Chairman, Subcommittee on Child Welfare, 26 South Goodman Street, Rochester, New York.

J. G. Fred Hiss, M.D., Chairman, Subcommittee on 4-H Clubs and Youth Health Activities, 505 State Tower Building, Syracuse, New York.

A. Clement Silverman, M.D., member, Subcommittee on Child Welfare, 608 East Genesee Street, Syracuse, New York.

SPEAKER BAUER: I will refer this supplementary report to Reference Committee on Report of the Council—Part III, of which Dr. Frey is chairman.

Section 11. (See 48)

Supplementary Report of the Council—Part VII: Legislation

The Council Committee on Legislation respectfully submits a supplementary report:

The chiropractors did not introduce their bill until the late afternoon of the last day allowed for introduction of bills. Whether it was considered good strategy to wait and attempt to rush the *Chiropractic Bill* through in the increasing excitement of final activity is not known. The bill came out on the floor in the Senate and with the third reading was destined for action a few days later in the Senate. The Assembly Rules Committee held it up.

Twenty-four hours before adjournment a Resolution was introduced in the Senate for the creation of a committee to make a study of chiropractic and to report to the next Legislature on or before February 15, 1944, with an appropriation of \$10,000 to meet the expenses of the Committee; this Committee to submit whatever recommendations it deems most efficacious to regulate and control the practice of chiropractic. With the concurrence of the Assembly, both Houses adopted the Resolution. Some feel this is an adroit move to secure positive and favorable action—a really aggressive political move with full agreement of the chiropractors. Others feel that a valuable opportunity to bring to light the complete story of chiropractic is offered; your Legislative Committee is hoping that the Governor will approve this Resolution. We are confident that the findings of the committee will support the contention that chiropractic should not be recognized until the applicants for licensure meet the educational qualifications now required of physicians and osteopaths.

The Council has voted that the Legislative Committee appoint a subcommittee to be prepared to furnish all facts concerning chiropractic, and also to study fully the merits or uselessness of a separate *Basic Science Law*. This subcommittee shall seek convenient occasions to meet with this committee of the Legislature, in order to bring out all of the facts. If we are correct in assuming that this committee, when appointed, will be earnest and sincere in studying and in investigating chiropractic, they will welcome our subcommittee and our Executive Officer. The controversy of years' standing will be brought to an end. This should result to the satisfaction of the Regents, who must uphold the high standards of the Medical Practice Act. This should be satisfactory to the medical profession, who rightly feel that chiropractic is against the best interests of the sick public. It should be gratifying to those who enforce the law, for it should terminate the abuse of the law—illegal practice.

The Governor has already signed the *Whitney-Bawley Bills* which provide for reasonable personal income tax deductions for unusual medical expenses, including the cost of childbirth; for life insurance premiums; and for exempting dependents over 18 years of age in full time attendance at an accredited school or college.

The Governor has also signed the *Pillion-Burney Bill*, providing for extension until July 1, 1944, of the privileges of applying for renewal of license without examination within three months after finishing military services, to a person inducted into military service and licensed to practice medicine or dentistry or other professions and occupations.

The *Radiology Bill* as amended was defeated.

Did the Anti-Vivisectionists, who have not been heard from in a number of years, hope to slip through a bill in these times?

Assembly Int. 1923—Rules Committee was introduced with the backing of the State Administration giving the Governor the right to appoint a layman as

Commissioner of Mental Hygiene with a medical man under him as Medical Director. Doctor Lawrence promptly expressed disapproval of this measure, pointing out that the Commissioner should continue to be a doctor and if necessary, a business director should be provided. In those hectic days, time to amend the bill was lacking. The Council on April 8 thoroughly discussed this bill, and voted that the opinion of the Council should be transmitted to the Governor; that the medical responsibilities of the Commissioner are such that only a person with the thorough understanding of mental diseases can efficiently and satisfactorily manage the activities of this department. The chairman of the Committee on Public Health and Education and the Executive Officer, with the Secretary, composed a suitable letter to the Governor, and it was sent out over the signature of the Secretary. On March 22, 1943, Doctor Lawrence thoroughly discussed the situation in a special letter to the County Society Legislative Chairmen. You will find it also further stressed in Bulletin No. 7, issued on March 25, 1943.

A committee of the Council to Study the Present and Future Status of Foreign Physicians presented a recommendation on February 11, 1943, which was adopted and referred to the Committee on Legislation. This resolution requires citizenship in the United States, changing the State Educational law, Sec. 1256, Ch. 1. The Legislative Committee was instructed to use discretion and judgment, in order that such a move might be made only at an opportune time. Legislators, especially the Speaker of the Assembly and the Minority Leader, were contacted. All were sympathetic. The opinion was that the time was not right. The interpretation of the opinions of the various legislators was that objection would be made that this might seem to interfere with federal activities by decreasing the availability of physicians. In other words, we were prepared to introduce a citizenship bill, but were counselled against such a move this year.

Our Executive Officer, so often spoken of as our "able representative," secured a report on the work of the Department of Education, the Board of Regents, and the Office of Professional Conduct, in the interest of the medical profession. In this report, covering a little over a month, it was shown that 247 complaints have received attention. Some were closed, some were referred to the Attorney General, some were before the Medical Grievance Committee, and some before the Board of Regents. Doctor Lawrence was promised monthly reports. Because of the pressure of complaints, the Medical Grievance Committee has been asked to furnish two subcommittees until further notice, and the full Grievance Committee has agreed to meet four times a year instead of twice.

Credit is due the Board of Regents for their extraordinary efforts to meet the present situation. The record system and the administrative procedure in the Office of Professional Conduct have been completely reorganized to render the best possible service to the profession. Newspaper publicity in disciplinary cases has been avoided. A physician's license might be suspended, but public reaction to the doctor might make it amount to a revocation—a more severe penalty.

The session of the Legislature has been unusually brief; yet the Senate was deluged with 1,650 bills, and the Assembly with 1,944. Doctor Lawrence weeded out 40 Senate and 49 Assembly bills of a medical aspect, and some of the most important medical bills were brought out together in the terrific

rush of the last hours, keeping our Executive Officer on his toes.

The county societies' legislative committees and officers were very cooperative. The answer report sheets were promptly returned. We are greatly indebted to them and to the medical society auxiliaries for their coordinated efforts. The Council of the State Medical Society has aided us in many different ways and we appreciate fully their assistance and advice.

The Legislature adjourned on Friday, March 26. There are many bills in the hands of the Governor for signature or disapproval, and he has thirty days from the time of adjournment in which to act. Our Executive Officer, Dr. Joseph S. Lawrence, will give a complete report in time for the House of Delegates, on all bills acted on during the Legislative session. At this time, may we refer you to the final Bulletin issued on March 31, 1943, for the present status of the bills followed during the year?

WALTER W. MOTT, M.D.

LEO F. SIMPSON, M.D.

JOHN L. BAUER, M.D., *Chairman*

Addendum Report

April 26, 1943

The thirty-day period allotted the Governor for action upon the bills passed by both houses of the Legislature in the last days of the session has elapsed and the following bills have received the Governor's signature:

Senate Int. 1559—Wallace (Assembly Int. 1847—Manning), provides relief for sick and disabled veterans of World War II and appropriates \$10,000. Chapter 327 of the Laws of 1943.

Assembly Int. 335—Mailler (Senate Int. 278—W. J. Mahoney), authorizes Governor, on recommendation of State Health Commissioner, to designate emergency health and sanitary areas when inadequacies of medical facilities or personnel caused by national emergency exist in any area in the State; State Health Commissioner to cooperate with local health and welfare agencies and employ necessary medical and health personnel. Chapter 294 of the Laws of 1943.

Some states are meeting this emergency by authorizing their medical examining boards to recognize, with a temporary license, physicians licensed to practice in other states. In the State of Washington the period of this temporary license extends only until the next regular examination given by the board of examiners.

Assembly Int. 544—Breed, provides that crime of sexual intercourse with person in U.S. Military Service by one infected with venereal disease shall be punishable by imprisonment for not less than one and one-half years nor more than three years. Chapter 343 of the Laws of 1943.

Assembly Int. 647—Milmo (Senate Int. 515—Young), provides for forwarding to executive officer of State Education Department a copy of all charges against physicians in cases in which subcommittee of Medical Grievance Committee, as well as the Committee, shall deem a trial necessary. Chapter 460 of the Laws of 1943.

This law will increase the efficiency of the Grievance Committee by permitting it to appoint from its membership subcommittees to take the first evidence.

Assembly Int. 666—Mitchell, empowers New York City magistrate to try and punish any person

charged with violating sections of sanitary code, penalty to be fine not exceeding \$25 or imprisonment not exceeding ten days, or both. Chapter 278 of the Laws of 1943.

Assembly Int. 877—Owens (Senate Int. 705—Williamson), provides rules and orders of county health board shall state date on which they take effect, copy signed by county health commissioner or deputy to be filed in State Health Department, county health department, and county clerk's office; they must be published from time to time as sanitary code, certified copy to be furnished for fee of \$1.00; such code shall have effect of law. Chapter 258 of the Laws of 1943.

Assembly Int. 907—Molinair (Senate Int. 954—Bainbridge), provides that when ragweed or other noxious weed or plant is growing in any city, local health board may declare it to be a nuisance and order it destroyed or abated; if order is not complied with, local board may enter property and remove same. Chapter 398 of the Laws of 1943.

Assembly Int. 958—Archinal (Senate Int. 785—Hampton: Assembly Int. 1185—Schwartz), provides restriction on public hospitals treating workmen's compensation cases only during emergency shall not apply where carrier or employer refuses or neglects to authorize any hospital service after employee requested that they furnish same or when nature of injury required such services and employer or agent neglected to provide same; injured employee may then select any hospital. Chapter 442 of the Laws of 1943.

It is claimed that the principal reason for this amendment to the law is to aid an injured workman when the responsibility for the injury is to be litigated, permitting the workman to select a hospital where, in the event that he should lose the case, his hospital bill will not fall entirely upon him.

Assembly Int. 1125—Mailler (Senate Int. 937—W. J. Mahoney), extends to July 1, 1944, effective date of provision permitting practice of medicine in hospital by physicians and interns with certain educational qualifications and provisions relating to medical students performing clinical clerkship. Chapter 193 of the Laws of 1943.

Certain hospitals are employing, both as interns and as clinical clerks, persons whose educational qualifications would not be acceptable by the Medical Examining Board. Under the law these persons should not be continued in their present employments, but owing to the war emergency the enforcement of the law is being postponed another year.

Assembly Int. 1390—Mailler (Senate Int. 1051—W. J. Mahoney), continues to April 1, 1944, commission created to formulate long-range health program, and appropriates \$75,000. Chapter 207 of the Laws of 1943.

Assembly Int. 1923—Rules Committee, strikes out provision that State Mental Hygiene Commissioner shall be a physician and provides for medical director in such Department who shall be a physician with certain experience to advise the Commissioner as to medical policy and to have direct charge and control of treatment of inmates. Chapter 691 of the Laws of 1943.

This law is permissive and not mandatory, so in the event that the Governor can find a physician who would meet the qualifications as previously stated, there is nothing to prevent the Governor from appointing him commissioner.

The following bills were signed by the Governor

before adjournment of the Legislature and were previously reported:

Assembly Int. 377—Whitney (Senate Int. 328—Bewley) provides for reasonable personal income tax deductions for unusual medical expenses, including cost of childbirth, for life insurance premiums, and for exempting dependents over 13 years of age in full time attendance in an accredited college or school. Chapter 12 of the Laws of 1943.

Assembly Int. 672—Pillion (Senate Int. 605—Burney), extends until July 1, 1944, provisions permitting person inducted into military service and licensed to practice medicine, dentistry, and other professions and occupations to apply for renewal of license without examination within three months after termination of military service. Chapter 116 of the Laws of 1943.

Among the bills reported in our bulletins as having a casual interest, the following have been passed and signed by the Governor:

Senate Int. 333—Desmond, provides that a psychiatrist, in a criminal action to determine whether or not defendant is sane, shall be entitled to reasonable traveling expenses if psychiatrist is employee of state. Chapter 289 of the Laws of 1943.

Assembly Int. 92—Milmo, provides that where there are fewer than 10 physically handicapped children, city or union free school district education board may establish special class with consent of education commissioner and apportionment of school moneys therefor shall be prorated. Chapter 449 of the Laws of 1943.

Assembly Int. 93—Milmo, authorizes education boards to provide milk for pupils within limitation of appropriation therefor and strikes out provision that cafeteria or restaurant service shall be self-supporting. Chapter 450 of the Laws of 1943.

Assembly Int. 95—Moffat, suspends until July 1, 1944, provisions prohibiting purchase of butterine or oleomargarine by certain state institutions. Chapter 540 of the Laws of 1943.

Assembly Int. 231—Stuart, continues to July 1, 1944, provision authorizing health commissioner to embargo milk supply that he believes dangerous to health or to transfer milk from one plant to another to prevent sabotage or enemy action. Chapter 13 of the Laws of 1943.

Assembly Int. 233—Stuart, provides that birth and death certificates when applied for shall be accompanied by other evidence besides sworn statements and affidavits, as State Health Commissioner may require. Chapter 17 of the Laws of 1943.

Assembly Int. 840—W. R. Williams, makes it a misdemeanor to grow narcotic plant known as marihuana without license, or knowingly to allow it to grow on land without destroying same. Chapter 123 of the Laws of 1943.

Assembly Int. 1282—Dwyer, requires police chief or peace officer with similar functions to cause blood-grouping tests to be taken of person arrested and charged with felony or major misdemeanor if necessary for identification. Chapter 592 of the Laws of 1943.

The following bills were vetoed by the Governor:

Senate Int. 9—Wicks (Assembly Int. 1771—Knauf), creating in State Education Department board for licensing and regulating the practice of optical dispensing and appropriating \$10,000; providing for issue of license without examination to

person with five years' experience before January 1, 1944, and to person in U.S. armed forces within six months after discharge. Vetoed with the following memorandum:

This bill seeks to establish professional standards under supervision of the Department of Education for opticians whose function it is to grind lenses and fit them. Licensing and some supervision of opticians is undoubtedly desirable and there have been deceptive practices by some, which must be stopped. To attempt, however, in the midst of a war to set up new standards as rigorous as those imposed by this bill might deprive the public of essential services. At this time, in view of the difficult standards established by the bill, it is disapproved."

Senate Int. 334—Burney (Assembly Int. 449—Wright), providing in workmen's compensation cases the furnishing by employer of medical services or appliances for replacement or repair of artificial members of body shall not be construed to admit liability for or to be payment of compensation. Vetoed with the following memorandum:

"This bill would amend the Workmen's Compensation Law. It provides that the furnishing by an employer of medical treatment shall not be construed to admit liability on the part of the employer.

"On its face, this amendment seems harmless. In fact, it would permit an employer to lull the injured employees into a sense of security by making payments until passage of the final date on which to make claim for compensation. Thereafter, the time for making claim having elapsed, the injured employee would be without recourse.

"This amendment would not protect the employer from any hazard he now faces. At the present time, he is under an obligation to furnish the medical treatment specified to an injured employee. One of the effects of this bill would be to over-rule previous court decisions favorable to injured employees. Were the amendments proposed by this law applicable to those cases, the employees would have been deprived of the opportunity of obtaining compensation for injuries sustained in the course of their employment.

"The Workmen's Compensation Law, properly administered, is one of the important bulwarks of a free society and a secure people. It must not be weakened or impaired by legislation such as this."

Senate Int. 1230—W. J. Mahoney, providing physicians, medical inspectors, and dentists appointed or promoted to competitive civil service positions in cities and employed on June 30, 1940, with annual salary, shall continue on annual salary basis with salary increments, including retirement rights. Vetoed with the following memorandum:

"This bill would require municipalities to employ certain specified professionals in the competitive class on a per annum salary basis. The law, if approved, would be mandatory. It may be that the purposes of this bill are desirable. However, the mandating of a municipality in the conduct of local affairs is contrary to the extension of local home rule in this State and is highly undesirable."

Assembly Int. 880—M. Wilson (Senate Int. 699—Condon), providing in workmen's compensation cases injured employee may be treated by licensed pediatricist authorized by industrial commissioner to render such care; providing for schedules limited

to defined localities, of minimum charges and fees therefor. Vetoed with no memorandum.

Assembly Int. 1620—P. A. Quinn, making it a misdemeanor to conduct a nurse registry without local license; no licensee to send out a nurse without authority of physician or hospital official or operate lodging house for nurses either on or apart from place where registry is located; fees limited and other regulations imposed. Vetoed with no memorandum.

COMMITTEE ON LEGISLATION
JOHN L. BAUER, *Chairman*
WALTER W. MOTT
LEO F. SIMPSON

EXECUTIVE OFFICER
Joseph S. Lawrence

SPEAKER BAUER: I will refer this supplementary report to Reference Committee on Report of the Council—Part VII, of which Dr. Anderton is chairman.

Section 12. (See 64)

**Supplementary Report of the Council—Part VIII:
War Participation**

April 30, 1943

The latest information obtainable from the State Procurement and Assignment Committee is as follows:

Number of physicians from New York in service on February 1, 1943.....	9,000
Additional listed since February 1....	800 to 900
Total.....	9,800 to 9,900
New York quota for 1942.....	8,600
New York quota for 1943.....	2,100
Total.....	10,700

It is evident, therefore, that New York has not only met its 1942 quota but is on the way to meeting its 1943 quota.

Procurement and Assignment reports that practically all counties outside of New York City are stripped of every possible available physician. . . . In Kings County, there are 2,024 in service. Three hundred more are still being processed. Only 39 men under 37 were declared essential, and there are only 63 men still available. . . . Richmond has been stripped to the last available man. . . . New York and the Bronx are fast approaching the same condition, so very few more men can be obtained from New York State.

At the start, in New York, 15,700 men were under 45 years of age. Of these, 9,800 to 9,900 are in service, and 2,185 have been physically disqualified. The remainder includes the younger men essential in the full time faculties in the 9 medical schools, all the alien physicians, women physicians, physicians essential in hospitals, and physicians essential in industry and in the mental hospitals. It must in addition furnish the balance required for the armed services.

With 43,000 physicians in the armed services, it will be seen that New York has furnished between 20 and 25 per cent of the total.

It is believed that these figures definitely prove that New York is not the laggard state it has been accused of being, and that this State can be relied upon to furnish every available man who can possibly be spared for military service.

Respectfully submitted,
LOUIS H. BAUER, M.D., *Chairman*,
War Participation Committee

SPEAKER BAUER: I will refer this supplementary report to Reference Committee on Report of the Council—Part VIII, of which Dr. Holcomb is chairman.

Section 13. (See 82)

**Supplementary Report of the Council—Part XII:
Miscellaneous**

April 27, 1943

The Council begs to report on two matters taken up at its April meeting:

Chiropractic Study. The Council was informed of the action of the Legislature setting up a Legislative Commission to study the subject of chiropractic.

After discussion of this matter, the Council decided that it would be well to appoint a Subcommittee of the Council Committee on Legislation, to prepare to attend hearings that will undoubtedly be held by this Commission. The Council recommends that the House approve this decision.

County Health Units. The Council received the following letter from Dr. Haven Emerson, and decided to submit it to the House:

Columbia University
College of Physicians and Surgeons
De Lamar Institute of Public Health
600 West 168 Street, New York

April 3, 1943

To the Council of the New York State Medical Society
292 Madison Avenue
New York, New York

Dr. Peter Irving, Secretary

Dear Sirs:

The House of Delegates of the American Medical Association at their meeting in Atlantic City last June passed the following resolution:

"WHEREAS, a major inadequacy in the civilian health protection in war as in peacetime consists in the failure of many states and of not less than half the counties in the states to provide even minimum necessary sanitary and other preventive services for health by full time professionally trained medical and auxiliary personnel on a merit system basis, supported by adequate tax funds from local and state, and where necessary, from federal sources; therefore be it

"Resolved, that the Trustees of the American Medical Association be urged to use all appropriate resources and influences of the Association to the end that at the earliest possible date complete coverage of the nation's area and population by local, county, district, or regional full time modern health services be achieved.

Since then, the status of local health services throughout our 48 states has been studied and reported upon by a Committee of the American Public Health Association, as will be seen in the current April issue of the *American Journal of Public Health*.

The *Journal of the American Medical Association* has, in its April 3 issue, made favorable editorial comment upon the committee's report, with special reference to pending legislation in the State of Illinois. The *New York Times* of April 2 has given editorial attention to the *Journal of the American Medical Association* editorial.

New York State, with its 62 counties and its population of 13,479,100, in spite of its historic leadership in many respects of both urban and rural health services, has so far failed to take advantage of existing permissive legislation by organizing its entire area for full time health service under local jurisdiction.

There are 11 counties with full time health service under local city or county jurisdiction in New York State (including the 5 in New York City), providing for 8,780,600 population. There are also 11 cities with full time local health service within state-administered health districts, thus providing for an additional 1,660,800 population.

There are 20 state health districts made up of 51 counties with health services organized, directed and almost wholly

supported by the State Department of Health, providing for 3,037,700 population. These, however, do not have a full time health service comparable with that in the 11 counties and 11 separate cities above described. These 51 counties with a rural and small town population of 3,037,700 have no direct responsibility for such health services as they receive through the administration of the districts by the State Department of Health.

In view of the attitude of the House of Delegates of the American Medical Association, and taking into consideration the lack of complete coverage of the State of New York with full time local health services under the direction of trained and experienced medical health officers, I ask the Council to take such action, make such declarations or prepare such resolutions as may seem to them best to make it clear that the organized medical profession of New York State is solidly in support of the point of view of the American Medical Association and will give its support to such legislation and administrative action of state and county governments as will at the earliest practicable date bring to our entire population those indispensable local full time health services now enjoyed by the majority.

In bringing this matter to your attention, may I note that on some occasions in the past thirty years, efforts to obtain full time single and multiple county health units for all the areas of the state have been obstructed by the vested interests (personal, financial, and political) of some of the approximately 800 part-time, relatively untrained local health officers of villages and towns, many of which positions would be abolished if health service by trained full-time medical officers of health were provided.

Better health services, at no greater cost to the taxpayers, and requiring a smaller number of medical health officers, can be provided under the full-time county system than can be had where the part-time health officer prevails as at present.

Asking your favorable consideration of this matter, so that suitable attention and action may follow through the House of Delegates at the meeting in Buffalo, May 3 to 6, I am,

Respectfully yours,

HAVEN EMERSON, M.D.

Woman's Auxiliary. The Council Advisory Committee to the Woman's Auxiliary consisted of the following: Louis H. Bauer, M.D., chairman; Francis R. Irving, M.D.; and Carlton E. Wertz, M.D.

Because of the war situation, and in the interest of economy in time and travel, no meetings of the Committee were held during the year. The Chairman corresponded with the President of the Auxiliary, relative to a program of activity.

The President of the Auxiliary has submitted the following report. Approval is recommended, and it is also recommended that the same activities be approved for the ensuing year.

Respectfully submitted,

L. H. BAUER, M.D., *Chairman*

Annual Report.—At the suggestion of our Advisory Council, the program of our Auxiliary for the year 1942-1943 was built on the following four points:

1. Organize new counties and increase membership in those already organized.
2. Each county to make a survey of the capabilities of the membership to be turned over to the county medical societies.
3. Offer assistance to the medical societies in any of their work in which they could use our help.
4. Continue our program of health education with particular stress on the Health Insurance project of the State Society.

On the first point we struck a snag. We found several county societies who were interested in forming auxiliaries when the war is over but were not in favor of doing so now. In membership many coun-

ties are remitting their local dues and paying the national and state dues of wives of doctors who are in service. There has been some increase in membership, but this may be offset by the loss of some members in the small rural counties.

Most of the counties have reported making the survey suggested by the Advisory Council, and have offered their services to the county societies.

Our public relations chairmen have continued wherever possible with health education programs for lay people and many of the counties have had meetings given over to a discussion of the Health Insurance project.

The chairman of legislation has visited various sections of the state to explain her program and has sent out comprehensive bulletins to the counties covering all bills pertaining to medicine which have been introduced in our State Legislature. The members of the Executive Board visited the State Senate in session in February.

Public relations work has continued in spite of the loss of our state chairman when she joined her husband who was called into service. The outline suggested by the National Chairman has been followed.

Our Program Chairman has followed the outline of the National Chairman with very creditable results.

The Hygeia Chairman has been tireless in her efforts and has a substantial increase in subscriptions to her credit for the year. We hope also to show an increase for the *Bulletin*, as great stress has been put upon its value to Auxiliary officers and members.

Our state philanthropic project is the Physicians' Home, for which we solicit subscriptions from the individual counties. A Special Committee of the Executive Board remembers birthdays of the inmates as well as Christmas and special occasions.

Many of the county auxiliaries have local projects which they sponsor or aid each year, such as Scout Camps and camps for underprivileged children.

The restrictions placed on motor transport in the East have had their effect on many auxiliaries. Some have been unable to meet regularly; many have had to curtail the number of their meetings; some have had to hold their meetings to coincide with the medical societies in order to ride with their husbands; and many other changes and make-shifts have had to be made. All of our members individually are busy in their local communities in all kinds of war work, however, and enthusiasm for the auxiliary runs high. We have the spirit that will carry us through the emergency and gives promise for a rosy future when the world returns to normalcy.

Respectfully submitted,

MRS. J. EMERSON NOLL, *President*

Memorials. The Council offers memorials of two former Presidents of the Medical Society of the State of New York, and one Councilor, who have died since the last meeting of the House of Delegates.

Dr. Terry Monroe Townsend

Dr. Terry Monroe Townsend, of New York City, served organized medicine over many years, until his death on May 16, 1942, in his sixty-sixth year.

He was an original founder of the American Urological Association, President of the New York Urological Society (Branch of the American Urological Association), 1911 to 1912. He was President of the

to defined localities, of minimum charges and fees therefor. Vetoed with no memorandum.

Assembly Int. 1620—P. A. Quinn, making it a misdemeanor to conduct a nurse registry without local license; no licensee to send out a nurse without authority of physician or hospital official or operate lodging house for nurses either on or apart from place where registry is located; fees limited and other regulations imposed. Vetoed with no memorandum.

COMMITTEE ON LEGISLATION
JOHN L. BAUER, *Chairman*
WALTER W. MOTT
LEO F. SIMPSON

EXECUTIVE OFFICER
Joseph S. Lawrence

SPEAKER BAUER: I will refer this supplementary report to Reference Committee on Report of the Council—Part VII, of which Dr. Anderton is chairman.

Section 12. (See 64)

**Supplementary Report of the Council—Part VIII:
War Participation**

April 30, 1943

The latest information obtainable from the State Procurement and Assignment Committee is as follows:

Number of physicians from New York in service on February 1, 1943.....	9,000
Additional listed since February 1....	800 to 900
Total.....	9,800 to 9,900
New York quota for 1942.....	8,600
New York quota for 1943.....	2,100
Total.....	10,700

It is evident, therefore, that New York has not only met its 1942 quota but is on the way to meeting its 1943 quota.

Procurement and Assignment reports that practically all counties outside of New York City are stripped of every possible available physician. . . . In Kings County, there are 2,024 in service. Three hundred more are still being processed. Only 39 men under 37 were declared essential, and there are only 63 men still available. . . . Richmond has been stripped to the last available man. . . . New York and the Bronx are fast approaching the same condition, so very few more men can be obtained from New York State.

At the start, in New York, 15,700 men were under 45 years of age. Of these, 9,800 to 9,900 are in service, and 2,185 have been physically disqualified. The remainder includes the younger men essential in the full time faculties in the 9 medical schools, all the alien physicians, women physicians, physicians essential in hospitals, and physicians essential in industry and in the mental hospitals. It must in addition furnish the balance required for the armed services.

With 43,000 physicians in the armed services, it will be seen that New York has furnished between 20 and 25 per cent of the total.

It is believed that these figures definitely prove that New York is not the laggard state it has been accused of being, and that this State can be relied upon to furnish every available man who can possibly be spared for military service.

Respectfully submitted,
LOUIS H. BAUER, M.D., *Chairman*,
War Participation Committee

SPEAKER BAUER: I will refer this supplementary report to Reference Committee on Report of the Council—Part VIII, of which Dr. Holcomb is chairman.

Section 13. (See 82)

**Supplementary Report of the Council—Part XII:

April 3, 1943

To the Council of the New York State Medical Society
292 Madison Avenue
New York, New York

Dr. Peter Irving, Secretary

Dear Sirs:

The House of Delegates of the American Medical Association at their meeting in Atlantic City last June passed the following resolution:

"WHEREAS, a major inadequacy in the civilian health protection in war as in peacetime consists in the failure of many states and of not less than half the counties in the states to provide even minimum necessary sanitary and other preventive services for health by full time professionally trained medical and auxiliary personnel on a merit system basis, supported by adequate tax funds from local and state, and where necessary, from federal sources; therefore be it

"Resolved, that the Trustees of the American Medical Association be urged to use all appropriate resources and influences of the Association to the end that at the earliest possible date complete coverage of the nation's area and population by local, county, district, or regional full time modern health services be achieved.

Since then, the status of local health services throughout our 48 states has been studied and reported upon by a Committee of the American Public Health Association, as will be seen in the current April issue of the *American Journal of Public Health*.

The *Journal of the American Medical Association* has, in its April 3 issue, made favorable editorial comment upon the committee's report, with special reference to pending legislation in the State of Illinois. The *New York Times* of April 2 has given editorial attention to the *Journal of the American Medical Association* editorial.

New York State, with its 62 counties and its population of 13,479,100, in spite of its historic leadership in many respects of both urban and rural health services, has so far failed to take advantage of existing permissive legislation by organizing its entire area for full time health service under local jurisdiction.

There are 11 counties with full time health service under local city or county jurisdiction in New York State (including the 5 in New York City), providing for 8,780,600 population. There are also 11 cities with full time local health service within state-administered health districts, thus providing for an additional 1,660,800 population.

There are 20 state health districts made up of 51 counties with health services organized, directed and almost wholly

two brothers, John F. Brosnan, a member of the New York Bar, and Captain Vincent J. Brosnan, Catholic chaplain of the Army of the United States, stationed at Camp Livingston, Louisiana. To all of them the sincerest sympathy and heartfelt condolence of this House of Delegates are extended and be it recorded that this expression of our deep sense of loss is placed in our minutes and that a copy be transmitted to the family.

SPEAKER BAUER: I will refer this supplementary report to Reference Committee on Report of the Council—Part XIII, of which Dr. Krakow is chairman.

Section 15. (See 60)

Supplementary Report of Special Committee on Office Administration and Policies.

The Special Committee on Office Administration and Policies recommends that the House of Delegates continue this Special Committee working under supervision of and reporting to the Council, and that the House give the following directive as to continuance of its personnel in keeping with the action of the House in 1942.

"The Committee on Office Administration and Policies shall consist of the general manager, the business manager of the *JOURNAL* and *Directory*, the literary editor, the treasurer, and one member of the Board of Trustees to be appointed by the president of the Society, after consultation with the chairman of the Board of Trustees."

SPEAKER BAUER: I will refer this supplementary report to Reference Committee on Report of the Council—Part IV, of which Dr. Eggston is chairman.

Section 16. (See 53)

Supplementary Report of Special Committee on Publication

The Committee on Publication recommends that the House of Delegates continue this special Committee of the Society working under supervision of and reporting to the Council, and that the House give the following directive as to the continuance of its personnel in keeping with the action of the House in 1942.

"The Committee on Publication shall consist of the general manager, the treasurer, the director of the Public Relations Bureau, the literary editor, and one trustee, who shall be chairman; the trustee to serve shall be selected by the Chairman of the Board of Trustees, and the literary editor shall be selected by the Committee on Publication at its first meeting after this meeting of the House of Delegates, the former literary editor not voting. This is deemed to be the most satisfactory way to choose the incumbent of this position, who thereupon becomes a member of the Committee, because of the familiarity of the Committee with the duties involved and the qualifications necessary for the satisfactory performance of them."

SPEAKER BAUER: I will refer this supplementary report to Reference Committee on Report of the Council—Part IV, of which Dr. Eggston is chairman.

Section 17

Introduction of Representatives from Other State Societies

SPEAKER BAUER: Are there any delegates present from Connecticut, New Jersey, or Vermont?

(Dr. Marshall, of Vermont, arose amid applause.)

SPEAKER BAUER: Dr. Marshall, we are very glad indeed to have you here. I am pleased to extend to you the privileges of the floor.

If at any time during the session anyone learns of delegates from other states being present, I wish they would let the Chair know so they can be properly introduced.

Section 18

Constitution and Bylaws—Amendments Adopted

SPEAKER BAUER: There are four amendments introduced last year which come before you now for consideration, they having been printed in accordance with the bylaws.

Mr. Secretary, will you read the amendments?

(A) Amendment to Chapter X of the Bylaws

SECRETARY IRVING: The first one, sir, is an amendment to Chapter X, of the Bylaws, Section 1. It refers to "Expenses."

"Section 1. Allowances for expenses incurred in the actual performance of official duties by officers, members of the Council, the Board of Trustees, of the Board of Censors and committees, and delegates to the American Medical Association, shall be made in conformity with the following conditions: The President shall be allowed a per diem and expenses when engaged upon official business. All other officers shall be allowed traveling expenses when engaged upon official business. Members of the Council, of the Board of Trustees, and of the Board of Censors, shall be allowed traveling expenses. Members of committees of the Council and all special committees of the Society shall be allowed traveling expenses. Presidents of the District Branches sitting in the House of Delegates shall be allowed necessary expenses. There shall be no allowance made for the expenses, traveling or otherwise, for any committee appointed pursuant to Chapter XI of these Bylaws. Proper vouchers must be filed with the secretary before any of above allowances are made. The delegates to the American Medical Association who have attended each session of the House of Delegates of that Association and who shall have filed with the secretary evidence of such attendance shall be allowed the actual cost of railroad transportation and Pullman accommodations to the place of meeting and return. Each district branch shall be entitled to receive a sum not to exceed \$200, exclusive of the work done by the secretary regarding notices, programs, etc., to defray the expenses of holding the annual meeting of such district branch, provided a proper statement of such expense shall have been presented to the secretary. All bills, claims, or vouchers herein provided for shall be filed within thirty days after the date of the incurring of such expense. This time may be extended for any cause by the Board of Trustees and such extension shall not exceed ninety days. *Payment of all these expenses shall be made under directions of the Board of Trustees.*"

SPEAKER BAUER: There was one provision purposely omitted, which was to the effect that "The vouchers of such expense shall be approved by the Board of Trustees before payment." That was the point of the amendment.

SECRETARY IRVING: Yes, it was designed to facilitate the payment of vouchers; that is, the trustees could set up regulations under which vouch-

Medical Society of the County of New York in 1933, President of the First District Branch of the Medical Society of the State of New York in 1936, and President of the Medical Society of the State of New York, 1939-1940. At the time of his death he was serving on the Committee on Grievances of the New York State Department of Education.

Doctor Townsend was a Fellow of the American College of Surgeons, and a Diplomate in Urology. He had practiced his specialty since coming to New York in 1899. He was active on the staffs of the New York City Hospital, Morrisania Hospital, Lutheran Hospital, Midtown Hospital, West Side Hospital and Dispensary, Reconstruction Unit of Post-Graduate Hospital, Hospitals of the Department of Correction of the City of New York; and Consulting Surgeon to the Sing Sing Prison Hospital.

A man of tremendous and never-failing energy, Doctor Townsend lived a life of highest value to the health of the community, personally and through his many medical society activities. He was a clear-thinking individual who held and expounded strong convictions on the best ways for doctors to practice the healing art and to constantly improve their knowledge with the help of medical societies.

The Medical Society of the State of New York feels deeply the loss of Dr. Terry Monroe Townsend.

Dr. Augustus Joseph Hambrook

Augustus J. Hambrook, M.D., of Troy, New York, died following a long illness, at the Homer Folks Hospital, Oneonta, Otsego County, New York, on July 13, 1942.

He was elected to membership in the Medical Society of the County of Rensselaer in 1909, and served as its secretary during 1912-1913. In 1928 he became a member of the Committee on Public Relations of the Medical Society of the State of New York, on which he served until 1937 when he was elected a councilor and was appointed chairman of the Council Committee on Public Relations and Economics, in which capacity he served the State Society until his demise.

In 1933 and 1934 he was second vice-president of the Third District Branch and in 1935 and 1936 became its president. During these years he also was a censor of the State Society. In 1937 he was a member of the Committee on Trends in Medical Practice and also of the Committee to Confer with the State Hospital Association. The next year he served on the Council Committee on Contacts with the Health and Welfare Departments of the state while at the same time acting as chairman, during that year, of the Council Committee on the Deaf and Hard of Hearing. In 1942 he also acted as a member of the Joint Committee on Dental Health of the State Medical and State Dental societies.

He was a graduate of Albany Medical College, and during the first World War was a captain in the Medical Corps, U.S. Army.

The Medical Society of the State of New York suffered a great loss in the death of this valuable Councilor.

Dr. Grant Charles Madill

Dr. Grant Charles Madill, of Ogdensburg, served the Medical Society of the State of New York over many years until his death in his seventy-ninth year on March 26, 1943. Elected to membership by the St. Lawrence County Medical Society in 1906, he had been a very active worker in county and state societies.

Doctor Madill was President of the Fourth District Branch of the Medical Society of the State of New York in 1911 and 1912; President of the Medical Society of the State of New York, 1919-1920; Delegate to the American Medical Association before and after his Presidency for many years. He was a Trustee of the State Medical Society from 1926 to 1935.

Doctor Madill secured his M.D. from Bellevue Medical College in 1886, and interned at Presbyterian Hospital in New York, 1886-1888, and then started his long practice in Ogdensburg.

In 1908 he was given the degree of LL.D. by St. Lawrence University, and in 1932 the same degree by New York University. Long interested in medical education, Doctor Madill was a Regent of the University of the State of New York for years, and active in that capacity at the time of his death.

Doctor Madill was a Fellow of the American College of Surgeons, and Chief Surgeon, of long-standing, at the A. Barton Hepburn Hospital in Ogdensburg.

The death of Dr. Grant Charles Madill was a great loss to the Medical Society of the State of New York and to the State of New York.

SPEAKER BAUER: I will refer this supplementary report to Reference Committee on Report of the Council—Part XII, of which Dr. Monteith is chairman.

Section 14. (See 85)

Supplementary Report of the Council—Part XIII: Malpractice Defense and Insurance

The Council Committee on Malpractice Defense and Insurance presents the following memorial drawn up after the untimely death of the Society's Legal Counsel, Mr. Lorenz J. Brosnan.

Lorenz J. Brosnan

Lorenz Joseph Brosnan died on April 13, 1943, after a brief illness. Mr. Brosnan had served the Medical Society of the State of New York as counsel since 1930 and had fulfilled every expectation of that position with a competency second to none. Prior to his designation as counsel Mr. Brosnan had been associated with Lloyd Paul Stryker, his immediate predecessor.

Lorenz Brosnan was born in New York City in 1894 and had attended De La Salle Institute. He was graduated from Manhattan College in 1915 with the degree of A.B. and in 1918 was graduated from the Law School of Columbia University and shortly thereafter was admitted to the Bar. During the thirteen years that Mr. Brosnan served our Society as counsel he rendered most exacting and varied services, all of which were faithfully performed. His annual report for the year 1942 has been presented to this House of Delegates, and, as always, reveals his vast accomplishments for the good of our organization.

Mr. Brosnan was a member of the Association of the Bar of the City of New York, the New York County Lawyers Association, the New York State and the American Bar Associations, the Archbishop's Committee of the Laity for Catholic Charities, the Xavier Alumni Sodality, the Manhattan College Alumni Society, the Knights of Columbus, the Society of the Friendly Sons of St. Patrick, the Catholic Club, the Manhattan Club, and the Larchmont Shore Club.

Lorenz Brosnan is survived by his widow, his four daughters, and two sons. Also surviving are

trials and charges of violations of any of the provisions of the Law, as well as any investigation and follow-up of complaints; the Bureau serves as a collecting agency for physicians of the Society without cost to the physicians; the Bureau coordinates Workmen's Compensation in relation to the component county societies.

"The Director of the Bureau attends all arbitrations throughout the State.

"The Bureau maintains contact with the seventy insurance carriers operating under the amended Compensation Law; serves as a clearing house in arbitration matters for the carriers and Labor Department; maintains active contact with the self-insurer organizations; it also is concerned with the quality and type of legislation affecting Workmen's Compensation.

"The Director has been instrumental in obtaining uniform fee schedules for the entire State against the active opposition of insurance companies and employers;

"The result of this has been an excess of over \$1,000,000 a year for upstate physicians:

and

"WHEREAS, the multifarious duties of this Bureau and the obligation recently imposed for investigation; and

"WHEREAS, it is contrary to the best interests of the State Society and the component medical societies to have such onerous duties discharged by a part-time director; be it

"Resolved, that the Director of the Bureau of Workmen's Compensation shall be a full-time individual and who, once appointed, in no way engages in private medical practice; be it further

"Resolved, that the State Society employ such full-time individual on a contract basis for a minimum period of five years, with the choice of reappointment by either party; be it further

"Resolved, that the Board of Trustees determine the annual remuneration to such individual in keeping with the responsibility of the position and the administrative capacity of the individual. It is suggested that a remuneration of \$15,000 a year is adequate and would meet the present living conditions; and be it further

"Recommended that this salary be apportioned amongst the State Society, per se, and one or another of the component medical societies, depending upon the numerical panel of physicians engaged in compensation work."

SPEAKER BAUER: This resolution is referred to the Reference Committee on New Business A, of which Dr. Masterson is chairman.

Section 21. (See 57)

Amendment to Medical Practice Act

DR. B. WALLACE HAMILTON, *New York*: For the Medical Society of the County of New York I desire to present:

"Resolved, that the delegates of the Medical Society of the County of New York be instructed to urge the House of Delegates of the Medical Society of the State of New York to consider an amendment to the Medical Practice Act, Section 1264, 'Revocation of certificates; annulment of registrations.'"

To give you the background before I introduce the new matter, I might add that in this little pink book

with which you are probably familiar (holding up *Handbook 9*, The University of the State of New York, Higher Education, Medicine Including Osteopathy and Physiotherapy Law, Rules, and Information, June, 1935), Section 1264 deals with the revocation of certificates and annulment of registration. In Section 2, which introduces the new matter which we propose, it reads:

"2. The license or registration of a practitioner of medicine may be revoked, suspended, or annulled or such practitioner reprimanded or disciplined in accordance with the provisions and procedure of this article upon decision after due hearing in any of the following cases:

- (a) That the physician is guilty of fraud or deceit in the practice of medicine or in his admission to the practice of medicine.
- (b) That a physician has been convicted in a court of competent jurisdiction, either within or without this State, of a crime or misdemeanor; or
- (c) That a physician is an habitual drunkard, or addicted to the use of morphine, cocaine, or other drugs having similar effect, or has become insane; or
- (d) That a physician is guilty of untrue, fraudulent, misleading, or deceptive advertising; or advertising that he can cure or treat disease by a secret method, procedure, treatment, or medicine; or that he can treat, operate, and prescribe for any human condition by a method, means, or procedure which he refuses to divulge upon demand to the committee on grievances; and
- (e) That a physician did undertake or engage in any manner or by any ways or means whatsoever to procure or to perform any criminal abortion or to violate section eleven hundred and forty-two of the penal law."

The proposal we make would be a new subsection (f), and this is the new matter:

"(f) Any physician participating in the division, transference, assignment, rebating, splitting, or refunding of his fee for medical care."

Do I make it clear that this is under the section dealing with "Revocation of certificates; annulment of registration," after due hearing?

The Medical Society of the County of New York would like to introduce this resolution contingent on the judgment of the Committee on Legislation as to the expedient time for introducing any change in the Medical Practice Act.

SPEAKER BAUER: As this pertains pretty much to the same subject, it is referred to the same Reference Committee on New Business, of which Dr. Masterson is chairman.

Section 22. (See 56)

Moreland Act Investigation

DR. A. A. EGGSTON, *Westchester*: This resolution is in connection with the Moreland Act Investigation, and reads:

"WHEREAS, charges made against certain physicians in connection with the Moreland Act investigation of the medical aspects of the Workmen's Compensation Law—if subsequently substantiated and proved by trial—would convict these

ers could be paid but not to cause the delay of waiting until the trustees met and they could be approved.

During the war particularly the trustees have been meeting only every two months instead of every month, and it causes considerably delay in the payment of expense vouchers. This would merely facilitate the payment immediately after the service was performed under the regulations set up by the trustees, who would be responsible as in the past, but would not require their prior approval.

SPEAKER BAUER: This amendment is before you for consideration.

DR. JOHN J. MASTERSON, *Kings*: I move the adoption of that amendment to the Bylaws.

DR. JAMES R. REULING, JR., *Queens*: I second the motion.

... There being no discussion, the motion was put to a vote, and was unanimously adopted

(B) Amendment to Chapter II, Section 1, of the Bylaws

SECRETARY IRVING: The second is an amendment to Section 1 of Chapter II, as follows:

"Section 1. The House of Delegates shall be composed of (a) Delegates elected by the component County Medical Societies; (b) Officers of the Society and other members of the Council and of the Board of Trustees; (c) the Presidents of the District Branches sitting as District Delegates; and (d) a representative from each Scientific Section to be elected by each such Section."

(That (d) is the new material.)

"Past-Presidents of the Society shall be life members of the House of Delegates. Each component County Society shall be entitled to elect as many delegates as there shall be State Assembly Districts in such county at the time of the election, but each component County Medical Society shall be entitled to elect at least one delegate. A component Society representing by its name more than one county shall be entitled to as many delegates as there are Assembly Districts in the counties named in the title of such society."

SPEAKER BAUER: This amendment has but one change. It adds to the membership of the House one delegate from each Scientific Section of the Society, and provides for their being seated in the House the same as delegates from County Societies and District Branches. This amendment is now before you for consideration.

DR. PHILIP I. NASH, *Kings*: I move its adoption.

DR. MOSES H. KRAKOW, *Bronx*: I second the motion.

... There being no discussion, the motion was put to a vote, and was carried. . . .

Section 19

Constitution and Bylaws Amendments—Action Delayed One Year

SPEAKER BAUER: The next two amendments are tied together, and I suggest you read them both: New Article, No. XIV, to the Constitution, and New Section, No. 4, to Chapter XII of the Bylaws.

SECRETARY IRVING: My understanding is that the member who introduced those two amendments would like to have them withdrawn. This is Dr. Kosmak.

DR. GEORGE W. KOSMAK, *New York*: I should like to ask that consideration on these resolutions

be postponed until the next year's meeting of the House of Delegates.

SPEAKER BAUER: Dr. Kosmak, in effect, moves that consideration of these amendments be postponed until next year's meeting. Is there a second to that motion?

DR. KIRBY DWIGHT, *New York*: I will second it.
DR. CHAS. GORDON HEYD, *New York*: A question of order: These have been published for action at this meeting. It seems to me that the motion should be that they be withdrawn, after which they can be reintroduced, but I know of no mechanism which can, after publication of a projected change in the Constitution and Bylaws, avoid a vote on it. Unless they are withdrawn, there is no mechanism, in my opinion, by which to postpone action upon them until next year. In order for us to take that course they must be reintroduced and we must follow the plan laid down for all changes in the Constitution and Bylaws.

SPEAKER BAUER: It is true that amendments cannot be tabled, but action on an amendment could be postponed until the following year because it amounts to the same thing as giving notice that one intends to bring the amendment up next year. I take it that that is the meaning of Dr. Kosmak's motion—that he wishes no action taken this year, but he is giving notice that he will reintroduce them, so that after republication they may be acted upon next year. Is that correct, Dr. Kosmak?

DR. KOSMAK: That is correct, Mr. Speaker.

SPEAKER BAUER: Does that satisfy you, Dr. Heyd?

DR. CHAS. GORDON HEYD: Yes.

SPEAKER BAUER: Is there any discussion on the motion?

... The question was called for, and the motion was put to a vote, and was unanimously carried . . .

SPEAKER BAUER: They will remain in the hands of the Secretary, and be republished next year.

The meeting is now open for the introduction of resolutions.

Section 20. (See 58)

Full-Time Director of Workmen's Compensation Bureau

DR. CHAS. GORDON HEYD, *New York*: I wish to introduce the following resolution:

"WHEREAS, the amendment to the Workmen's Compensation Law in 1935 delegated specific functions to the Medical Society of the State of New York; and

"WHEREAS, it has been alleged through the public press that certain physicians have participated in practices contrary to the ethical principles of the Society; and

"WHEREAS, it is mandatory upon the Medical Society of the State of New York to investigate and try such alleged conditions; and

"WHEREAS, there has been set up a Director of the Bureau of Workmen's Compensation activities by the Medical Society of the State of New York in conjunction with the component societies; and

"WHEREAS, this Bureau embraces all activities, duties, and responsibilities under the amendment to the Workmen's Compensation Law of 1935:

"These duties and activities include qualification of physicians, licensing of x-ray laboratories, and medical bureaus operated by physicians and employees; it includes hearings and

*Section 27. (See 69)***Graduates of Unapproved Colleges as Interns**

DR. HARRY ARANOW, *Bronx*: This resolution concerns the use of graduates of unapproved medical colleges in hospitals in this war emergency:

"WHEREAS, for the last few years the number of medical graduates applying for internship has been inadequate to supply the demand; and

"WHEREAS, the present emergency is drastically reducing the number of interns available; and

"WHEREAS, though the large, desirable, prominent hospitals manage to obtain a minimum number of interns compatible with the proper running of the hospitals, some of the smaller hospitals have been unable to obtain enough interns to give their patients even the most essential care; and

"WHEREAS, the situation is so critical in some localities that hospitals may be compelled to either reduce the character of their service or close altogether; therefore be it

"Resolved, that the American Medical Association be petitioned to permit the approved hospitals, under their supervision, to accept 'for the duration' interns from the several as yet unapproved medical colleges."

SPEAKER BAUER: That resolution also will be referred to the Reference Committee on New Business C, of which Dr. Carroll is chairman.

*Section 28. (See 91)***Blood and Plasma Exchange Bank**

DR. J. STANLEY KENNEY, *New York*: I have a resolution that I have been asked to introduce by the New York County Medical Society relative to the subject of the Blood and Plasma Exchange Bank, which has now been operating for about a year in that county. Though it was conceived and the plans for it were laid about two years ago, it began to function only within the last year, and is proving, we believe, to be a very practical and useful project in the Greater City:

"WHEREAS, the Medical Society of the County of New York, under the leadership of its Special Committee on Blood Transfusion, is sponsoring a nonprofit organization known as the Blood and Plasma Exchange Bank; and

"WHEREAS, this organization has been approved by the Greater New York Hospital Association; and

"WHEREAS, the Blood and Plasma Exchange Bank has put into effect in the County of New York a uniform procedure of the highest standards for blood banks organized within the hospitals; and

"WHEREAS, the Blood and Plasma Exchange Bank is making available to patients blood and plasma, both fluid and dried, at reduced cost for those who can and wish to pay, and free of charge to those who can only supply blood; and

"WHEREAS, the Blood and Plasma Exchange Bank is storing up a reserve of plasma to be used in the event of a catastrophe; and

"WHEREAS, organized medicine is not only rendering these benefits to the sick, but also retaining for members of the profession the practice of transfusion and the art of preparing plasma within the present hospital system; therefore be it

"Resolved, that the Medical Society of the State of New York sponsor the extension of the

activities of the Blood and Plasma Exchange Bank throughout the State, with the view of assisting and encouraging the Blood and Plasma Exchange Bank to extend to the sick throughout the State, and even to our remotest communities, the benefits that it is now rendering; and further be it

"Resolved, that the Medical Society of the State of New York appoint a Special Committee on Blood Transfusion to accomplish these aims."

May I add that transfusion, or whatever name you wish to call it, is an important therapeutic measure, and the objects of this resolution are:

First, that the Medical Society of the State of New York be made familiar with the organization and the aims of the Blood and Plasma Exchange Bank. The New York County Society is, through the Blood and Plasma Exchange Bank, establishing a uniform procedure of the highest standards in blood banks organized within the hospitals. It is making available to patients blood and plasma at reduced cost for those who can and wish to pay, and free of charge to those who can only supply blood. It is storing up a reserve of plasma to be used in the event of a catastrophe. Organized medicine is not only rendering these benefits to the sick but also keeping the practice of transfusion and the art of preparing plasma within the present hospital system and by members of the profession.

Second, it is urged that a special committee on blood transfusion be appointed by the Medical Society of the State of New York with the view of spreading these benefits throughout the State.

SPEAKER BAUER: This resolution is referred to the Reference Committee on New Business A, of which Dr. Masterson is chairman.

*Section 29. (See 81)***County Legislative Committees, Additional Meeting in Fall**

DR. ROBERT B. ARCHIBALD, *Westchester*: This resolution is submitted with the idea that it will materially facilitate the work of the various legislative committees of the county societies and also the similar committee of the State Society:

"WHEREAS, the Medical Society of the County of Westchester believes that the legislative work of the Medical Society of the State of New York and the various County Societies would be greatly facilitated by a conference of county society legislative committee chairmen with the State Society Legislative Committee to be held in the late fall each year, in advance of the Legislative Session, in addition to the legislative conference regularly held midway during the Legislative Session; and

"WHEREAS, such a preparatory conference would enable agreements to be reached for the support of legislation mandated by the House of Delegates; would enable county societies having legislative problems to bring them in advance of the meeting of the legislature to the attention of the other counties and of the State Committee; would enable the State Committee to inform county committees of the prospects of the forthcoming legislative session and, in general, would prepare the county committees for more effective cooperation with the State Committee in its work; therefore, be it

"Resolved, that this House of Delegates advise the Council that it favors the holding of such an additional legislative conference with the chairmen of county society legislative committees

physicians of acts which are clearly unethical; and

"WHEREAS, the prominent notice given these charges in the press may have led a portion of the public to infer that such actions are condoned or tolerated by the profession; therefore be it

"Resolved, by the House of Delegates of the Medical Society of the State of New York that all unethical activities in connection with the provision of medical service under the Workmen's Compensation Law are hereby unreservedly condemned and repudiated; and be it further

"Resolved, that the Medical Society of the State of New York urges its component county societies to take prompt and uncompromising action, to the full extent of their disciplinary powers, whenever a member is proved to be guilty of the alleged unethical practices."

SPEAKER BAUER: That is also on the same general subject so it, too, will be referred to the Reference Committee on New Business A, of which Dr. Masterson is chairman.

Section 23. (See 73)

Full Citizenship as Requirement for License to Practice

DR. ALFRED H. NOEHREN, *Erie*: I have been instructed by the Erie County Medical Society to present the following resolution, which is in accordance with action taken at their stated meeting held April 27, 1943:

"WHEREAS, full citizenship has not been required for the securing of a license to practice medicine in New York State; and

"WHEREAS, most foreign countries will not allow United States physicians who are not citizens to secure a license to practice; and

"WHEREAS, many foreign physicians have not been in this country long enough to secure citizenship or become acquainted with the ethics and customs of American medicine; and

"WHEREAS, many of these foreign physicians are not familiar with the health problems and the laws of this State; and

"WHEREAS, there is an undue concentration of refugee physicians in New York State owing to the fact that most states insist upon citizenship as a requirement for licensure; therefore be it

"Resolved, that the delegates representing the Medical Society of the County of Erie be instructed to petition the House of Delegates of the Medical Society of the State of New York to pass a resolution favoring full citizenship as a requisite for securing a license; and be it further

"Resolved, that the Legislative Committee of the Medical Society of the State of New York take steps to have introduced legislation to modify the requirements for licensure so that full citizenship will be a prerequisite."

SPEAKER BAUER: That resolution will be referred to the Reference Committee on New Business B, of which Dr. Swift is chairman.

Section 24. (See 71)

U.S. Cabinet Secretary of Health

DR. BENJAMIN M. BERNSTEIN, *Kings*: The resolution I should like to present reads:

"WHEREAS, the forward march of civilization depends on the world's health; and

"WHEREAS, the health of the people of the United States is the concern of all the people; and

"WHEREAS, coordination of all agencies working for the maintenance of health and the prevention and cure of disease is becoming increasingly important in our daily lives; and

"WHEREAS, the problems of medical care could best be coordinated and correlated under the guidance of a central agency; be it

"Resolved, that the American Medical Association again urge with all the power at its command that a cabinet ministry of health be established, at the head of which there shall be a physician."

SPEAKER BAUER: That resolution will be referred to the Reference Committee on New Business C, of which Dr. Carroll is chairman.

Section 25. (See 72)

World Food Conference

DR. BENJAMIN M. BERNSTEIN, *Kings*: The second resolution I should like to offer concerns the World Food Conference and reads:

"WHEREAS, the use of food and the study and application of problems of nutrition are increasingly essential in the training and practice of the doctor; and

"WHEREAS, the problems of food in this country, as well as the world at large, are the concern of the medical profession; and

"WHEREAS, the knowledge and experience in the possession of the medical profession in this country is of the utmost value in the discussion of national as well as international food relationships; be it

"Resolved, that the American Medical Association be urged to request representation at the coming United Nations' Food Conference to be held at Hot Springs, Virginia, on May 18, 1943.

SPEAKER BAUER: This resolution is referred to the Reference Committee on New Business C, of which Dr. Carroll is chairman.

Are there any further resolutions?

Section 26. (See 68)

Committee for Liaison with Hospital Administrators

DR. ABRAHAM KOPLOWITZ, *Kings*: This resolution is pretty self-evident, and I do not think it will require very much debate:

"WHEREAS, the medical profession in its daily work in hospitals is in intimate contact with the administrations of such hospitals; and

"WHEREAS, such contact is through Medical Boards who represent its own staff only; and

"WHEREAS, medical care in hospitals is now so complex and involves economic factors which affect all physicians; now therefore be it

"Resolved, that the House of Delegates of the Medical Society of the State of New York, through its Council, organize a standing committee on liaison with hospital administrators under an appropriate name; to have such subdivisions of such committee as will adequately represent the various subdivisions of the State."

SPEAKER BAUER: This resolution is referred to the Reference Committee on New Business C, of which Dr. Carroll is chairman.

instructed by the New York County Medical Society to present a suggested draft of an amendment to Section 17 of the Principles of Professional Conduct of the Medical Society of the State of New York. I think that a complete description of the purposes of this would take too much of the time of the House, and had probably better be given in committee, but, briefly, it is in reference to a good many of the unfairnesses in practice which will occur in large cities, such as New York City and the other large cities of the State. The suggested draft to the amendment reads as follows:

"When one physician seeks the medical aid of another with whom he has previously had no significant professional or social connection, it is proper for the physician seeking aid to offer, and ethical for the treating physician to receive, reasonable compensation for the services rendered."

SPEAKER BAUER: That is referred to the Reference Committee on New Business C, of which Dr. Carroll is the chairman.

Section 33. (See 79)

Suggested Amendment to Federal Compensation Act Covering Longshoremen and Harbor Workers

DR. PETER M. MURRAY, *New York*: By vote of the Medical Society of the County of New York I have been instructed to introduce the following resolution:

"WHEREAS, employees working as longshoremen and harbor workers are covered against injury or death resulting from accidents while at work, by the Federal Compensation Act (Public No. 803-69 Congress.) known as 'Longshoremen's and Harbor Workers' Compensation Act'; and

"WHEREAS, the employer of such workmen is obligated to furnish such medical, surgical and other attendance or treatment, nurse and hospital service, medicine, crutches, and apparatus for such period as the nature of the injury or the process of recovery may require; and

"WHEREAS, physicians in the neighborhood of docks and harbors where such injury may occur have given such injured employees emergency treatment, and have had the patient taken away from them by the employer or his agent and sent to the physician preferred by, or under contract with, the employer; and

"WHEREAS, such physicians who have treated such injured employees have difficulty in collecting fees for services rendered, even for emergency treatment; and

"WHEREAS, the employee, by such procedure, is deprived of free choice of a physician as provided for by the New York State Workmen's Compensation Law, and advocated by the ethics of the American Medical Association; therefore, be it

"Resolved, that it is the consensus of opinion of the New York County Medical Society that the Federal Compensation Act known as Longshoremen's and Harbor Workers' Compensation Act be amended to allow injured employees to be treated by a physician of their own choice with whom they may stay until the completion of treatment."

SPEAKER BAUER: This resolution is referred to the Reference Committee on New Business B, of which Dr. Swift is the chairman.

Section 34. (See 59)

Medical Relief, Direct Payment of Medical Fees

DR. EUGENE H. COON, *Nassau*: I have been instructed to present this resolution on behalf of the Nassau County Medical Society:

"WHEREAS, the report of the Subcommittee on Medical Relief of the Council of the Medical Society of the State of New York, as published in the *NEW YORK STATE JOURNAL OF MEDICINE*, March 1, 1943, issue, states that doctors rendering authorized care to recipients of old age assistance of the Welfare Department are in many cases not receiving payment for their services because of the failure of the recipients of such services to pay to the physicians the money given them for such payment, and reports that the State Welfare Department has agreed to send an itemized bill to the patient of the old age group definitely stating the amount due the doctor; and

"WHEREAS, it is the feeling of the Nassau County Medical Society that this proposed step will not be sufficient to assure payment to the physician of his just fee; and

"WHEREAS, numerous complaints have been received from physicians in Nassau County of the inability of the physicians to collect such just fee because of the present regulations prohibiting the direct payment to the physicians by the Welfare Department for services rendered the recipients of relief in those categories which are covered by Federal 'reimbursement' regulations; be it hereby

"Resolved, that it is the opinion of the Nassau County Medical Society that attempts should be made to secure a return to the old system under which payment is made directly to the physician for medical services authorized by the Welfare Department; and be it further

"Resolved, that the delegates representing the Nassau County Medical Society at the annual meeting of the House of Delegates of the Medical Society of the State of New York introduce resolutions calling upon the State Society to recommend to the New York State Department of Social Welfare that steps be taken to assure the payment of physicians for services rendered by making direct payment for such services to the authorized physician."

SPEAKER BAUER: Inasmuch as this same subject is discussed in the Report of the Council—Part VI—on Medical Relief, this resolution will be referred to the Reference Committee on the Report of the Council—Part VI, of which Dr. Rawls is chairman, instead of to a new business committee.

Section 35. (See 70)

Amendment to Workmen's Compensation Law to Cover Paid Hospital Physicians

DR. JACOB WERNE, *Queens*: Mr. Speaker and Members of the House of Delegates, I am instructed by the Queens County Society to introduce the following resolution relative to amending the Workmen's Compensation Law:

"WHEREAS, physicians employed by hospitals or other institutions allied to the practice of medicine are exposed to certain special hazards incident to their employment, in addition to the ordinary hazards common to all individuals employed by these institutions; and

shortly before the opening of the regular session of the State Legislature, for the purposes enumerated above, and to the end that the coordinated legislative activities of the county and State societies may be more purposeful and effective than they can be under present procedures."

SPEAKER BAUER: This resolution is referred to the Reference Committee on New Business B, of which Dr. Swift is chairman.

Section 30. (See 52, 54) Directory Publication

DR. WALTER P. ANDERTON, New York: Mr. Speaker and Members of the House, I have been instructed by the Medical Society of the County of New York to introduce the following resolution:

"WHEREAS, the last issue of the *Medical Directory of New York, New Jersey, and Connecticut*, Volume XLI, 1941-1942, is in many instances out of date because of the absences of practitioners of medicine in the armed forces and because of removals; therefore be it

"Resolved, that it is recommended by this House assembled that the *Medical Directory of New York, New Jersey, and Connecticut*, Volume XLII, be published in the near future."

SPEAKER BAUER: Inasmuch as one of the Council Committee reports takes up this same subject, instead of being referred to a New Business Committee this resolution will be referred to the Reference Committee on Report of the Council—Part IV, Publications and Medical Publicity, of which Dr. Eggston is the chairman.

Section 31. (See 62) Basic Science Law

DR. CHARLES GULLO, Livingston: The following resolution is introduced by the Livingston County Medical Society:

"WHEREAS, there are people in the State of New York practicing the Healing Art without having adequate knowledge of the human body; and

"WHEREAS, experience has shown that it is most difficult and generally futile to effectively prosecute these people even when they have violated the Medical Practice Act; and

"WHEREAS, it is the duty of Organized Medicine to promulgate medical information and prevent fraudulent and inferior medical service to our people; now, therefore, be it

"Resolved, that the House of Delegates of the New York State Medical Society hereby authorizes and instructs its Legislative Committee to present to the Legislature of the State of New York a suitable bill to correct this condition and that such bill shall provide substantially as follows:

"An Act to provide for examination in the basic sciences, authorizing the Board of Regents to issue a Certificate of Proficiency in the basic sciences, which Certificate shall be a prerequisite to eligibility for examination for license to practice medicine and surgery, osteopathy, osteopathy and surgery, as now prescribed by law, dentistry, or any other system or method of healing that may hereafter be legalized in the State of New York, to define the basic sciences, the practice of healing, a license, and to provide penalties for the violation of this Act.

'Section 1. Definition as used in this Article:

"Wherever the term, "Practicing Healing," or "Practice of Healing" is used in this Act unless otherwise specifically defined, the same shall be understood and construed to mean and include any person not hereinafter excepted from the provisions of this Act who shall in any manner for any fee, gift, compensation, or reward, or in expectation thereof, engage in, or hold himself out to the public as being engaged in the practice of medicine or surgery, the practice of osteopathy, the practice of any legalized method of healing, or the diagnosis, analysis, treatment, adjustment, correction, or cure of any disease, injury, defect, deformity, infirmity, ailment, or affliction of human beings, or any condition or conditions incident to pregnancy or childbirth or examination into the fact, condition, or cause of human health or disease or who shall for any fee, gift, compensation, or reward, or in expectation thereof, suggest, recommend, or prescribe any medicine or any form of treatment, correction, or cure therefor; also any person or persons, not hereinafter excepted from the provisions of this Act, individually or collectively who maintains an office for the reception, examination, diagnosis, or treatment of any person for any disease, injury, defect, deformity, or infirmity of body or mind, or who attaches the title of Doctor, Physician, Surgeon, Specialist, M.D., M.B., D.O., D.C., or any other work, abbreviation, or title to his name indicating or designed to indicate that he is engaged in the practice of healing.

'Section 2. Qualifications

"No person shall engage in the "Practice of Healing" unless he shall first have complied with the following prerequisites:

"First: He must pass an examination given by the Board of Regents through its Board of Medical Examiners in the Basic Sciences—namely: anatomy, physiology, physiologic chemistry, bacteriology, pathology, and hygiene—and upon satisfactorily passing such an examination shall receive a Certificate of Proficiency in the Basic Sciences which shall not be interpreted as conferring the right to engage in the practice of healing.

"Second: After receiving said Certificate of Proficiency, he must pursue other studies as established by law and appear before the Board of Choice of the Board of Regents for further examination and having fulfilled other requirements prescribed by law, he may be licensed to practice.

'Section 3. Exemptions

"All persons already licensed prior to enactment of this Act.

'Section 4. Penalty

"Any person violating any provision or provisions of the foregoing Sections shall be guilty of a misdemeanor punishable by law."

SPEAKER BAUER: This resolution is referred to the Reference Committee on New Business A, of which Dr. Masterson is chairman.

Section 32. (See 66)

Amendment to "Principles of Professional Conduct"

DR. HAROLD B. DAVIDSON, New York: Mr. Speaker, Ladies and Gentlemen of the House, I am

that designation has already been made, but there are others to be made.

SPEAKER BAUER: This is referred to the Reference Committee on New Business C, of which Dr. Carroll is the Chairman.

Dr. Irving has a communication along the same line and I would ask him to read that now.

SECRETARY IRVING: This is on the stationery of The Homeopathic Medical Society of the State of New York, and it is addressed to the Speaker of the House of Delegates, Medical Society State of New York Convention, Hotel Statler, Buffalo, New York, under date of May 1, 1943:

"Dear Sir:

"At the annual meeting of the Homeopathic Medical Society of the State of New York held on Thursday, April 29, 1943, the following resolution was adopted:

'WHEREAS, The Board of Regents of the State of New York is called to act upon and deliberate many aspects of medicine and related medical problems, and whereas the medical profession cannot properly be represented except by a competent physician, The Homeopathic Medical Society of the State of New York therefore endorses the name of Dr. Chas. Gordon Heyd, of New York City, for appointment on the Board of Regents of the State of New York, since we feel that the medical profession should be represented in the deliberations of this august body.'

"Fraternally yours,

FRANK J. BORRELLI, M.D., *President*"

(Applause)

SPEAKER BAUER: That will be attached to the resolution and referred to the Reference Committee on New Business C, together with the resolution.

Are there any other resolutions to be introduced at this time?

.... There was no response

Section 40

Announcements by the Speaker

SPEAKER BAUER: I invite your attention to the

fact that there will be an opportunity to introduce resolutions in the final session tomorrow afternoon only by a two-thirds vote. I hope nobody will wait that long because we will be very cramped for time. There will be further opportunity for introducing resolutions this afternoon and tomorrow morning, but so far as possible please try to get your resolutions in by this afternoon.

The Reference Committees, as I told you, are going to be cramped for space. The tables are in here, but those who will have to continue their deliberations during the session of the House will find room on the eighteenth floor, in Room 1814.

I hope the Reference Committees will meet as promptly as they can so that as many as possible will be able to get their reports in this afternoon. All officers and members of committees who are interested in any of the resolutions or in any of the reports should seek out the reference committees to whom they have been referred so that you can state your views to them.

SPEAKER BAUER: Gentlemen, the officers of the Society and the Sections were considerably uneasy as to the attendance we might have this year in view of the rather stringent conditions of transportation and difficulty in getting away. Now I am glad to say that everyone is very much pleased that this promises to be a well-attended meeting. There apparently was no hesitation or worry on the part of the exhibitors because they came out in full force, and we owe them a debt of gratitude for coming here and getting their equipment set up under the difficulties they had in transporting their material. I hope, therefore, that every member of the House will see to it that at some time during the meeting he visits all the exhibits which have been prepared, both the technical and the scientific exhibits.

I have another announcement concerning a change in one of the reference committees. Dr. Kelley, who was scheduled to be a member of the Reference Committee on New Business C, is not here. Dr. James B. Lawler, of Oneida, is appointed in his place.

If there are no further resolutions, the House will stand in recess until 3:00 P.M.

(At 12:00 M. a recess was taken.)

Afternoon Session

May 3, 1943

The session convened at 3:15 P.M., pursuant to recess.

SPEAKER BAUER: The House will be in order.

Section 41.

Introduction of President-Elect Zoe Allison Johnson, M.D., of the American Medical Women's Association

SPEAKER BAUER: Members of the House, we have a distinguished visitor here this afternoon, and I am going to ask Dr. J. Stanley Kenney, of New York, to present her to us.

DR. J. STANLEY KENNEY, New York: Mr. Speaker and Members of the House, I have the honor and the pleasure of presenting to you Dr. Zoe Allison Johnson, President-Elect of the Alleghany County Medical Society in Pennsylvania and President-Elect of the American Medical Women's Association. (Applause)

SPEAKER BAUER: Dr. Johnson, I believe this is the first time this Society has had the honor of having the President-Elect of the American Women's Medical Association here. We are delighted to welcome you, and hope you will say a few words to us now.

DR. ZOE ALLISON JOHNSON: Mr. Speaker and Members, I am very happy to have this courtesy extended to me. As one delegate from the State of Pennsylvania to their House of Delegates, I bring the greetings of the Pennsylvania State Medical Society.

I have one other thing that I should like to say. No doubt you have been properly thanked, or if you have not been you will be by the proper representative, Dr. Barringer, the Chairman of the Committee for Securing Commissions for Women Physicians in the Army and Navy, for the efforts you made in our behalf. However, I want you to know that all of the women who have worked so hard for this want

"WHEREAS, such physicians (with the exception of interns) are not included as beneficiaries under the Workmen's Compensation Law; and

"WHEREAS, disability resulting from injury or illness sustained as a result, and in the course of such employment may markedly diminish or entirely dissipate the earning power of such physicians; be it hereby

"Resolved, that the Medical Society of the State of New York initiate measures, through appropriate channels, to cause the Workmen's Compensation Law to be so amended as to provide for the inclusion of the class of physicians above described as beneficiaries under that Law."

In explanation, I might say that the reason for the introduction of this resolution is that a physician, one of our members, a pathologist in one of our hospitals, contracted tuberculosis because of an exposure, we believe, in the routine of the work he was called upon to perform. The Compensation Law covers interns who so contract tuberculosis, but not paid staff physicians. The purpose of this amendment is to remedy that injustice.

SPEAKER BAUER: This resolution is referred to the Reference Committee on New Business C, of which Dr. Carroll is chairman.

Section 36. (See 65) Practical Nurse Training

DR. GEORGE W. KOSMAK, *New York*: I would like to introduce this resolution:

"WHEREAS, there has long existed an evident need for another type of nursing service of a less demanding character than that hitherto supplied by the highly trained professional registered nurse group, for those patients, for example, afflicted with simple illness, undergoing convalescence from previous operations or confinements, or suffering from disabling chronic disease; and

"WHEREAS, this need has been intensified during the present emergency by the lack of available nurses for civilian and hospital needs; and

"WHEREAS, there are at present inadequate facilities for the procurement and training for this special practical nurse group; therefore, be it

"Resolved, that the House of Delegates of the Medical Society of the State of New York endorse the movement to extend the facilities for training such practical nurses and likewise commend the efforts by the Nursing Council of this State in the procurement of candidates for such training."

SPEAKER BAUER: This is referred to the Reference Committee on New Business C, of which Dr. Carroll is the chairman.

SPEAKER BAUER: Are there any other resolutions to present?

Section 37. (See 56) Commendation of Dr. Emily D. Barringer

DR. ALBERT A. GARTNER, *Erie*: This is a resolution that was passed by the Medical Society of the County of Erie, and I was asked to read it here today:

"WHEREAS, women physicians have been active in the treatment of civilians, regardless of sex; and

"WHEREAS, the Medical Department of the United States Army up to recently has refused to commission women physicians as medical officers; therefore be it

"Resolved, that the Medical Society of the County of Erie go on record as commending Dr. Emily D. Barringer for her stand and constant effort in securing commissions for women physicians, and that this resolution be read at the meeting of the House of Delegates of the Medical Society of the State of New York."

SPEAKER BAUER: That resolution is referred to the Reference Committee on New Business A, of which Dr. Masterson is chairman.

Section 38

American Medical Women's Association—Commendation Received for Aid in Securing Commissions for Women Doctors

SPEAKER BAUER: The Secretary has a communication on this same subject, which I will ask him to read at this time.

SECRETARY IRVING: This is a letter from Emily Dunning Barringer on the stationery of the American Medical Women's Association, Inc., dated April 29, 1943, and is addressed:

House of Delegates, Medical Society of the State of New York
Buffalo, New York

To the Members of the House of Delegates:

As Chairman of the Special Committee, "Commissions for Women Physicians in the Army and Navy" of the American Medical Women's Association, I am writing to send the heartiest thanks of our Committee to the Members of the House of Delegates of the Medical Society of the State of New York for the magnificent support that it has given the women physicians in their recent struggle to attain proper Wartime Rating in the Medical Corps of the United States Army and Navy.

If it had not been for the generous and gallant stand of the House of Delegates of New York State, not once but on several occasions, it is more than likely that the earnest effort of the women physicians would have been of no avail.

It will be a matter of lasting gratification to the women physicians of New York State that their State Society was the first to have the vision and the courage to blaze a trail for us at a time when public opinion was in doubt as to the justice of our quest.

With our profound appreciation, believe me,

Respectfully yours,

EMILY DUNNING BARRINGER

(Applause)

SPEAKER BAUER: Dr. Barringer, I am sure I speak for the House in thanking you for the letter just read by the Secretary. It will be entered in our minutes.

Section 39. (See 67)

Board of Regents Appointment Suggested

DR. B. WALLACE HAMILTON, *New York*: This resolution has been endorsed by the New York County Medical Society, and now we ask for its endorsement by this House:

"Resolved, that the House of Delegates of the Medical Society of the State of New York respectfully recommend and urge upon the joint caucus of the Senate and Assembly of the State of New York the designation of Dr. Chas. Gordon Heyd as Medical Representative on the Board of Regents of the University of the State of New York."

In introducing this resolution we are quite aware unofficially that this designation to succeed Dr. Madill will be quite impossible as Dr. Madill was a resident of the Fourth Judicial District, and that

reduces abortions; healthier babies, since it permits child spacing—and studies by the United States Children's Bureau show that babies born two or three years apart have better chance of life and health. It assures greater emotional security in family life; and it offers sound methods of birth control medically prescribed.

Planned parenthood clinics can perform an excellent public health service by provision of medical advice on family planning through private physicians and public clinics; education of the public in relation to drugstore and other nonmedical sources of information on contraception and instruction; education of the public in prevention of disease; referral of patients to private physicians or other clinics for suspected or actual cancer, suspected or actual tuberculosis, venereal disease, sterility, and marriage counsel.

The immediate thought, then, is: shall organized medicine lead the public in medical matters, or shall it follow under coercion of public opinion?

The prophecy of Dr. William H. Ross, when he was president of the Medical Society of the State of New York in 1931, which I shall take the opportunity of quoting here, has been amply fulfilled and will be even more completely fulfilled in the future. At that time he said: "Social changes will continue to increase in America, and social organizations will become more and more active. It will be better for the future position of the profession of medicine to guide the advent of these activities, determine their soundness, and give them leadership in medical matters. It is medicine's obligation to furnish leadership, and in leadership rests the future position of medicine in public opinion."

I offer the following resolution:

"WHEREAS, the American Medical Association has recommended in its resolution of June 8, 1937, that the legality of the use of contraceptives be made clear to physicians; that the Association undertake investigation of contraceptive devices and methods; that medical students be instructed in the problems of human fertility; and that the dissemination of contraceptive advice be under medical control; and

"WHEREAS, the law of New York State, according to Justice Crane's opinion, 222 N. Y. 192 (1918), supports the physician 'who in good faith gives. . . (contraceptive) advice to a married person to cure or prevent disease. . .'; and

"WHEREAS, the public looks to the medical profession for leadership in medical matters involving the health of the people of the State; therefore be it

"Resolved, that the Medical Society of the State of New York approves the giving, by physicians, of information relating to pregnancy spacing and fertility to married women when in the opinion of the physician such advice is indicated for the maintenance of health or the prevention and cure of disease."

SPEAKER BAUER: This resolution is referred to the Reference Committee on New Business B, of which Dr. Swift is chairman.

Section 47. (See 75)

Foreign Physicians Survey

DR. JOSEPH C. O'GORMAN, *Erie*: I wish to offer the following resolution concerning foreign physicians:

"WHEREAS, medical care is an integral part of plans for the relief and aid to peoples in the stricken foreign countries; and

"WHEREAS, citizens of the United States and graduates of the medical faculties of the United States are ineligible to apply for licensure to practice medicine in Continental Europe and the British Isles; and

"WHEREAS, there are in the United States of America many physicians—the refugee, the exiled, and the expatriate—who are eligible to practice in Continental Europe and the British Isles; and

"WHEREAS, these physicians are ineligible for service in the armed forces of the United States; and

"WHEREAS, statistics record that approximately 50 per cent of the graduates of the medical faculties abroad, examined for licensure in the United States, failed; and

"WHEREAS, the licensed and unlicensed refugee, exile, and expatriate physicians in the United States are denied the privilege of serving the United States or their own country; and

"WHEREAS, these physicians know the language, the people, and the customs, and are eligible for service in their respective countries; therefore be it

"Resolved, that the Medical Preparedness Committee of the Medical Society of the State of New York make a survey of physicians available and eligible to practice medicine in Continental Europe and the British Isles, and report to the Procurement and Assignment Committee of the Medical Society of the State of New York; and be it further

"Resolved, that the Procurement and Assignment Committee of the Medical Society of the State of New York proceed to form a corps of these available and eligible physicians for service, when and where needed, in relief and aid areas."

SPEAKER BAUER: This resolution is referred to the Reference Committee on New Business A, of which Dr. Masterson is chairman.

Are there any other resolutions?

. . . There was no response . . .

SPEAKER BAUER: If there are no other resolutions to be introduced at this time, are any Reference Committees ready to report?

Section 48. (See 11)

Report of Reference Committee on Report of the Council—Part VII: Legislation

DR. WALTER P. ANDERTON, *New York*: Your Reference Committee on Part VII of the Council's Report—Legislation—has studied this report and the supplementary report and the final bulletins from our Legislative Bureau. Many bills were introduced into the State Legislature's recent session relating to public health, medical education, and medical practice. It is to be noted with approval that Governor Dewey has signed the bill allowing reasonable personal income tax deductions for unusual medical expenses and the bill permitting certain professional members of the armed forces to apply for renewal of license registration without examination within three months after ending military service.

The bill to license chiropractors failed to emerge from the Assembly Rules Committee. On the other hand, the bill defining radiology as part of the prac-

to thank you because they know that the New York State group was one of the first groups that were behind them. I thank you very much for that in the name of the American Medical Women's Association. (Applause)

SPEAKER BAUER: Are there any reference committees ready to report?

Section 42. (See 1)

Report of the Reference Committee on Credentials

SPEAKER BAUER: The Chairman of the Committee on Credentials will give the report on the registration to date.

SECRETARY IRVING: Present here today:

Officers and Past-Presidents.....	32
Delegates.....	142
making a total of.....	174

SPEAKER BAUER: Is any reference committee ready to report?

... There was no response ...

SPEAKER BAUER: While we are waiting, the Secretary will read a letter.

Section 43.

Women's Medical Society of New York State—Letter of Commendation

SECRETARY IRVING: This is from the President of the Women's Medical Society of New York State, addressed to Dr. George W. Cottis, President, and Delegates of the Medical Society of the State of New York, and reading:

"Gentlemen:

"The Women's Medical Society of New York State at its annual meeting, held at the Town Club of Buffalo, May 3, 1943, unanimously passed the following resolution:

"WHEREAS, the House of Delegates of the Medical Society of the State of New York has for a period of over two years gone on record as giving women physicians vigorous support in their effort to obtain commissions in the Medical Reserve Corps of the United States Army and Navy; and

"WHEREAS, the women physicians of this State feel that the recent successful passage of legislation to this effect is due in great part to the wholehearted endorsement of the Medical Society of the State of New York; therefore be it

"Resolved, that the Women's Medical Society of New York State express their profound appreciation and tender their heartiest thanks to their men colleagues."

"WOMEN'S MEDICAL SOCIETY OF NEW YORK STATE
By Marguerite P. McCarthy, President"

SPEAKER BAUER: That will be entered in our minutes.

While we are waiting for the reference committees, are there any further resolutions to be introduced?

Section 44. (See 83)

Remission of Dues of Members Serving in Veterans Administration Facility

DR. JOHN J. BUETTNER, Onondaga: This resolution is introduced on behalf of the Medical Society of the County of Onondaga:

"WHEREAS, at a recent meeting of the Comitia Minora, the motion was passed that the delegates to the Annual State Meeting soon to be held in

Buffalo be instructed to present a resolution to the House of Delegates that the dues and assessments of members of the county societies who are enrolled in the Veterans Administration Facility for the duration be remitted while they are temporarily removed from active civilian practice in the same manner as those members in the United States Public Health Service.

"The reason prompting this action is the fact that one of our members has gone into the Veterans Administration Facility for the duration, and we have carried on a considerable correspondence in the hope of having his dues and assessments remitted, only to find that this is not possible unless the House of Delegates takes some action at their meeting.

"The Comitia Minora, with the approval of the Onondaga County Medical Society, requests that their delegates introduce the following resolution at the coming meeting of the Medical Society of the State of New York; therefore, be it

"Resolved, that members of component county medical societies entering the Veterans Facility Administration on a temporary basis have their dues remitted for the duration."

SPEAKER BAUER: This resolution is referred to the Reference Committee on New Business C, of which Dr. Carroll is chairman.

Section 45. (See 74)

Mental Hygiene State Administration

DR. JOHN J. BUETTNER: I have another resolution, which concerns mental hygiene, and which reads:

"WHEREAS, the medical profession is interested in any change from medical administrative control of our mentally sick because of the possibility of affecting detrimentally the service which has been built up to be one that is looked upon throughout the country and the world as a model; be it

"Resolved, that we express to Governor Dewey full confidence in his purpose and design and hope that he may appoint capable and experienced personnel for both administrator and director."

SPEAKER BAUER: This resolution is referred to the Reference Committee on New Business A, of which Dr. Masterson is chairman.

Section 46. (See 80)

Planned Parenthood

DR. CHARLES C. TREMBLEY, Franklin: The American Medical Association took leadership in recognizing contraception as a medical measure in 1937, and has acted to implement their resolution since.

Following the American Medical Association's action of 1937, the medical societies of ten states have passed resolutions recognizing contraception as a legitimate part of medical practice, an increasing interest in the subject being indicated by the fact that five were passed in 1942.

The law of the State of New York recognizes the physician's right to give contraceptive advice in the practice of medicine, as evidenced by the interpretation of Judge Crane in 1918.

Planned parenthood offers the opportunity for: healthier mothers, since it enables mothers to regain their strength and health between pregnancies, enables women with serious disease to avoid pregnancies which may further endanger their lives, and

medical profession, the programs made available for postgraduate teaching have been of such a high order that twenty-six county medical societies of the State have demanded and have been granted a total of ninety-four lectures during the past year. This total is about the same as the previous year's record, which was the highest ever attained.

By cooperation of the State Department of Health in presenting subjects which the department considered of importance in its medical education program, our committee has received very substantial financial assistance from this department, thus enabling it further to increase its work and extend its services.

The *Course Outline Book*, published by the committee and distributed to the county medical societies, medical schools, and various health and educational agencies, is a compendium of available postgraduate educational courses of which our Society may well be proud. Every phase of the practice of medicine is covered by these courses and changes in subjects and lecturers are made with each new yearly edition. A study of the subjects and courses asked for from year to year is an interesting commentary on medical trends. In the past year lectures on sulfonamide therapy and plasma and transfusion therapy have been most widely in demand, with eleven lectures given on each subject, together with eight on cancer, nine on war medicine, six on general medicine, and only three on obstetrics. In addition to the usual lectures, regional meetings and teaching days, embracing districts covering several counties, have this year proved to be a big drawing card, and it is expected that such meetings will be much in demand in the future.

Your committee, in commending Dr. Mitchell and his committee for their outstanding accomplishments in providing continuous medical education for the medical profession of this State, recommends that he and his committee be granted every facility and ample funds to continue this monumental work, and also recommends that the constituent county medical societies make increasing use of the available programs, for by so doing they will provide constantly improving medical services to their communities.

I move the adoption of the reference committee's report, which is signed by Albert F. R. Andresen, Conrad Berens, William J. Gracey, Lyman C. Lewis, and Leo C. Reimann.

.... The motion was seconded

SPEAKER BAUER: It has been regularly moved and seconded that the report and supplementary report of the Council—Part I, Postgraduate Education, be approved. The reference committee's report in substance reviews the work of the Committee on Public Health and Education on postgraduate education, and recommends that the county societies make further use of its facilities. Is there any discussion on it?

DR. GEORGE W. KOSMAK, New York: May I ask of the committee that they eliminate the word "only" before the "three lectures on obstetrics"?

DR. ANDRESEN: Yes, we can do that. I am sure my committee will be agreeable to that.

SPEAKER BAUER: Dr. Andresen said he will take out the word "only" as requested in the Reference Committee's report.

Other than that, are there any comments or discussion?

The question was called for, and the motion was put to a vote and was unanimously carried

Section 51. (See 10)

Report of Reference Committee on Report of the Council—Part III: School Health

DR. W. GUERNSEY FREY, JR., Queens: The Council Committee on Public Health and Education, the Subcommittee on Child Welfare, and the Subcommittee on 4-H Clubs held a meeting in Syracuse on October 26, 1942, with representatives of the New York State Department of Education and the New York State Association of School Physicians. Your reference committee reviewed the Council's report on this meeting and would comment on the several items therein as follows:

1. Your reference committee approves the establishment of minimum standards for instruction of undergraduate medical students in School Health and feels that at the very least the students should become acquainted with the various agencies which are available.

2. The recommendation that more postgraduate instruction in school health be made available is approved, with the suggestion that this be coordinated as far as possible with the activities of local postgraduate education and school health committees.

3. Your reference committee feels that the Council's comment concerning requirements for part-time school physicians is ambiguous; your reference committee calls attention to the "Medical Standards for Physicians in the Schools" proposed by the American Academy of Pediatricians, as published in the *J.A.M.A.*, February 20, 1943.

4. and 5. Concerning the annual physical examination of all school children (which is required by State law) and the correction of remediable defects, your reference committee heartily commends the Council's effort to secure greater cooperation between school physicians and family physicians in regard both to annual examinations and to treatment of physical defects.

6. The recommendation of the Council that every component county society appoint a committee or subcommittee on school health is endorsed by your reference committee.

I move the approval of this portion of the reference committee's report.

.... The motion was seconded, and as there was no discussion, it was put to a vote and was unanimously carried

DR. FREY: The Council reports the appointment of three representatives of the Medical Society of the State of New York (Dr. Beaven, of Rochester, and Drs. Hiss and Silverman, of Syracuse) to confer upon request with State Education Department officials charged with arranging the program of health education for high school students. Your reference committee recommends that the House approve this action of the Council.

I move the adoption of this portion of the report.

.... The motion was seconded, and as there was no discussion, it was put to a vote and was unanimously carried

DR. FREY: Finally, the Council reports that "several conferences were held by the Chairman of the Committee on Public Health and Education with Dr. Hiram Jones, State Director of Physical Fitness of the Office of Physical Fitness of the State War Council, regarding cooperation between the Medical Society of the State of New York and several government and voluntary agencies. The plan for providing essential health examinations in connection with the Physical Fitness Program was developed and

tice of medicine also remained in committee when the Legislature adjourned.

Your committee takes this opportunity to commend highly the Council Committee on Legislation—Dr. John L. Bauer, chairman, and Drs. Walter W. Mott and Leo F. Simpson—for their diligent performance of their duties, as well as the Executive Officer, Dr. Joseph S. Lawrence, whose unremitting zeal and understanding has been one of the best assets of our Society.

This report is respectfully submitted by the Committee consisting of Walter P. Anderton, *chairman*, John J. Buettner, B. Wallace Hamilton, Harry W. Miller, and Eugene H. Coon.

I move the adoption of the Reference Committee's report.

... The motion was seconded, and as there was no discussion, it was put to a vote and was unanimously carried

SPEAKER BAUER: Thank you, Dr. Anderton!

Are any other Reference Committees ready to report?

Section 49

Report of Reference Committee on Reports of Secretary, Censors, and District Branches

DR. SCOTT L. SMITH, *Dutchess*: Your Reference Committee on the Report of the Secretary would call particular attention to the efficiency and energy with which the administration of the Society has met the demands of our first war year. It has had on the one hand to contend with greatly increased general activities and on the other hand with reduced funds to meet the extra effort. Up to date, we are informed that the remissions of assessments for war service have totaled \$40,150. This loss of revenue has been met by the delayed publication of the *Directory*, by a reduction in the cost of the *JOURNAL*; and by a reduction of the office force, which still permits continuance of its full-time job.

We would commend the Secretary and his staff for the manner in which this difficult situation has been handled.

The changes in setup of the Council Committee:

1. A Subcommittee on Tuberculosis and Chest Diseases;
2. The division of the Maternal and Child Welfare Committee into two parts, Maternal Welfare, and Child Welfare,

would appear to be definitely indicated by the increased activities in these fields.

The new Council Committee to Study the Present and Future Status of Foreign Physicians, practicing or wishing to practice here, is urgently needed to explore and solve the problem of this difficult and potentially very dangerous field. Your Committee would approve and recommend the continuance of these four committees.

I move the adoption of the Secretary's Report.

... The motion was seconded, and as there was no discussion, it was put to a vote and was unanimously carried

DR. SMITH. On the Report of the Censors, your reference committee would note that the Board had only one appeal referred to it, and that it upheld the decision of the county Board of Censors from whose decision the appeal was taken. This decision had rejected the application for reinstatement of a member, dropped for nonpayment of dues. It is of further interest to note that the appellant has not exercised his rights under the Bylaws to file an ap-

peal with the House of Delegates. Your committee would approve the Report of the Censors.

I move its approval.

... The motion was seconded, and as there was no discussion, it was put to a vote and was unanimously carried

DR. SMITH: Reports of the District Branches. With the years, it becomes more evident what an extensive field the District Branches fill in coordinating, consolidating, and crystallizing the educational work of the county societies. These results are effected by either of the two types of meetings commonly held by the District Branches—the so-called clinical meeting or the didactic addresses.

It is apparent, from careful study of the eight District Branch reports, how much thoughtful effort has been put into the selection and carrying out of the programs of these meetings.

Your committee notes with interest that our State President has found time to attend and address all of these Branch meetings and has in each case spoken along the line of his presidential address on the future of medicine.

In these times of stress, when it is difficult to attend meetings, the desirability of holding annual District Branch meetings has often been discussed. It is the opinion of your committee that the important educational role of these meetings makes their contribution most desirable, and we urge it in spite of the difficulties.

I move the adoption of the eight District Branch reports.

... The motion was seconded, and as there was no discussion it was put to a vote and was unanimously carried

DR. SMITH: Now I move the adoption of the report, signed by Scott L. Smith, William G. Cooper, Clifford F. Leet, Daniel A. McAteer, and Madge C. L. McGuinness, as a whole.

... The motion was seconded, and as there was no discussion, it was put to a vote and was unanimously carried

SPEAKER BAUER: Are any other reference committees ready to report?

... There was no response

SPEAKER BAUER: Are there any further resolutions to be introduced?

... There was no response

SPEAKER BAUER: If there are no other reference committees ready to report at this time and no further resolutions to be introduced, I will declare a recess for ten minutes. Will you kindly try to get your reports in as soon as possible? The first order of business tomorrow afternoon is the elections, and we would like to get everything behind us that we can today, so that we will have the major part of our business disposed of by that time.

(There was a ten-minute recess at this point.)

SPEAKER BAUER: The House will be in order.

We have two reference committees ready to report, and I hope by the time we have those reports acted upon some more will be ready.

Section 50. (See 8)

Report of Reference Committee on Report of the Council—Part I: Postgraduate Education

DR. ALBERT F. R. ANDRESEN, *Kings*: This report, so beautifully supplemented by the committee's exhibit on the mezzanine floor, is a tribute to the remarkable energy and vision of its chairman. In spite of the war, with its extra demands on the

DR. EGGSTON: This is in the way of a summary: This is a crucial period in our Society, so what more appropriate time could be anticipated wherein some of the Society's net worth might be more advantageously utilized? A long-sighted, constructive policy must maintain in this Society, as a contribution to the winning of the war as well as to the peace that is to follow. The contributions and policy of the medical profession may well be the keystone of a better human understanding and a contribution to an enduring peace.

I move the adoption of that portion of the report. . . . The motion was seconded, and as there was no discussion, it was put to a vote and was unanimously carried

DR. EGGSTON: Now I move the adoption of the report, signed by Andrew A. Eggston, as chairman, and Drs. Alfred M. Hellman, J. P. Henry, Charles A. Anderson, and A. A. Gartner, as a whole.

. . . . The motion was seconded, and as there was no discussion, it was put to a vote and was unanimously carried

Section 53. (See 16)

Report of Reference Committee on Report of the Council—Part IV: Publications and Medical Publicity—Special Committee on Publication

DR. ANDREW A. EGGSTON, *Westchester*: As to the Report of the Special Committee on Publications, the Committee on Publications recommends that the House of Delegates continue this Special Committee of the Society working under supervision of and reporting to the Council, and that the House give the following directive as to the continuance of its personnel in keeping with the action of the House in 1942:

"The Committee on Publication shall consist of the general manager, the treasurer, the director of the Public Relations Bureau, the literary editor, and one trustee, who shall be chairman; one trustee to serve shall be selected by the Chairman of the Board of Trustees, and the literary editor shall be selected by the Committee on Publication at its first meeting after this meeting of the House of Delegates, the former literary editor not voting. This is deemed to be the most satisfactory way to choose the incumbent of this position, who thereupon becomes a member of the Committee, because of the familiarity of the Committee with the duties involved and the qualifications for the satisfactory performance of them."

The reference committee, consisting of Andrew A. Eggston, chairman, Charles A. Anderson, Alfred M. Hellman, J. P. Henry, and A. A. Gartner, recommends the adoption of this report, and I so move.

. . . . The motion was seconded, and as there was no discussion, the motion was put to a vote and was unanimously adopted

Section 54. (See 30, 52)

Report of Reference Committee on Report of the Council—Part IV: Publications and Medical Publicity—Resolution on Medical Directory

DR. ANDREW A. EGGSTON, *Westchester*: There was also a resolution introduced by the New York County Medical Society on the publication of a *Directory*. Shall I read that, before reading our recommendation?

SPEAKER BAUER: Yes.

DR. EGGSTON: The resolution reads as follows:

"WHEREAS, the last issue of the *Medical Directory of New York, New Jersey, and Connecticut*, Volume XLI, 1941-1942, is in many instances out of date because of the absences of practitioners of medicine in the armed forces and because of removals; therefore be it

"Resolved, that it is recommended by this House assembled that the *Medical Directory of New York, New Jersey, and Connecticut*, Volume XLII, be published in the near future."

Your reference committee recommends the adoption of this resolution, and that the *Medical Directory of New York, New Jersey, and Connecticut*, Volume XLII, be published as soon as physically possible, although it would probably cost at this time more than \$30,000 net to the Society as against the cost of the last issue of \$21,000.

I so move.

SPEAKER BAUER: I believe this recommendation is rather out of order in that the House has already adopted the prior report of this reference committee approving that the *Directory* be published as soon as possible, and, if possible, in 1944. I think it is not necessary to repeat our action. If there is no objection by the House, therefore, we will take no action on this resolution. It has already been covered in the reference committee's report already adopted. Hearing no objection, I will so rule.

DR. EGGSTON: That is all, for the time being.

SPEAKER BAUER: Thank you, Dr. Eggston!

Is there any other reference committee that is ready to report?

Section 55. (See 37)

Report of Reference Committee on New Business A—Commendation of Dr. Emily D. Barringer

DR. JOHN J. MASTERSON, *Kings*: I wish first to report on the resolution presented by the Medical Society of the County of Erie, reading:

"WHEREAS, women physicians have been active in the treatment of civilians, regardless of sex; and

"WHEREAS, the Medical Department of the United States Army up to recently has refused to commission women physicians as medical officers; therefore be it

"Resolved, that the Medical Society of the County of Erie go on record as commending Dr. Emily D. Barringer for her stand and constant effort in securing commissions for women physicians and that this resolution be read at the meeting of the House of Delegates of the Medical Society of the State of New York."

It is with great pleasure that I report our recommendation on this resolution: The Committee approves this resolution and congratulates Dr. Barringer on the successful accomplishment of her untiring efforts in securing commissions for women physicians in the armed forces. It is with very great pleasure that we recommend the spreading of this resolution on the Minutes of the House of Delegates.

I move its adoption.

. . . . The motion was seconded

SPEAKER BAUER: The recommendation of the reference committee is one of commendation to Dr. Barringer. Is there any discussion on it? If not, I suggest that we give our testimonial to Dr. Barringer by a rising vote.

approved by the Council." Since this item is included in the portion of the Council's report that concerns the school health program, it is assumed that the individuals affected are principally school children. This would appear to be an effort to carry out the mandate of the 1942 House of Delegates that "the Council. . . continue its efforts to bring about the changes whereby supervision of health and health problems among children of school age will be under the charge of physicians," etc.

Your reference committee heartily endorses any activity of the Council guarding against lay domination, through physical training departments, or other State agencies, of medical personnel.

Your reference committee further recommends that in every community where physicians are appointed by school authorities to examine school and high school students that the county society invite the proper authorities to select the appointees from panels of physicians submitted by the county society.

I move the adoption of this portion of the committee's report.

. . . . The motion was seconded, and as there was no discussion, the motion was put to a vote and was unanimously carried

DR. FREY: Now I move the adoption of the report, signed by W. Guernsey Frey, Jr., Joseph H. Cornell, Ralph I. Lloyd, Walter G. Hayward, and Ralph Sheldon, as a whole.

. . . . The motion was seconded, and as there was no discussion, it was put to a vote and was unanimously carried

SPEAKER BAUER: Thank you, Dr. Frey!
Dr. Eggston, are you ready to report?

Section 52. (See 30, 54)

Report of Reference Committee on Report of the Council—Part IV: Publications and Medical Publicity

DR. ANDREW A. EGGSTON, *Westchester*: It is regrettable that the JOURNAL has to appear in an abridged form, but this is a necessary war economy. It is with pleasure that we note that the form and editorial policies of the JOURNAL maintain the same high quality. It is suggested that the book reviews be more prominently placed in the JOURNAL. The finances of the JOURNAL show a decrease in the cost to the Society in the past year of \$7,480.31, and this saving is in great part due to an increase in the advertising receipts. This fact is both interesting and encouraging, because at first glance conditions would anticipate a loss of the acceptable type of advertising. The Committee feels that extreme vigilance should always be exercised so that only the most generally acceptable types of advertising be admitted to the JOURNAL and *Directory*, and only an amount in proper proportion to the scientific matter. In general, your committee offers congratulatory commendations to the publication committee of the JOURNAL.

Your reference committee approves the decision not to publish a 1943 *Directory*. It is felt, however, that if conditions at all warrant publication of a 1944 *Directory*, this should be undertaken and, furthermore, that all physicians in the military services should have an adequate listing of their contributions to the armed forces of the nation. Such a new directory would be a sustainer of morale and would also be of much practical value. I move the adoption of that portion of the committee's report.

. . . . The motion was seconded

SPEAKER BAUER: You have before you the Report of the Reference Committee on the JOURNAL and the *Directory*. In substance the report commends the JOURNAL for its high standards and recommends that advertising be in proportion to its scientific content, and that the *Directory* be not published for 1943, but, if at all possible, it be published in 1944. Do you wish to consider those two items together or separately?

CHORUS: Separately.

SPEAKER BAUER: We will take up the JOURNAL first. Is there any discussion on the motion to commend the high quality of the JOURNAL and to restrict its advertising in proportion to its scientific content?

. . . . The question was called for, and the motion was put to a vote and was unanimously carried

SPEAKER BAUER: That portion of the report is adopted. We next come to the recommendation relative to the *Directory*. The committee approves the action of the Council in not publishing a *Directory* for 1943, but recommends that if at all possible it be published for 1944, and that it contain data relative to the men in the military service. I believe that is a correct statement of your recommendation?

DR. EGGSTON: Yes.

SPEAKER BAUER: Is there any discussion?

DR. EGGSTON: There is also a separate resolution before the House on that.

. . . . The question was called for, and the motion was put to a vote and was carried

SPEAKER BAUER: That portion of the report is adopted.

DR. EGGSTON: The bulletins for club talks should be continued and extended and be published in available form. The mailing list has been advisedly reduced for the bulletins from 819 to 544. An abridged list of interested members and organizations should continue to receive these publications.

I move the adoption of that portion of the report.

. . . . The motion was seconded, and as there was no discussion, it was put to a vote and was unanimously carried

DR. EGGSTON: There has been a decrease in the cost of the Public Relations Bureau of \$6,805.75. These economies might well be continued until urgent public issues call for the judicious expenditure of a larger amount. It will require a keen sense of foresight to decide judiciously when, and for what, and how much of our surplus capital should be spent to improve our Public Relations.

Your committee takes cognizance of the disposition of the instructions for the 1942 House of Delegates in regard to the compilation of current historic medical data, etc. This subject is again revived because it is felt that it is of great importance to the future of the Society. It is true that the problem of employment of office personnel is a difficult one and that costs have mounted. It is, therefore, suggested that the work of compilation of historic facts might well be undertaken by a committee composed of some of our historically minded members with the aid of a small secretarial staff. It is suggested that some of the savings in the cost of the JOURNAL and *Directory*, supplemented by a portion of investment dividends, be earmarked for the Society's historic archives. The printing of this material might judiciously be postponed.

I move the adoption of this portion of the committee's report.

. . . . The motion was seconded, and as there was no discussion, it was put to a vote and was unanimously carried

State against the active opposition of insurance companies and employers.

"The result of this has been an excess of over \$1,000,000 a year for upstate physicians, and

"WHEREAS, the multifarious duties of this Bureau and the obligation recently imposed for investigation; and

"WHEREAS, it is contrary to the best interests of the State Society, and the component medical societies, to have such onerous duties discharged by a part-time director; be it

"Resolved, that the Director of the Bureau of Workmen's Compensation shall be a member of the Medical Society of the State of New York on a full-time basis and, when appointed, in no way engaged in private medical practice; be it further

"Resolved, that the Medical Society shall appoint such full-time director on a contract basis for a minimum period of five (5) years; be it further

"Resolved, that the Board of Trustees determine the annual remuneration to such individual in keeping with the responsibility of the position and the administrative capacity of the individual. It is suggested that a remuneration of \$15,000 a year is adequate and would meet the present living conditions."

Recommendation: The committee approves the resolution in full, and urges early action by the Council and Board of Trustees in carrying into effect the recommendation of the resolution.

I move its adoption.

.... The motion was seconded

SPEAKER BAUER: It has been moved and seconded that this resolution be adopted. The resolution in substance covers the activities of the Workmen's Compensation Bureau, and recommends the appointment of a full-time director instead of a part-time director, who must give up all relation to private practice during the period of his appointment, which will be for a term of five years. The salary as recommended is \$15,000?

DR. MASTERSON: Well, it is suggested that it be that; but that is not recommended.

SPEAKER BAUER: A suggested salary—but that it be left to the Board of Trustees to determine what the salary shall actually be.

Is there any discussion?

DR. W. GUERNSEY FREY, JR., *Queens*: I wanted to raise a query rather than discuss it. Did you read the entire resolution as presented? Was there not something in it as presented whereby the man that was to be selected was to be paid by the various county societies in proportion to the amount of work done in those various counties? I thought there was in the resolution read by Dr. Heyd this morning something to that effect.

DR. MASTERSON: We deleted that.

DR. FREY: Then the resolution you read was not the same as that presented this morning?

DR. MASTERSON: Not quite. We made several changes in the resolution. There is one paragraph we deleted.

SPEAKER BAUER: Read the deleted paragraph.

DR. MASTERSON: It is the last one:

"Be it further recommended that this salary be apportioned amongst the State Society, per se, and one or other of the component medical societies, depending upon the numerical panel of physicians engaged in Compensation work."

I did not read that because we did not recommend it. I only read what we recommended.

SPEAKER BAUER: The committee, therefore, recommends the elimination of that paragraph from the original resolution.

Is there any further discussion?

... The question was called for, and the motion was put to a vote and was adopted

SPEAKER BAUER: Is there any other reference committee ready to report?

Section 59. (See 34)

Report of Reference Committee on Report of Council—Part VI: Medical Relief, Direct Payment of Medical Fees

DR. WILLIAM B. RAWLS: The committee recommends the acceptance with commendation of the report as a whole, and after studying the resolution introduced by the Nassau County Delegates, wishes to introduce the following substitute resolution:

"Be it resolved that the House of Delegates of the Medical Society of the State of New York go on record as favoring such change in the Federal Social Security Law as is necessary that will permit direct payment to the physician, and further recommends that the delegates to the A.M.A. be instructed to introduce a resolution requesting the A.M.A. to memorialize the proper authorities for such changes that are necessary in the Federal Security Law to allow direct payment to the physician."

Do you wish me to read the Nassau County recommendation?

SPEAKER BAUER: Yes, I think you had better, and then read the change.

DR. RAWLS: The introduced resolution by Nassau County reads:

"WHEREAS, the report of the Subcommittee on Medical Relief of the Council of the Medical Society of the State of New York, as published in the NEW YORK STATE JOURNAL OF MEDICINE, March 1, 1943, issue, states that doctors rendering authorized care to recipients of old age assistance of the Welfare Department are in many cases not receiving payment for their services because of the failure of the recipients of such services to pay to the physicians the money given them for such payment, and reports that the State Welfare Department has agreed to send an itemized bill to the patient of the old age group, definitely stating the amount due to the doctor; and

"WHEREAS, it is the feeling of the Nassau County Medical Society that this proposed step will not be sufficient to assure payment to the physician of his just fee; and

"WHEREAS, numerous complaints have been received from physicians in Nassau County of the inability of the physicians to collect such just fees because of the present regulations prohibiting the direct payment to the physicians by the Welfare Department for services rendered the recipients of relief in those categories which are covered by Federal 'reimbursement' regulations; be it hereby

"Resolved, that it is the opinion of the Nassau County Medical Society that attempts should be made to secure a return to the old system under which payment is made directly to the physician for medical services authorized by the Welfare Department; and be it further

... The motion was unanimously adopted by a rising vote

DR. EMILY D. BARRINGER: Thank you!

Section 56. (See 22)

Report of Reference Committee on New Business
A—Moreland Act Investigation

Dr. MASTERSON: On the resolution introduced by Dr. A. A. Eggston, of Westchester County, concerning the Moreland Act Investigation, and reading:

"WHEREAS, charges made against certain physicians in connection with the Moreland Act Investigation of the medical aspects of the Workmen's Compensation Law, if subsequently substantiated and proved by trial, would convict these physicians of acts which are clearly unethical; and

"WHEREAS, the prominent notice given these changes in the press may have led a portion of the public to infer that such actions are condoned or tolerated by the profession; therefore be it

"Resolved, by the House of Delegates of the Medical Society of the State of New York that all unethical activities in connection with the provision of medical service under the Workmen's Compensation Law are hereby unreservedly condemned and repudiated; and be it further

"Resolved, that the Medical Society of the State of New York urges its component county societies to take prompt and uncompromising action to the full extent of their disciplinary powers whenever a member is proved to be guilty of the alleged unethical practice."

Recommendation: The committee approves the resolution and moves its adoption.

... The motion was seconded, and as there was no discussion, the motion was put to a vote, and was unanimously carried

Section 57. (See 21)

Report of Reference Committee on New Business
A—Amendment to Medical Practice Act

Dr. MASTERSON: On the next resolution introduced by Dr. B. Wallace Hamilton, of the Medical Society of the County of New York, concerning an amendment to the Medical Practice Act:

"Resolved, that the delegates of the Medical Society of the County of New York be instructed to urge the House of Delegates of the Medical Society of the State of New York to consider an amendment to the Medical Practice Act, Section 1264, 'Revocation of certificates; annulment of registrations.'

"2. The license or registration of a practitioner of medicine may be revoked, suspended, or annulled or such practitioner reprimanded or disciplined in accordance with the provisions and procedure of this article upon decision after due hearing in any of the following cases: (a) fraud and deceit, (b) conviction of crime or misdemeanor, (c) addict or drunkard, (d) untrue advertising and secret remedies, and (e) abortion"

and this is the suggested new matter:

"(f) Any physician participating in the division, transference, assignment, rebating, splitting, or refunding of his fee for medical care."

Recommendation: Approved with the recommendation that the resolution be referred to the Committee on Legislation, who shall determine, after conference with the Counsel of the State So-

ciet, any changes in the wording of the suggest amendment which will not conflict with the spirit the amendment. The Legislative Committee sh determine the opportune time for introducing t legislation.

I move its adoption.

... The motion was seconded, and as there w no discussion, it was put to a vote and was unar mously carried

Section 58. (See 20)

Report of Reference Committee on New Business
A—Full-Time Director of Workmen's Compensation Bureau

Dr. MASTERSON: The next resolution is introduced by Dr. Heyd, of New York, regarding the appointment of a full-time director of the Bureau o Workmen's Compensation of the Medical Society of the State of New York.

Do you want me to read that?

SPEAKER BAUER: We have had so many resolutions introduced that I am afraid it would not be clear in the minds of the delegates unless it is read again, so I think you had better read it again, despite the time it will take.

Dr. MASTERSON: As we have changed it, the resolution reads:

"WHEREAS, the amendment to the Workmen's Compensation Law in 1935 delegated specific functions to the Medical Society of the State of New York; and

"WHEREAS, it has been alleged through the public press that certain physicians have participated in practices contrary to the ethical principles of the Society; and

"WHEREAS, it is mandatory upon the Medical Society of the State of New York to investigate and try such alleged conditions; and

"WHEREAS, there has been set up a Director of the Bureau of Workmen's Compensation activities by the Medical Society of the State of New York in conjunction with the component societies; and

"WHEREAS, this Bureau embraces all activities, duties, and responsibilities under the amendment to the Workmen's Compensation Law of 1935:

"These duties and activities include qualification of physicians, licensing of x-ray laboratories, and medical bureaus operated by physicians and employees; they include hearings and trials and charges of violations of any of the provisions of the law, as well as investigation and follow-up of complaints; the Bureau serves as a collecting agency for physicians of the Society without cost to the physicians; the Bureau coordinates Workmen's Compensation in relation to the component county societies.

"The Director of the Bureau attends all arbitrations throughout the State.

"The Bureau maintains contact with the seventy insurance carriers operating under the amended Compensation Law, serves as a clearing house in arbitration matters for the carriers and the Labor Department; maintains active contact with the self-insurer organization; it also is concerned with the quality and type of legislation affecting Workmen's Compensation.

"The Director has been instrumental in obtaining uniform fee schedules for the entire

June 15, 1943]

tion and Policies, which was referred to us, reads:

"The Special Committee on Office Administration and Policies recommends that the House of Delegates continue this Special Committee working under supervision of the reporting to the Council, and that the House give the following directive as to continuance of its personnel in keeping with the action of the House in 1942:

"The Committee on Office Administration and Policies shall consist of the general manager, the business manager of the JOURNAL and DIRECTORY, the literary editor, the treasurer, and one member of the Board of Trustees to be appointed by the President of the Society, after consultation with the Chairman of the Board of Trustees."

That is approved by your reference committee, consisting of Andrew A. Eggston, Chairman, Charles A. Anderson, J. P. Henry, A. A. Gartner, and A. M. Hellman.

I so move.

DR. ALFRED M. HELLMAN, *New York*: I second the motion.

SPEAKER BAUER: This recommendation is merely approval of a continuation of the practice now in effect—namely, that this committee shall be continued.

DR. GEORGE W. KOSMAK, *New York*: I think the original recommendation contained the phrase that the member of the Board of Trustees should be the chairman of this committee.

SECRETARY IRVING: No, that was in the report of the other special committee, the Committee on Publications.

DR. KOSMAK: But the original intent of the motion would make it apply to this committee likewise.

SPEAKER BAUER: You are privileged to make an amendment to the motion, Dr. Kosmak.

DR. KOSMAK: I so amend it.

.... The motion was seconded

SPEAKER BAUER: Dr. Kosmak moves the amendment of the motion by making the member of the Board of Trustees the chairman of the Special Committee on Office Administration and Policies.

Is there any discussion on the amendment?

.... The question was called for, and the amendment was put to a vote and was unanimously carried

SPEAKER BAUER: Now you have the amended motion before you, which carries with it the recommendation for the continuation of this committee as it is at present set up, plus the amendment suggested by Dr. Kosmak which was just voted on. Are you ready for the question?

.... The question was called for, and the motion, as amended, was put to a vote and was unanimously carried

SPEAKER BAUER: Are there any other reference committees ready to report?

Section 61. (See 4, 5, 6, 7)

Report of Reference Committee on Report of the President, the President-Elect, and Speaker

DR. DAVID W. BEARD, *Schoharie*: On the Report of the President, the Medical Society of the State of New York in the opinion of this reference committee has been singularly fortunate in having had the considered wisdom and sagacity that has been exemplified in all of Dr. Cottis' official acts and utterances during this past year. In the trying and troubled times through which we are now passing,

his solid opinions and logical thinking have been substantial assets. His finger at all times has been on the pulse of medical trends. He has demonstrated remarkable cognizance of organized medicine's important and inseparable relationship to the changing social order. His talks before the various District Branches, his quoted and publicized speeches, have all shown evidence of his practical and wholesome grasp of the intricacies and perplexities of the serious problems that confront us as a profession.

In reviewing this Report of the President, we should like to call attention particularly to the last half of it, those portions referring to the great socioeconomic changes that this Society must be prepared to face. Let us quote briefly these remarks of his:

"No man can say how far the changes in our social organization will go before the end of the war, but no man can doubt the direction of the trend. Furthermore, it makes no difference whether we favor or dislike the trend. As long as this country remains a democracy, the people will decide."

He has reasonable and proper doubts that we are prepared to meet these imminent changes. We must prepare and have ready plans and proposals to meet any others that may be offered.

We are heartily in accord with Dr. Cottis' recommendation that a special committee be created to study and report on this problem. In this connection we respectfully refer to the supplemental report of this reference committee on the resolution introduced by Dr. Louis H. Bauer at the opening session of this House of Delegates.

We note with satisfaction his considered opinion regarding New York State doctors' full contribution to the war effort, not only in the supplying of the needs of the armed forces, but also in fulfilling the urgent demand of Selective Service and the requirements of the home front. These latter services have been unselfish and patriotic duties well performed.

The President has called attention to and has recommended the reading of the published and detailed committee reports. We urge compliance of the membership at large with this request that they may be better informed of the serious efforts of organized medicine in this State to cope with and attempt the solution of the vexing problems that confront us.

We would stress particularly the pressing need now to expand and activate the scope and plan of Medical Expense Indemnity Insurance. We believe that the best solution is a broad, unified, and comprehensive plan for medical care that can be distributed in conjunction with the well-accepted and established hospitalization plans, always safeguarding organized medicine's right to retain its proper influence and control.

We commend the President's complimentary references to the earnest and efficient work of all the various components that make up the administrative machinery of the State Society.

SPEAKER BAUER: I suggest that you move the adoption of that portion before you go ahead with the supplemental report.

DR. BEARD: I move the adoption of this portion of the reference committee's report.

.... The motion was seconded, and as there was no discussion, it was put to a vote and was unanimously carried

DR. BEARD: The supplemental report of the President in reference to this House of Delegates

"Resolved, that the delegates representing the Nassau County Medical Society at the Annual Meeting of the House of Delegates of the Medical Society of the State of New York introduce resolutions calling upon the State Society to recommend to the New York State Department of Social Welfare that steps be taken to assure the payment of physicians for services rendered by making direct payment for such services to the authorized physician."

Now our substitute resolution reads:

"Be it resolved that the House of Delegates of the Medical Society of the State of New York go on record as favoring such change in the Federal Social Security Law as is necessary that will permit direct payment to the physician, and further recommends that the delegates to the A.M.A. be instructed to introduce a resolution requesting the A.M.A. to memorialize the proper authorities for such changes that are necessary in the Federal Social Security Law to allow direct payment to the physician."

The committee moves for the adoption of the substitute resolution.

DR. ABRAHAM KOPLOWITZ, *Kings*: I second the motion.

DR. BENJAMIN M. BERNSTEIN, *Kings*: Some of you will recall that last year a similar motion was made, and I said at that time that we were sometimes very paradoxical and changed our skins, as it were, as the chameleon does, when the move hits us and we get touched somewhere in our pocket books.

We are accepting socialized medicine if we accept payment from the government for care given to a ward of the government. I think we want that very clearly understood before we vote to accept this resolution. Either we are going to maintain our traditional and old-time physician-family-patient relationship or we are not. Whether we are to accept the government's, shall I say, largess for the payment of these poor devils, or whether we are going to deal with them directly, regardless of where they get their money, is the problem.

As we understand it, last year only about 5 per cent of the fees had not been paid. Are we going to change the law because 5 per cent of the doctors in treating these people have not been paid? I do not think it is fair when 95 per cent are being paid and are perfectly willing to maintain this physician-family-patient relationship. I think we ought to maintain ourselves as we are at all times.

May I tell you a story in conclusion? A man came to a small town one night looking for a room in which to sleep. No beds were to be had in the hotel, but he found there was one empty bed in a room which a general would occupy. He said, "Why don't you give me that extra bed? The general is fast asleep by now, and he won't know I have been there. You wake me up early, at 6:00 A.M., tomorrow morning, because I must catch a train, and he won't even know I have been there."

After much persuasion the hotel proprietor gave him the bed, and woke him at 6:00 A.M., according to the arrangement. As this man was dressing in the dark, he put on the general's uniform by mistake. As he went out into the street, he was saluted right and left. He could not understand why he was being so saluted, until he got to the train and was about to comb his hair and wash his face and saw himself in the mirror arrayed in a general's uniform. He said, "What a stupid fool that hotel proprietor is. I told him to wake me up at six, and

he woke up the general instead." (Laughter) "As a matter of fact, I think I may even miss my train." (Laughter)

SPEAKER BAUER: Is there any further discussion on the substitute resolution?

DR. CHARLES F. McCARTY, *Kings*: Dr. Bernstein said that only 5 per cent of the doctors were having trouble being paid. I have information, which I got last week from the New York City Department of Welfare, that during the past two years about 33 1/2 per cent of the doctors either were not paid or had great difficulty in collecting their fees in that they had to find out from the Department of Welfare when the person was going to be paid and go to the home and collect the money themselves before the check was cashed; otherwise they would be out of luck.

SPEAKER BAUER: Is there any further discussion? If not, are you ready for the question? The question is on the adoption of the reference committee's report, which carries with it the adoption of the substitute resolution. All those in favor of the adoption of the committee's report say "Aye"; those opposed, "No." The chair is in doubt. Those in favor of the motion—namely, the adoption of the committee's report—will please rise and stand until they have been counted. Now those opposed please rise. The vote is 53 in favor and 47 against; the committee's report is, therefore, adopted and with it the substitute resolution.

DR. RAWLS: In view of Paragraph 4 in the report of the Committee on Medical Relief, your committee thinks it important to adopt the following resolution:

"WHEREAS, a blanket policy of taking care of the families of all men in service will include many that are financially able to purchase their own medical care; and

"WHEREAS, the meaning of the word 'family' is not fully described; and

"WHEREAS, there are at present facilities for taking care of those who are financially unable to secure medical care through the Welfare Department; therefore be it

"Resolved, that the delegates of the Medical Society of the State of New York go on record as opposing a blanket policy of taking care of the families of all men in the service, recommending that the Welfare Department render such service as is necessary to those families of men in service who are not financially able to secure proper medical care."

I move its adoption.

... The motion was seconded, and as there was no discussion, it was put to a vote and was unanimously carried

DR. RAWLS: Now I move the adoption of the report of the Reference Committee, consisting of William B. Rawls, chairman, Edgar O. Boggs, Joseph A. Geis, Abraham Koplowitz, and Guy S. Philbrick, as a whole.

... The motion was seconded, and as there was no discussion, it was put to a vote and was unanimously carried

SPEAKER BAUER: Thank you, Dr. Rawls!

Section 60. (See 15)

Report of Reference Committee on Report of the Council—Part IV: Publications and Medical Publicity—Special Committee on Office Administration and Policies

DR. ANDREW A. EGGSTON, *Westchester*: The Report of the Special Committee on Office Administra-

tion and Policies, which was referred to us, reads:

"The Special Committee on Office Administration and Policies recommends that the House of Delegates continue this Special Committee working under supervision of the reporting to the Council, and that the House give the following directive as to continuance of its personnel in keeping with the action of the House in 1942:

"The Committee on Office Administration and Policies shall consist of the general manager, the business manager of the *JOURNAL and Directory*, the literary editor, the treasurer, and one member of the Board of Trustees to be appointed by the President of the Society, after consultation with the Chairman of the Board of Trustees."

That is approved by your reference committee, consisting of Andrew A. Eggston, Chairman, Charles A. Anderson, J. P. Henry, A. A. Gartner, and A. M. Hellman.

I so move.

DR. ALFRED M. HELLMAN, *New York*: I second the motion.

SPEAKER BAUER: This recommendation is merely approval of a continuation of the practice now in effect—namely, that this committee shall be continued.

DR. GEORGE W. KOSMAK, *New York*: I think the original recommendation contained the phrase that the member of the Board of Trustees should be the chairman of this committee.

SECRETARY IRVING: No, that was in the report of the other special committee, the Committee on Publications.

DR. KOSMAK: But the original intent of the motion would make it apply to this committee likewise.

Is there any discussion on the amendment?

.... The question was called for, and the amendment was put to a vote and was unanimously carried

SPEAKER BAUER: Now you have the amended motion before you, which carries with it the recommendation for the continuation of this committee as it is at present set up, plus the amendment suggested by Dr. Kosmak which was just voted on. Are you ready for the question?

.... The question was called for, and the motion, as amended, was put to a vote and was unanimously carried

SPEAKER BAUER: Are there any other reference committees ready to report?

Section 61. (See 4, 5, 6, 7)

Report of Reference Committee on Report of the President, the President-Elect, and Speaker

DR. DAVID W. BEARD, *Schoharie*: On the Report of the President, the Medical Society of the State of New York in the opinion of this reference committee has been singularly fortunate in having had the considered wisdom and sagacity that has been exemplified in all of Dr. Cottis' official acts and utterances during this past year. In the trying and troubled times through which we are now passing,

his solid opinions and logical thinking have been substantial assets. His finger at all times has been on the pulse of medical trends. He has demonstrated remarkable cognizance of organized medicine's important and inseparable relationship to the changing social order. His talks before the various District Branches, his quoted and publicized speeches, have all shown evidence of his practical and wholesome grasp of the intricacies and perplexities of the serious problems that confront us as a profession.

In reviewing this Report of the President, we should like to call attention particularly to the last half of it, those portions referring to the great socio-economic changes that this Society must be prepared to face. Let us quote briefly these remarks of his:

"No man can say how far the changes in our social organization will go before the end of the war, but no man can doubt the direction of the trend. Furthermore, it makes no difference whether we favor or dislike the trend. As long as this country remains a democracy, the people will decide."

He has reasonable and proper doubts that we are prepared to meet these imminent changes. We must prepare and have ready plans and proposals to meet any others that may be offered.

We are heartily in accord with Dr. Cottis' recommendation that a special committee be created to study and report on this problem. In this connection we respectfully refer to the supplemental report of this reference committee on the resolution introduced by Dr. Louis H. Bauer at the opening session of this House of Delegates.

We note with satisfaction his considered opinion regarding New York State doctors' full contribution to the war effort, not only in the supplying of the needs of the armed forces, but also in fulfilling the urgent demand of Selective Service and the requirements of the home front. These latter services have been unselfish and patriotic duties well performed.

The President has called attention to and has recommended the reading of the published and detailed committee reports. We urge compliance of the membership at large with this request that they may be better informed of the serious efforts of organized medicine in this State to cope with and attempt the solution of the vexing problems that confront us.

We would stress particularly the pressing need now to expand and activate the scope and plan of Medical Expense Indemnity Insurance. We believe that the best solution is a broad, unified, and comprehensive plan for medical care that can be distributed in conjunction with the well-accepted and established hospitalization plans, always safeguarding organized medicine's right to retain its proper influence and control.

We commend the President's complimentary references to the earnest and efficient work of all the various components that make up the administrative machinery of the State Society.

SPEAKER BAUER: I suggest that you move the adoption of that portion before you go ahead with the supplemental report.

DR. BEARD: I move the adoption of this portion of the reference committee's report.

.... The motion was seconded, and as there was no discussion, it was put to a vote and was unanimously carried

DR. BEARD: The supplemental report of the President in reference to this House of Delegates

giving serious consideration to a *Basic Science Law* is well taken. It has come to our attention that a subcommittee of the Committee on Legislation will be created by the Council to study and consult with a committee of the State Legislature on the chiropractic problem. After conference with the Reference Committee on the Report of the Council—Part XII, we would recommend that this question of the *Basic Science Law* be also referred to this same subcommittee for their consideration and study in conjunction with the chiropractic situation.

In conclusion, we commend this unusual and accomplished report and move its adoption.

... The motion was seconded, and as there was no discussion, it was put to a vote and was unanimously carried ...

DR. BEARD: As to the report of the President-Elect, Dr. Thomas A. McGoldrick: Dr. McGoldrick in his brilliant address before the House of Delegates in this morning's session stressed the patriotic contribution of the doctors of this State to the war effort and called attention to the misleading report that New York State had failed to meet its quota.

It is comforting to note the President-Elect's warnings of the tendency to foster lay-controlled medical schemes and plans under the guidance of social welfare. We would respectfully urge that the Reference Committee on the Supplementary Report of the War Participation Committee (Report of Council—Part VIII) and the Director of Public Relations employ the means at their command to counteract all such propaganda.

Relating to the part that industry is assuming in the distribution of medical care, we would quote the following from the address of Dr. McGoldrick:

"It is not the function of industry to directly care for the employee and his family in sickness. That is the duty of the doctor outside the factory, the physician in the community, the physician chosen by the patient, the doctor of his home-life—and it is the obligation of county and State medical societies to prevent further invasion by corporations or employers into the practice of medicine. The physician in industry will be well employed in protecting all the employees from disease or accident; in knowing at all times the physical capabilities of the man for his particular job; in finding places in the plant for the employee who by accident or disease is unable to maintain his former skill and in striving to maintain in the plant every man capable of work, regardless of his chronological age."

These words of Dr. McGoldrick, in the opinion of our committee, state the case so adequately that we can only endorse it with all the weight at our command. We hope its import will be suitably publicized.

We note with satisfaction the President-Elect's encouragement of further expansion of plans for Medical Expense Indemnity Insurance.

We are glad to note that the President-Elect is in full accord with the recommendation of Dr. Cottis and Dr. Bauer for a planning committee for medical policy.

Dr. McGoldrick has also pointed out in his address the significance of unemployment with its resultant poverty and ill health, and is pleased to refer to the attitude of the present State administration "in its aim to maintain the highest possible rate of industrial activity with its full employment."

He has reiterated, and we believe it cannot be repeated too often, that medicine must be free from

political domination and must be allowed to have proper representation and control in all matters appertaining to the availability and distribution of medical care.

We move the adoption of this report.

... The motion was seconded, and as there was no discussion, it was put to a vote and was unanimously carried ...

DR. BEARD: As to the resolution introduced by the Speaker of the House of Delegates, Dr. Louis H. Bauer, the reference committee has carefully reviewed and considered the masterly resolution of Dr. Louis H. Bauer presented to the House at its morning session today, and is in full accord with its entire meaning and intent. We feel it fully implements the recommendations of President Cottis and President-Elect McGoldrick in their remarks which we have just reported upon.

We move the adoption of this resolution.

... The motion was seconded, and as there was no discussion, it was put to a vote and was unanimously carried ...

VICE-SPEAKER HALE: The resolution is adopted.

DR. BEARD: Now I move the report of the Reference Committee, consisting of David W. Beard, J. Stanley Kenney, Charles A. Prudhon, and Philip I. Nash, as a whole.

... The motion was seconded, and as there was no discussion, it was put to a vote and was unanimously carried ...

VICE-SPEAKER HALE: Thank you, Dr. Beard!

SPEAKER BAUER: Is any other Reference Committee ready to report?

Section 62. (See 31)

Report of Reference Committee on New Business A—Basic Science Law

DR. JOHN J. MASTERSON, *Kings*: Concerning the resolution on the *Basic Science Law*, introduced by Dr. Charles Gullo, of Livingston County—shall I read the resolution?

CHORUS: No. We remember it.

SPEAKER BAUER: The House already having acted on the subject, I think you can give the substance of it without rereading it.

DR. MASTERSON: It changes the law entirely.

CHORUS: Read your recommendation.

SPEAKER BAUER: Just give the recommendation of the reference committee.

DR. MASTERSON: The Committee spent considerable time with Dr. Gullo discussing this resolution. Dr. Gullo has given much time and a lot of study to this important matter. He has accumulated a vast amount of material regarding the favorable working of the *Basic Science Law* in the states where it is now on the statute books.

We are of the opinion that the adoption of this law would help considerably in preventing practice of medicine by the various cults.

Recommendation: In view of the fact that this matter is referred to in the President's Supplementary Report and has been referred to the Committee on the Report of the President, we feel that it is not necessary for our committee to make any recommendation at this time.

I move the recommendation of the reference committee.

SPEAKER BAUER: This subject was discussed a short time ago, and the question of the *Basic Science Law* was referred by the House to this new subcommittee of the Legislative Committee for study.

.... The motion was seconded, and as there was no discussion, it was put to a vote, and was unanimously carried

Section 63.

Proposed Amendment to Bylaws, Chapter II, Section 1

DR. J. STANLEY KENNEY, *New York*: This is a resolution to amend the Bylaws, Chapter II, Section 1, of the Medical Society of the State of New York:

"WHEREAS, the recently enacted reapportionment bill is based upon the population ratio and will thereby cause a redistribution of delegates from the component medical societies to the House of Delegates to the Medical Society of the State of New York; therefore be it

"Resolved, that the number of delegates from any component medical society be not reduced from their present number unless there has been a material reduction of the number of physicians in the area of any county medical society."

DR. ALFRED M. HELLMAN, *New York*: I second that.

SPEAKER BAUER: This being an amendment to the Bylaws, no action is required on it at this time, but it will remain in the hands of the Secretary and be acted on next year after due publication.

Is there any other committee ready to report?

.... There was no response

SPEAKER BAUER: Has anybody else a resolution to introduce at this time?

.... There was no response

SPEAKER BAUER: I will have to declare another ten-minute recess. We want to get several more committee reports out of the way this afternoon, so that we can get through with the major portion of our business tomorrow and be ready for the elections at 1:00 P.M.

.... There was a ten-minute recess at this point

SPEAKER BAUER: The House will be in order.

The Chair recognizes Dr. Holcomb, Chairman of the Reference Committee on the Report of the Council—Part VIII: War Participation.

Section 64. (See 12)

Report of the Reference Committee on Report the Council—Part VIII: War Participation

DR. F. W. HOLCOMB, *Alster*: The Reference Committee on the Report of the Council—Part VIII: War Participation, wishes to commend the committee of which Dr. Louis H. Bauer served as chairman, together with Dr. Peter Irving and his staff, for their excellent work during the past year with the State Chairman of Procurement and Assignment in connection with supplying physicians for the armed services from the State of New York.

This committee, through its untiring efforts, has made surveys of the whole State and has cooperated with Procurement and Assignment in an attempt to solve the perplexing problem of supplying physicians for the armed services without causing too great a shortage of physicians to care for the civilian population.

Your reference committee approves the recommendations made by this committee, which are as follows:

1. That all county medical societies continue their War Participation Committees and that they function in close liaison with the State

Committee and with Procurement and Assignment.

2. That these Committees see to it that industrial plants be adequately safeguarded from a medical standpoint.
3. That these Committees safeguard civilian welfare as well as furnish a pool for the Army and Navy.
4. That hospital staffs and teaching institutions be protected by declaring minimum necessary personnel as "essential."
5. That shortages in medical personnel developing from general increases in population or from expansion of industrial plants be reported promptly to Procurement and Assignment so that such shortages may be relieved.
6. That the Committees representing those counties which have not yet met their quotas take every step possible to induce eligible physicians to enter the service so that New York may meet whatever demands are made upon it.
7. That all physicians be urged to do welfare work regardless of whether or not they have done so heretofore, so that the indigent population may not be neglected but will continue to receive the medical care that the Society has always insisted that they have.
8. That the Society give a vote of thanks to Dr. Henry W. Cave and Dr. Joe R. Clemmons for their wholehearted cooperation with the State Society and for their eminent fairness in handling their difficult assignments.

The reference committee, consisting of Frederic W. Holcomb, chairman, Kenneth F. Bott, Emil Koffler, Erich H. Restin, and Thomas B. Wood, recommends the adoption of these recommendations as a whole.

.... The motion was seconded, and as there was no discussion, it was put to a vote and was unanimously carried

DR. HOLCOMB: On the Supplementary Report of the Council—Part VIII: War Participation: In this report the committee has obtained the latest figures from the Procurement and Assignment Committee as of February 1, 1943. This report states that the number of physicians from New York State on February 1, 1943, was 9,000 with an additional 800 to 900 listed since February 1.

As the New York quota for 1942 was 8,600, this report proves that New York State has met its 1942 quota.

The report of the Council further states that at the start, in New York, 15,700 men were under 45 years of age. Of these, 9,800 to 9,900 are in service, and 2,185 have been physically disqualified. The remainder includes the younger men essential in the full-time faculties of the nine medical schools, all the alien physicians, women physicians, physicians essential in hospitals, and physicians essential in industry and in the mental hospitals. This original number, 15,700, must, in addition, furnish the balance required for the armed services.

With 43,000 physicians in the armed services, it will be seen that New York has furnished between 20 and 25 per cent of the total.

It is the opinion of the reference committee that this supplementary report disproves various publicized statements which maligned the medical profession of New York State, inferring that they had failed to meet their quota in the armed services, and that the medical profession has been remiss in

making efforts to supply physicians to areas in which there was inadequate civilian medical care.

Your committee recommends the adoption of the supplementary report.

SPEAKER BAUER: You have before you the recommendation of the Committee calling for adoption of the Supplementary Report. Is there any discussion?

DR. ABRAHAM KOPLOWITZ, Kings: Is it in order for me to make an amendment now?

SPEAKER BAUER: Yes.

DR. KOPLOWITZ: I would like to amend that to this extent: that a copy of this report be sent to the American Medical Association, and that they be asked to make the correction in the *Journal*.

DR. BENJAMIN M. BERNSTEIN, Kings: I second that amendment.

DR. HOLCOMB: We are making that recommendation later.

DR. KOPLOWITZ: Oh, I did not know that.

SPEAKER BAUER: Do you want to withdraw the amendment, then, for the time being?

DR. KOPLOWITZ: Yes.

DR. BERNSTEIN: Yes, as long as it is taken care of.

SPEAKER BAUER: You have before you, then, the adoption of this portion of the report of the reference committee. Is there any further discussion?

.... The question was called for, and the motion was put to a vote and was unanimously carried

DR. HOLCOMB: Your committee further recommends that copies of these reports be sent to the Office of Procurement and Assignment and to the Editors of the *Journal of the American Medical Association* for their information.

SPEAKER BAUER: I think the recommendation should be a little more specific. When you say "the Office of Procurement and Assignment," do you mean the national one?

DR. HOLCOMB: Yes, I will make it "the National Office of Procurement and Assignment."

SPEAKER BAUER: Because there are a good many offices throughout the various states.

DR. HOLCOMB: Thank you, it has been so amended.

SPEAKER BAUER: We will consider the committee's report amended to the extent that copies of these reports be sent to the National Office of Procurement and Assignment and to the Editors of the *Journal of the American Medical Association*. Is there any discussion?

.... The question was called for, and the motion was put to a vote and was unanimously carried

DR. HOLCOMB: I move the adoption of the report, as amended, as a whole.

.... The motion was seconded, and as there was no discussion, it was put to a vote, and was unanimously carried

SPEAKER BAUER: Thank you, Dr. Holcomb!

Section 65. (See 36)

Report of Reference Committee on New Business C—Practical Nurse Training

DR. JOHN D. CARROLL, Rensselaer: Concerning the resolution introduced by Dr. George W. Kosmak, on: "Practical Nurse Training," reading:

"WHEREAS, there has long existed an evident need for another type of nursing service of a less demanding character than that hitherto supplied by the highly trained professional registered nurse group, for those patients, for example, afflicted with simple illness, undergoing convales-

cence from previous operations or confinements, or suffering from disabling chronic disease; and

"WHEREAS, this need has been intensified during the present emergency by the lack of available nurses for civilian and hospital needs; and

"WHEREAS, there are at present inadequate facilities for the procurement and training for this special practical nurse group; therefore be it

"Resolved, that the House of Delegates of the Medical Society of the State of New York endorse the movement to extend the facilities for training such practical nurses and likewise commend the efforts by the Nursing Council of this State in the procurement of candidates for such training,"

your committee recommends the approval of this resolution, and I so move.

.... The motion was seconded, and as there was no discussion, it was put to a vote and was unanimously carried

Section 66. (See 32)

Report of Reference Committee on New Business C—Amendment to "Principles of Professional Conduct"

DR. CARROLL: Regarding the amendment to Section 17 of the Principles of Professional Conduct, introduced by Dr. Harold B. Davidson, there is a suggested draft reading:

"When one physician seeks the medical aid of another with whom he has previously had no significant professional or social connection, it is proper for the physician seeking aid to proffer, and ethical for the treating physician to receive, such compensation."

The committee has recommended slight correction in the wording of this resolution, but does approve the resolution as read.

I move the adoption of the recommendation of the reference committee.

DR. HARVEY B. MATTHEWS, Kings: I second the motion.

SPEAKER BAUER: You have before you the recommendation of the committee for this amendment to the principles of professional conduct. Is there any discussion on it?

DR. THOMAS B. WOOD, Kings: Is that not somewhat in violation with our Hippocratic oath?

SPEAKER BAUER: Would you care to answer that, Dr. Carroll?

DR. CARROLL: This is the way it was described to my committee: It has been unethical in the past, according to our principles of professional conduct, for one physician to accept a fee for treating any immediate member of another physician's family. Apparently a situation has developed in the lower section of the State where some men have been taking care of other physicians' families for years gratis and have done very little other work for such physicians. So often has this been the case that it has been a hardship for some of these men to get along. When these instances were cited to the committee, providing that there was not really a definite fee charged, the committee felt there were certain circumstances in which a gratuity or gift—we hated to use the word "gratuity" so we used the word "compensation"—when offered could be taken by the attending physician.

DR. WOOD: I suggest the word "honorarium" for "compensation."

DR. CARROLL: That would be a very good word for it. I am sorry that the committee did not have the benefit of your advice originally on that.

June 15, 1943]

SPEAKER BAUER: Do you amend your report accordingly?

DR. CARROLL: I think that is permissible if none of my committee objects.

DR. WOOD: I suggest that it be amended so that an honorarium may be paid, but a fee may not be charged.

SPEAKER BAUER: Dr. Wood moves that the resolution be amended by leaving out the words "fee" or "compensation" and substituting therefor "honorarium"—that an honorarium may be paid but a fee may not be charged.

DR. WOOD: An honorarium may be accepted but no fee can be charged.

SPEAKER BAUER: An honorarium may be accepted but no fee can be charged.

You have the question on the amendment of the resolution. Is there any discussion on that?

.... The question was called for, and the amendment was put to a vote and was unanimously carried

SPEAKER BAUER: We now have the amended resolution before us for adoption. Does anyone wish to discuss this? Do you want the resolution, as amended, read?

DR. HARRY ARANOW, Bronx: Yes, it might be better for us to know how it reads as now amended.

SPEAKER BAUER: Will you read it, please?

DR. CARROLL: As amended, it reads:

"When one physician seeks the medical aid of another with whom he has previously had no significant professional or social connection, it is proper for the physician seeking aid to proffer, and ethical for the treating physician to receive, such honorarium."

That is the word that was substituted for the word "compensation."

The Committee has recommended slight correction in the wording of this resolution, but does approve the resolution as read.

I recommend the adoption of this part of the report.

Then there is an amendment that an honorarium may be received but no fee charged.

SPEAKER BAUER: Can you tie that into the resolution so you can read the resolution with those words in? I believe the reason Dr. Aranow requested that the resolution as amended be read was that we might see if it fitted in smoothly.

DR. HAROLD B. DAVIDSON, New York: If the simple change were made of changing the word "compensation" to "honorarium," I believe it would carry the same meaning and would leave the resolution clear, because there is not a question of charging anything anyway, and the unchanged part of Section 17 precludes the charging of a fee.

DR. CARROLL: I have changed that word "compensation" to "honorarium."

DR. DAVIDSON: Yes, and that would not require the repetition of it by the extra sentence that you added. What is wanted would be accomplished by that change of word instead of also adding the extra sentence.

DR. CARROLL: I have changed the word "compensation" to "honorarium."

SPEAKER BAUER: Will you read it as it will be when it is amended, please?

DR. CARROLL: "When one physician seeks the medical aid of another with whom he has previously had no significant professional or social connection, it is proper for the physician seeking aid to proffer, and ethical for the treating physician to receive, such honorarium." Now—

DR. WOOD: I move the adoption of this portion of the report.

.... The motion was seconded

SPEAKER BAUER: Is there any further discussion of the amended motion? If not, all those in favor say "Aye"; opposed, "No." The Chair is in doubt. All those in favor of this amended motion will arise and stay standing until you have been counted. Now those opposed to the amended resolution will stand. The resolution as amended, and as just read, is carried, 71 for and 32 against.

Continue with your report, Dr. Carroll.

Section 67. (See 39)

Report of Reference Committee on New Business C—Board of Regents Appointment Suggested

DR. CARROLL: In regard to the resolution introduced by Dr. B. Wallace Hamilton on the Board of Regents vacancy, reading:

"Resolved, that the House of Delegates of the Medical Society of the State of New York respectfully recommend and urge upon the joint caucus of the Senate and Assembly of the State of New York the designation of Dr. Chas. Gordon Heyd as Medical Representative on the Board of Regents of the University of the State of New York when a vacancy occurs in the First Judicial District."

Your committee, in session, added that last statement, "when a vacancy occurs in the First Judicial District." The reason for that was that there is now a vacancy in the Fourth Judicial District, and a man to fill that vacancy must be chosen from that District, but there will be a vacancy within the next year in the First Judicial District; therefore the Committee added the clause, "when a vacancy occurs in the First Judicial District."

With the explanatory addition, the resolution is approved by the committee, and I move the adoption of this part of the report.

.... The motion was seconded

SPEAKER BAUER: You have before you the reference committee's report moving adoption of this resolution with the amendment added by the committee. Is there discussion?

DR. WALTER P. ANDERTON, New York: There should also be added another clarifying expression to that—"when a vacancy at large or in the First Judicial District should occur."

SPEAKER BAUER: Does the committee accept that addition?

DR. CARROLL: It is true that there are three delegates at large in the State of New York. I think that the Committee will accept the addition. Will my committee members back me up on that?

.... Drs. Horace E. Ayers, Harry I. Johnston, J. B. Lawler, and Harvey B. Matthews replied in the affirmative

SPEAKER BAUER: If there is no objection, it will be amended in that form. Hearing none, it will stand as amended. Now is there any discussion on the amended recommendation?

.... The question was called for, and the motion was put to a vote and was unanimously carried

Section 68. (See 26)

Report of Reference Committee on New Business A—Committee for Liaison with Hospital Administrators

DR. CARROLL: On the resolution introduced by Dr. Abraham Koplowitz, of Kings, on a Committee

for Liaison with Hospital Administrators, reading:

"WHEREAS, the medical profession in its daily work in hospitals is in intimate contact with the administrations of such hospitals; and

"WHEREAS, such contact is through Medical Boards who represent its own staff only; and

"WHEREAS, medical care in hospitals is now so complex and involves economic factors which affect all physicians; now therefore be it

"Resolved, that the House of Delegates of the Medical Society of the State of New York, through its Council, organize a standing committee on liaison with hospital administrators under an appropriate name; to have such subdivisions of such committee as will adequately represent the various subdivisions of the State."

Your committee recommends that this matter be approved in principle, but taken care of by the Public Relations and Economics Committee of the Council. I so move.

.... The motion was seconded, and as there was no discussion, it was put to a vote and was unanimously carried

Section 69. (See 27)

Report of Reference Committee on New Business C—Graduates of Unapproved Colleges as Interns

DR. CARROLL: On the use of graduates of unapproved medical colleges, introduced by Dr. Harry Aranow, and reading:

"WHEREAS, for the last few years the number of medical graduates applying for internship has been inadequate to supply the demand; and

"WHEREAS, the present emergency is drastically reducing the number of interns available; and

"WHEREAS, though the large, desirable, prominent hospitals manage to obtain a minimum number of interns compatible with the proper running of the hospitals, some of the smaller hospitals have been unable to obtain enough interns to give their patients even the most essential care; and

"WHEREAS, the situation is so critical in some localities that hospitals may be compelled to either reduce the character of their service, or close altogether; therefore be it

"Resolved, that the American Medical Association be petitioned to permit the approved hospitals, under their supervision, to accept 'for the duration' interns from the several as yet unapproved medical colleges."

Your committee recommends that this resolution be sent to the Council, and that this matter be taken up with the American Medical Association.

I move the adoption of this part of the report.

.... The motion was seconded

SPEAKER BAUER: You have before you the reference committee's report which recommends that this resolution be referred to the Council, who should take it up with the American Medical Association.

DR. HARRY ARANOW, Bronx: Mr. Speaker, in the first place I want to explain the reason why I introduced this resolution, and then I will also bring out its purpose.

I brought this up before the Council, and the Council suggested that I bring it up before the House. (Laughter)

There are hospitals in New York that are so shorthanded now that unless they get some interns they will have to close. We have one or two hos-

pitals in New York that have refugees, inadequately trained refugees, as interns. We have in one institution two or three refugee women physicians who can hardly speak English and who don't know a great deal of medicine either, yet we have to pay them to stay there.

We are not asking the American Medical Association to let down the barriers; but what we are asking them to do is to close their eyes to any possible infractions in regard to this ruling for the time being.

I know of one hospital in New York that took in one or two interns from the Middlesex College, and they were notified by the American Medical Association to discharge them at once or they would have to take out all the other interns.

While these colleges are not up to date—and I am the last one to wish to reduce the standards of medical education—it seems to me that for the duration we should at least ask the American Medical Association not to be so strict, if you want to do it that way, and give us a chance to run some of these hospitals so they will not have to close up. If this ruling is strictly enforced, the hospitals will be compelled to close.

DR. W. GUERNSEY FREY, Jr., Queens: I should like to move an amendment to the report of the reference committee that the resolution be disapproved.

SPEAKER BAUER: That is hardly in order. The defeat of the resolution accomplishes the same thing

DR. FREY: I don't think so. I should like to appeal from the ruling of the Chair in that regard. I think we ought to go on record definitely as disapproving this.

SPEAKER BAUER: The resolution, or the motion, rather, if I am not mistaken, was that the matter be referred to the Council. If the motion is defeated, then the resolution dies with it, because there is no other resolution before the House.

DR. BENJAMIN M. BERNSTEIN, Kings: I should like to ask that this resolution be defeated. Again we are letting down the bars in one way or another and permitting things which we disapprove of in normal times to take place at the present time.

Let us analyze the situation briefly in this way: There are about three schools that are not approved at the present time. The total number of graduates from all of those three schools in any one year would amount to fewer than 300. Three hundred distributed over 600 hospitals throughout the country would mean very little relief to those hospitals for the duration; at the same time we would again be doing with our left hand what we disapprove of with our right. Let us be consistent. Let us have these colleges approved if they are worthy, or let us not quibble about the details at the moment. I would urge disapproval of the resolution.

SPEAKER BAUER: Dr. Frey, on your point of order: If this committee's motion is lost you may then move that the resolution be disapproved by this House, of, if you wish, at this time you could move a substitute motion for the committee's report but not an amendment in the terms you proposed.

DR. FREY: I should like to see the House take positive action rather than negative action.

SPEAKER BAUER: You can do it either way. You can either wait until the House has disposed of this motion of commitment, or you may move a substitute motion for the committee's report.

DR. FREY: I move such a substitute motion.

SPEAKER BAUER: Has anybody seconded that substitute motion?

... The motion was seconded by several

DR. CHAS. GORDON HEYD, New York: Mr. Speaker and Members of the House of Delegates, if Dr. Aranow wants the Council on Medical Education in Hospitals to be a little asleep in enforcing this requirement, he is taking a bad way to accomplish his purpose, because if you put in a resolution, letter, or request, it has to be acted on, and in that way he defeats his own objective. If he would like the Council to undergo a Rip Van Winkle sleep for the duration, please don't disturb them by asking them a question. (Laughter)

Furthermore, there are only three of these schools involved, and there is no question that it is to the best interests of medicine that they be put out of business, and it does not affect the intern problem at all. There will be by the first of October over 1,500 more internships than can be supplied. About a third of the Middlesex boys are already in the Army under special examinations, and it will not solve your intern problem to pick up the balance of these boys. I don't believe that we are going to be particularly anxious about one or two men that happen to be mal-located, let us say, but I agree with the substitute motion that we should under no circumstances, as a body to whom the confidence of the people has been given, pass a resolution that tears down thirty years of constructive efforts in medical education. (Applause)

SPEAKER BAUER: The question before the House now is on the substitution of Dr. Frey's motion for the motion by the reference committee. That is what we are discussing—the substitute motion, which carries with it the disapproval of the resolution.

DR. ARANOW: I want just to read what Dr. Lahey, the ex-president of the American Medical Association, said on this very same problem when he was asked that question about accepting interns from substandard colleges. Dr. Lahey replied, "I will do it, and I will let the American Medical Association go and whistle, and I say that as the ex-president of the American Medical Association." We simply have to cut corners in this emergency. That is from a newspaper clipping, given to me by one of the gentlemen here as I was on my way to the platform.

SPEAKER BAUER: The question is on Dr. Frey's substitute motion. The committee's report recommends that this resolution be referred to the Council with instructions to take it up with the American Medical Association. Dr. Frey has moved that instead the House substitute a motion of disapproval of the resolution. Now the question before you is whether you will substitute that motion of Dr. Frey's for the motion given by the committee. Is there any further discussion on that?

... The question was called for, and the motion was put to a vote and was carried

SPEAKER BAUER: The motion is substituted. The substituted motion is now before you for further discussion. Is there any further discussion on it?

... The question was called for, and the substituted motion was put to a vote and was carried

SPEAKER BAUER: Continue, Dr. Carroll.

Section 70. (See 55)

Report of Reference Committee on New Business
C—Amendment to Workmen's Compensation
Law to Cover Paid Hospital Physicians

DR. CARROLL: On the Amendment to the Workmen's Compensation Law, which resolution was introduced by Dr. Jacob Werne, of Queens, reading:

"WHEREAS, physicians under salary employed by hospitals or other institutions allied to the practice of medicine are exposed to certain special hazards incident to their employment, in addition to the ordinary hazards common to all individuals employed by these institutions; and

"WHEREAS, such physicians (with the exception of interns) are not included as beneficiaries under the Workmen's Compensation Law; and

"WHEREAS, disability resulting from injury or illness sustained as a result and in the course of such employment may markedly diminish or entirely dissipate the earning power of such physicians; be it hereby

"Resolved, that the Medical Society of the State of New York initiate measures, through appropriate channels, to cause the Workmen's Compensation Law to be so amended as to provide for the inclusion of the class of physicians above described as beneficiaries under that Law."

Your committee is sympathetic with the resolution. It recommends that it be referred to the Compensation Committee for consideration. I move the adoption of this part of the report.

SPEAKER BAUER: As I understand the reference committee's report, it is that this resolution be committed to the Council Committee on Workmen's Compensation for consideration?

DR. CARROLL: That is right.

... The motion was seconded, and as there was no discussion, it was put to a vote and was unanimously carried

Section 71. (See 24)

Report of Reference Committee on New Business
C—U.S. Cabinet Secretary of Health

DR. CARROLL: On the resolution introduced by Dr. Benjamin M. Bernstein, on the subject "A Secretary of Health," reading:

"WHEREAS, the forward march of civilization depends on the world's health; and

"WHEREAS, the health of the people of the United States is the concern of all the people; and

"WHEREAS, coordination of all agencies working for the maintenance of health and the prevention and cure of disease is becoming increasingly important in our daily lives; and

"WHEREAS, the problems of medical care could best be coordinated and correlated under the guidance of a central agency; be it

"Resolved, that the American Medical Association urge, with all the power at its command, that a cabinet ministry of health be established at the head of which there shall be a physician."

Your committee recommends the approval of this resolution, and I move the adoption of this part of the report.

SPEAKER BAUER: Is the motion seconded?

DR. J. B. LAWLER, Oneida: I will second it.

DR. J. STANLEY KENNEY, New York: Would it not be wise to include that the physician be a representative of organized medicine rather than just the word "physician"? I listened to Mr. Waldemar Kaempfert, of the New York Times, make a public statement not long ago that he was in favor of such

a thing, but he hoped that the doctor would not be a member of the American Medical Association.

SPEAKER BAUER: Do you wish to move an amendment, Dr. Kenney?

DR. KENNEY: Yes—that he be a representative of organized medicine or something to that effect. If you leave him without a tag, I think you are making a big mistake.

SPEAKER BAUER: I think "organized medicine" is a little indefinite. We all know what is meant by that expression, but officially I suppose there is not any such designation, although unofficially there is, and we all understand what is meant by it. I think if you made it that the physician be a member of the American Medical Association you would accomplish the same purpose.

DR. KENNEY: That is suitable to me.

.... The amendment was seconded

SECRETARY IRVING: Why not say he shall be a member of a county medical society, and leave out the American Medical Association, so there will not be a howl on that score?

CHORUS: Finel

DR. BENJAMIN M. BERNSTEIN, Kings: That is better and accomplishes the same thing.

DR. KENNEY: I will accept that.

DR. BERNSTEIN: May I say that Dr. Irving's amendment is very much better because the Surgeon-General is a member of the American Medical Association and, therefore, he may be appointed; if you make it a member of a county medical society, he is out.

DR. KENNEY: I will accept the wording of Dr. Irving's amendment.

SPEAKER BAUER: Is there any objection to Dr. Kenney's accepting that amendment? If not, the amendment will read that the physician must be a member of a county medical society. Is there any further discussion on the amendment?

.... The question was called for, and the amendment was unanimously carried

SPEAKER BAUER: You now have before you the amended motion.

DR. EDWARD P. FLOOD, Bronx: It is referred to as a cabinet ministry of health. That is not a term that connotes any American department. That is an English term. We might have a Department of Health.

DR. BERNSTEIN: Secretary of Health.

DR. FLOOD: But Secretary of a Department of Health—not a Ministry of Health.

DR. BERNSTEIN: Right.

DR. CARROLL: My committee will accept that change in wording: "cabinet secretary of health."

SPEAKER BAUER: If there is no objection that amendment will be made without vote. Hearing none, it is so ordered.

DR. IRVING J. SANDS, Kings: If we pass this resolution, won't that really be furnishing ammunition to those people who advocate socialized medicine?

CHORUS: Why?

SPEAKER BAUER: Why?

.... There was no response

SPEAKER BAUER: Does anybody want to answer that question?

DR. EDWARD R. CUNIFFE, Bronx: I just want to tell you that if a man is made Secretary of Health, he is the health official of the United States, and automatically becomes a member of the American Medical Association.

DR. HARRY E. UNGERLEIDER, New York: I think it is a very poor thing for the Society to pass

this resolution for the following reason: The Secretary of Health will be nominated by the President of the United States. You know how these appointments are made. A good many of them are political appointments. Whether this will work to the good of the public depends on the personality of the man who is appointed, and if the present President of the United States or some future President of the United States prefers to appoint a man who is not sympathetic with the aims of the American Medical Association and its component bodies, we will have socialized medicine foisted upon us quicker than we know. I think we ought to think this thing over thoroughly before we give it our approval.

DR. BERNSTEIN: Suppose a year from now we receive a report from a special committee appointed by the Speaker to study postwar planning, and that committee has some definite plan to offer. To whom are you going to offer it? With whom are you going to discuss it? The present plans being considered in Britain are being discussed by the British Medical Association and the Ministry of Health. With whom are we going to talk? How are we going to propose a plan? With whom are we going to consult after we have a plan all formulated? If you get a Secretary of Health he does not have to be a socialized minister of health at all, but he has to be a man who can coordinate health activities, be they socialized or not. We must have somebody to talk with when we are ready to talk with anybody at all.

SPEAKER BAUER: Is there any further discussion? You have the amended motion before you for adoption or rejection, as you see fit. If there is no further discussion, will you read the amendment?

DR. CARROLL: The way I had it before?

SPEAKER BAUER: We have already amended it, so read it as thus amended.

DR. CARROLL: The last amendment was that he be a member of a county medical society.

SPEAKER BAUER: Read the whole thing with that incorporated in it.

DR. CARROLL: It will now read:

"WHEREAS, the forward march of civilization depends on the world's health; and

"WHEREAS, the health of the people of the United States is the concern of all the people; and

"WHEREAS, coordination of all agencies working for the maintenance of health and the prevention and cure of disease is becoming increasingly important in our daily lives; and

"WHEREAS, the problems of medical care could best be coordinated and correlated under the guidance of a central agency; be it

"Resolved, that the American Medical Association urge with all the power at its command that a cabinet secretary of health be established, at the head of which there shall be a physician, a member of a county medical society."

SPEAKER BAUER: Is there any further discussion? If not, all in favor of the motion as amended will say "Aye"; those opposed, "No." The Chair is in doubt. All in favor of the motion as amended please rise and stay standing until you are counted. Now those opposed will please rise. The motion is carried 51 to 43. The recommendation of the committee, as amended, is therefore adopted.

Section 72. (See 25)

Report of the Reference Committee on New Business C—World Food Conference

DR. CARROLL: On the resolution introduced by

Dr. Benjamin M. Bernstein, concerning the World Food Conference, reading:

"WHEREAS, the use of food and the study and application of problems of nutrition are increasingly essential in the training and practice of the doctor; and

"WHEREAS, the problems of food in this country, as well as the world at large, are the concern of the medical profession; and

"WHEREAS, the knowledge and experience in the possession of the medical profession in this country is of the utmost value in the discussion of national as well as international food relationships; be it

"Resolved, that the American Medical Association be urged to request representation at the coming United Nations' Food Conference to be held at Hot Springs, Virginia, on May 18."

Your committee recommends the approval of this resolution, and I move the adoption of this part of the report.

.... The motion was seconded, and as there was no discussion, it was put to a vote and was unanimously carried

DR. CARROLL: I move the adoption of the report of the committee as a whole, as amended.

.... The motion was seconded, and as there was no discussion, it was put to a vote and was unanimously carried

SPEAKER BAUER: Thank you, Dr. Carroll!

Section 73.

Report of Reference Committee on Reports of Treasurer and Board of Trustees

DR. J. LEWIS AMSTER, Bronx: The financial management of the Medical Society of the State of New York is of vital importance and of great concern to this House of Delegates.

After making a most careful and painstaking survey of the reports submitted by the Treasurer, Dr. Kirby Dwight, and the Board of Trustees, Dr. Edward R. Cunniffe, chairman, our committee is prepared to report the following findings:

(A) Concerning the Treasurer's Report:

1. That the financial status of the Society, as shown by excerpts from the annual report of the auditors, Messrs. J. K. Lasser & Co., for the year 1942, merits commendation.

2. The figures show an increase in our balance of \$54,900 for last year.

3. The increase in saving was largely due to rigid economy in management as reported by the Treasurer, nonpublication of the *Directory*, and increased advertising income of the *JOURNAL*.

However, we must realize that more and more of our members will be in the armed forces, and with the remission of their dues during the remainder of the war, and with costs on a steady increase, our finances may become somewhat crippled as time goes on. It is, therefore, advisable for the Society to curtail its expenditures as much as possible.

I move adoption of the Treasurer's report.

.... The motion was seconded, and as there was no discussion, it was put to a vote, and was unanimously carried

(B) Concerning the Trustees' Report:

DR. AMSTER: 1. Your reference committee notes with appreciation that while the 1942 House of Delegates empowered the Trustees "to use income from investments, if necessary," wise management obviated the need for utilization of this power. However, this discretionary power should again be granted to

the Trustees for the ensuing year because of future uncertainty.

2. Your committee highly commends the increased investment in Defense Savings and Treasury Bonds as sound financial as well as patriotic practice.

I move the adoption of this report.

.... The motion was seconded

SPEAKER BAUER: It has been regularly moved and seconded that the Report of the Reference Committee on the Report of the Trustees, which recommends extension of the authorization by the House to the Trustees to use income from investments during the next year, if they find it necessary to do so, be adopted. Is there any discussion on this portion of the report?

DR. JOSEPH A. GEIS, Esser: Does the adoption of this report grant the Trustees the power to draw on that money for another year?

SPEAKER BAUER: It expresses the opinion of the House that the Trustees are justified in using income from investments, if they find it necessary to do so.

DR. GEIS: Does that give them the authority to do so?

SPEAKER BAUER: Yes.

.... The question was called for, and the motion was put to a vote and was unanimously carried

DR. AMSTER: Now I move that the report of your committee, consisting of J. Lewis Amster, chairman, Archibald K. Benedict, Corbet S. Johnson, Leo P. Larkin, and Ezra A. Wolff, as a whole, be adopted.

.... The motion was seconded, and as there was no discussion, it was put to a vote and was unanimously carried

SPEAKER BAUER: Thank you, Dr. Amster!

I think we have time for one more report.

Section 74. (See 45)

Report of Reference Committee on New Business A—Mental Hygiene, State Administration

DR. JOHN J. MASTERSON: In connection with the resolution introduced by Dr. John J. Buettner on mental hygiene, which reads as follows:

"WHEREAS, the medical profession is interested in any change from medical administrative control of our mentally sick because of the possibility of affecting detrimentally the service which has been built up to be one that is looked upon throughout the country and the world as a model; be it

"Resolved, that we express to Governor Dewey full confidence in his purpose and design and hope that he may appoint capable and experienced personnel for both administrator and director,"

we feel that it would be injudicious to pass the resolution and recommend it be not approved.

I so move.

.... The motion was seconded, and as there was no discussion, it was put to a vote and the motion of disapproving the resolution was unanimously adopted

Section 75. (See 47)

Report of the Reference Committee on New Business A—Foreign Physicians Survey

DR. MASTERSON: This is on the resolution introduced by Dr. Joseph C. O'Gorman, of Erie. Shall I read the resolution? It is rather long.

SPEAKER BAUER: Yes, read it, so we may know what we are considering.

a thing, but he hoped that the doctor would not be a member of the American Medical Association.

SPEAKER BAUER: Do you wish to move an amendment, Dr. Kenney?

DR. KENNEY: Yes—that he be a representative of organized medicine or something to that effect. If you leave him without a tag, I think you are making a big mistake.

SPEAKER BAUER: I think "organized medicine" is a little indefinite. We all know what is meant by that expression, but officially I suppose there is not any such designation, although unofficially there is, and we all understand what is meant by it. I think if you made it that the physician be a member of the American Medical Association you would accomplish the same purpose.

DR. KENNEY: That is suitable to me.

.... The amendment was seconded

SECRETARY IRVING: Why not say he shall be a member of a county medical society, and leave out the American Medical Association, so there will not be a howl on that score?

CHORUS: Fine!

DR. BENJAMIN M. BERNSTEIN, *Kings*: That is better and accomplishes the same thing.

DR. KENNEY: I will accept that.

DR. BERNSTEIN: May I say that Dr. Irving's amendment is very much better because the Surgeon-General is a member of the American Medical Association and, therefore, he may be appointed; if you make it a member of a county medical society, he is out.

DR. KENNEY: I will accept the wording of Dr. Irving's amendment.

SPEAKER BAUER: Is there any objection to Dr. Kenney's accepting that amendment? If not, the amendment will read that the physician must be a member of a county medical society. Is there any further discussion on the amendment?

.... The question was called for, and the amendment was unanimously carried

SPEAKER BAUER: You now have before you the amended motion.

DR. EDWARD P. FLOOD, *Bronx*: It is referred to as a cabinet ministry of health. That is not a term that connotes any American department. That is an English term. We might have a Department of Health.

DR. BERNSTEIN: Secretary of Health.

DR. FLOOD: But Secretary of a Department of Health—not a Ministry of Health.

DR. BERNSTEIN: Right.

DR. CARROLL: My committee will accept that change in wording: "cabinet secretary of health."

SPEAKER BAUER: If there is no objection that amendment will be made without vote. Hearing none, it is so ordered.

DR. IRVING J. SANDS, *Kings*: If we pass this resolution, won't that really be furnishing ammunition to those people who advocate socialized medicine?

CHORUS: Why?

SPEAKER BAUER: Why?

.... There was no response

SPEAKER BAUER: Does anybody want to answer that question?

DR. EDWARD R. CUNIFFE, *Bronx*: I just want to tell you that if a man is made Secretary of Health, he is the health official of the United States, and automatically becomes a member of the American Medical Association.

DR. HARRY E. UNGERLEIDER, *New York*: I think it is a very poor thing for the Society to pass

this resolution for the following reason: The Secretary of Health will be nominated by the President of the United States. You know how these appointments are made. A good many of them are political appointments. Whether this will work to the good of the public depends on the personality of the man who is appointed, and if the present President of the United States or some future President of the United States prefers to appoint a man who is not sympathetic with the aims of the American Medical Association and its component bodies, we will have socialized medicine foisted upon us quicker than we know. I think we ought to think this thing over thoroughly before we give it our approval.

DR. BERNSTEIN: Suppose a year from now we receive a report from a special committee appointed by the Speaker to study postwar planning, and that committee has some definite plan to offer. To whom are you going to offer it? With whom are you going to discuss it? The present plans being considered in Britain are being discussed by the British Medical Association and the Ministry of Health. With whom are we going to talk? How are we going to propose a plan? With whom are we going to consult after we have a plan all formulated? If you get a Secretary of Health he does not have to be a socialized minister of health at all, but he has to be a man who can coordinate health activities, be they socialized or not. We must have somebody to talk with when we are ready to talk with anybody at all.

SPEAKER BAUER: Is there any further discussion? You have the amended motion before you for adoption or rejection, as you see fit. If there is no further discussion, will you read the amendment?

DR. CARROLL: The way I had it before?

SPEAKER BAUER: We have already amended it, so read it as thus amended.

DR. CARROLL: The last amendment was that he be a member of a county medical society.

SPEAKER BAUER: Read the whole thing with that incorporated in it.

DR. CARROLL: It will now read:

"WHEREAS, the forward march of civilization depends on the world's health; and

"WHEREAS, the health of the people of the United States is the concern of all the people; and

"WHEREAS, coordination of all agencies working for the maintenance of health and the prevention and cure of disease is becoming increasingly important in our daily lives; and

"WHEREAS, the problems of medical care could best be coordinated and correlated under the guidance of a central agency; be it

Resolved, that the American Medical Association urge with all the power at its command that a cabinet secretary of health be established, at the head of which there shall be a physician, a member of a county medical society."

SPEAKER BAUER: Is there any further discussion? If not, all in favor of the motion as amended will say "Aye"; those opposed, "No." The Chair is in doubt. All in favor of the motion as amended please rise and stay standing until you are counted. Now those opposed will please rise. The motion is carried 51 to 43. The recommendation of the committee, as amended, is therefore adopted.

Section 72. (See 25)

Report of the Reference Committee on New Business C—World Food Conference

DR. CARROLL: On the resolution introduced by

On the subject of child welfare, the committee recommends the acceptance of the report as made, with the specific changes which it has suggested.

I so move.

.... The motion was seconded, and as there was no discussion, it was put to a vote and was unanimously carried

DR. TOWNE: Continuing:

Tuberculosis and Chest Diseases. The report of the committee of the Council with specific reference to tuberculosis and chest diseases is endorsed as presented, with special commendation as to the desirability of amending Section 326-A of the Public Health Law in such a manner that more strict control of careless and dangerous patients will be brought about.

I so move.

.... The motion was seconded, and as there was no discussion, it was put to a vote and was unanimously carried

DR. TOWNE: Continuing:

Industrial Health. Under the Subdivision of Industrial Health, we note with approval the type of programs and activities which have been rendered during the past year and recommend that they be continued. We further recommend that the Council make financial provision adequate to the necessary expenses of the committee in furthering its activities.

I so move.

.... The motion was seconded, and as there was no discussion, it was put to a vote and was unanimously carried

DR. TOWNE: The next subdivision is:

Dental Health. Regarding the dental health, this reference committee heartily endorses the program as outlined under the heading of "Dental Health." We specifically commend the suggestion of setting up training courses for dentists in the emergency war medicine and surgery. This is a definite step toward greater cooperation between the medical and dental professions. This committee has carefully considered this section and commends its provisions with the hope that greater activity during the coming year can be accomplished. The predominating thought of the scientific program of this present session is war medicine and surgery. The interest which the profession generally is showing is evidence of its desire to keep abreast of modern advances along this line.

Medical Aspects of Chemical Warfare. We also wish to commend the action of the committee on

its action relative to the Medical Aspects of Chemical Warfare and recommend the continued enlightenment of the profession relative to modern advances and changes in line of treatment.

Blood Plasma Therapy and Whole Blood Transfusion. We have of the suggestion made by t Postgraduate Instruction in Plasma Therapy and Whole Blood Transfusion. We urge increased activities in promoting the dissemination of knowledge regarding this subject.

Rheumatic Fever. The paragraph relating to rheumatic fever is thoroughly approved, together with the suggestion that more intensive study be given this subject for presentation before county medical societies.

4-H Clubs and Youth Health Activities. The 4-H Clubs and Youth Health Activities are especially commended. We thoroughly approve of the objectives outlined in the report, together with the project and requirements relating to:

1. Health examinations
2. Encouraging correction of defects
3. Health and safety training
4. Community health and safety education

I move the adoption of these portions of the report.

.... The motion was seconded, and as there was no discussion, it was put to a vote and was unanimously carried

DR. TOWNE: Now I move the adoption of the report of the Reference Committee, consisting of G. Scott Towne, Chairman, Herbert E. Wells, Morris Maslon, Edward P. Flood, and Albert A. Cinelli, as a whole.

.... The motion was seconded, and as there was no discussion, it was put to a vote and was unanimously carried

SPEAKER BAUER: Thank you, Dr. Towne!

Dr. Irving has an announcement to make.

SECRETARY IRVING: This evening in Room A, on the Mezzanine Floor, Dr. Kaliski will be very glad to meet with anyone who has to do with Workmen's Compensation Committee work in the county societies, to discuss any matters in which they may be interested.

SPEAKER BAUER: Gentlemen and Ladies, we thank you for your patience, and we will recess now until 9:00 A.M. tomorrow.

.... The session recessed at 6:15 P.M.

(To be continued in the July 1 issue.)

DR. MASTERSON: It reads:

"WHEREAS, medical care is an integral part of plans for the relief and aid to peoples in the stricken foreign countries; and

"WHEREAS, citizens of the United States and graduates of the medical faculties of the United States are ineligible to apply for licensure to practice medicine in Continental Europe and the British Isles: and

"WHEREAS, there are in the United States of America, many physicians, the refugee, the exiled, and the expatriate, who are eligible to practice in Continental Europe and the British Isles; and

"WHEREAS, these physicians are ineligible for service in the armed forces of the United States; and

"WHEREAS, statistics record that approximately 50 per cent of the graduates of the Medical Faculties abroad, examined for licensure in the United States, failed; and

"WHEREAS, the licensed and unlicensed refugee, exile, and expatriate physicians in the United States are denied the privilege of serving the United States or their own country; and

"WHEREAS, these physicians know the language, the people, and the customs, and are eligible for service in their respective countries; therefore be it

Resolved, that the Medical Preparedness Committee of the Medical Society of the State of New York make a survey of physicians available and eligible to practice medicine in Continental Europe and the British Isles"

and we have cut out:

"and to report to the Procurement and Assignment Committee of the Medical Society of the State of New York; and be it further

Resolved, that the Procurement and Assignment Committee of the Medical Society of the State of New York, proceed to form a corps of these available and eligible physicians for service, when and where needed, in relief and aid areas."

Recommendation: This is a big order. We presume that the International Red Cross and other agencies set up for war and postwar relief and aid have already given much thought to this subject. However, if the Medical Preparedness Committee of the Medical Society of the State of New York could find it possible to make a survey of physicians who would be willing to return to Continental Europe for relief work, and have it available for the proper authorities, it would greatly aid in expediting their work and would be of much value to them when the services of these men will be needed.

I so move.

.... The motion was seconded

SPEAKER BAUER: There is one other amendment that should be made. You refer to the Medical Preparedness Committee, which has been changed by order of the Council to the War Participation Committee.

DR. MASTERSON: We are agreeable to that change.

SPEAKER BAUER: You have before you the amended resolution, which in substance recommends that the War Participation Committee make a survey of these physicians. The rest of the resolution is deleted. Is that not so?

DR. MASTERSON: Yes, but we have a recommendation.

SPEAKER BAUER: Read the recommendation.

DR. MASTERSON: Recommendation: This is a

big order. We presume that the International Red Cross and other agencies set up for war and postwar relief and aid have already given much thought to this subject. However, if the War Participation Committee of the Medical Society of the State of New York could find it possible to make a survey of physicians who would be willing to return to Continental Europe for relief work, and have it available for the proper authorities, it would greatly aid in expediting their work and be of much value to them when the services of these men will be needed.

SPEAKER BAUER: In substance the committee recommends that the War Participation Committee of the State Society conduct a survey, that information to be available for whomever might want it. Is that what in substance the committee recommends?

DR. MASTERSON: That is right.

SPEAKER BAUER: But not to be reported to Procurement and Assignment?

DR. MASTERSON: That is right.

.... The question was called for, and the motion was put to a vote and was unanimously carried

SPEAKER BAUER: Dr. Towne, do you have a report ready?

DR. G. SCOTT TOWNE, *Saratoga*: Yes.

SPEAKER BAUER: This will be the last one we have time for. We will convene tomorrow morning promptly at 9:00 A.M. We have a good deal of ground to cover, and I want nothing left over for the afternoon except the election of officers and A.M.A. delegates and retired members. As you know, the general session of the Society will start 2:30 P.M., so that is going to give us only one hour and a half to call the roll and hold the election, which always takes some time for the voting. Therefore, please be prompt at 9:00 A.M., so we can clear up everything tomorrow morning.

Section 76. (See 9)

Report of Reference Committee on the Report of the Council—Part II: Public Health Matters

DR. G. SCOTT TOWNE, *Saratoga*: Your Reference Committee on Public Health Matters—Part II—begs to submit to you the following report:

In making this report we have followed the outline of topics as they appear in the written report published in the NEW YORK STATE JOURNAL OF MEDICINE, April 1, 1943, issue.

Maternal and Child Welfare. The first item considered is on the subject of maternal and child welfare. The committee thoroughly approves of the program suggested by the Council, which included:

1. Coordination of the maternal and child welfare activities of the Medical Society of the State of New York and the State Department of Health
2. Subjects to be included in the regional programs
3. More emphasis on pediatrics in regional programs
4. The proposed "Consultant Service"

Relative to the supplemental report regarding the Federal Deficiency Appropriation Act of 1943, making an appropriation of \$1,200,000 to provide so-called emergency maternal and infant care to wives and infants of men in the armed forces, we note with apprehension that there is no specific statement as to amounts or how attending physicians shall be compensated. We recommend that the committee continue its efforts to secure specific data relative to these facts.

Hospital News

Governor Appoints Board to Investigate Mental Hospitals

An investigation of New York State's mental hospital system has been ordered by Governor Thomas E. Dewey, who appointed for the purpose a Moreland Act commission of five members, headed by Archie O. Dawson.

The others appointed by the Governor to act with Mr. Dawson were:

Dr. Peter Irving, of New York, secretary and general manager of the Medical Society of the State of New York; Charles Roswell, Springfield, Queens, assistant director of the United Hospital Fund and consultant on hospital accounting, formerly assistant director and comptroller of St. Luke's Hospital in New York; Dr. Fraser D. Mooney, of Kenmore, superintendent of the Buffalo General Hospital and vice-president of the American College of Hospital Administrators; and Assemblyman Lee B. Mailler, of Cornwall, chairman of the

State Health Preparedness Commission and superintendent of Cornwall Hospital.

Governor Dewey emphasized that this was not an "inquisitorial commission," but that its purpose would be to examine the methods and procedures for caring for the state's 90,000 mental patients.

Noting that the state has eighteen mental hospitals, six schools, and two institutes, all operated by the Department of Mental Hygiene, he said that "with the staggering percentage of mental cases among our war casualties, we are entering a period when research and improvement in treatment of mental illness will become a major consideration of society.

"Not only must better methods of hospitalization and cure be developed," he said, "but earlier recognition of mental disturbances and more prompt treatment must be our objective."

MacCurdy Is New State Hygiene Commissioner

DR. FREDERICK MACCURDY, professor of hospital administration of Columbia University and director of the Vanderbilt Clinic of the Columbia Presbyterian Medical Center in New York, has been appointed by Governor Thomas E. Dewey as State Commissioner of Mental Hygiene.

Dr. MacCurdy succeeds Dr. H. Beckett Lang, who has been acting commissioner since the resignation of Dr. William J. Tiffany.

"The medical profession generally," Dr. MacCurdy said, "should have a broader background in mental cases, so they can be recognized quicker. The majority of mental patients respond to treatment more quickly if they get early care, and I have the definite view that we should make more use of the mental hospitals for the training of young physicians in the mental side of medical care."

Governor Dewey said it was "deeply gratifying" to him that Dr. MacCurdy has accepted the direction of the state's mental hospitals. The Governor pointed out that it was only because of the enactment of a new law this year that he could "procure a man of Dr. MacCurdy's stature for this all-important work." This law eliminated the requirements that the Commissioner of Mental Hygiene have at least ten years' psychiatric experience in a mental hospital.

A former president of the New York State Hospital Association, Dr. MacCurdy was one of the original members of the joint administrative board which planned and constructed the Columbia Presbyterian Medical Center and is a member of the group of operating executives intimately associated with the Center since its opening in 1928.

Newsy Notes

Two State hospitals which celebrated their fiftieth anniversaries in May were Lebanon Hospital of the Bronx and the New Rochelle Hospital.

The 900 guests who attended the dinner at the Waldorf-Astoria in commemoration of Lebanon Hospital's fifty years contributed \$60,000 toward the \$275,000 fund for furnishing and equipping the new building.

Announcement was made recently in New York and in Albany that these two cities are adequately prepared to treat civilian casualties that may result from enemy action or any other war disaster.

Pilgrim State Hospital, Brentwood, Long Island, will be converted into an Army general hospital.

A wartime convention of the Hospital Associations of New York and New Jersey was held in New York City May 27, 28, and 29. Each of the state associations held its annual business meeting and election of officers at that time.

Harold A. Grimm, Esq., medical director of the Millard Fillmore Hospital, Buffalo, was elected president of the New York group, to succeed the retiring president, the Rev. John J. Bingham. The new president of the New Jersey association is Dr. J. Berkeley Gordon, of the Marlboro Hospital.

DR. PITTS RE-ELECTED HEAD OF CANCER SOCIETY

Dr. Herman C. Pitts, of Providence, Rhode Island, was recently re-elected president of the American Society for the Control of Cancer at the annual meeting of the group in New York City. Other officers, also re-elected, include Dr. John J. Morton, Rochester, New York, vice-president;

Dr. Frank E. Adair, New York City, vice-president; Dr. C. F. Rhoads, New York City, secretary; and James H. Ripley, treasurer.

Dr. Clarence E. Little, managing director of the Society, urged that a drive to rouse interest in cancer control be started in secondary schools.

*A complete unit for
Approved
Contraceptive Technique*

"THE KOROMEX SET COMPLETE"

Koromex Set Complete* is an attractively packaged unit containing the important items used for approved contraceptive technique. Identified by a removable label. To order or prescribe, merely write, "Koromex Set Complete, Diaphragm Size_____".

Each Unit Contains...

KOROMEX DIAPHRAGM—Widely accepted as the outstanding diaphragm in use today. Durable. GUARANTEED FOR 2 YEARS.

KOROMEX TRIP RELEASE INTRODUCER—Specially designed swivel tip facilitates usage. Gauged to take all size diaphragms.

KOROMEX JELLY and H-R EMULSION CREAM—Both preparations have equally high spermicidal value, but differ in degree of lubrication. Both are included so the patient may determine which preparation better meets her requirements and personal preferences.

* Price of Koromex Set Complete is only that of the Koromex Diaphragm and Koromex Trip Release Introducer

THE STATE OF NEW YORK

A PLUS SERVICE for hard-pressed physicians

Thousands of physicians are off to the war. On the men remaining in civilian practice a heavy task is imposed. These men have a right to every available extra facility and service for easing the burden of extended hours and practice. You have such an adjunct in Saratoga Spa. Here, Nature localized the only naturally carbonated mineral waters in eastern America and New York State organized the facilities physicians require for the use of these waters.

Most of the people who come to Saratoga, come on their doctors' advice. Many are chronic sufferers from heart, circulatory, rheumatic disorders; from stomach ailments; conditions of obesity; and from general debility due to the stress and strain of the times. The relaxation achieved at the Spa brings relief from these tensions and makes the patient receptive to the full benefit of your continuing medical direction. The Medical Staff of the Spa does not practice... it oversees the treatments you prescribe. *Open all year.*

For professional publications of The Spa, physician's sample carton of the bottled waters, with their analyses, please write W. S. McClellan, M.D., Medical Director, Saratoga Spa, 155 Saratoga Springs, N. Y.

"DOCTOR JONES" SAYS—

The Research Council on Problems of Alcohol: ever hear of 'em? Well, sir, they're doing a job that's needed to be done for a good many years. It seems they're tied up some way with the American Association for the Advancement of Science, so you'd expect 'em to do a scientific job. And the names on their Board of Directors and Scientific Committee—various kinds of professors and doctors and so on—several well-known psychiatrists—it's enough to recommend 'em.

Anyway, out of every thousand adults they figure that on the average there's six or seven that can't drink alcoholic beverages without drinking to excess. If something ain't done about it they get to be chronic alcoholics. And alcoholism—they say it ain't a moral offense to be punished; it's sickness, just as much as heart disease or arthritis or cancer or what have you. The same as any other sickness: you need to get at the underlying causes in individual cases and give the kind of treatment that fits each case.

And what they're doing: they're sponsoring scientific studies and establishing clinics and information centers where anybody can get the advice of experts—that sort of thing. In Sweden—I was reading that before the war there were ten

state hospitals just for alcoholics. Here in this country, the way they put it, about the only institutions that's willing to accept an alcoholic is the jail.

Yes, sir, alcoholism—I mean the condition responsible for 'em drinking to excess—is it's a mental or physical proposition—some combination of both. These various kinds of treatment they advertise (you remember "Keeley cure"?)—some of 'em help 'em but if you want a permanent cure you've got to get at the underlying cause. And to get it takes courage and backbone.

Often there's not it's some sort of a deep emotional conflict. Maybe the fellow's in one way or another, in his ambitions, drunk: an "escape mechanism," they call it. But it's like a dog with a tin can on its tail: the faster he runs the more commotion is to escape from. If the dog's got sense he'll stop when he comes to somebody he knows and let him untie the can.

Curing 'em: it's largely a matter of getting loose from the can that's causing the trouble—that's what his organization is for: helping him do it.—Paul B. Brooks, M.D., in *Health News*

Time to Collect

IT IS NEWS when a collection firm gets fan mail. A doctor writes, "You are wizards." A hospital superintendent says, "Your skillful methods bring checks in every mail." The truth of the matter is that patients who were unable to pay medical fees a few years ago are now receiving fat pay checks. These days there is no such thing as a hopeless account. We are willing to try to collect any of your bills at a moderate percentage of the amount recouped.

Now is the time to write for details.

For Skins that are "Convalescent"

A skin that is "under-par" can be cleaned and pampered at the same time with CREAM OF SOAP. For this important new product, a colloidal solution of fine soap, is neutral; does not alkalize the surface of the skin; does not disturb its normal acid-base balance. But it does clean, even the very greasy skin, thoroughly. Skins that are "convalescent" need CREAM OF SOAP. To find out what it will do for the normal skin, use it yourself! Send a dollar bill for a full sized jar. Address: CREAM OF SOAP, Room 21, 55 West 16th St., New York, 11, N. Y. Your druggist can obtain CREAM OF SOAP from his wholesaler.

Accepted for advertising in publications of the A.M.A. and
admitted exclusively to physicians

CREAM OF SOAP, 55 W. 16th St., New York, N.Y.

"A. MOVIE," PROMOTER OF BLOOD BANKS

Born at the Albany Hospital, Albany, New York—an idea, "A. Movie"! What a handicap to start a life under—no parents and, of all things, colored, with no funds to pay expenses. E. W. Jones, director-on-leave of the hospital, took a great interest in the young idea and did not want him to anguish for want of nourishment. He called in two people who he thought should be interested in adopting the feeble youngster—F. M. Nielson of Educational Film Service, Nassau, New York, and F. C. VanDenburgh, director of the hospital's service division, E. H. Foster and Company, Inc., Cohoes, N. Y.

Mr. Nielson was to administer the proper nourishment and Mr. VanDenburgh was to direct the care. They adopted little A. Movie, christening him "Building and Operating Blood and Plasma Banks." They, with Mr. Jones, went into consultation with the personnel of Albany Hospital and of Crouse-Irving, Memorial, and University hospitals of Syracuse, New York, to get the proper shots to give the infant idea. These hospitals all worked together to formulate the prescribed scenario of treatment.

The treatment was under the direct supervision of Dr. John B. Alsever, director of the Transfusion Service Center, University Hospital, Syracuse, and now technical consultant on blood and plasma banks to the Office of Civilian Defense, Washington, D.C. The good doctor gave to the young idea the proper technical skill and care. To him and to Dr. F. A. D. Alexander, chief of anesthesia, gas therapy, and blood bank service, Albany Hospital, goes all the credit for keeping him alive and growing.

He lived and grew lusty, as forty-three 100-foot color shots were taken by the foster parents at all the hospitals listed. These shots show the state

police working with the hospital in handling an emergency resulting from a traffic accident; a blood transfusion to an accident victim in the emergency room; a typical donation to a blood bank; typical centrifugation and aspiration of blood; transfusion in the operating room; transfusion in a private room; plasma transfusion to a poliomyelitis victim in an iron lung, and a plasma transfusion to a burn patient in the emergency room.

Today, "A. Movie" is a full-sized 1,600 foot film capable of doing his job well, going from hospital to hospital working to stimulate interest in building and operating blood and plasma banks. He is an independent fellow whose sole purpose in life is to help get a blood bank in every hospital. Any hospital that wants to use this husky fellow for its blood bank should write for information to Albany Hospital.

What can "A. Movie" do for you? He can get you a blood bank if you don't have one. This can be done by interesting your community in the value of a blood bank. This movie will also aid in obtaining blood donors. If you already have a bank, the film will help you win the complete cooperation necessary to maintain and enlarge it. Of most importance, the use of "A. Movie: Building and Operating Blood and Plasma Banks" will do a fine job of improving public relations in your community.

A souvenir booklet illustrated with pictures taken from the movie is an important part of the program and should be given to all members of the audience. The combination of the movie and the booklet has produced hundreds of favorable comments from our audiences.—*The Modern Hospital*
